# THE GARDENERS' MAGAZINE.

No. 3,036.
Vol. LV.
(Reg. at the G.P.O. as a Newspaper, and for Canadian Magazine Post.)
SATURDAY, JAN. 6, 1912.
(10/6 per Ann. Post Free. To Foreign Countries, 15/-.)
Twopence

BARR'S SEED GUIDE FOR 1912 contains a select List of the best VEGETABLES, and the most beautiful ANNUALS and PERENNIALS for Garden and Greenhouse, including many fine Novelties of Sterling Merit. Sent free on application. BARR and SONS, 11, 12, and 13, King Street, Covent Garden, London.

---

BARR'S REMOVAL SALE OF HARDY PLANTS.—Clearance List of surplus plants at greatly reduced prices (prior to removal of nurseries from Surbiton to Taplow), sent post free on application. BARR and SONS, 12 and 13, King Street, Covent Garden, London.

---

FIDLER'S NEW ILLUSTRATED CATALOGUE OF CHOICE GARDEN SEEDS will be sent, post free, to any address, on receipt of postcard. Write at once for a copy. It may help you to save 50 per cent. on your seed bill this season. FIDLER and Sons, Royal Berks Seed Stores, Reading.

---

GISHURST COMPOUND is harmless in use; its soluble Sulphur, etc., has for 40 years cured blight and fungus on plants, and is good for washing unhealthy dogs. Gishurstine keeps boots dry in all weathers; they will polish. Good for harness. Wholesale from
PRICE'S PATENT CANDLE CO., LIM., LONDON.

---

JAMES GRAY, Horticultural Builder, Chelsea, is this winter keeping a large staff of hot-water men in the shops, in order that they may attend immediately to any breakdown of boilers or hot-water piping in any part of the country. In case of emergencies, please telephone 201 Western, or wire, "Gray, Chelsea, London."

---

OSMUNDA FOR ORCHIDS.
CONSIGNMENTS ARRIVE FORTNIGHTLY.
2s. 6d. per bushel; per bag, 8s. 6d.
SANDER AND SONS, ST. ALBANS.

---

FERNS, FERNS, FERNS, etc.—Foliage and Blooming Plants for stove, greenhouse, and garden. 100,000 large garden Ferns, 20s. 100. 5,000 cases sent off yearly. Amateur Catalogue free. J. E. SMITH, London Fern Nursery, Loughborough Junction, S.W.

---

LAXTON FRUIT TREES.—An immense stock, the finest trees we have ever offered, splendid well-ripened wood and fine roots. Absolutely none better obtainable. Trained in all forms. Fully illustrated Catalogue gratis.—LAXTON BROS., Bedford.

---

PERPETUAL CARNATIONS.
Our 1911 Illustrated Catalogue free.
Read our "Cultural Treatise," 1s.
YOUNG and CO., Carnation Specialists,
Hatherley, Cheltenham.

---

CHOICE NEW CHRYSANTHEMUMS.—Our New Catalogue of 800 finest varieties in all sections is now ready, most up-to-date yet issued. Contains Splendid Novelties for 1912. Post free. J. W. COLE and SON, Chrysanthemum Specialists, Peterboro.

---

ROCK GARDENS and ALPINE PLANTS.—A new work and a complete guide to the Formation and Management of Rockeries, by E. H. Jenkins, F.R.H.S. Many Illustrations. Cloth, 2s. 10d., post free, from Publisher, 148, Aldersgate Street, London.

---

WELLS' Catalogue and Novelty List of
CHRYSANTHEMUMS,
PERPETUAL CARNATIONS,
HERBACEOUS PLANTS,
ALPINE AND ROCK PLANTS,
now ready. Post free on application. Wells' Book, "The Culture of the Chrysanthemum," post free, 1s. 6d. W. WELLS and CO., Mersham, Surrey.

---

GREENHOUSE PAINTING and GLAZING "Vitrolite," superior to White Lead Paint, 9s. per gall. "Plastine" supersedes Putty, 16s. per cwt. Particulars from W. CARSON and SONS, Grove Works, Battersea. Agents throughout the country

---

FORCING NOVELTIES FOR SOWING NOW.
WEBBS' EARLY FAVOURITE PEA.
2s. per pint; 3s. 6d. per quart.

---

WEBBS' SELECTED AILSA CRAIG ONION, 1s. and 2s. 6d. per packet.

---

WEBBS' PEERLESS MELON.
2s. 6d. per packet.

---

WEBBS' WONDERFUL CARROT.
1s. 3d. per ounce.

---

WEBB AND SONS, THE KING'S
Seedsmen, Wordsley, Stourbridge.

---

BUNYARD'S CATALOGUES
Free on Application.

---

FRUIT TREES, SHRUBS.

---

ROSES AND OTHER CLIMBERS IN POTS.

---

HERBACEOUS AND AQUATIC PLANTS.
For Autumn Planting.

---

Royal Nurseries, MAIDSTONE.
Established 1796.

---

CLAY'S MANURES, CRUSHED BONES
(See page ix.)

CLAY'S FERTILIZER IS
UNSURPASSED for all Horticultural Purposes.
CLAY and SON, Stratford, E.

---

BRACKEN ROOTS for Naturalising.—These quick-growing underground stems, 1s. per lb. Bluebells, 1s. 6d. 100. Eight kinds hardy Ferns, 10s. 100.—CRUMP, Wray, Mortonhampstead, Devon.

---

IRISH-GROWN SEED POTATOES.—Write for Catalogue of leading varieties, post free. Prizes offered at English Exhibition. WM. E. SANDS, F.R.H.S., Potato Specialist (Dept. M), Hillsborough, Co. Down.

---

PERPETUAL-FLOWERING or American Tree Carnations, strong, healthy Guernsey plants, from pots, 4s. per doz., carr. paid; 20s. per 100, carr. forw. Ask for catalogue, 75 vars., with full directions. VAN DER SLUYS, F.R.H.S., Ramee, Guernsey, C.I.

---

CHRYSANTHEMUMS. — Cuttings from prize plants, Eastbourne Show, 1911, 25, 4s. 9d., including some in article "A. G." Dec. 23. Cat. free—Exhibition, Decorative, Outdoor vars.—G. and P. ATTFIELD, Hampden Park Nurseries, Eastbourne.

---

SEEDS ON APPROVAL, carriage paid; reliable quality, reasonable prices. Catalogue Free.—ELLISON, 57, West Bromwich. Estab. 1890.

---

ORCHIDS FOR AMATEURS.—A practical guide to the Cultivation of Cool and Warmhouse Orchids, adapted for Small Mixed Greenhouses. The author is C. Alwyn Harrison, F.R.H.S., and the book can be obtained, by post, for 2s. 10d., from Publisher, 149, Aldersgate Street, London.

---

GREENHOUSES and CONSERVATORIES. Distinctive Designs and Finished Workmanship. Write now for ILLUSTRATED CATALOGUE. CARTER and HOWARD, Horticultural Builders, Kingston-on-Thames. Phone: 1308 P.O. Kingston.

---

HEATING APPARATUS for GREENHOUSES. Write for special prices. Give length and width of greenhouse. Catalogue free. Medals awarded 1865, 1881, 1895. J. ATTWOOD, Stourbridge.

---

WM. DUNCAN TUCKER and SONS, Lim., 27, Cannon Street, London, E.C.; Works, Tottenham. Conservatories, Winter Gardens, Vineries, Peach-houses, portable buildings, etc. Catalogue gratis.

---

SOW NOW UNDER GLASS.
SUTTON'S PIONEER PEA.
per pint, 2s.; quart, 3s. 6d., post free.

Mr. A. Wood, gardener to A. J. Allcock, Esq., writes: "I must remark on your dwarf Pioneer Pea. I had it to follow Harbinger and Little Marvel, and it completely outclassed all other dwarfs. Large, handsome, well-filled pods of grand quality, entirely smothering the plants."

---

SUTTON AND SONS, THE KING'S
SEEDSMEN, READING.

---

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s. post free, from KELWAY and SON, LANGPORT, SOMERSET.

From ———, Esq.
Northwood,
Middlesex.

28 September, 1911.

"I find that I have never forwarded 2s. for your lovely Catalogue you sent me some weeks since. It would be cheap at five times the price, and I sincerely regret the oversight."

---

THOMSON'S CELEBRATED MANURES.
(For full particulars see page x.)

---

SWEET PEAS.—All best varieties recommended by the Nat. Sweet Pea Society. Collections, 1s. to 30s.—ELLISON, 57, West Bromwich.

---

CHRYSANTHEMUM CUTTINGS.—My collection contains nearly 600 up-to-date vars. Purchaser's selection, from 1d. each. Catalogue free. H. WOOLMAN, Shirley, Birmingham.

---

POULTRY and KENNEL APPLIANCES of every description. Write for latest Catalogue free on application.—BOULTON and PAUL, Lim., Norwich.

---

PERPETUAL TREE CARNATIONS, best vars., strong plants, from pots, 4s. doz., carr. paid; 20s. 100, carr. pd.; good flowering plants, in 5in. pots, 10s. 6d. doz. G. S. EVANS, Bexley Heath.

---

BEGONIAS.—Choice Liliums, named Achimenes, Cannas, German and Japanese Iris, Montbretias, Arums, Gladioli, Gloxinias, Spiræas, Tritomas, Hippeastrums.—ELLISON, West Bromwich.

---

"ROSES AND THEIR CULTIVATION."—A new edition of this Standard Book is now ready, and every Rose Grower should secure a copy. Cloth, many Illustrations, 2s. 10d., post free, from Publisher, 149, Aldersgate Street, London, E.C.

---

BECKETT'S NEW BOOK.—The most practical and Up-to-date Book on Vegetables. Price 5s.; post free, 5s. 6d. EDWIN BECKETT, Aldenham House Gardens, Elstree, Herts.

---

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardener's favourite Fumigant, both Liquid and Cake.

XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown, both poisonous and non-poisonous, are XL ALL WEED KILLER, XL ALL FERTILISER, XL ALL WINTER WASH for Fruit Trees, RICHARDS' BANDING GREASE, etc. Don't forget to ask your N. S. or Florist for Richards' small pink list.

G. H. RICHARDS, Manufacturer,
234, Borough High Street, London, S.E.

# THE GARDENERS' MAGAZINE.

## NOTE OF THE WEEK.

◆

### Effect of Grass on Fruit Trees.

For some years past it has been a debatable point among fruit growers whether the crops obtained from trees growing in surface cultivated soil are so far superior to those produced by trees occupying grass-covered areas as to justify the increased cost involved in keeping the ground free from weeds and maintaining the surface in a loose state. It is generally acknowledged that the finest fruit is produced by trees occupying ground that is regularly tilled, and it is also recognised that the most profitable market crops are obtained from plantations where the trees are free from competition with grass or other forms of plant life. Yet many who grow fruit have a liking for grass-grown orchards. It may be sentimental, or it may be a desire to obtain supplies with as little cost as possible. In some instances, the belief of those who regard the grass-grown orchard with favour is founded on the heavy crops of excellent fruit that are in many seasons produced by some orchard trees that have from their earliest years had their root run carpeted with grass. In the latter case there is some excuse for the opinion held with regard to the sufficiency of such trees, and we should certainly not advise those who have profitable grass orchards to break up the surface. The fact, however, is unquestionable that grass has an injurious effect upon fruit trees, especially in a young state, and that the best results are obtained when the surface soil is kept free from grass for some distance from the stem until at least the trees have become well established, and have made several years' growth. It would be, however, better were the soil tilled throughout. Recognising the injury done by grass, we have for many years consistently advocated surface cultivation as an essential detail of hardy fruit culture, and a great improvement has been effected as the result. We have on several occasions referred to the series of experiments that are being carried out at the Woburn Experimental Fruit Farm under the direction of the Duke of Bedford and Mr. Spencer Pickering for the purpose of determining with scientific accuracy the effect produced by grass upon fruit trees and the cause thereof. The report on these experiments, which forms a substantial volume, is now before us, and is a valuable contribution to pomological literature. There can be no question as to the subject being of great practical importance to fruit growers, but, as stated in the report, the bearing, which it has on the question of the conditions of growth of plants in general and of the process occurring in the soil, is of still greater importance. It is pointed out in the introduction that the general conclusion to which the earlier results led has been greatly strengthened, if not proved, by recent work. This conclusion was to the effect that the action of the grass was due to the existence of some substance which was actively inimical to the growth of the trees, though how such substance originated was a matter of conjecture. The general result, as so clearly shown in the report, of grassing the ground, either by sowing seeds or replacing the turf after the trees have been planted, is the arrest of growth, and the consequent stunting of the trees. The illustrations which form so useful a part of the report, fully support this conclusion. The first of the plates illustrates two rows of trees of Bramley's Seedling, one of which had the ground grassed over immediately after planting, and in the other case it remained in a state of tillage. The trees in the first row made a poor, stunted growth, and in the second row the trees present the appearance of having been placed under the conditions most favourable to a robust state of health. Somewhat similar results are shown in the fourth plate, in which are represented two rows of Cox's Orange Pippin. Unlike the Bramley's Seedling, the whole of the trees were given the advantage of a tilled surface until the end of their fourth year after they had been planted, and then a portion of them had the surface of the soil, as far as their roots extended, grassed over. The deleterious effect of the grass upon the trees was evident in the first season, and this became more apparent each season, until in the sixth year, when the majority of the trees were practically dead. We have on several occasions had an opportunity of seeing the experimental fruit plantations at Woburn, and are much impressed by the fidelity with which the results obtained are represented in the illustrations. Other apple trees, both standards and dwarfs, that have been similarly treated twelve years after planting, behaved in much the same manner, except that they did not show signs of such serious injury until the third or fourth year after the surface of the ground had been grassed. We learn from the report that some varieties of apples suffer less than others, but very little difference has in this respect been found between bush and standard trees. It has also been proved beyond all question that, not only do apple trees suffer from the injurious effects of grass, but those of cherries, pears,

MR. EDWARD A. BUNYARD.

and plums are affected in much the same way, and to a similar extent, but standards are less seriously injured than bush trees. With reference to the distance grass should be removed from the trees so as to have no effect upon them, it is very properly observed that much depends upon the nature and size of the trees, and also on the character of the soil. With newly-planted standard apple trees it was demonstrated that a considerable effect was produced when the grass was four feet away from the stems, and, on the other hand, keeping a space free from grass only six inches from the stems of newly-planted dwarf trees was found to have a beneficial effect. It has been proved by the experiments that the stronger growing grasses are more injurious than those of weak growth. In seeking for an explanation of the cause of the injurious effects of grass, the questions of soil aeration, a deficiency of moisture in the soil, an insufficiency of the food supply, the physical alteration in the soil, and soil bacteria, were fully investigated, but they all gave negative results. But in the course of the various series of experiments with trees grown in pots, evidence of a positive character was obtained as to the formation of a toxic substance during the growth of grass. It was found "that such trees, when watered with the leachings obtained from trays containing grass growing in sand, flourished more than when water alone was supplied; but when the trays were placed on the surface of the soil (or sand), in which the trees were growing, so that the washings from the grass reached the tree roots with practically no exposure to the air, they had a very deleterious effect, nearly, if not quite, as great as when the grass was grown above the roots of the trees in the ordinary way." The difference in the effect produced by the use of water that had passed through the grass-filled trays, and the drainings from similar trays placed on the surface of the soil, is explained by the rapid oxidisability of the toxic matter, and, as suggested by the authors of the report, is in full accordance with what has been established as to the behaviour of heated soils towards plants.

---

**Mr. Edward A. Bunyard,** son of Mr. George Bunyard, V.M.H., entered business in 1896, the year in which the firm of Messrs. George Bunyard and Co., Lim., celebrated its centenary. As a member of this firm, he is keenly interested in all that relates to fruit culture, but in addition to being an excellent man of business, he has devoted considerable time to the compilation of an "Index to Illustrations of Apples" and an "Index to Illustrations of Pears," both of which have been published in the "Journal" of the Royal Horticultural Society. Mr. E. A. Bunyard is a collector of old books relating to fruits and fruit trees, and is now at work on a bibliography of the English works on these subjects. He is a keen student of Genetics, and at the Conference on Genetics held in London in 1906, he read a paper on "Xenia." In addition to his earlier education in England and study in the home nursery, Mr. E. A. Bunyard has lived in France for the express purpose of studying French nursery methods, becoming familiar with the language, and acquiring a knowledge of French pomological works. He has lectured before the Royal Horticultural Society and the Horticultural Club, and is a member of the R.H.S. Library Committee and of the Governing Body of the Gardeners' Royal Benevolent Institution. In local affairs Mr. Bunyard has been Guardian of the Poor for the parish of Allington since 1903. His chief hobby is music, and he acts as accompanist to the Maidstone Choral Union. Of this society he has been secretary since its institution in 1903, and it is in no small measure due to his skill that the society won the championship banner for Kentish societies, and in 1909 won the "Daily Telegraph" shield at the South London Musical Festival.

**The "Gardeners' Magazine" Almanack for** 1912 accompanies the present issue, and is free to subscribers. It will be found equally remarkable for its attractiveness and utility, the dates of exhibitions and meetings being as complete and accurate as it is possible to make them thus early in the year. We hope our readers will like the coloured illustration of Japanese irises and water-lilies on the almanack; it represents these popular and beautiful flowers in the water garden that forms so distinct and interesting a feature of the Royal Horticultural Society's gardens at Wisley.

**The New Rock Garden at Wisley.**—We may remind our readers that quite close to the charming spot mentioned above, a very fine rock garden is rapidly approaching completion, and is already becoming furnished with plants. This important feature extends over a large area, and is arranged on sloping ground, the lower margin being not far from the water garden. It represents with remarkable fidelity the lower slope of a mountain that has been found especially adapted to the growth and display of the finest of the plants that have their home in Alpine regions. Messrs. Pulham and Son, of Broxbourne, to whom the construction of the rock garden has been entrusted, have so cleverly designed and carried out the work that a far more suitable site for alpine and rock-loving plants has been secured than is provided at the base of a Swiss or Pyrenean Alp. The work is worthy of all praise, and when fully planted and well furnished with plants, it should add greatly to the reputation of the Messrs. Pulham and to the many attractions of a famous garden.

**Education in Forestry.**—During the past year, as our pages amply testify, questions relating to afforestation and education in forestry received a large share of attention. In a resolution relating to forestry passed at one of their earlier meetings, the Development Commissioners decided that their first grants should be made with the object of improving the facilities for obtaining a sound education in forestry. In 1888 a lecturer in forestry was appointed at the Edinburgh University, and since the appointment, a course of lectures has annually been delivered during the winter session. A few years since the Edinburgh and East of Scotland Agricultural College included in its curriculum a short course of lectures on elementary forestry for working foresters and others at the Agricultural College. Subsequently the Edinburgh University, appreciating the importance of forestry, instituted a B.Sc. degree in forestry, and appointed lecturers to give the special courses of lectures which the forestry student was required to take, such as forest botany, forest chemistry, and forest entomology. The demands made upon the resources of the department brought into prominence the fact that provision was required for (1) a forest garden, including an area for experimental formation of woods; (2) extensions of the present museum and the provision of laboratories; (3) additional lecturers on the University staff. In collaboration with the Edinburgh and East of Scotland Agricultural College, steps have been taken towards the attainment of these objects. The Development Commissioners were approached by the University court and the governors of the Agricultural College, and their applications were met by the Commissioners in a generous spirit. A sum of money has been promised annually for a period of years for the rent and upkeep of a forest garden and an area of experimental plantations. In addition, the Development Commissioners have granted the University a sum of £4,500 towards the erection of a new forestry building, provided a similar amount is provided by the University. A grant of £2,000 has been made towards the equipment of the museums and laboratories, and £500 annually for five years has been promised as a provision for the salaries of an additional lecturer and an assistant in the Forestry Department.

**Our Carnation Cover.**—The present issue goes forth with a somewhat unusual cover, and one that indicates the progress that is being made in reproduction by the three-colour process. The perpetual carnations are particularly good, and the varieties represented are Wanoka, crimson, the topmost flower; Baroness de Brienen, the highest flower on the right, a beautiful pink variety, which, like Lady Alington, the fine red variety on the left, was raised by Messrs. Stuart Low and Co., Bush Hill Park Nurseries, Enfield. The lowest flower, also a pink variety and of much merit, is Admiration. Messrs. Stuart Low and Co. have taken a very prominent part in popularising perpetual carnations, and by raising and introducing new varieties, the firm has shown great skill and enterprise, and thereby obtained much fame, both at home and abroad, in connection with these charming and useful flowers. On the back cover a rock garden scene is presented, and probably not one in ten of our readers will need to be told that the picture illustrates that portion of the rock garden at the Royal Gardens, Kew, so generally known as the Dripping Well.

**Hardy Plants and Flowers for Exhibition.** The National Hardy Plant Society has issued three model schedules, compiled with a view to help committees of horticultural societies in the task of providing suitable and useful classes for hardy herbaceous plants and flowers for either spring, summer, or autumn shows. The society lays particular stress upon the advisability of excluding liliums, gladioli, and other bulbous plants from the ordinary classes for collections of herbaceous flowers, and suggests that these subjects should have classes to themselves. The inclusion of flowering shrubs, or sub-shrubby subjects in any collection of herbaceous plants will of necessity disqualify on technical grounds. For example: a tree pæony is not herbaceous, though all other pæonies undoubtedly are. Quite rightly the society considers it undesirable that subjects which cannot be held to be generally hardy in British gardens be staged with herbaceous flowers, while it considers that perpetual or Malmaison carnations, roses, dahlias, must not be staged in exhibits of hardy herbaceous perennials. Excellent advice is that in wording a schedule the greatest care should be exercised to make clear the exact requirements and restrictions insisted upon. The word "kind" shall always be taken to mean "genus" or "family," as e.g., iris, pyrethrum, etc ; "species" to mean "wild type" and "variety" any form raised in gardens. There seems to be a little weakness in the description of "variety" because if this definition applies only to garden raised forms then it necessarily excludes wild varieties of a species.

# PROGRESS IN SWEET PEAS.

In penning a few notes on the progress of sweet peas, I do not think it necessary to make comparisons with varieties more than ten or twelve years old, for even in this short space of time, the progress and development has been so great that varieties holding high place are very seldom seen now, and certainly they are not worth growing with the grand varieties of to-day. I imagine a great many of our present sweet pea enthusiasts never knew the varieties introduced, say, fifteen years ago, which tends to show the rapid advance made, and how quickly one variety supersedes another. Just now it is a good variety indeed that can hold its position at the head of any colour class for more than two or three years.

The formation of the National Sweet Pea Society some eleven years ago has, without the slightest doubt, been one of the great factors in this development. But the greatest factor was the introduction at that time of some of the finest varieties in the old grandiflora type by Henry Eckford. Many will urge that it was the advent of Countess Spencer that caused such a boom in our favourite flower; this variety, no doubt, gave it a filip, but I firmly believe that without this change in form, the boom in sweet peas would still have been the same, for we were annually receiving distinct advances in all shades of colour, as well as in the size and substance of the blooms, and, what was more necessary for the development of any particular flower, the general public were just realising the utility of the flower from a decorative point of view, and the great pleasure that could be derived from the cultivation of a few rows or even clumps.

Not many years ago classes for sweet peas at summer shows were far from numerous, but now we have several classes at all the principal shows, arranged to suit growers of every description, and the sweet pea tent at many of them proves the centre of interest. The number of sweet peas exhibited would, I am sure, compare favourably with that of any other flower, so that the compilers of schedules have not only helped their own particular show, but also added to the popularity and progress of the sweet pea.

In reviewing varieties one has perforce to compare the present-day Spencer form with the grandiflora type, and, speaking generally, we may say there has been a wonderful all-round improvement. The size of the flower has considerably increased, which is a decided advantage (providing there is no loss in quality or colour); the length of stem of the Spencer form is greater than in the old type, which makes the spikes more useful as decorative subjects, and, of late, we have had varieties introduced that could hardly be surpassed for their brilliancy of colouring, notably in the orange, salmon, scarlet, and crimson shades, whilst in the softer colours, such as blue, pink, lavender, and mauve, we have varieties almost innumerable, many of them of most pleasing shades, and not a few of them having two or three distinct shades of colour in them, which greatly enhances their decorative value.

While making a few comparisons in the different colour classes, I do not infer that the varieties will be best at the present time, but that they will be among the best in their respective classes. One of the best crimsons that I remember of about fifteen years ago was a variety called Ignia; this was improved upon two or three times by further introductions from the Eckfords, King Edward VII. being probably the best in the grandiflora type, but even this fine variety is surpassed by such excellent varieties as Maud Holmes and Sunproof Crimson. The scarlet sweet pea is a much later introduction than the Crimson and Scarlet Gem (Eckford), the first real scarlet that I remember; this was superseded by the variety Queen Alexandra some three years later, a variety which has held its own longer than most, owing to the difficulty that has been experienced in breeding a really sunproof Scarlet Spencer form, but the last two years have seen a remarkable advance in this colour, for we now have several really first-class varieties to pick from, though, as might be expected, they are very much alike, and Scarlet Monarch, Scarlet Emperor, Red Star, George Stark Improved, and Doris Burt are all varieties that show a decided advance even on Queen Alexandra.

SWEET PEA HERCULES.

A beautiful variety raised by Messrs. Stark and Son; the flowers large, and the colour rich pink.

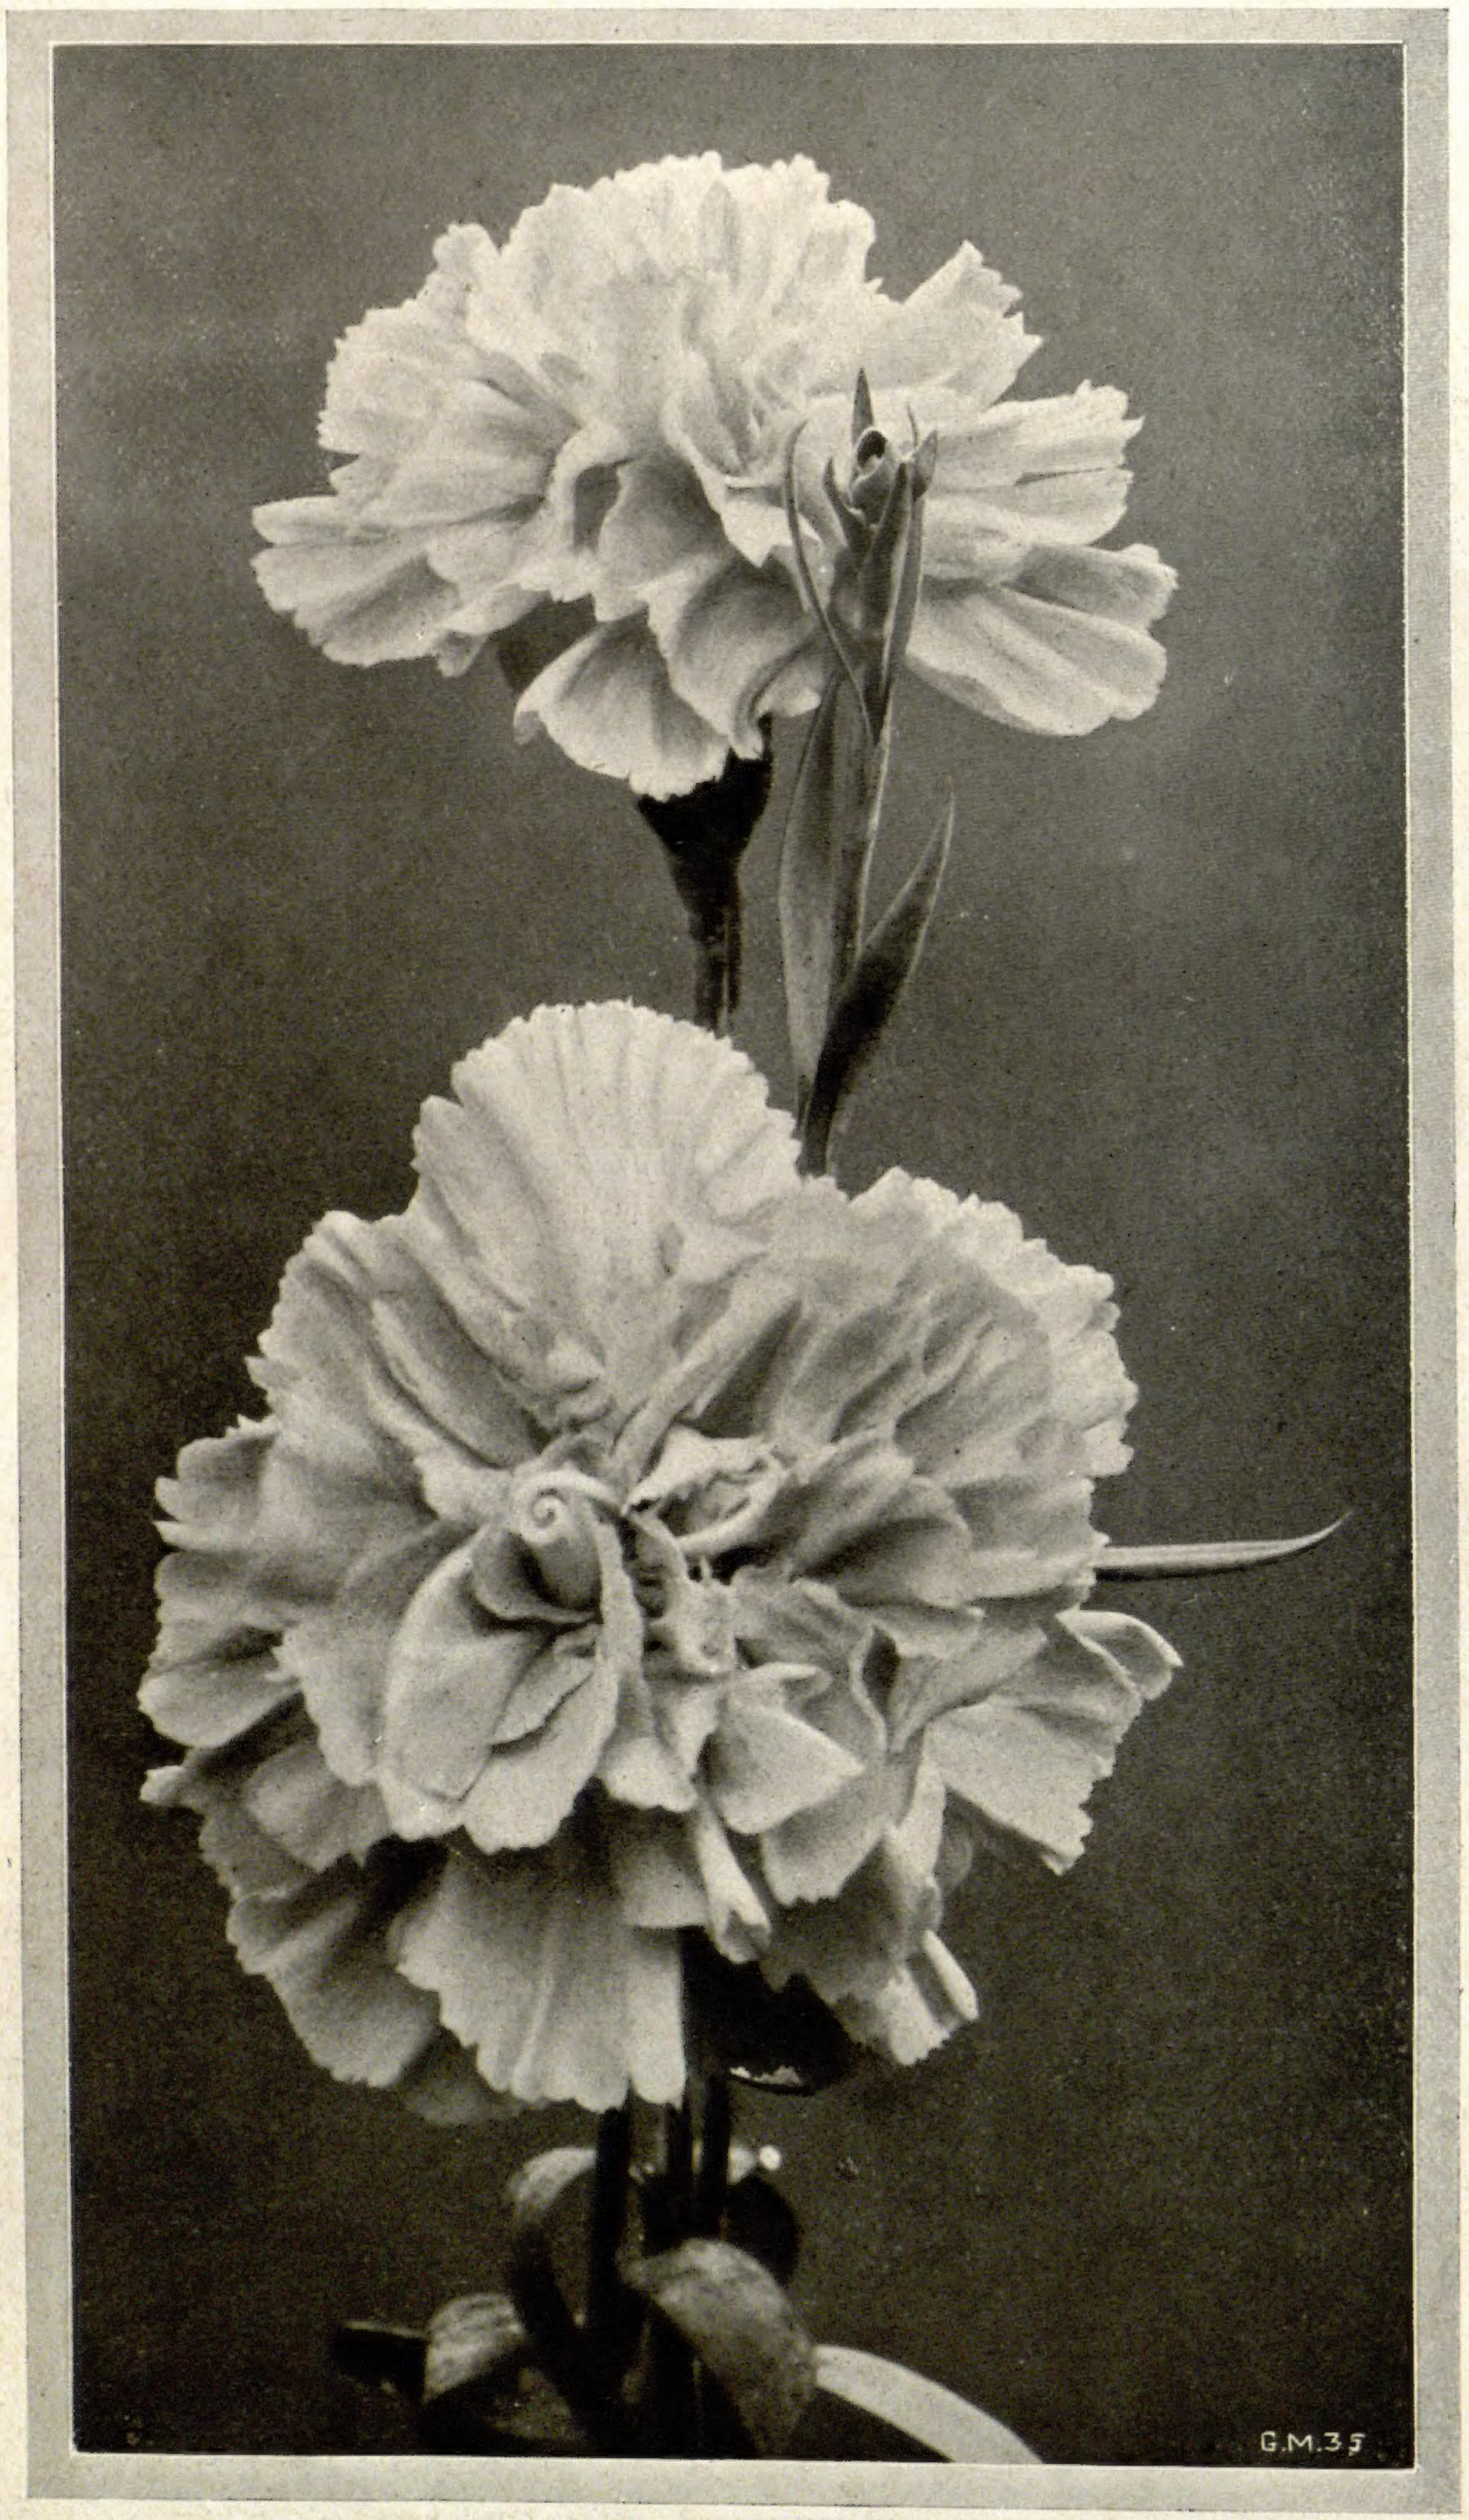
Among white varieties the advance made is not so pronounced Emily Henderson was a variety of the grandiflora type that stood for some considerable time, but was eventually superseded by Dorothy Eckford in 1902 or 1903, and though we have plenty of whites in the Spencer form, I do not think we have yet one of the quality and substance of Dorothy Eckford; Etta Dyke is excellent, but we want a flower with a better standard, or, at least, that will show itself off better, and with a little more substance. Dark Blue is the one colour that we have not yet been able to reproduce to stand the sun in the Spencer form, and though Jack Tar and Mrs. George Charles are very good, they do not compare favourably with Navy Blue or Lord Nelson, which were the best grandiflora varieties we had. The old Emily Eckford was a very distinct shade of blue, and very beautiful, and, though we have a Spencer variety under this name, I fail to see any great similarity between the colour of the two varieties. A waved form of the colour of Emily Eckford, and as good in form as Mrs. Hugh Dickson, would, indeed, be an acquisition. In light blues we are rather better off, the improvement being more marked. Anglian Blue and Zephyr are varieties that may be said to be first rate.

Looking back, Boreatton, and, later, Black Knight, impress me as being the best dark varieties in the old form; but here again they are entirely eclipsed by such varieties as Prince of Asturias, Black Knight Spencer, Tom Bolton, and others, while Arthur Green, Red Chief, and Colossus are distinct colours that have come in waved form, and all of which may be classed among the bronze or maroon shades.

The pink varieties, always popular from a decorative point of view, provide one of the most striking instances of progress. Princess Beatrice was probably the best and most widely grown sweet pea for a number of years, and I believe even now it is sent to the market, but I consider this variety superseded by Lovely and Prima Donna, both varieties of great merit, and they might have continued in popular favour for a long time but for the introduction of Countess Spencer. Since this introduction, we have had pink varieties almost too numerous to mention, some with white, cream, or lemon grounds, and Elfrida Pearson, Mrs. Hugh Dickson, and Doris Usher are good examples of progress in this direction. But if they were properly fixed, I believe the three best and distinct pink varieties in cultivation would be Audry Crier, Anglian Pink, and Marjorie Linzee, these being giants in size and quality. Hercules, herewith illustrated, is also noteworthy among pink varieties.

T. STEVENSON.

(To be continued.)



CARNATION BATH'S PREMIER.

A distinct and beautiful perpetual-flowering variety with rich yellow flowers, raised by Messrs. R. H. Bath, Lim.

## CARNATION BATH'S PREMIER.

Perpetual carnations with yellow flowers are so few in number that there was no occasion for surprise at the fine variety exhibited by Messrs. R. H. Bath, Lim., of Wisbech, under the name of Bath's Premier, at the meeting held by the Royal Horticultural Society, on December 5 last, should have received an Award of Merit from the Floral Committee, and obtained much attention from the visitors. Of its distinctness and value there can be no question, for the flowers are of high quality, and the colour is a soft, yet rich yellow. The form is admirably shown in the accompanying illustration of two of the flowers exhibited, and with regard to their quality it will suffice to say that the petals are of good substance, and the calyx perfect. In the illustration the blooms are represented of a size rather below the average. This valuable addition to the list of perpetual carnations has descended from the "Lawson" variety, and is similar in habit and style of flowering to that notable carnation.

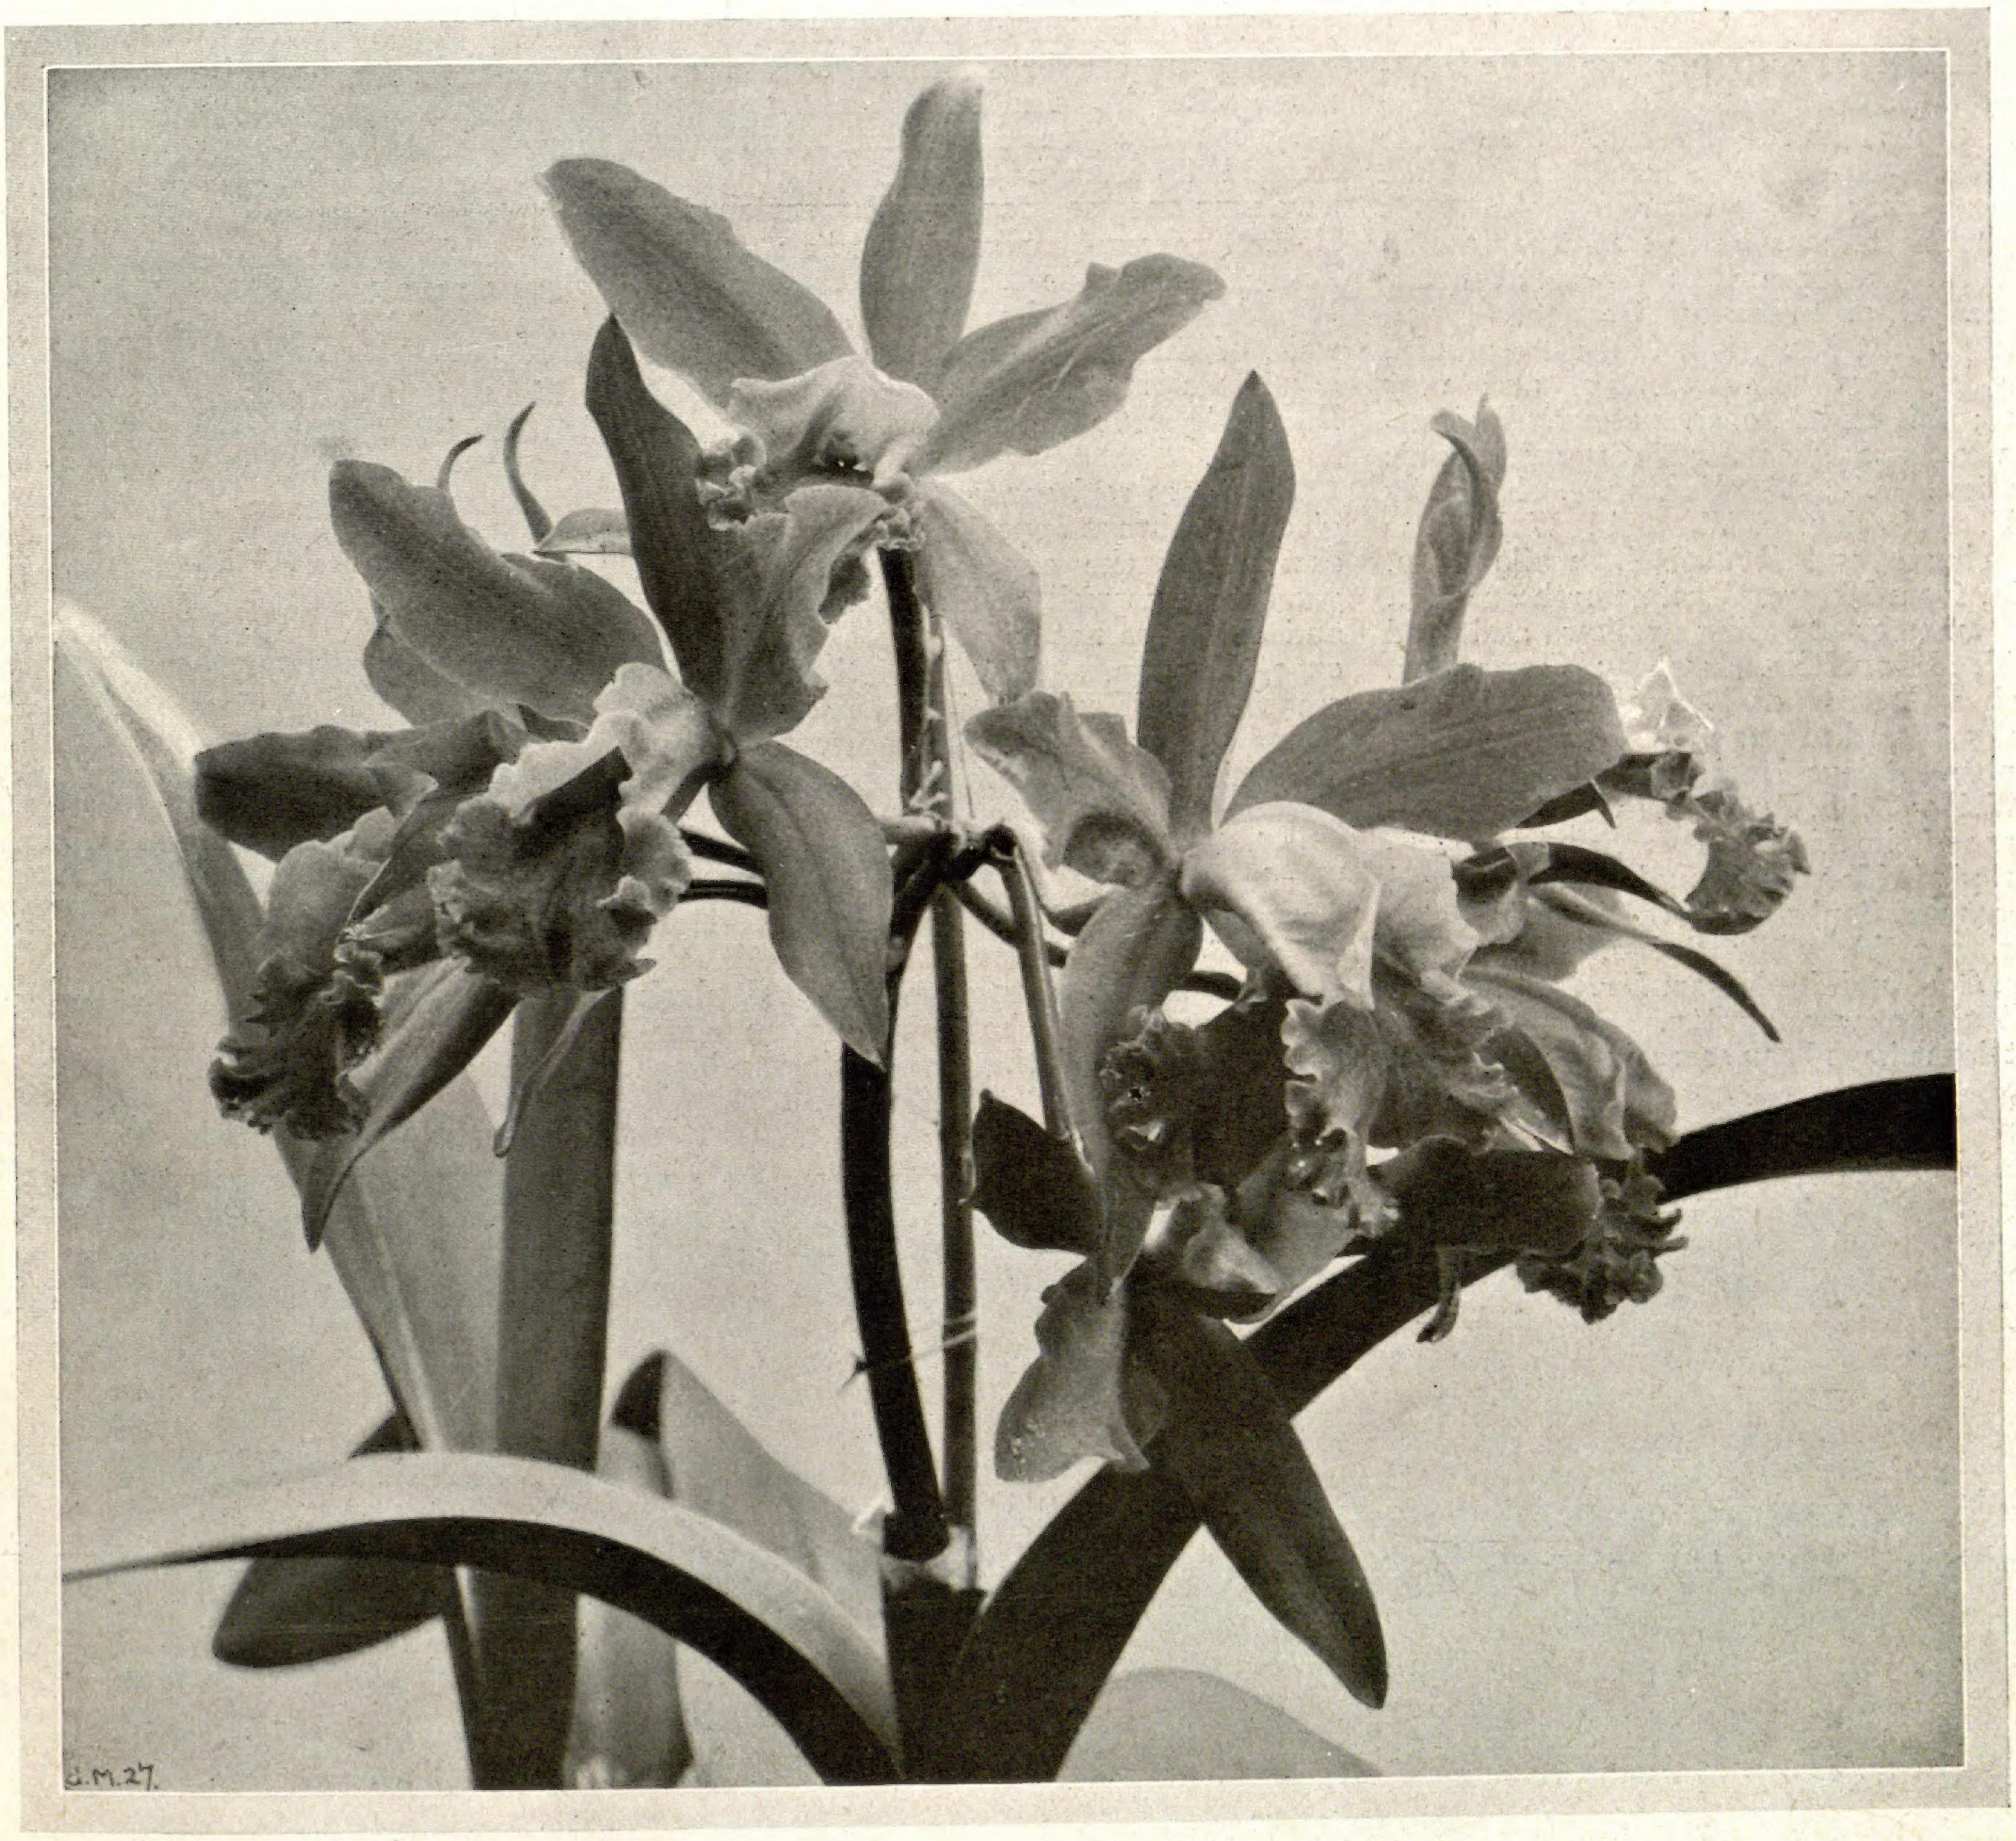
## GRAPE LADY HUTT.

I was much interested in the article on this grape which appeared on page 935 (December 16). I am interested in all matters pertaining to varieties of grapes, and in the case of Lady Hutt specially so, because I have added a vine to my collection, planting it last spring. And as I have not had any experience in the cultivation of the variety I should be grateful for some further information regarding the pruning. I have been assured that the best crops are obtained by close, hard pruning, and also that close pruning was not advisable. Perhaps some successful cultivators will give their experiences and explain their practice in the GARDENERS' MAGAZINE. I believe the vine to possess a fairly strong constitution. I only decided to put one in last Easter, and the vine got badly crushed in transit, consequently much sap was lost before I could get the new shoots forward; but notwithstanding all this, the young rod made during the summer is most satisfactory. The leaves die off gradually, and are throughout quite distinct from those of other varieties. Perhaps Mr. Hanson would kindly give a few more details regarding his system of pruning. G. B.

**Zephyranthes aurea.** — This charming bulbous plant, so well illustrated in the GARDENERS' MAGAZINE of December 16, attracted a very large share of attention when shown at the meeting of the Royal Horticultural Society on December 5. On looking at its beautiful golden blossoms one could not fail to be struck with their great general resemblance to those of a vallota; indeed, the relationship appeared so marked as to lead to the suggestion that it might be possible to obtain a hybrid between the two. So many very unlikely subjects have of late years proved amenable to the skill of the hybridist, that such a suggestion can scarcely be regarded as a fanciful one. Furthermore, the vallota has been successfully crossed with Cyrtanthus (or Gastronema) sanguinea, and this last, viewed superficially, appears to be more widely removed from the vallota than does the zephyranthes. —W. T.

## THE NEW ORCHIDS OF 1911.

There appears to be no diminution in the output of new orchids, and the work of the Royal Horticultural Society's Orchid Committee shows no decrease. This body meets at Westminster fortnightly, and, taking the year through, it is probable that more novelties came before it than before any other of the committees. It becomes increasingly difficult to rightly appraise the merits of varietal differences among orchids owing to the large number of varietal forms found in certain species, and also in some hybrids. It not seldom happens that a fine orchid comes before the committee, but fails to secure an award, and the exhibitor is at a loss to know why it failed. The reason usually is that the large collection of orchid paintings is at hand, and the flower on the plant exhibited has been compared with the paintings of varietal forms of the same species or hybrid, and found wanting.



LÆLIO-CATTLEYA PRINCE OF ORANGE.
A beautiful winter-flowering hybrid with bright yellow, ruby-lipped flowers. Awarded F.C.C., R.H.S., November 21, 1911. Lieut.-Colonel Sir George Holford (grower, Mr. Alexander), Westonbirt, Tetbury.

During 1911 thirty-eight First Class Certificates were awarded, and fifty-five Awards of Merit, though these figures may be subject to correction as the award fails if the exhibitor does not afford facilities for the painting of the plant's portrait. Curiously enough the certificates and awards are almost identical in number to those granted during the previous year. In every case a description has appeared in these pages, and a quite large number of the orchids honoured by the society have been figured; abridged descriptions and an alphabetical arrangement of these new orchids appear in "The Gardening Year Book for 1912." I think Messrs. Charlesworth and Co., head the list for number of honours as they have obtained nine First Class Certificates and ten Awards of Merit, while Mr. Alexander, orchid grower to Lieut-Colonel Sir G. Holford, Westonbirt, owns to seven First Class Certificates and three Awards of Merit.

Cypripediums arrive in large numbers for consideration and in some instances they show that the exhibitor has a very small knowledge of what constitutes advance or distinction in this genus. A great deal of improvement is being made in C. insigne by the use of C. i. Harefield Hall and other very fine varieties as parents, and, of course, there is of necessity a great family likeness among the newcomers. Winter-flowering cattleyas and lælio-cattleyas, with odontiodas, and brasso-cattleyas seem to be the most popular of orchids at present, though the finer hybrid odontoglossums are not far behind them.

Taking the cypripediums first, a few of those showing marked distinction were C. Draco Westonbirt var. and C. Lucifer, from Westonbirt; C. Charles Sladdin and C. Royal Sovereign, from Messrs. Sander and Sons, St. Albans, both very distinct and handsome; C. Sybil superba, from Mrs. Norman Cookson; the fine C. Elizabethæ var. Vogelsang, from M. Lambeau; C. Royal George, a beautiful hybrid, from Messrs. Armstrong and Brown, Tunbridge Wells, and now in the Westfield collection; and C. aureum Laekenense, from Mr. E. V. Low, Haywards Heath.

Odontiodas have become quite plentiful. and here Messrs. Charlesworth's O. Enterpe, the Westonbirt and the Gatton Park varieties of O. Bradshawiæ, M. Vuylstekes' O. Vuylestekæ Coronation, and O. V. Lady Colman, and Mr. D. Barri Crawshay's large-flowered O. Rosefieldiense Crawshayana are all considerable improvements, either in size, form, or colouring. The range of these showy bigeneric hybrids is steadily increasing as the result of the use of the various species and hybrids of odontoglossum as one parent, is seen. Oncidioda Cybele (Charlesworth), combines oncidium with cochlioda, and is therefore very interesting. New or rare oncidiums were O. Claesi from Gatton Park, and O. Mulleri from the St. Alban's firm, the latter a very distinct species.

The only dendrobium to pass muster was

D. Victoria Regina, the "blue" dendrobium, which was so finely shown from the Burford Lodge collection by Mr. W. H. White, on July 5. Epidendrum Laucheanum, the only other member of its genus to gain recognition, also came from Sir Trevor Lawrence's collection. Dià-cattleya Sanderæ (Sander) is a very interesting hybrid between Diacrium bicornutum and Cattleya Mendeli; Houlletia, Wallisi (Charlesworth), a rare species; and Trichopilia Lehmanni (Lawrence), are three very interesting additions. Very distinct and beautiful is Vanda cærulea Sanderæ in which a light shade of rose takes the place of the usual blue colouring. M. Lambeau's Miltonia Bleuana Laeken gives us the deepest colouring yet seen in this popular hybrid.

The important position occupied by læliocattleyas has been strengthened during the year. I must own to a great weakness for the yellow and orange-coloured hybrids that flower during the winter months, even though the blooms be not so fine in size and form as those that flower at other seasons. L.-c. Prince of Orange, figured in the present issue, is a first-class orchid, strong-growing, free-flowering, and very bright; this and L.-c. Cranstounæ Westonbirt var., are from Sir George Holford's collection. L.-c. Morningtoniæ, shown by Mr. F. Wellesley, of Westfield, Woking, is very chaste and beautiful, while L.-c. Sylvia, from Messrs. Charlesworth and Co., is a summer-flowering yellow and red hybrid. L.-c. Nella, shown by Messrs. Jas. Veitch and Sons, on December 19, is also a really fine addition.

Sophro-cattleya Doris, Cobbs' var., from Mr. Walter Cobb, Rusper, is very beautiful, and one of the finest of its race. Three trigeneric hybrids were brought forward, and the best was Sophro-lælio-cattleya Jeanette (Charlesworth), while S.-l.-c. Althæ and S.-l.v. Goodsoni, both from Mr. H. S. Goodson, Putney, were pretty.

Cattleyas have been scarcely so prominent as usual, and I think only one, C. Rhoda illuminata (Charlesworth) has gained a F.C.C. C. Mrs. Frederic Sassoon, from Westfield; and C. Mossiæ alba Queen Mary, from Messrs. Mansell and Hatcher, Leeds, are others that possess great beauty and distinction. No fewer than four new hybrid cymbidiums were shown, and three of them—C. Alexanderi (Holford), C. Gottianum (Sander), and C. Lawrenceanum (Pauwels), all own the comparatively new C. insigne as one parent. The fourth, C. Veitchi (Veitch), from C. Devonianum and C. Lowianum, is very distinct. These hybrids from Cymbidium insigne show perhaps more than anything else could how keen and quick raisers are to take advantage of any new orchid that is introduced for the production of new hybrids.

Many of the brasso-cattleyas are very much alike, but practically all of them are very beautiful, the large and wonderfully fringed lip always attracting attention. Two new ones call for special mention, i.e., B.-c. Digbyano-Mossiæ Holford's var., and B.-c. Senateur de Bast, the former from Westonbirt, and the latter from M. Pauwels, of Ghent. B.-c. Senateur de Bast is a particularly fine orchid derived from B.-c. Digbyano-Mossiæ and B.-c. Mrs. J. Leeman.

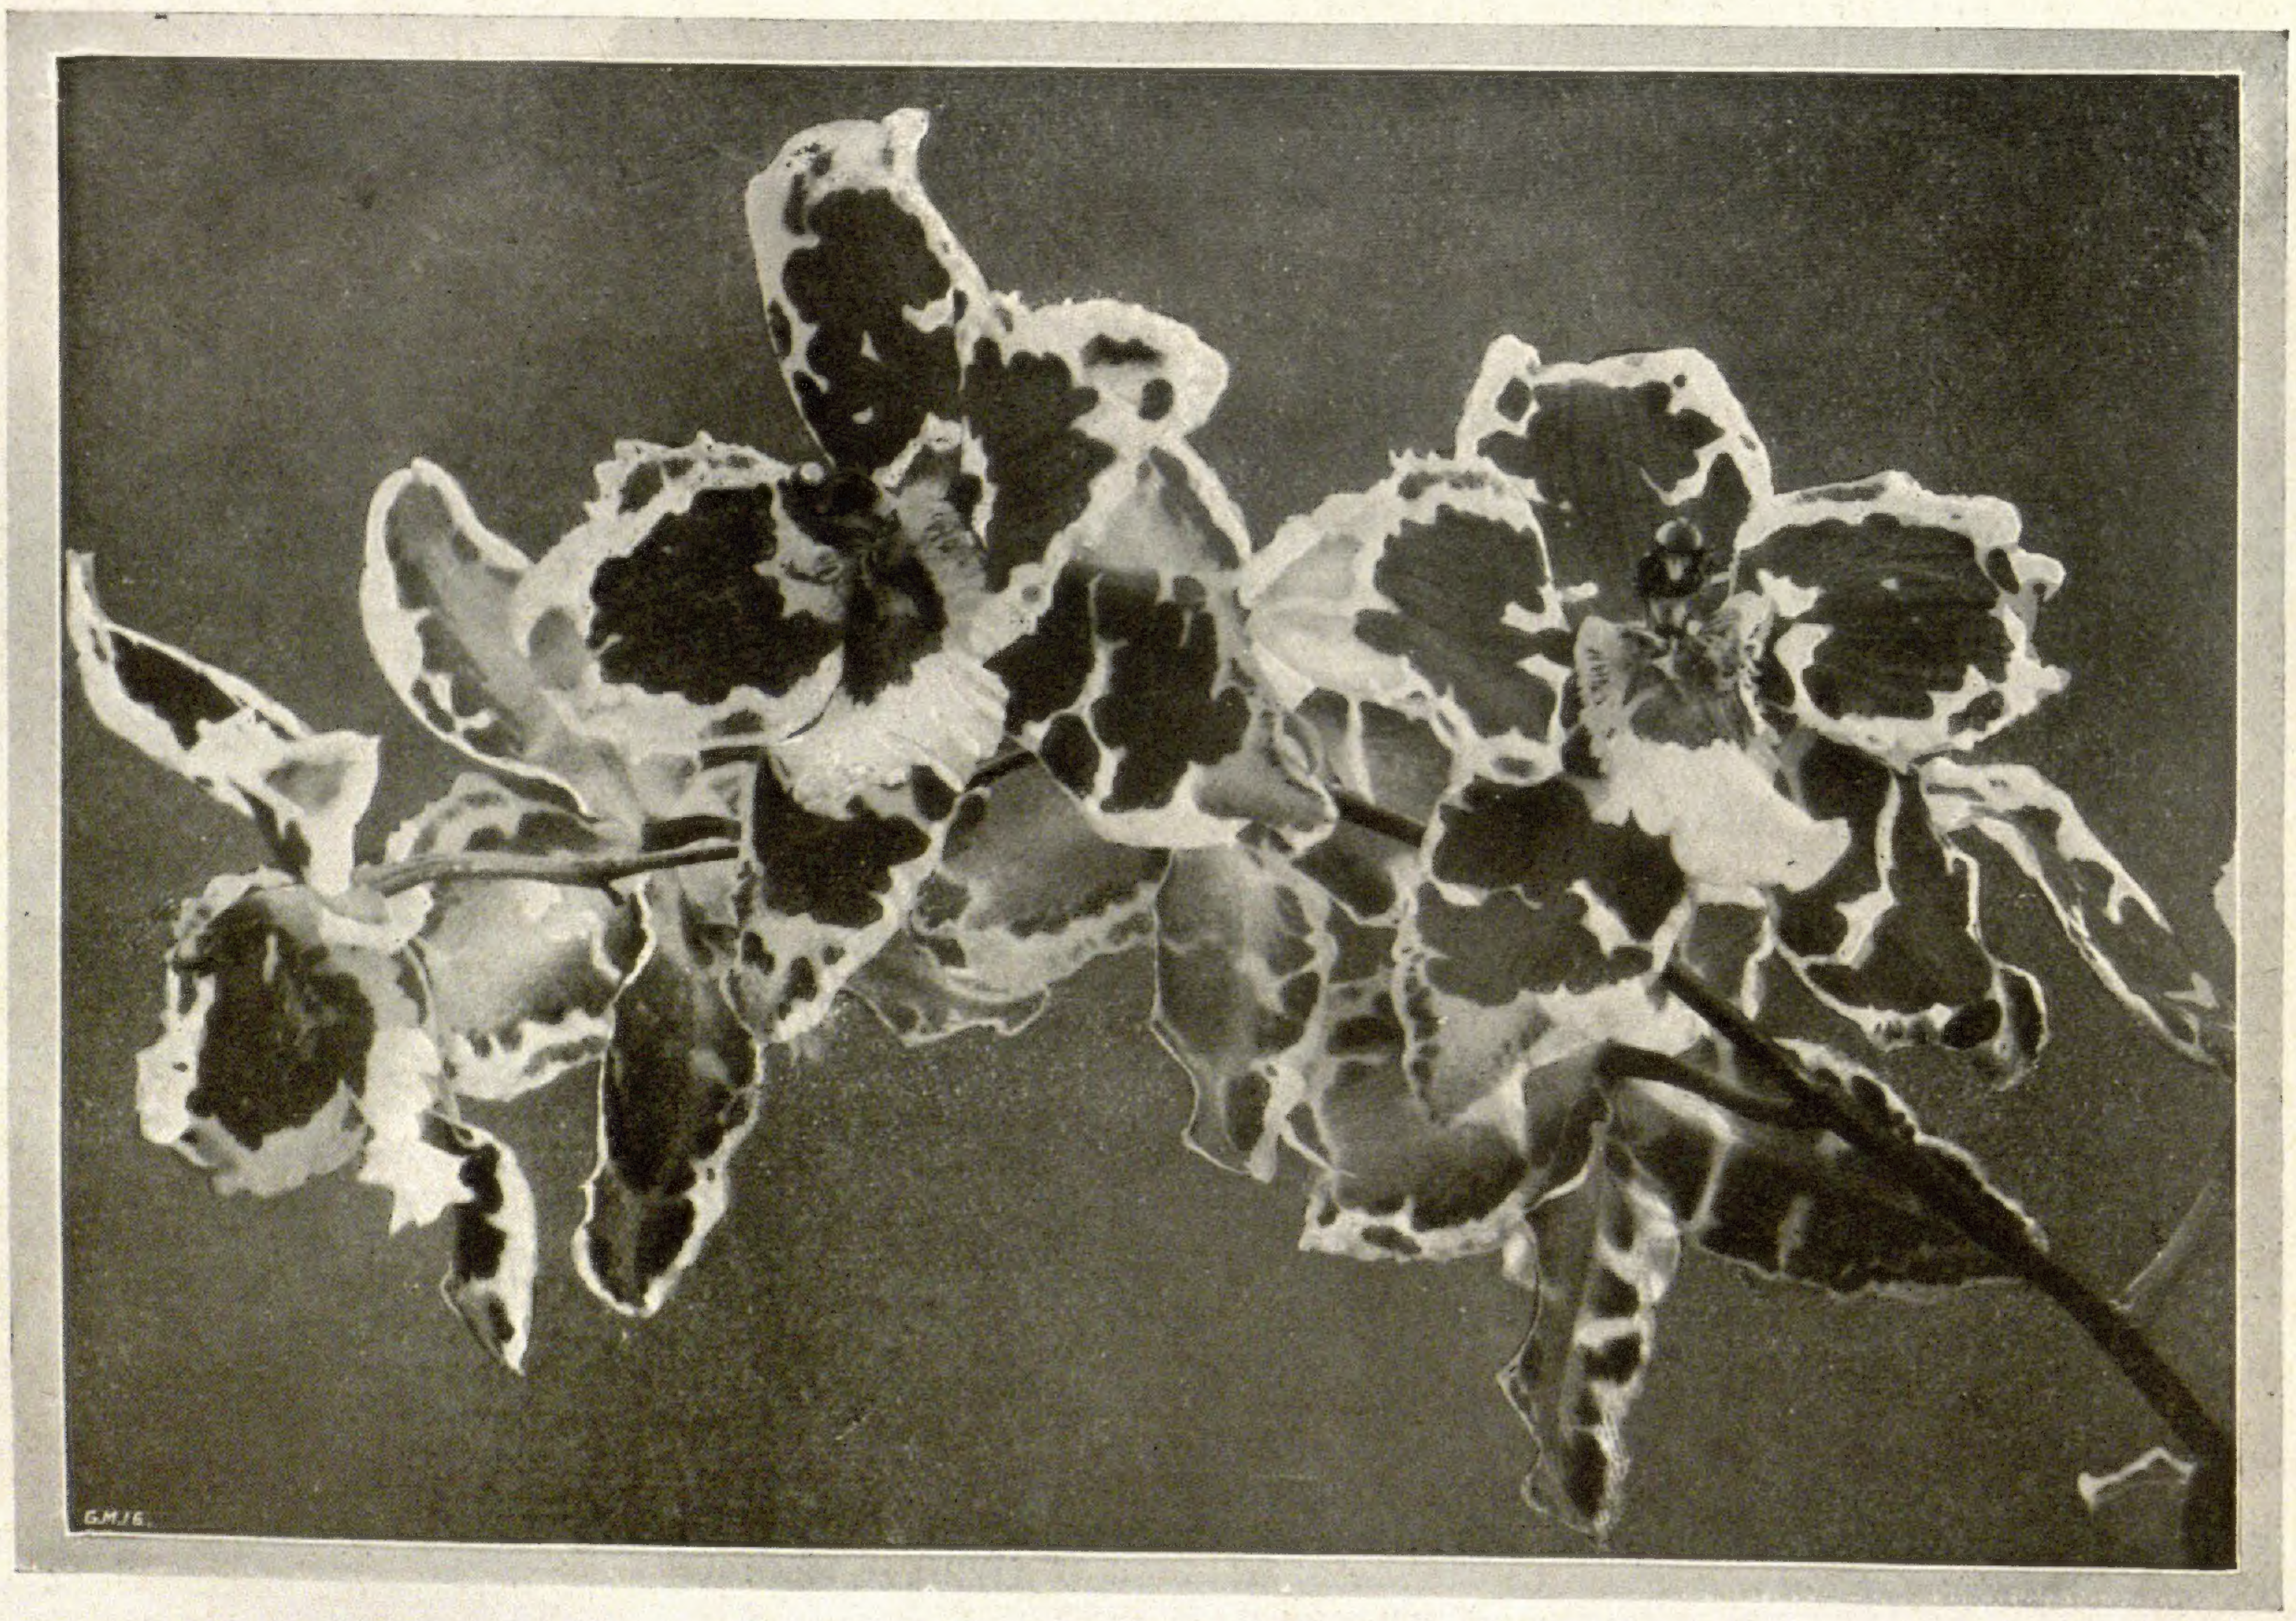
The grace and general beauty of odontoglossums always appeal to visitors to flower shows, but the expert requires size and good form as well as distinctive colouring, and these are not so easy to obtain as was once the vase, at least, it is becoming increasingly difficult to improve on the fine forms of O. crispum, O. Pescatorei, O. andentissimum, O. Lambeaueanium, etc., already in collections. The most striking new hybrid of the year in this class is O. Hardwoodi, that is itself surpassed in some measure by O. H. Shrubbery var. Both were raised by Messrs. Charlesworth, the colours, bright orange-yellow and dark red-brown, make the flowers very effective. Other good things include the large and dark-hued O. Black Prince, Dell variety, from Baron Schröder's collection; O. illustrissimum Queen Mary, a fine maroon, white-and-gold coloured flower, from Mr. W. Thompson, of Walton Grange, O. Jeanette, and the fine form of O. Ossulstoni named The Shrubbery var., from Messrs. Charlesworth and Co.; O. Rosefieldiense—a glorified O. Lambeauianum—from Mr. De Barri Crawshay; the mahogany-red and yellow O. Swieteni-color from Sir Trevor Lawrence; the beautiful O. crispum Aleyone shown at the last meeting of the year by Mr. J. Gurney Fowler; and two famous hybrids from Mr. W. R. Lee, Plumpton Hall, Manchester, namely, O. Thais and O. Chione, both of which gained the higher award on November 21. O. Thais, figured herewith, is of unrecorded parentage, but doubtful antecedency does not detract from the beauty of its blush, purple-blotched flowers.

There were obviously many beautiful orchids besides those mentioned, to which the hall-mark of the Royal Horticultural Society was attached, but those referred to have special claims to notice. One other also deserves mention, and it is the pure white Calanthe Cooksoniæ gigantea, shown by Mr. H. J. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne, on November 8; it is the finest of the white calanthes.

CHAS. H. CURTIS.

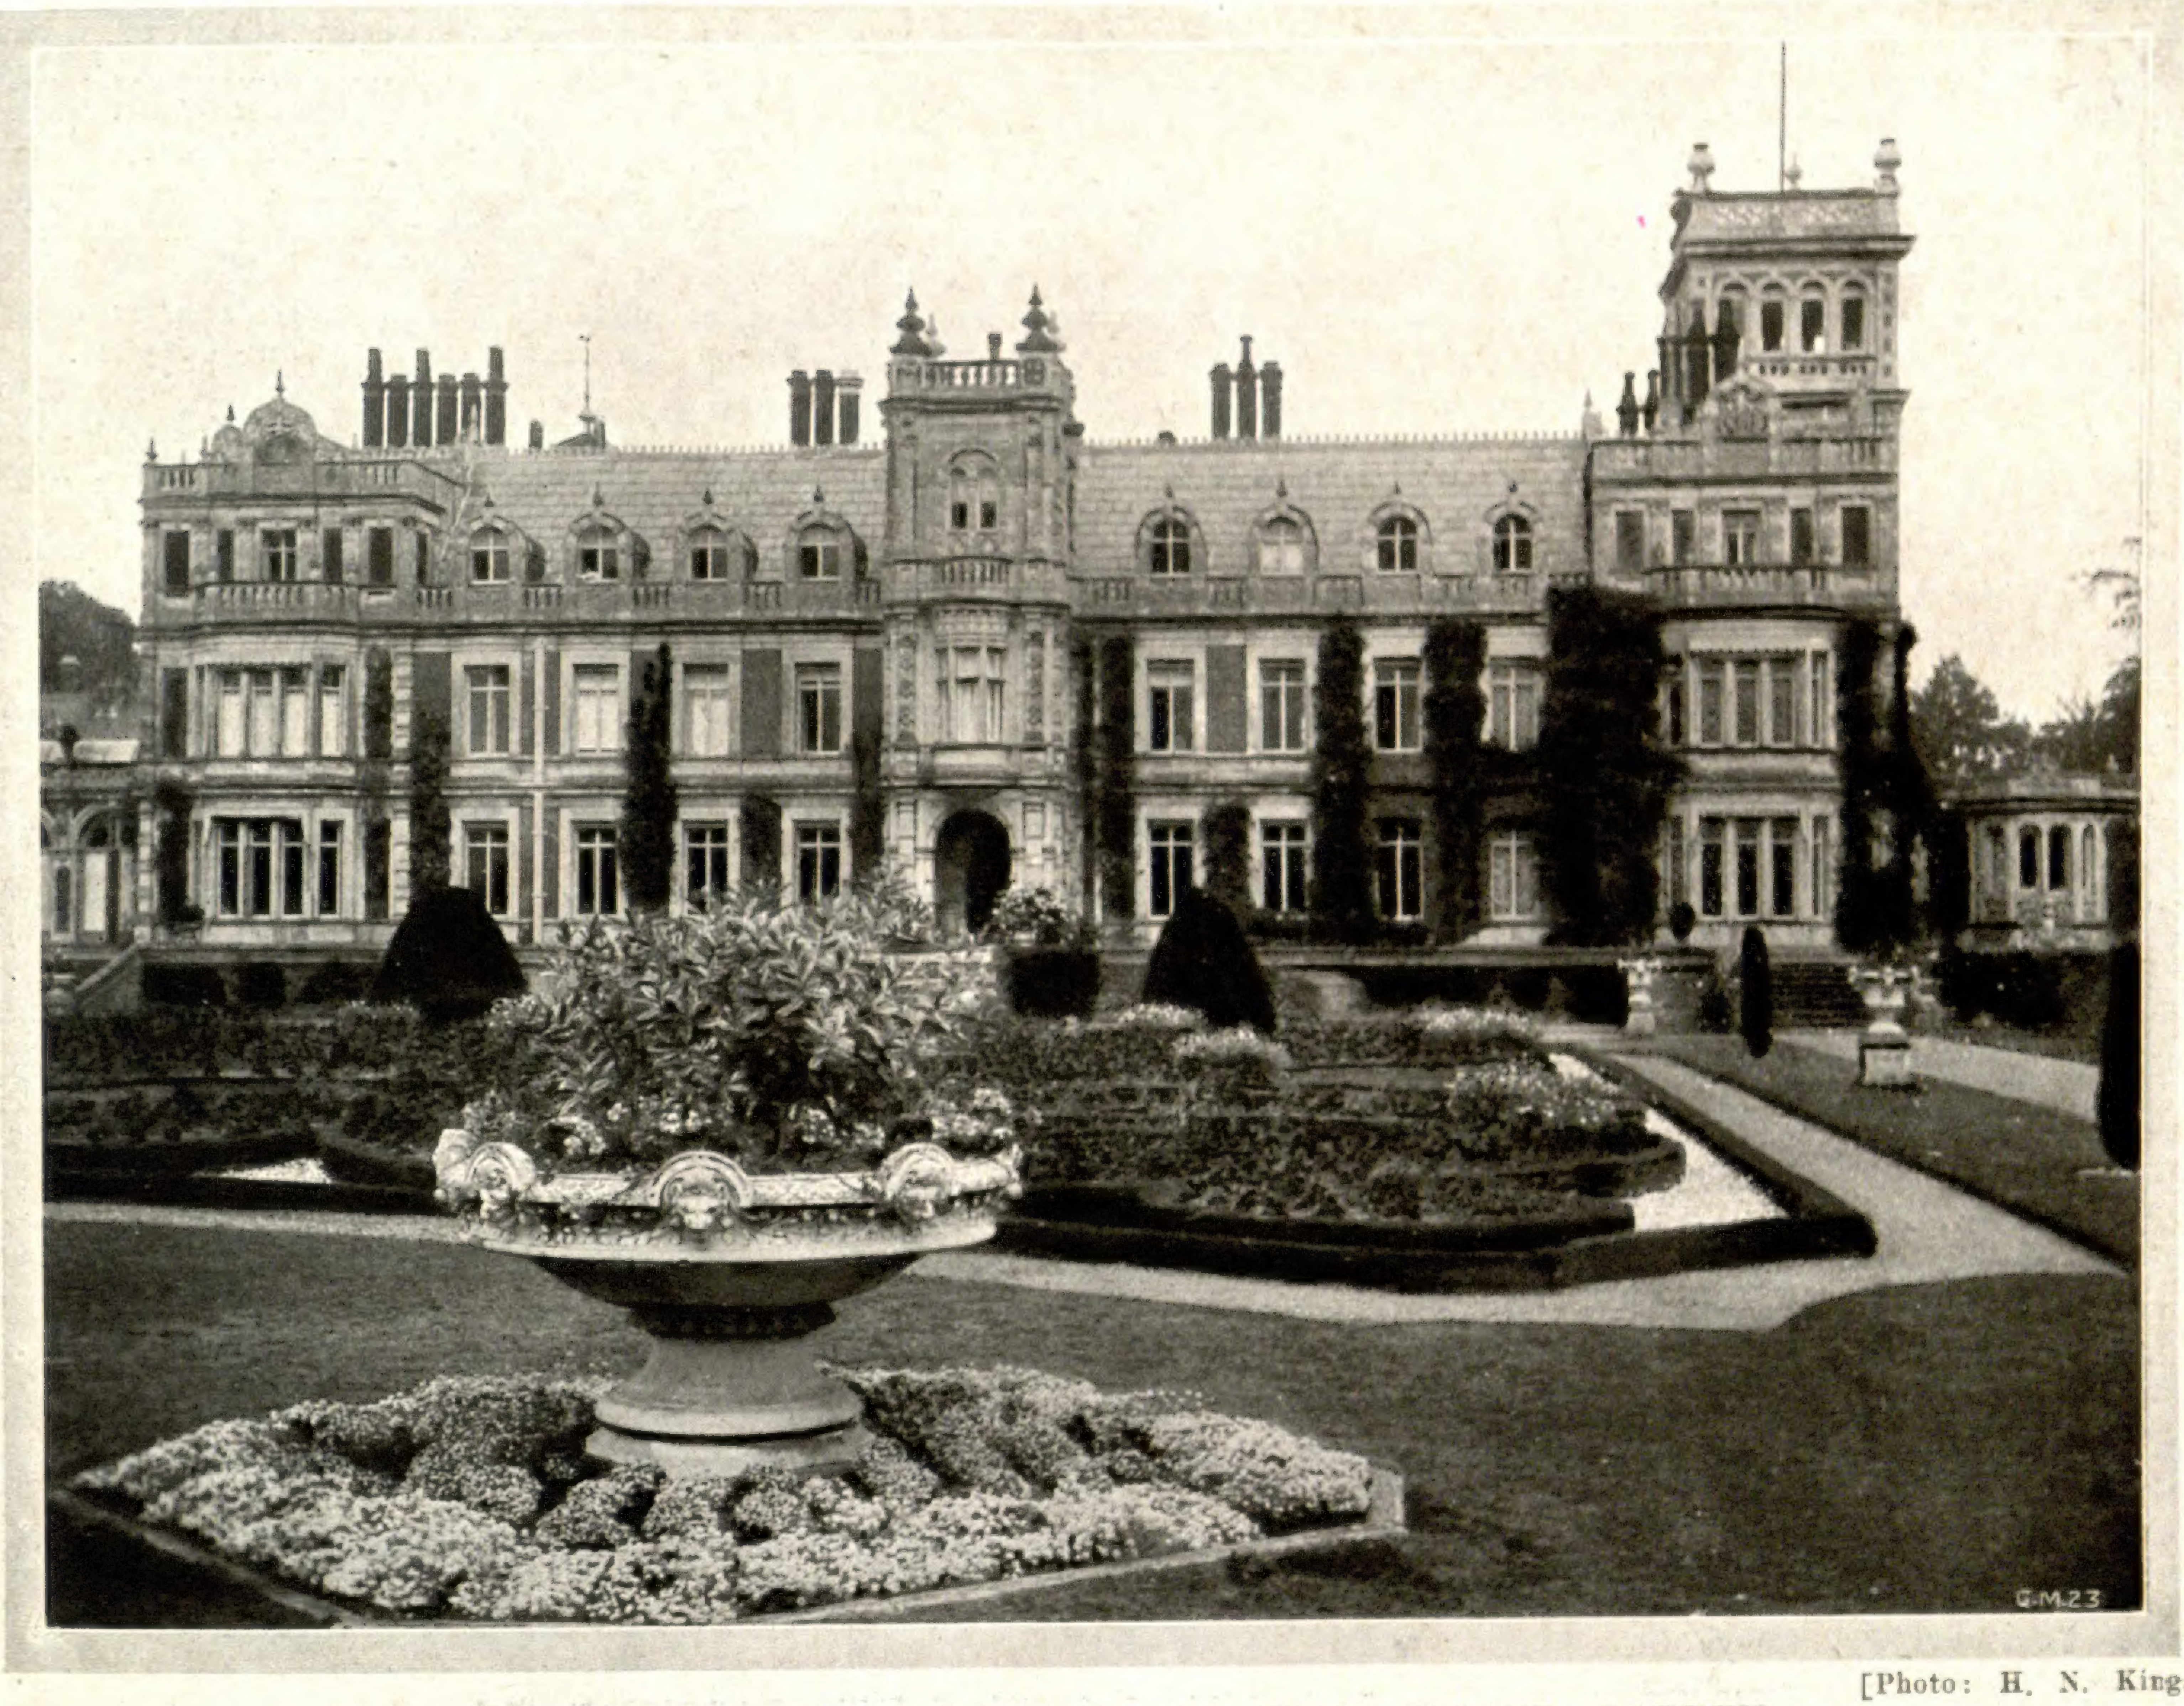
---

**Exacum macranthum.** — This showy member of the Gentian family, which has come so prominently forward within the last few years, seems to have no set period of flowering. The Messrs. Veitch showed it in fine condition at Olympia in the summer of 1911, and its rich purple-blue flowers formed one of the most conspicuous features of a group from the same exhibitors put up in the Horticultural Hall at the last meeting of the year 1911.—W. T.



ODONTOGLOSSUM THAIS.

A fine hybrid of unrecorded parentage; flowers blush, blotched with rose-purple. Awarded F.C.C., R.H.S., November 21, 1911. W. R. Lee, Esq., Plumpton Hall, Manchester.



[Photo: H. N. King.

SOMERLEYTON HALL: WEST FRONT WITH FLOWER GARDEN.

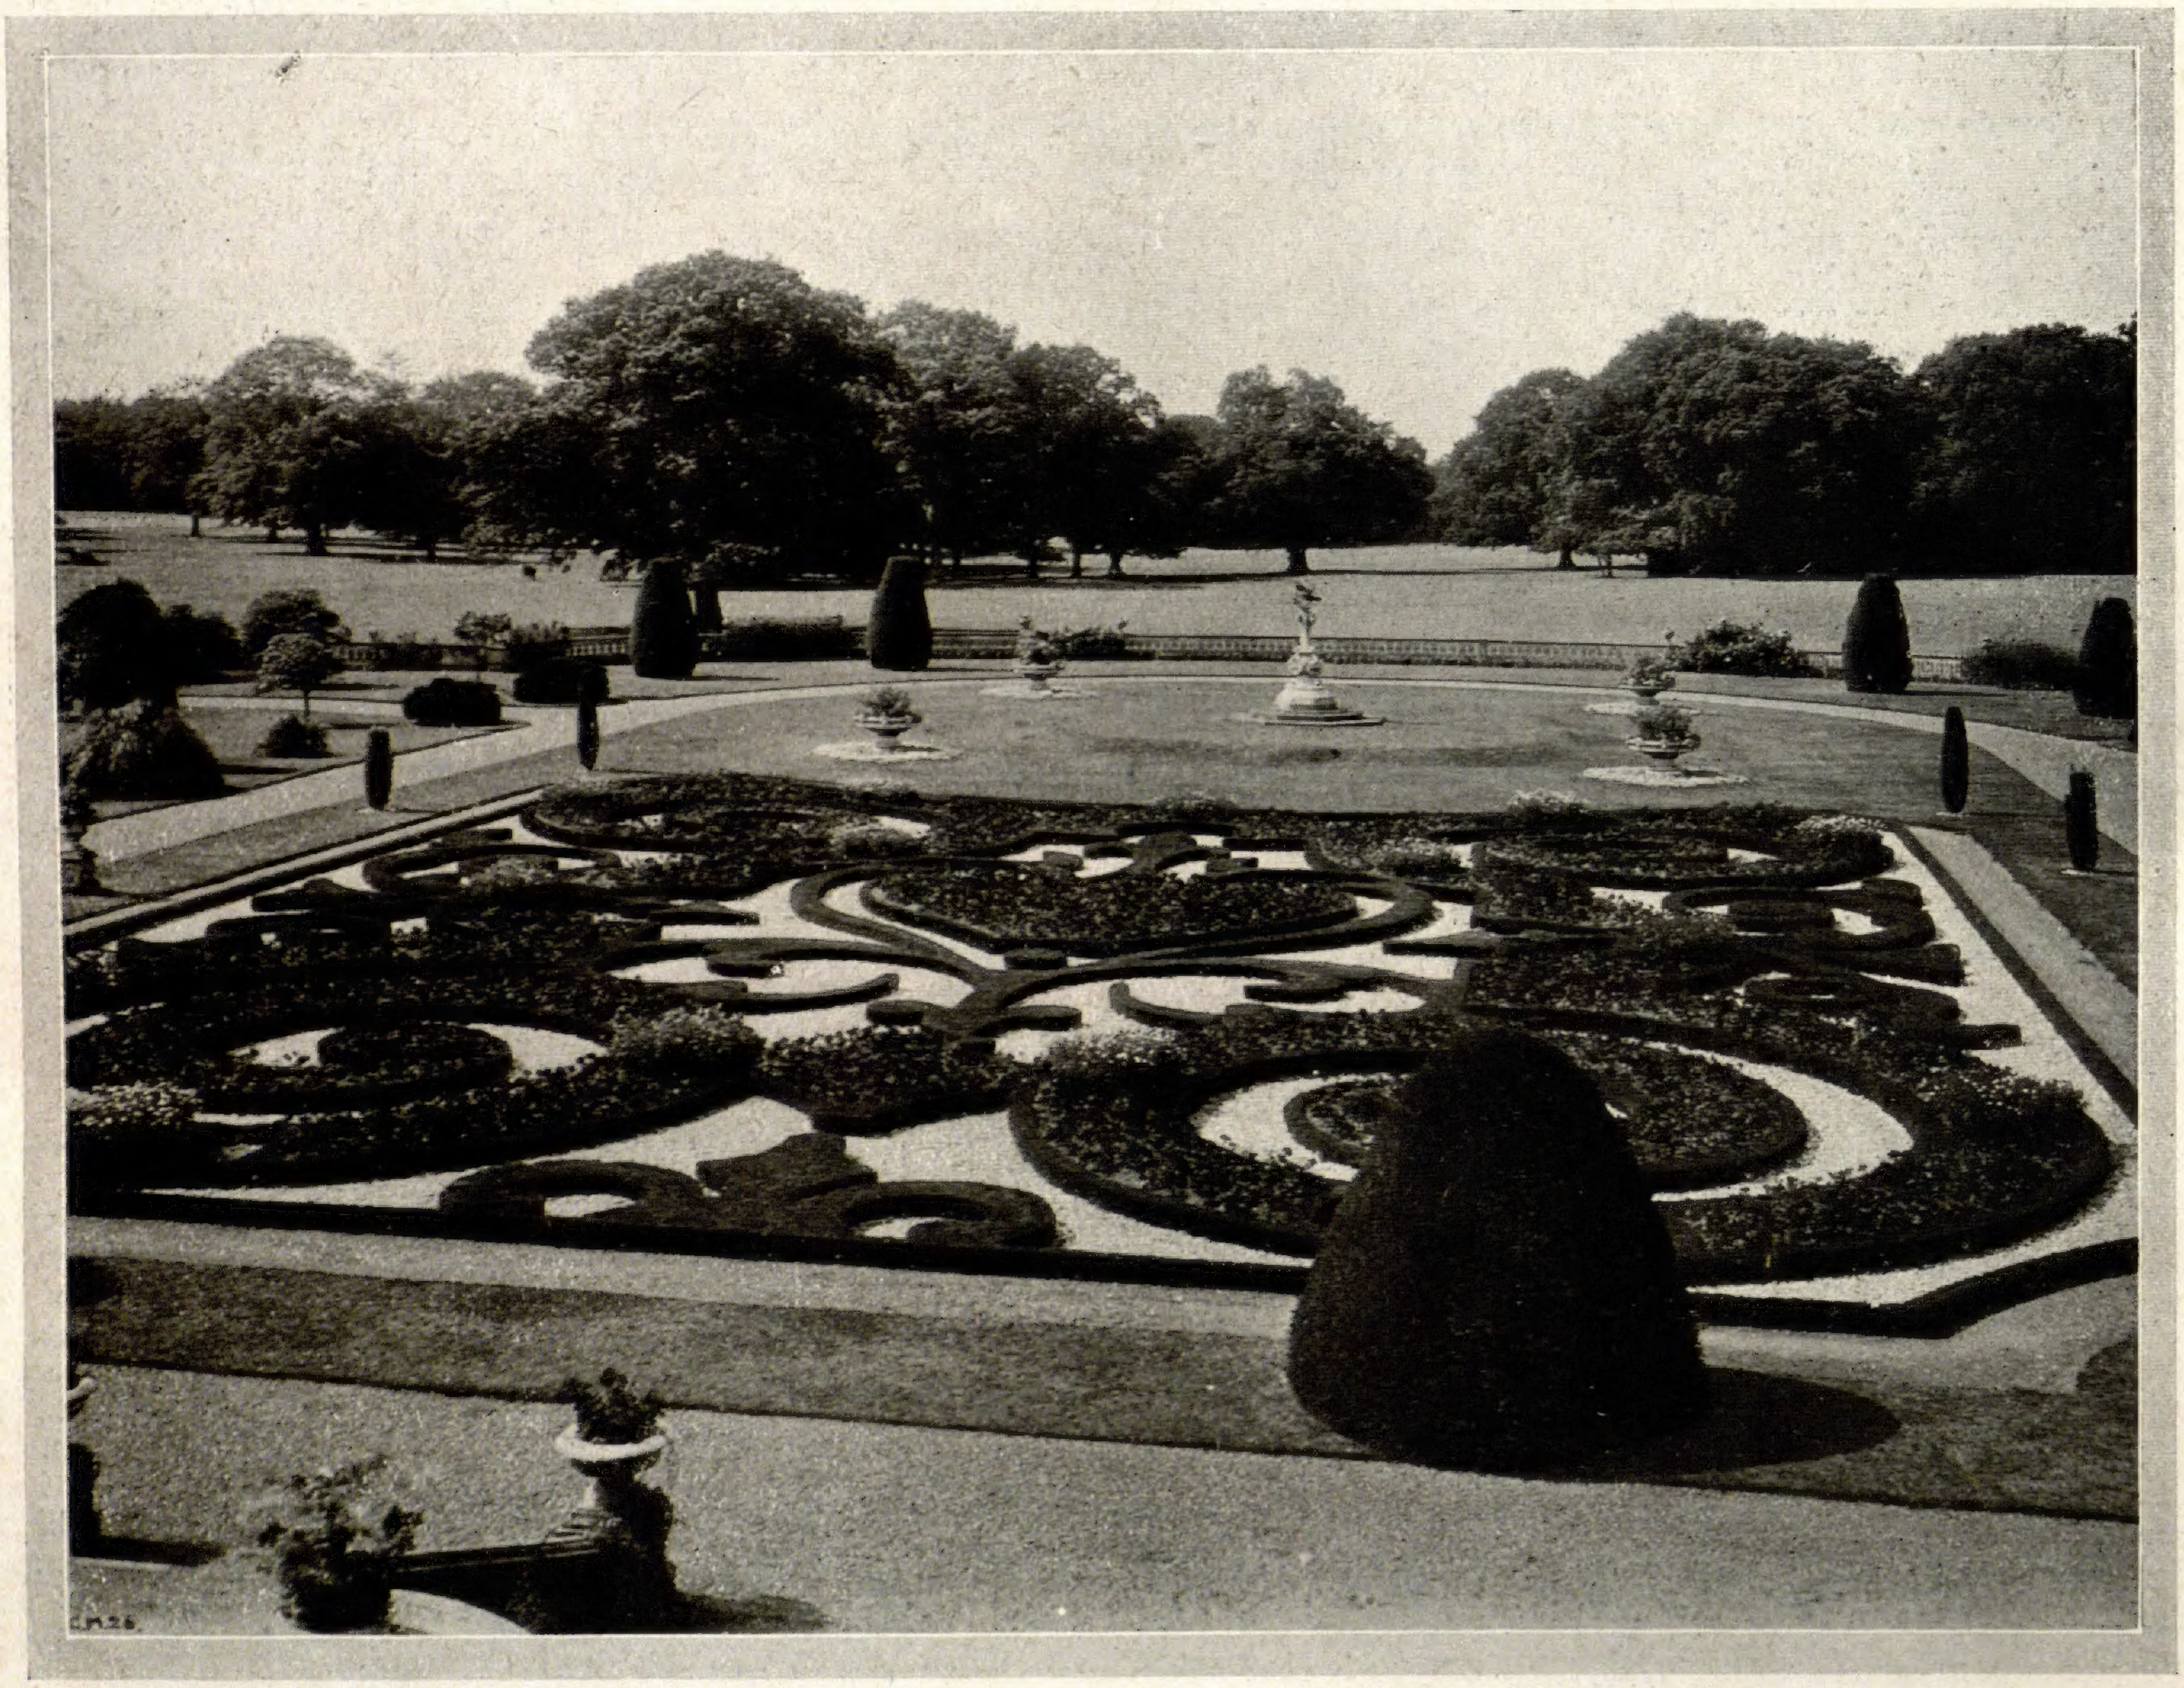
# SOMERLEYTON HALL.

Although great gardens are less numerous in the, according to Fuller, "sweet and civil county" of Suffolk than in the adjoining lands of the North Folk, there are within its boundaries many of first-rate importance, and chief among them by common consent are those of Somerleyton Hall, the East Anglian seat of Sir Saville Crossley, Bart. Equally remarkable for extent and beauty they form a delightful setting to the stately mansion which occupies a prominent position in one of the highest, as, indeed, in one of the most charming parts of the Lothing district, and afford many an object-lesson in garden management of immense value.

Somerleyton Hall is situate about eight miles to the west of Lowestoft, and may be readily reached from that town or from Yarmouth, by the branch of the Great Eastern Railway, which connects these two popular marine resorts. In commencing the journey to the Somerleyton Station at Yarmouth one is not particularly impressed by the scenery, for the country is for a short distance quite flat with several waterways and a vegetation that indicates a liberal degree of moisture in the soil. But as the train speeds onward the ground rises rapidly, the uniform level gives way to pleasant undulations, and the moisture-loving plants are replaced by arborescent vegetation, and in their season by waving fields of corn and by other farm crops that flourish in the district. The hall is about two miles from the station, and, as there is a continuous rise throughout, the estate must occupy a considerable elevation. What the altitude is cannot be stated from the information available at the time of writing, but it is sufficient to afford a series of widely-extending views of surpassing beauty from the mansion, the gardens, and the higher part of the park, which has an area of upwards of 300 acres, and is finely wooded. The characteristic features of the scenery of Suffolk are quaintly described by Reyce in his "Breviary" of the county, which was published in 1618, and, quaint as the description is, it gives an excellent idea of the general aspect of the country at the present day. "This county," writes Reyce, "delighting in a continuall evenes and plaines, is void of any great hills, high mountains, or steepe rocks. Notwithstanding the which it is not always so low or flat, but that it is severed and divided with little hills easy for ascent and pleasant ryvers watering the low valleys with a most beautiful prospect."

It may be of interest to recall the fact that Somerleyton is of considerable historic interest by mentioning that it was from an early period the principal seat of the Lords of the Island of Lothingland, and that in the course of its history it was in the possession of the Allens, FitzOsberts, Jemigans, and other East Anglian notabilities. In the year 1844 the estate became the property of Sir Morton Peto, who greatly improved the gardens, chief among the improvements being the erection of the magnificent winter garden, which, having regard to its area, elegance of design, and suitability for the cultivation of plants from temperate regions, has probably no superior in this country, and but few equals. The mansion, built from designs by John Thomas, an architect of distinction, and the sculptor of the statues in the present Houses of Parliament, is, as will be seen from a glance at the accompanying illustration, of handsome elevation and occupies a commanding position in the park. On the southern side of the mansion is a wide expanse of lawn that extends to the fine avenues of limes and elms which stretch away into the far distance, and form distinct features of much interest. On the west side, which we illustrate, is the formal flower garden that carries the mind back to the days of Nesfield, when closely-clipped box edgings and glistening spar entered so largely into the composition of flower garden schemes. On the north side is the winter garden, and beyond are spacious lawns richly furnished with rhododendrons and other shrubs, remarkable for the beauty of their flowers or foliage, and specimen coniferous and other trees. To the north-east are the maze, the pergola, and the kitchen garden and orchard, all of which features are of much interest.

One of the chief features of interest to horticulturists, and indeed to visitors generally, is the winter garden, which is light and elegant in design, and while in complete harmony with the architecture of the mansion, is admirably adapted to the various forms of plant life that find a home within its portals. In adaptability to plant growth it differs so appreciably from many of the architectural structures built in the early part of the last century as to give it added interest. The roof is formed with a series of curved ridges and a central dome which rises to a considerable height, and adds much to the appearance of the structure when seen from the pleasure grounds. Immediately under the dome is a handsome marble fountain and surrounding the base of the central figure and within the basin is a specimen of the graceful Woodwardia radicans that is probably unequalled. The specimen has a diameter of twenty-one feet, and is perfect in every way. The roots have the run of a bank formed with pieces of turf and raised above the surface of the water, and the fronds enjoy a shower bath from the fountain when playing. In the basin is growing a selection of the choicest of the nymphæas. The general effect in the centre of the structure is further enhanced by splendidly developed basket specimens of the elegant Nephrolepis exaltata suspended from the roof at intervals over the basin of the fountain.



[Photo: H. N. King.

FORMAL FLOWER GARDEN AS SEEN FROM ABOVE, SOMERLEYTON HALL.

From the fountain walks radiate in all directions, and in passing along these many are the noteworthy objects that come under notice. Huge camellias now bristling with flower buds, but soon to be bright with colour, are plentiful, and prove to demonstration that, although not regarded with the favour once shown them, they have no equals among conservatory shrubs for beautifying cool houses during the earlier months of the year. There is no occasion to give the names of varieties, for all the finest are represented, and there appeared to be no great difference in their vigour of growth or freedom of flowering. Associated with the camellias are specimen acacias, variegated forms of the New Zealand flax and tree ferns. Climbing the pillars and spreading freely over the roof trellis are many plants of scandent habit, of interest for their comparative rarity or exceptional development. Passion flowers, tacsonias, and tecomas are especially well represented. Fuchsias in variety are used with good effect, and some of them have occupied their present positions for so long a time as to have main stems of so large a size as to surprise those who have but few, if any, opportunities for seeing these flowers growing otherwise than under ordinary conditions. It was interesting to find that Madame Corneillson, which has been in cultivation for more than half a century, still one of the most highly appreciated of the fuchsias with a white corolla. Especially noteworthy also for its development is Bignonia chere, which has a main stem with a diameter of twelve inches, spreads over a large area of the roof trellis, and in its season produces a wealth of its bright orange-red flowers. Solanum jasminiflorum, one of the most elegant of white-flowered climbers suitable for the conservatory, does well in the winter garden, and is appreciated accordingly. The wall on the east side of the winter garden is more or less shaded, and this is clothed with Woodwardia radicans, aspleniums, and Asparagus deflexus, all of which make a vigorous growth, although the layer of peat in which they are growing has a thickness of only three inches.

Plants in great variety are also grown in pots for beautifying this structure, and prominent among these, when we were at Somerleyton a few weeks since, were the bush chrysanthemums, which made a rich display of colour. Prominent among the varieties was the white Felton's Favourite, which is a favourite also at Somerleyton.

Adjoining the winter garden is a palm house that was provided for species requiring the temperature of the plant stove. The house is fully furnished with a representative collection in the best possible condition, and it is a point of some interest that a lower temperature is maintained than is usually considered advisable for palms from tropical regions. Palms are in constant request for the adornment of the mansion, and Mr. Hanson finds that by growing them in a comparatively low temperature they suffer but little from adverse conditions when removed from the palm house. Connecting the two structures is a spacious corridor that was filled with Japanese chrysanthemums that had been grown under the conditions most favourable to the production of specimen blooms. The rich colour effect at once attracted attention, and the finely developed blooms were of interest as showing that while Mr.

Hanson no longer exhibits chrysanthemums, he is careful that his employers and their friends should still have an opportunity of seeing specimen blooms at home in the highest state of development.

Returning to the flower garden on the western side of the mansion, and enjoying for a short period the bright display of colour in the scroll beds, the eye commences to range over the fair prospect looking westwards, and the many objects of interest within this part of the pleasure grounds. Especially interesting are the shapely Irish yews that flank the fine breadth of velvety turf, the relatively large specimens of Abies orientalis nana, that may be seen on the far side of the illustration, the fine old sundial, the standard rhododendrons, all representing meritorious varieties. Alongside the southern part of the cross walk are the standard Portugal laurels that flank the northern portion. In a line with the southern front of the mansion is the fine avenue of elms, and in a line with the western boundary of the garden is the avenue of limes. Both avenues are formed with four rows of trees, and apart from the splendid development of the latter, they are of special interest as connecting links between the present and the Somerleyton of bygone days.

ENTRANCE TO KITCHEN GARDEN, SOMERLEYTON HALL. [Photo: H. N. King.

Proceeding in a northerly direction from the western flower garden are great masses of select varieties of the pontic rhododendron, that are growing in clay, and are in the most vigorous state of health, and promise to produce, as is usually the case, a glorious display of colour in their season of flowering. There are also in this part of the grounds numerous fine beds of choice hybrid rhododendrons, each containing one variety. Note was also made of an exceptionally fine specimen of the weeping green holly, which has a spread of twenty feet, and is so graceful as to render it difficult to imagine a specimen so perfect as to surpass it.

In the naturally arranged grounds to the north of the winter garden there is a remarkably fine selection of coniferous trees, all being in a robust state of health, and for the most part are of large size. The specimens of Wellingtonia gigantea are especially noteworthy, for they are perfect from base to apex, and are of the richest green. Very fine also are Abies Smithiana, A. brachyphylla, A. Albertiana, A. Parryana glauca, Picea cembra, P. insigne, Retinospora plumosa, Cupressus Lawsoniana aurea, a superb specimen rising to a height of thirty feet, and glowing with colour. Thuia gigantea aurea is hardly less rich in colour, Cedrus atlantica and C. Libani are also remarkable for their large size and rich colour, the strong soil being evidently as favourable to them as to the other conifers. Contiguous to the principal coniferous trees is a large bay, wherein is a rustic summer house with a broad border devoted to choice herbaceous plants, arranged in bold masses, and a central group of choice rhododendrons. This enclosure is reached through a pergola over which such rambling roses as Excelsa and Minehaha fling their slender growths in graceful profusion, and produce a glorious display of colour during the summer months. Not far distant is the maze, which forms so distinct a feature of the gardens, and enjoys a high degree of popularity with the visitors who come over from Lowestoft in their thousands during the summer months. To enable the general public to participate in the pleasure that a garden of the first-class is so well able to afford, Sir Saville Crossley very generously opens the gardens to the public on certain days during the summer months, and although a small charge is made for admission, the visitors number between 8,000 and 9,000 annually. The amount realised for admission is at the end of the season distributed among the local charitable institutions. The hedges of the maze are of yew, and are of greater breath than is usually the case, and the maze is entered by a handsome yew arch.

Another feature of interest is the pergola, which, unlike the majority of such structures, has a framework or iron, and affords a conclusive proof that the majority of plants suitable for clothing pergolas have not so strong an objection to coming into contact with iron as is generally supposed to be the case. However that may be, the whole of the plants are in the best possible state of health, and annually yield freely of their flowers. The dimensions are ideal for a garden of any considerable size, and with the hope that the figures may prove useful, they are given herewith. The length is 300ft., the height 9ft., and the width 9ft. The uprights supporting the framework are made of 1½in. T iron, and are placed 10ft. apart. They are connected together on either side with flat 1¼in. irons fixed at 7ft. above the ground level. The uprights are connected across the area with arches of flat iron of the same size as that used for the sides, and over these are fixed horizontally six iron rods ⅜in. in diameter. Thus is formed a framework that is practically indestructible, proof against the strongest winds, is light in appearance, and not injurious to the plants. Among the roses that have been utilised in clothing the pergola are Madame Abel Carriere, Minehaha, Dorothy Perkins, White Dorothy, Crimson Rambler, Longworth Rambler, and Fortune's Yellow, which grows with great vigour, and produces great masses of flowers. The small-flowered hybrid clematis have also been utilised with much success as also have the purple-leaved vine, and Polygonum baldschuanicum, which is annually pruned rather hard back, and thus kept well within bounds. At one end of the pergola the plants trained to the last pair of uprights are exposed to so strong a draught that there was a difficulty in furnishing them until Mr. Hanson tried the elegant Escallonia Langleyense, which has answered admirably, and presents a pleasing appearance.

[Photo: H. N. King.

VIEW IN THE WINTER GARDEN, SOMERLEYTON HALL.

On one side of the pergola there is a lawn, and on the other a broad border, the latter this year being effectively furnished with broad bands of red pentstemons, blue salvias, herbaceous phloxes, Calceolaria amplexicaulis, and white marguerites. Not far distant is a border 300ft. in length, wholly devoted to hardy perennials that bloom from the latter part of the summer until the autumn is well advanced. All the subjects were arranged in bold groups, and conspicuous among them were Artemesia lactiflora, Solidago Golden Wings, Helianthus sparsiflorus, and Asters Climax and Perry's Favourite.

Within recent years the kitchen garden has been considerably enlarged, and the additional wall space has been fully utilised for the production of choice fruits, such as the finest of the dessert pears. The soil is a strong loam, with clay at no great distance from the surface, and Mr. Hanson finds that he obtains the best results from both apple and pear trees on dwarfing stocks. The pears he necessarily grows on the quince, and in planting all the stations are carefully prepared with a view to preventing the roots striking down into the cold subsoil. Mr. Hanson does not regard with much favour single cordon pear trees, and now few remain, but cordons with six stems are most satisfactory. The apples are grown on the broad-leaved paradise, and as evidence that on a strong soil, this stock is fully able to produce a robust growth, it may be mentioned that one of the bush trees of Gascoyne's Scarlet measured 14ft. in height and 10ft. in diameter. Ribston Pippin bears well on young trees. Lord Burghley is considered one of the best late varieties. James Grieve is highly satisfactory, and Rival is regarded as one of the best of the apples raised by Mr. Charles Ross.

The glass structures devoted to fruits were built from designs by Sir Joseph Paxton, are spacious, and have ridge and furrow roofs, but whatever may be the drawback to this form of roof, as compared with the conventional form, Mr .Hanson does not allow it to interfere with crops of the highest excellence. They include peach and fig houses and vineries in considerable numbers, and the crops of Muscat of Alexandria and the various late kinds other than Muscats were so admirably finished as to indicate cultural skill of a high order. As recently mentioned in these pages, Mr. Hanson grows with much success that excellent late white grape Lady Hutt, and it may now be mentioned that the companion grape Appley Towers was represented by remarkably fine bunches. It is also worthy of note that Lady Downes is chiefly depended upon for late supplies of black grapes, and that the showy Alicante is not regarded with much favour.

In a run through the numerous structures devoted to the production of supplies of decorative plants, and cut flowers, it soon became evident that perpetual-flowering carnations are not less appreciated at Somerleyton than elsewhere. Several houses were devoted to them, and throughout the plants were in buxom health and producing a full quota of flowers. Malmaison carnations are also grown largely and well. Seldom is that attractive stove plant, Gesnera zebrina, grown with so much success as here, and the big bank of plants in one of the structures afforded a useful object-lesson, both as regards cultural methods and utility in decorations. Hardly a plant had a flower spike less than eighteen inches in length, and the finely-developed orange-red flowers presented a brilliant contrast to the large velvety foliage. Several houses were filled with the varieties of Begonia Gloire de Lorraine known as Mrs. Leopold de Rothschild and Turnford Hall, and of the first-named there must have been scores of plants growing in three-inch pots that were simply pyramids of flowers with a height of eighteen inches. GEORGE GORDON.

## RAISING THE SOIL LEVEL OF FLOWER BEDS.

A practice which seems greatly on the increase is that of raising the soil of flower beds in a pincushion-like manner, with, in many cases, the result that the plants therein are absolutely starved. It is bad enough when carried out by those who make no profession of a knowledge of gardening and simply follow the example of their neighbours, but when one sees very pronounced examples of it in some of our public parks, it is, of course much worse.

Examples of this unnatural way of treating plants were plentiful enough during the past summer, for with everything arranged so that nearly all the water poured on them was wasted, failures were, as a matter of course, frequent. In a wet summer the folly of arranging beds in this way is not so pronounced, but in such a season as the last, it should be brought home to everyone. We all know how fond the beautiful flowering cannas are of liberal treatment, yet last summer I saw some completely starved, and looking as miserable as possible. This, too, was in an establishment that enjoys a great reputation. The beds had been freely watered, but nearly all the liquid ran on to the surrounding grass. On the other hand, in a far less extensive place, a splendid bed of the same kinds of cannas came under my notice. It was fashioned like a shallow saucer, with the result that not one drop of water was wasted, and the plants were in luxuriant health.

Last summer was, from its great heat and long-continued drought, a very trying one for many plants, but its effects would in many cases have been lessened had the soil of the beds been disposed in a more rational manner. Apart from any other consideration, this heaping up of the soil above the surrounding level causes a great deal of extra work during the summer months. K.

# NEW TREES AND SHRUBS OF 1911.

Omitting roses, which are dealt with by other writers, a notable feature of 1911 was the number of rhododendrons that received Awards of Merit from the Royal Horticultural Society. What is even more striking is the fact that, though the newer species from China have been greatly in evidence within the last few years, not one of these has been so honoured during the past season; in fact, eight of the nine plants honoured, are garden hybrids, and the remaining one is the Japanese Rhododendron (Azalea) sublanceolatum.

Though that enthusiastic lover of the rhododendron family, the late Mr. J. H. Mangles, of Valewood, Haslemere, passed away as long ago as August 24, 1884, the fruits of his labours among this beautiful class of plants are still apparent, for of the nine varieties referred to four were shown by his sister, Miss Mangles, of Seale, Surrey. Those in question are R. Glory of Littleworth, a superb member of the genus belonging to that section sometimes referred to as Azaleodendron. This group originated by the intercrossing of an evergreen and a deciduous member of the genus, the best known examples of which are those two old varieties, R. azaleoides or R. odoratum, and R. Smithi aureum. The characteristic weak-looking foliage of this race is evident in R. Glory of Littleworth, but the flowers, which are borne in large clusters, are very beautiful, being of a creamy-white tint, with a large blotch of brilliant orange on the upper part. R. Littleworth corallina has bell-shaped flowers, disposed in loose trusses. In colour the blossoms are pink, with a rosy tinge on the exterior, and of a thick wax-like texture. The large calyx shows traces of R. Thomsoni, but its parentage was not given. R. Dawn's Delight reminds one a good deal of the popular R. Pink Pearl, but it is earlier in flowering than that well-known kind. As early as April 1, the last to mention of the four hybrids shown by Miss Mangles was placed before the Floral Committee. This was R. Mrs. Kingsmill, a reported hybrid between R. Aucklandi and R. campylocarpum. The flowers of this variety are white, and borne in large trusses.

Messrs. John Waterer and Sons, of Bagshot, have given us so many beautiful varieties that one always looks for something good from them. At the Temple Show they received an Award of Merit for the variety R. Corona, a delightful flower of a carmine-pink shade. Though the flowers are rather small they show markedly the influence of R. Aucklandi. Other varieties to which awards were made are R. Loder's White, a beautiful pure white flower, whose parentage is somewhat doubtful. From its extreme floriferousness, even in a small state, it is already very popular in Cornish gardens. A hybrid between R. Thomsoni and R. Aucklandi, shown by Sir T. D. Llewellyn, was much admired. The flowers of this are of a rich red, with a softer tone in the centre.

At the Temple Show one naturally expects to see a grand bank of deciduous rhododendrons, or azaleas as they are popularly termed, put up by Messrs. Cuthbert, of Southgate. The variety A. Duchess of Portland, from this firm, a large and well-formed flower of a pale yellow or straw colour, flushed and tipped with red, gained an award, though personally I preferred another from the same exhibitors, namely, A. Prince of Orange, with fiery orange-coloured blossoms. The last rhododendron or azalea to be honoured during the year was R. sublanceolatum, a rather spare-growing plant with clear rose tinted flowers.

The only First Class Certificate awarded at the Temple Show to hardy trees or shrubs was given to Davidia involucrata, now fairly well known in this country. It is a deciduous tree, in appearance, somewhat suggestive of a lime, and the most conspicuous feature of the inflorescence are two large pure white bracts, which suspend the clusters of flowers. As Messrs. J. Veitch and Sons were, through the agency of Mr. E. H. Wilson, the first to introduce this most promising tree into the British Isles, it was only in accordance with the fitness of things that they should be the first to flower it here, though it has previously bloomed in France. The particular specimen that flowered at Coombe Wood was raised there from seed sown in 1901. There is a larger specimen brought home personally by Mr. Wilson, which, though it did not flower in the spring, bore several of the showy bracts towards the end of September.

[Photo: C. P. Raffil.

CYTISUS DALLEMOREI.

A handsome hybrid broom raised at Kew, of free growth, and bearing a profusion of rose-purple flowers.

Of the two First Class Certificates awarded during the year, the first was, as above stated, given to the Davidia, and on June 20, Philadelphus Lemoinei Virginal obtained the other. This is one of the many varieties raised and distributed by M. Lemoine, of Nancy, and it must, I consider, be looked upon as one of the finest of all the mock oranges. The flowers, which are borne in clusters, are about 2½ inches across, and pure white in colour. They are double, but the petals in the centre are shorter than those around the outside, thus forming a somewhat anemone-like bloom.

Beside the above, Awards of Merit were given to Veronica Silver Queen, a free, dense-growing, prettily variegated veronica of the speciosa section, and the following Chinese trees and shrubs: Fokienia Hodginsi, a new conifer, bearing a considerable resemblance to Libocedrus macrolepis; Cornus paucinervis, a small, upright-growing, freely-branched member of the Dogwood family, with flattened clusters of whitish flowers in August; Itea illicifolia, an evergreen shrub suggestive of a holly, but the flowers are very striking; they are small and of a greensh-white colour, but are borne in long, slender, closely-packed semi-pendulous racemes. Clerodendron Fargesi is in the way of Clerodendron trichotomum, but does not promise to make as large a specimen. The flowers of C. Fargesi are white, and protrude from a reddish calyx. After the flowers fade this deepens, and the fruit in the centre becomes of a bright turqoise blue colour. Some cut sprays from Kew were shown on October 24.

Of the different subjects named above the following seven were illustrated in the GARDENERS' MAGAZINE of 1911, and the illustrations being so lifelike, they give a far better idea than can be formed of the plants than from a long description. Rhododendron Duchess of Portland, June 3; Rhododendron Beauty of Littleworth, June 3; Philadelphus Lemoinei Virginal, June 24; Itea illicifolia, August 5; Cornus paucinervis, August 12; Clerodendron Fargesi, November 4; and Veronica Silver Queen, November 4.

As the result of Mr. E. H. Wilson's travels, Messrs. J. Veitch and Sons are this autumn distributing over a dozen novelties. When at Coombe Wood in the autumn I was particularly impressed with two of these, and these particular species received Awards of Merit when shown with many others at the Horticultural Hall on October 24 These two are Berberis verruculosa, one of the prettiest of evergreen berberris, and a decided acquisition to our hardy shrubs. It reaches a height of about a couple of feet, and is of dense habit, but the arching character of the shoots give it a graceful appearance. The leaves are ovate, spiny, shining above, and glaucous beneath. The flowers are yellow, and succeeded by purple fruits. Lonicera nitida, which also received an Award of Merit, is, for a member of this genus, very singular, yet it is a remarkably handsome little shrub. At a casual glance it is far more suggestive of a cotoneaster than a member of the honeysuckle family, both the minor branches and the leaves being disposed in the regular manner common to some of the cotoneasters. This lonicera is said to reach a height of 3 to 6ft. in height. It is of a somewhat erect, compact habit, the numerous shoots being thickly clothed with small ovate leathery leaves that have a brilliant gloss on the upper surface. The tiny creamy-white flowers are in no ways showy, but pleasantly fragrant.

Osmanthus Delavayi, shown at one of the spring meetings of the Royal Horticultural Society by Messrs. Paul and Son, is so distinct from the other member of the genus, and withal such a pretty shrub, that it merits at least a passing notice. It is a neat, compact growing evergreen, clothed with small boxlike leaves of a dark green colour. The white flowers are tubular in shape, with a widely expanded mouth nearly an inch across, and borne freely in clusters at the point of every shoot. Its hardiness in this country has yet to be proved.

Elscholtzia Stanntoni, a Chinese member of the Labiate family, was, I believe, shown for the first time from Aldenham Gardens, at the Horticultural Hall, on September 26. It is of a half-shrubby character, and as shown formed a bushy specimen about six feet high and four feet through. The pointed, sharply serrated leaves have a decided mint-like odour when bruised. The flowers, which are freely borne in terminal spikes, are of a peculiar, almost indescribable, magenta shade.

Many of the novelties of the last few years have already become very popular, particularly Berberis Wilsonæ, a pretty little species, very attractive in autumn; Buddleia variabilis, represented by several forms; Cotoneaster applanata, Cotoneaster humifusa, and Cotoneaster rugosa Henryi; Dimorphanthus mandchuricus, variegated leaved forms; the newer hydrangeas, Hypericum patulum Henryi, Ilex Perneyi, one of the prettiest of the hollies; Petrowskia atriplicifolia, so effective in a mass; Populus lasiocarpa, by far the largest-leaved poplar; Robinia Kelseyi, a large-flowered, small-growing member of the False Acacia family; and Viburnums Carlesi, V. Henryi, V. rhytidophyllum, and V. utile. The free-growing and profuse-flowering hybrid broom, Cytisus Dallimorei, that was raised in the Royal Gardens, Kew, a few years ago has during the past year fully justified the Award of Merit made in its favour by the Royal Horticultural Society in 1910. When in bloom its rose-purple flowers produce a fine effect.

Though not new, yet Elliottia racemosa is so rare that its claims to mention cannot be overlooked. It flowered at Kew last summer, perhaps for the first time, and certainly for the first time within recent years. It belongs to the order Ericaceæ, and forms a deciduous shrub, which bears erect racemes of pure white fragrant blossoms about an inch across at the end of July. Another old plant, which was comparatively unknown till 1910, when it was given an Award of Merit, namely, Symphoricarpus occidentalis, has this autumn been much admired as it is an ornamental subject much superior to the common Snowberry.

W. T.

**Sparmannia africana.** — Probably owing to the roasting they received the plants of the Sparmannia that were stood outside during the summer and early autumn are this season flowering with unusual freedom. The most striking feature of the flowers is the beautiful purple and yellow colours of the crowd of long brush-like stamens.—S. W.

## THE ROSE SEASON OF 1912.

### An Anticipation.

With the passing of Christmas, the rosarian, forgetting those things that are behind, looks forward to that which is to come. Plant life is stirring. He is told that "January brings the snow, and makes our feet and fingers glow," and he knows the old adage, "as the days lengthen the cold strengthens," but he also knows, and knows full well, that when the white pall is withdrawn, the first whiff of a spring atmosphere, so delicious, so invigorating, may be inhaled at any moment. A few weeks later the sight of a florist's shop window daintily dressed out with Flora's choicest gifts, fills him with delight. Those long-stalked Richmonds and Chatenays and the pearly-white Kaiserins, with their dark-green foliage, are irresistible, and, regardless of mud or motor, he crosses the street to gaze at and admire his loved ones. And standing there, entranced, he sighs to himself, "How beautiful, how beautiful!" Yes, the spring is coming, we know it by its herald, the Brimstone butterfly, and soon the lark's song will awaken our Queen to summon her subjects to her durbar.

At the close of his letter of greeting to the members of the National Rose Society in annual meeting assembled, Mr. Edward Mawley, from his sick-room, which one and all prays that he may speedily quit, wished us "A happy Christmas and a better rose season next year than that of 1911." We reciprocate that wish. But what are the prospects? As to the weather, that question lies in the cap of the gods, but, so far as man is concerned, never were the prospects more rosy.

In the first place, we shall be summoned to the greatest event of the year, to Flora's Court in the Royal Hospital Gardens, Chelsea, on May 22 to 30, there to see the very best that the horticultural skill of the present day can produce. The schedule of this great Royal International Horticultural Exhibition provides twenty-six classes for roses, and such classes that would have been impossible ten years ago. Let us glance at the description of some of them. In the section for roses in pots we find a "Group of roses, in a space not exceeding 500 square feet," "One hundred roses, polyantha-dwarf section, five varieties, 20 plants of each, in pots not exceeding 6in," "Twelve roses, distinct, sent out since January, 1909, as evidenced by the National Rose Society's lists, climbers excluded," "Six climbing roses," on the same conditions; "Thirty-six roses, distinct, standards, weeping varieties excluded," "Nine standard roses, distinct, weeping varieties." In the cut flower section we read of a "Group of roses in space not exceeding 100 square feet," "Twelve varieties of roses, nine flowers of each, with long stalks, in vases or long glasses."

Suitable classes for roses in pots, boxes, and vases are also provided for amateurs. Never before has there been promised such a wealth of roses at one exhibition, and we believe that the highest anticipations will be surpassed by the fulfilment.

The National Rose Society has also great anticipations. It is true the society does not yet provide an exhibition of roses in May, but it will undoubtedly in the near future. Indeed, if the society is to keep pace with the progress of the rose world, it must have a May show for roses grown under glass. We are, however, this year promised four shows instead of three. A summer show at Southampton is fixed for June 26. Here we shall expect to see the early flowering teas and hybrid teas, together with the Provence and Damask, alpina and altaica, sinica, and multiflora, lutea, and its hybrids. The Metropolitan exhibition of the society in the Botanic Gardens on July 9 will bring roses from all points of the compass, and on such a date a great show may be confidently anticipated. A few days later, July 19, the society will take a trip to the Emerald Isle, where we know a hearty welcome awaits the visitors. With the display of autumn-flowering roses in the Horticultural Hall, Vincent Square, on September 12, the National Rose Society will complete its programme.

At the Royal Horticultural Society's exhibition at Holland House, on July 2, roses will again occupy a prominent position, whilst rose shows in the provinces from early in June to well on in August will more than fill up vacant dates. A five months' series of rose shows! Can any other flower claim a longer exhibition season!

And what shall we see at these exhibitions? The serried ranks of specimen blooms will be there, but in reduced numbers, because every society that would keep pace with the times knows full well that to confine its classes to roses staged in regulation boxes tends to monotony, and the consequent slacking of public interest. The demand of the present day is for roses possessing colour, perfume, and freshness, regardless of size and form, and this will be supplied by more classes for free-flowering varieties set up in baskets, vases, and bunches, displayed with more grace and more skill. The hybrid perpetuals have all but passed away, teas are but echoes of the past, and whilst the so-called hybrid teas still hold the premiership, the position is being challenged by the annually increasing varieties of wichuraiana and pernetiana.

We are promised by the National Rose Society another Rose Conference on the lines of that successful one held last April. But more than this, for a project is afloat whereby the society will extend the right hand of fellowship across the dinner-table to rosarians beyong the seas, rosarians who may be expected to visit and assist at the International Exhibition. Mindful of our indebtedness to them for some of the very best and most popular roses of the day, it may, as we hope it will, be an opportunity for making the acquaintance of our brothers in the craft, and get to know them almost as well as we know their roses. In the comity of nations we once prided ourselves on preserving an attitude of "splendid isolation." Recently we have been informed on the best authority that such an attitude is no longer tenable, and one ventures to hope that, should the proposed offer of hospitality to American and Continental rosarians be accomplished, it will in a degree, however small, increase the spirit of universal fellowship and international peace.

JOSEPH H. PEMBERTON.

Havering.

**Pink Spiræas.** — These spiræas are by no means seen at their best when forced, especially if a considerable amount of heat is used, as the flowers are then, even at their best, of a poor tint. When brought on under glass in order to hasten their season of blooming, they should have all the light and sunshine possible, while a free circulation of air also tends to deepen the colour of the flowers. One reason, I think, why these have not made so much progress in popular favour as was at one time anticipated, is owing to the fact that many of them were forced, and their colour did not then give satisfaction. Planted out of doors in a moist spot fully exposed to the sun, the blossoms then acquire a very pleasing tint.—K.

## FORESTRY AS A PROFESSION

The interest in forestry matters which has been awakened within the last few years has led to the assumption in some quarters that forestry is likely to become at an early date a lucrative profession for an unlimited number of men. There does not, however, appear to be any good basis for this idea, for in the event of a large afforestation scheme being adopted, many years would be bound to pass in preliminary work, and until young plantations began to yield revenue the number of officers and workmen must necessarily be small.

Some idea of the number of forest officers required for a given area may be obtained from the "Forest Survey of Glen Mor" (Afforestation in Scotland), Vol. XXV. of "The Transactions of the Royal Scottish Arboricultural Society," 1911. In a carefully considered scheme it is suggested that, for a forest block of 15,000 acres, one head forester would at first be required, with three under foresters, and that in fifteen or twenty years' time, as planting continued and thinning began to be necessary, three head foresters would be required for the 15,000 acres. Thus, if it were possible to take a million acres in hand at once, roughly, 67 head foresters and 200 under foresters would be required, with, of course, a certain number of men who had been specially trained in surveying, valuation, finance, and various other items. From this it will be seen that if a million acres were taken in hand within the next ten years, a comparatively small number of trained foresters would be required, and it is probable that practical foresters are being trained quite fast enough for all immediate requirements. This idea would appear to be upheld from the reports issued from time to time concerning the School for Working Woodmen in the Forest of Dean. For about eight men leave the school annually, and most of them obtain situations, but if the school were extended so that a greater number of men might be taken, it is considered doubtful whether they would all be able to obtain situations when their time at the school expired.

It is quite probable that, in the event of an extensive planting scheme being commenced, a dearth of planters would be experienced rather than foresters, for, although we have been told that anyone can plant trees, the views of practical foresters do not coincide with those of people who sometimes make such statements. Again, forestry is work for country-bred men rather than town men, and although some town men might get accustomed to the life, a great many would never become acclimatised, for it has to be admitted that the work of a forest hand who is worth his salt is of an arduous nature, and if any doubt it, let him try three months' planting on a bleak hill-side, exposed to all the winds of heaven and all the storms that come, for in the event of a storm he has to work through it; there is no running to shelter. Likewise, after a town life, many men would not settle down well to isolated country conditions. On the other hand, the man who has been born to a country life, and has worked all his time in woodlands, is rarely eager to change his lot with any other man; the work and life have a fascination for him, and instances are known of families who for generations have lived and worked in and about forest areas for a low wage, yet the sons and daughters prefer to stay about the old home rather than go further afield for higher wages. This love of a forest life does not apply to forest workmen only, for head foresters are, as a rule, deeply attached to the life, apart from its being their means of subsistence, and those whom force of circumstances has caused to take up other branches of the profession or other professions, find their keenest pleasure in visiting the old haunts.

Taken on the whole, the life of a forester who has succeeded in obtaining a fairly well paid situation may be considered as a comfortable and enjoyable one; certainly much to be preferred to many so-called good appointments in our large cities. That a forester's profession is an easy one to learn is another matter, for during his early training he finds that he has to become acquainted with many things besides tree-planting and tree-cutting. He must also have plenty of grit and perseverance, otherwise he is liable to be disheartened by the work of his earlier years. The forester of the future will also have to obtain a good theoretical knowledge of his profession, and know something of the numerous side issues of forestry.

It may not be out of place to point out how forestry training is to be obtained in this country. For the well-to-do, forestry instruction may be obtained at several of the Universities. Oxford University, Cambridge University, the University College of North Wales, Bangor; Armstrong College, Newcastle-upon-Tyne; the University of Edinburgh; the Royal Agricultural College, Cirencester; the Glasgow and West of Scotland Agricultural College; the Edinburgh and East of Scotland College of Agriculture, and the Aberdeen and North of Scotland College of Agriculture all have Schools of Forestry. Full particulars of the courses at these places and the approximate cost may be found in "The Journal of the Board of Agriculture," Vol. XVI., No. 12, March, 1910, pp. 969-981. A practical forester usually serves an apprenticeship under some good forester; he then moves about from place to place for several years in order to gain experience, and gradually works up to be a head forester. He is able nowadays to obtain a certain amount of theoretical training, for courses of lectures for practical foresters are now to be had at Edinburgh, Aberdeen, and Newcastle, and a two-year course of instruction is obtainable at the Forest of Dean School. Full particulars of the latter school are to be found in "The Journal of the Board of Agriculture," Vol. XVIII., No. 6, September, 1911, pp. 498-500. At this school two afternoons a week are given up to lectures and the rest of the week to practical work. There would, however, appear to be a need for a twelvemonths' course on theoretical work for approved young foresters who have spent a number of years at practical work. Practical men are seriously handicapped, inasmuch that most, or sometimes all, of their study has to be done at night, after a hard day's work in the open air, extending over from nine to twelve hours, and they are therefore unable to do themselves justice. Yet if a man wishes to fit himself for the higher branches of his profession, it is the only course open to him, as he cannot afford a full University course, neither would it be to his advantage to leave practical work for the necessary length of time; but for the year he might very well lock his spade and axe away. Men are expected to know something of the theoretical side of their profession, and it is only right that they should do so, but it is very difficult to obtain the knowledge under existing circumstances, except for those who are most favourably placed. It would, however, only be possible for the better men to undertake such a course of training; men who had no wish to improve themselves would be better away. The youth who could look forward to a year of sound instruction from fully-qualified teachers would in the intervening years between school and college, endeavour to keep up and improve his education, so that he could take full advantage of his teaching, whereas at the present, with nothing definite to look forward to, it is to be feared that on arriving home after a tiring day's work, he is apt to neglect study for something more entertaining. The man, too, who had been through five or six years of practical work would be able to make better use of scientific or theoretical training than the youth who went straight to college from school and spent little or no time at practical work. To men who think that forestry means only the planting and cutting of trees, the lower ranks of the profession only are open, but to intelligent youths who are prepared to work and study hard with low wages for a number of years until they have mastered their work, forestry offers an honourable and comfortable livelihood, with improving prospects in view.

W. DALLIMORE.

## SEAWEED AS MANURE.

I was much interested in the article on "Seaweed as Manure," which appeared in the issue of November 4, page 827. I have assisted in the gathering of many tons of seaweed from the Lancashire coast in Morecambe Bay. The weed clung to the rocks, which were scattered over many acres of the foreshore, and was, of course, when gathered, quite fresh and very succulent. The seaweed was used during the autumn and winter months to mix with the manure daily collected from the stables. As the strawy manure was formed into a neat heap the seaweed was judiciously mixed with it, and at the end of about six weeks the whole heap was turned over. By the end of January the heap had sunk considerably and become very solid and much rotted. This manure was exceedingly good for asparagus and potatoes, but it was used for general garden crops, and as the soil in that particular garden and the neighbourhood was naturally light, the crops grown in quarters so manured "held out" very well, even in hot seasons. The seaweed was generally used in this way by the farmers and market gardeners also.

Mussels were there very plentiful, and were dug and ploughed in for potato crops, and I have never seen tubers with clearer skins than those produced in that district. Scarcely any other kind of manure was used in addition to the mussels.

GEO. GARNER.

**Begonia Gloire de Sceaux.**—This is, as a rule, at its best quite early in the new year, at which time many of the B. Socotrana hybrids are past their best. It forms a bold specimen with handsome bronzy-green leaves, and a profusion of bright rose-coloured flowers. Though grown now for many years, its merits are sometimes apt to be overlooked.—K.

**Hippeastrum aulicum.**—The hippeastrums, as a rule, flower during the spring months, but this species, in common with two or three others, is at its best in the autumn. It produces a particularly stout flower scape, while the blossoms themselves are red, veined with a deeper tint. Compared with the present-day garden varieties of hippeastrum, the segments of the flower of this species are pointed, and irregular in shape. For this reason it has been but little employed by the hybridist for the production of new varieties; but it is a showy plant, and for autumn flowering much can be said in its favour.—W.

# REVOLUTION IN VEGETABLE GROWING.

One has only to look back into the pages of history to find periods when vegetables played but a minor part in the bill of fare of British people; few crops were represented in the patches of cultivated ground that could hardly be called gardens, and little attention was paid to matters of cultivation. In fact, the early history of Great Britain is one of war more than anything else, but we learn how warriors brought back from the Continent and elsewhere plants of an edible character, and we all learnt at school the story of Sir Walter Raleigh, and the way he introduced the potato into this country. Probably in its early stages, vegetable culture was chiefly associated with monasteries and places of religious seclusion, but as the spirit of war declined, arts and education advanced, men began to realise that there were other objects in life besides killing each other, so little by little they turned their attention, amongst other things, to gardening.

Since then this utility aspect of horticulture—i.e., the growing of vegetables, has never looked back, and, though it has seen its ups and downs, there never was a time when it was so important as it is to-day, and its importance is likely to increase. At one period of its history vegetable growing was confined almost entirely to the gardens of the wealthy, except, perhaps, a few of the most common crops, but, as industries developed, and the consequent congregation of people came about in towns, there arose a demand for vegetables, which led to the establishment of market gardens. At first these market gardens were all on the outskirts of populous centres, as some are still, but the builder has laid his hand on many of them, and streets and houses occupy many sites on which crops once grew. If market gardeners have been compelled to retreat further into the country there is the railway for the conveyance of their produce, and the result of it all is that vegetable growing has grown to be an industry of great commercial importance.

Then there are the cottage gardeners and allotment-holders, thousands and thousands of them scattered all over the country. Men engaged in every conceivable occupation, who, in their spare time on small patches of ground, grow vegetables, partly for the purpose of supplying their domestic requirements, and partly because gardening appeals to them as a hobby that is interesting, health-giving, and profitable. No one I think will deny that the working-classes have played an important part in the development of vegetable growing. Think of it all then, how in the history of the nation and its people there has been a complete revolution in the culture of vegetables, which, in its way, is as marked as that which has taken place amongst fruit and flowers, and the march is still in an onward direction.

## The Kitchen Garden.

By right of custom, the kitchen garden attached to private establishments is surrounded by a high wall, furnished with trained fruit trees, pyramids, and bushes may skirt the walks, and monotony is avoided by the presence of herbaceous borders; but it is on those highly-cultivated quarters that the revolution in vegetable culture has largely taken place, for vegetable growing was an art in private gardens when market gardening was in its infancy and the cult of cottage gardens could hardly be called a cult at all. In short, the kitchen garden is the utility part of the establishment, and the gardener, while he supplies the drawing-room with flowers, must of necessity look after the needs of the cook. Not infrequently the spade-work in the kitchen garden is in the hands of an intelligent labourer, but it is the gardener who does the organising, and the way in which private establishments have helped so much in the revolution of vegetable culture is that gardeners have been the first to grow the new and improved varieties sent out by seedsmen, and by this means the reputations of what are now known as standard types has been largely built. In other words, the gardener is a bit of an experimentalist; he likes to try a few new things each season; if they are disappointing he discards them, but if they turn out well he makes known the fact, and so the new variety becomes established in cultivation. I fear there is a danger in these days of young gardeners confining themselves too much to glasshouse training, and treating vegetables and kitchen gardens too much as subsidiary branches; but, depend upon it, this is a mistake, as many have found out when they came to take over their first charge as head, and realised that they were wanting in knowledge of vegetable culture and the management of the kitchen garden.

## Vegetables in Commerce.

If you turn to your Dickens you will find how the great author described the rumbling of market carts over the cobbled streets of London in the early morning, bringing in amongst other things vegetables, and passing on their way the early stage coaches departing on their various journeys. Doubtless the vegetable traffic in those days was considered great, but, shades of Dickens, compare it with the present time, and realise the revolution in commercial vegetable growing. Market carts still rumble, but they are passed on the road by the motor lorry, the railway competes with the road traffic, and Covent Garden is the centre of gravity for vegetable produce from all parts of the country. While this great industry has been growing men have found out that certain soils and localities are suited particularly to the growth of certain crops, and consequently, as illustrations, we get early potatoes from the Channel Islands, cauliflower from Cornwall, asparagus from Worcester, spring cabbage from the favoured vale of Evesham, and so on, and so on. Speaking of the men, it would be difficult to find a more hard-headed set of individuals than the fraternity of market gardeners, who are not to a great extent experimentalists, but in the way of stocks and varieties they stick to those which have proved in experience to serve their commercial purposes. Nevertheless, the revolution in commercial vegetable growing is due more to good cultivation than anything, for the market gardener willingly invests his capital on manure to the tune of fifty tons to the acre, and knows that by doing so he will get a better return for his money than if he applied one quarter as much. It is said of the market gardener that he is wanting in matters of co-operation as regards the disposal of his produce, but be that as it may, as an individual he meets the demands of the times. It is not many years ago since the man in the street first discovered that he liked tomatoes, and now, apart from the acres of land that are covered with glass to supply the demand, the tomato is an important outdoor crop, and I know one grower this year who has had twenty-five acres of land devoted to tomatoes, and each plant had to be raised from seed, potted, planted, and staked. Surely this is revolution and enterprise, for the tomato was ever a fickle plant outdoors, but the illustration shows the type of man that market gardeners are, and they have played no little part in bringing the culture of vegetables up to its present standard.

## Allotments and Cottage Gardens.

No matter what small town, village, or hamlet you go into you will meet with individuals who were endowed by Nature with a taste for gardening and vegetable growing in particular, and for downright keenness the enthusiastic cottager or allotment-holder is hard to beat. "Fond of his garden!" said a labourer's wife to me one day, in reference to her husband. "I should think he is; in fact, I hardly see him, for he is up as soon as it is light, puts in an hour or two before he goes to work, and when he gets home at night it is garden again till bed time." A man would not do this if he did not love his garden, and it is this type of individual whose plot is the pride of the village, and puts to shame that of his less industrious neighbour. This is the man, too, who supports his village show, wins his share of the prizes, and it may be said of him that he has no connection with the community who lounge round public-house doors and air their superior knowledge at street corners. The keen cottager is also a learner; he is the most apt pupil of the County Council Instructor, and he demonstrates a truth which runs all throughout horticulture, that the man who really knows something about gardening is the man who always wants to know more. Local gardening societies and village shows are a great impetus to the keen cottager, who has learnt that, in order to get his scarlet runner beans a bit straighter and a trifle longer than those of his neighbour he must have a good variety. This may be a strain on his slender means, but he does not begrudge the money, and one day a seedsman showed me a letter that he had received from a labourer, accompanied by an illustration of a variety of scarlet runner cut from the seedman's catalogue. It ran as follows: "Dear Sir,—If you can guarantee those beans to be as good as this picture of them, send me half a pint." Comment is needless, except to say that the cottager is keen on getting the best stocks, and in one way or another he has played his little part in the revolution of vegetable culture. It is likely that he will do more in the future, for education authorities have now begun at the right end by teaching gardening in the elementary schools. An important part of this gardening is vegetable growing, and it is not too much to say that hundreds of lads—the cottagers and allotment-holders of the future—are being turned out with a better knowledge of the principles of horticulture of which successful cultivation is based, than their fathers ever had the chance of obtaining.

(To be continued.)

---

**Acacia ovata.**—Of the immense number of acacias that are natives of the Australian continent, those that can be successfully flowered in a small state are comparatively few in number. This, however, is one of them, and a charming subject it is for the embellishment of the greenhouse early in the new year. It forms a freely-branched bushy specimen, the shoots clothed with small, roundish, ovate leaves of a deep green tint. The small globular flower heads are of a rich yellow colour. It is not at all exacting in its requirements, and may be stood out of doors during the summer.—S. W.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

COOL HOUSE.—To successfully cultivate the majority of orchidaceous plants we must have various houses heated to different temperatures and so constructed that the requirements of each section, either warm or cool, may be readily given. The cool department is one having sufficient heating apparatus to maintain a temperature of not less than 45 deg. during severe weather. During the summer months a moist atmosphere should be readily obtained. The house must be shaded by some means. A hot, dry atmosphere in this house is detrimental at any season of the year. At this season the temperature should be maintained, as nearly as possible, at the figures given, and the aim should be to keep a free, buoyant atmosphere by giving air on all occasions whenever the outside conditions permit. The amount of atmospheric moisture must be regulated by the amount of evaporation going on; on dull, wet days much less damping will suffice than on a clear, bright day. Cool orchids, although they require shade in the summer months, must at this season have all the light possible, and should be grown near the roof glass. A plant well exposed to the light will become robust and strong. Many inmates of this department will now be showing their flower spikes, notably the odontoglossums, both species and hybrids, and Masdevallia tovarensis. They should all receive the same cool airy treatment, receiving sufficient water to keep them plump. No attempt at forcing them into bloom should be made, but they should be allowed to come slowly and surely into flower, when their spikes will be stronger and the blooms much finer than they would have been if hurried in any way.

PESTS.—It is at this season that slugs and yellow thrips often make their appearance. The former soon discover the young, tender spikes and will devour them and ruin them. A careful look out for slugs must be carried out continually. In the case of yellow thrips the usual remedies of fumigation and sponging must be resorted to, and no relaxation must be allowed until the pest is eradicated. Thoroughness in all things is the sequel to all success in the cultivation of orchids. No cool orchid should be allowed to suffer either from an insufficiency of supply or an excess of moisture, one is as injurious as the other. When watering any plant see that it is properly soaked.

INTERMEDIATE, CATTLEYA, AND MEXICAN HOUSES.—These are practically all one, and the same thing, and at this season the occupants require the same management. During the summer it is a different matter, and it is then very useful if a compartment can be set aside for Mexican orchids, as they revel in the bright sunlight that would be most injurious to many of the cattleyas. The cattleya house must be so heated that the figures given below can readily be reached without unduly forcing the fires, as over-heated pipes are most harmful.

TEMPERATURE. — The temperature in the different houses should be maintained at this season, as nearly as possible at the following figures: Cool house, day, 55 deg.; night, 50 deg. Intermediate or cattleya house, day, 60 deg.; night, 57 deg. East Indian house, day, 65 to 70 deg.; night, 65 deg. General treatment at this season consists of paying close attention to the temperature and atmospheric conditions generally, and avoiding fluctuations as much as possible.—J. T. BARKER, West Hill Gardens.

## STOVE PLANTS.

CLEANLINESS.—In a well-ordered garden containing plant stoves there should be but few periods during the year when there is a scarcity of material, either of flowerng or foliage plants, for making a display; indeed, it is in such structures that one looks for a bright display at the dull season. At the same time an early opportunity should be taken to thoroughly examine and clean the houses and their occupants before a press of other work in the departments begins. In no part of the garden is cleanliness of greater importance than in the stove where the constant humidity and warmth necessary to the occupants has a tendency to encourage insect life and filth. If possible, remove the whole of the pot plants into an adjacent house while the woodwork and glass is being well scrubbed with hot soapy water; follow the scrubbing with a good syringing with tepid water to which is added a wine-glass of paraffin to each gallon; this must be kept well stirred during application. Any climbers there may be in the house should be removed from the rafters or pillars, and pruned where necessary, then cleansed and tied into position. Palms and other foliage plants should be sponged before again re-arranging them.

TEMPERATURE. — When cleaning is finished keep the temperature as low as is consistent with safety to the occupants at this season. Avoid exciting the plants into growth for a few weeks; when the days begin to lengthen will be time enough for this. A maximum of 70 deg. should not be exceeded, and the temperature may fall as low as 58 deg. on cold nights.

LOOKING AHEAD. — Note should be made of the plants that will be most in request in the coming season, and preparations made accordingly for propagating a sufficient number of each. Plants that have passed out of flower, such as poinsettias, Plumbago rosea, and other winter-flowering stove plants should have the water supply gradually lessened in order that they may rest before being restarted into growth for the production of cuttings. Avoid keeping resting plants of this character in too low a temperature; heavy losses often occur through

this error when propagating time comes round.

SOIL.—Place under cover good supplies of the various soils needed for potting during February and onwards. Mellow loam with plenty of fibre is of inestimable value for plant-growing, and a good stack should now be dug from an old pasture for later use, that stacked last year being used this season. Oak or beech leaves should be collected in sufficient quantities, and kept apart from the general leaf heap to rot down for leaf-soil. Sphagnum moss should be gathered or purchased while the weather remains open. —H. T. Martin, Warren Wood Gardens.

### FRUITS UNDER GLASS.

MELONS.—Where it is desirable to grow early crops of melons, preparations must be made forthwith; thoroughly cleanse the house, giving the rafters, sashes, and glass a good scrub down with hot soapy water, afterwards giving the whole a good rinsing with hot water, applied forcibly with the garden engine. In many places the bottom heat required for growing melons is supplied by the means of hot-water pipes fixed in a chamber immediately underneath the melon bed, but where fermenting material is used to supply the necessary bottom heat, this should be brought into the house at once, using long strawy stable litter, to which should be added some oak or beech leaves. Make the bed very firm, treading down the material as the work of filling proceeds; allow the fermenting material to settle down for a few days before placing the soil upon it. Use good fibrous loam that has been cut and stacked for some time; this should be chopped up roughly, adding a little leaf-mould, old mortar, and wood ashes. The materials must be thoroughly mixed and made up into firm flattish mounds ready to receive the plants. Seeds should be sown thinly in five-inch pots, in a light compost, and plunged in a brisk bottom heat. Cover the pots with glass, and when the plants have made their first rough leaf, put them singly into three-inch pots. Some growers sow melon seeds singly in small pots, but we find that potting the seedlings induces a stronger and more robust growth. Carefully water the plants, and when they have fairly filled the pots with roots, place them in their fruiting quarters. Strong stakes should be placed in the mounds of soil, sufficiently long to reach the first wire of the trellis, and to these the plants should be trained with clean stems until they reach the trellis, after which the laterals should be allowed to grow. Maintain a night temperature of from 65 to 70 degrees, allowing a rise of 10 degrees with sun heat during the daytime; lightly spray the plants on all favourable occasions, and guard against a superabundance of atmospheric moisture.

PROPAGATION OF VINES.—The culture of pot vines is practised in many gardens, and no time should be lost in attending to their propagation from "eyes." Where possible, select the prunings from vines which were forced early last season, as the buds from these start readily into growth, and consequently make better plants than those that are selected from later houses; the cuttings should be made into 1½-inch lengths with the bud in the centre; a little of the bark should be cut away on the under side of the cutting to ensure early rooting. The "eyes" should be placed singly in three-inch pots, in a compost of loam and leaf-mould, with a little sand added, and started in a temperature ranging between 60 to 70 degrees; no bottom heat will be required if the necessary house temperature is maintained. The following varieties are well adapted for pot culture: Black Hamburgh, Foster's Seedling, Alnwick Seedling, Alicante, Black Morocco, Madresfield Court, and Grizzly Frontignan.

FRUITING POT VINES.—These will require careful attention both in watering, and maintaining the necessary bottom heat. Where this is supplied by means of hot-water pipes, built in a chamber immediately under the pots, it is much easier accomplished than where fermenting material has to be used. Syringe the rods daily when the weather permits. The buds will be pushing into growth, and a night temperature of from 55 to 60 degrees should be maintained, with a day temperature of 5 degrees higher. Frequently damp down the house to create a moist, genial atmosphere, and when the outside conditions will allow, give air to strengthen the young growths.—H. R. Farmer, Cardiff Castle Gardens.

### THE FLOWER GARDEN.

PREPARATION OF THE SOIL. — Too much stress cannot be laid upon the importance of soil preparation for whatever plants are to be grown, whether hardy perennials, annuals, or tender bedding plants. It is well to commence the work as soon as the ground is dry enough to be properly dealt with. Frosty weather affords a good opportunity for wheeling manure on to the beds or borders, and in addition to this, burnt refuse, wood ashes, and road-scrapings are excellent materials for incorporating with the more heavy and retentive soils. It is desirable to cultivate the land to a depth of at the least two feet, as that enables the plants to root down deeply and withstand a prolonged drought with comparative ease. Leave the surface as rough as possible, for the weather will soon crumble this down, and as the work proceeds apply a good dusting of lime and soot, which helps to destroy slugs and other pests.

PLANTS IN FRAMES.—The various subjects that are being wintered in cold frames, like border carnations, chrysanthemums, pentstemons, etc., should be well supplied with air during favourable weather, and be afforded adequate protection from frost at night. Remove decayed foliage, and water with especial care. Lobelia cardinalis will pass the winter safely in a cold frame, and while water must be given it sparingly, it should not become dust dry. Salvia patens succeeds under the same treatment.

TRANSPLANTING SHRUBS.—Where this work is not yet completed take advantage of favourable weather to finish the operation, so that the various specimens may become well established before the growing season commences. It is desirable to remove all specimens with a good ball of soil attached to the roots, and in the case of those coming direct from the nursery, use plenty of old potting soil around the roots when planting, particularly where the natural soil is heavy and retentive. When transplanting it is important to bear in mind the necessity of allowing each plant sufficient space to develop its natural habit of growth without overcrowding its neighbours. All specimens that need support should be securely staked and tied to hold them in an erect position.

RHODODENDRONS.—From now onwards rhododendrons and azaleas can be successfully transplanted. They will succeed in most soils where lime is absent, but a peaty or sandy loam suits them the best. Heavy retentive soils should have a liberal amount of peat incorporated with them. Established beds will be greatly benefited by a top-dressing of equal parts of peat, leaf-soil, and well-decayed manure. This not only encourages root action, but helps to feed and plump up the flower buds; as these subjects are surface-rooting, avoid digging among them or forking up the surface of the beds.—J. Gardner, Batsford Park Gardens.

**The only resemblance** between a Pine Spray Syringe and others is in the shape of the barrel. The metal is more substantial. For the rest, the combination spraying head renders Spray, Rose, and Bend instantly obtainable without the addition or removal of a single fitment, while the adjustable leather bucket plunger gives perfect suction, never allows water to escape past it and up your sleeve, and wears interminably.

A written request from your ironmonger or seedsman, and a Syringe will be sent in 24 hours for your approval. Price 10/6. Sole proprietors and manufacturers, **Robinson Bros., Ltd., West Bromwich.**

**PINE SPRAY SYRINGE** (patent).

## THE ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION OF 1912.

Nineteen weeks hence we shall all be wondering how that great exhibition will look, for which some of us have been hoping ever since we knew how to crock a pot or plant a potato. Twenty weeks hence we shall know whether, as a horticultural people, we have done the right thing at the right time; in short, the financial and horticultural success of the Royal International Horticultural Exhibition of 1912 will by then have been won or lost. It seems hardly possible that the exhibition can be aught else but a horticultural success, because the nurserymen, seedsmen, and sundriesmen will not lose the grand opportunity the occasion affords for the display of their best goods. What is greatly needed, however, is an assurance that the noble and wealthy owners of famous private gardens will exhibit freely, and that amateurs with fewer conveniences, but who so splendidly specialise in some plant or flower, will show well. Regarding the financial success of the great event this seems likely to depend largely on two things, and these are the amount of publicity given during the next few weeks, both at home and abroad, and then upon the weather during the eight days commencing Wednesday, May 22.

The place of exhibition is, as every horticulturist knows, the grounds attached to the Royal Hospital, Chelsea, including the famous Ranelagh Gardens, all of which are under the care of Mr. T. W. Turner, who was at one time general foreman at the Royal Horticultural Society's Gardens, Chiswick. The exhibition will occupy about twenty-four acres, and there is a long, broad, central avenue, and quite a large number of goodly trees about the place. The huge tents for the tender plants will, really, be big canvas covered structures after the character of those with which visitors to the great Ghent and other Continental shows are familiar. The largest tent will cover about 3½ acres; it will be 220 yards long and 45ft. high, and arranged in five spans, all well fitted with complete arrangements for ventilation. It was originally intended to cover in about five acres of ground, but a very large demand for space from Continental growers led to the acquisition of about three acres more ground, and so several large tents will be erected, with connecting corridor, for exhibits from abroad, and each country, notably France, Belgium, and Germany, will have one tent, and be permitted to provide the interior decorations, and subject to certain conditions, arrange their own displays. This feature should add materially to the interest of the exhibition, and will give it a strong international character.

During recent years the development of rock and water gardening has been so marked that designers are asking for much space at the exhibition. To meet their requirements the embankment end of the Ranelagh Gardens has been set aside, and a winding waterway, bridged in four or five places, will be provided. In the upper part of the Ranelagh Gardens and also along the west side of the covered area, hardy trees and shrubs will be displayed, and serve to show the progress made in these subjects, thanks to travellers and hybridists.

Horticultural sundries are to be arranged near the Bridge Road, all along the east side of the Ranelagh Gardens, while kiosks for the publishing and similar trades will occupy positions on either side of the old lime avenue, alternating with groups of trees and shrubs.

It need hardly be said that as complete arrangements as possible have been made for refreshments; one large tent will occupy a fairly central position, and a teahouse is to be provided in the Ranelagh Gardens. Garden architecture will find a place, and at least two large fountains are to be erected. A great feature of the exhibition will be its illumination at night, and the provision of excellent music during the whole of each day.

**PROVISIONAL PLAN of Arrangement of the ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION.**

To meet the heavy expenses of this great undertaking a guarantee fund of £16,000 has been raised, including £4,000 from the Royal Horticultural Society; and subscriptions have been received amounting to a very large sum. In this connection it is interesting to notice that the expenses of the great international horticultural exhibition of 1866 amounted to a little over £12,000, and resulted in a profit of £3,500. The admission charges for 1912 are very high for the earlier days of the exhibition, and have given rise to a good deal of adverse comment.

Their Majesties King George, Queen Mary, and Queen Alexandra have given their patronage to the exhibition, as also have many other members of the Royal family. This of itself ensures a large measure of success, while the King's promise to open the exhibition at noon on May 22 should, weather permitting, be sufficient to make that day a record one in the annals of British horticulture.

The management of the exhibition is vested in a Council of Directors. The Duke of Portland is president, and Sir Jeremiah Colman, Bart., treasurer, while Mr. J. Gurney Fowler and Mr. W. A. Bilney are respectively chairman and solicitor, with Mr. Edward White, hon. managing director; Mr. T. Geoffrey Henslow, secretary; and Mr. G. J. Ingram, financial secretary. The other directors are Sir Albert Rollit and Messrs. N. F. Barnes, E. Beckett, E. A. Bowles, W. Cuthbertson, C. R. Fielder, J. Green, F. J. Hanbury, A. G. Jackman, A. Kingsmill, H. B. May, C. G. A. Nix, George Paul, C. Harman Payne, R. Hooper Pearson, T. A. H. Rivers, N. A. Sherwood, A. W. Sutton, Harry J. Veitch, and R. Wallace. Mr. Harry J. Veitch is the only gentleman on the Board who had anything to do with the management of the exhibition of 1866. The offices are at 7, Victoria Street, Westminster, and from thence can be obtained the schedule of 428 classes. Applications for space for non-competitive exhibits must be sent in on or before January 13, and entries in the classes under the schedule should be sent on or before February 1. There is no stint of prizes, and cups and medals have been offered by traders, amateurs, and societies in a most generous fashion, and there is a cup offered by the King which ought to bring out a strenuous competition. At the moment a movement is on foot among County Committees which has in view the presentation of a cup from each county, or group of counties, and it is receiving very favourable consideration.

In addition to the exhibition of flowers, fruits, plants, vegetables, etc., one large tent is to be set apart for exhibits of a purely educational and scientific character, i.e., those of service in the identification of fungus, insect, and other garden pests. Demonstrations with the microscope are being arranged. The Science and Education Committee, with the Right Hon. A. H. Dyke Ackland as chairman, and Mr. F. J. Chittenden as secretary, have very properly limited their programme to the consideration of two important questions, i.e., Legislation at Home and Abroad for the Prevention and Suppression of Plant Pests, and the absorbing one of Horticultural Education. The Conference for the consideration of these questions will, it is believed, take place in one of the large rooms at the Hospital, and, by the way, visitors should, as far as is allowable, see the beautiful chapel at the Hospital, the Great Hall, and the Cloisters. The date and hour of the Conference have not yet been decided, but two days will be needed to fully discuss the questions raised.

Entertainments will be on a lavish scale, as British horticulture owes a great deal in this respect to Continental horticulture, and will endeavour to reduce that indebtedness on this occasion. Those who have been to Paris, Ghent, Haarlem, Hamburg, Turin, etc., during recent years know how splendidly has been the entertainment offered to judges and pressmen. Here is the opportunity to reciprocate, and surely no one knows better how to make the necessary arrangements than Sir Albert Rollit, who presides over the Entertainment Committee. It is probable that the National Rose Society will actually open the proceedings by giving a dinner at the Westminster Palace Hotel to the foreign rosarians on the eve of the exhibition. It is understood that Sir Trevor Lawrence, Bart., president of the Royal Horticultural Society, will invite the jury, etc., to luncheon at Burford Lodge, Dorking, and similar hospitality will be extended on another day at Gunnersbury Park, by Leopold de Rothschild, Esq. A full-dress banquet appears to be a prominent item, and it is believed the official luncheon to the judges, etc., will take place on the opening day in the Great Hall of the Royal Hospital—at least so rumour says.

Much more might be written concerning the great horticultural event of this year, but here is enough to indicate its greatness, and it may be hoped, to increase the desire that in every sense the function shall be worthy of the British nation, and particularly worthy of our horticultural traditions. What is wanted, it seems to me, is a great scheme of advertisement, to be started immediately, and in such a fashion that everyone who has the slightest interest in gardeners and gardening shall "talk up" the exhibition.

C.

## OBITUARY.

◆

### MRS. WILKINSON.

We regret to record the death of Mrs. Wilkinson, the wife of Mr. Wilkinson, of the Tyntesfield Gardens, Bristol, which occurred at Tyntesfield on December 27. Mr. Wilkinson has our deepest sympathy in the loss he has sustained.

The sad news reaches us just as we go to press of the death on January 2, of Mr. William Deal, Brooklands, Kelvedon. The deceased gentleman was a well-known nurseryman and seed grower, and of late years had ranked among our leading sweet pea growers. We understand that his son, Mr. Bertrand W. Deal, will carry on the business. To him and the other members of the family we tender sincere sympathy in their bereavement.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

UNHEALTHY GOOSEBERRY TREES.—R. F., Berks: You have not been correctly advised as to the cause of the unsatisfactory condition of your gooseberry bushes. They are not suffering from a light attack of American gooseberry mildew, but the shoots were severely injured by aphis during the past summer. The tops of the shoots present much the same appearance as the same parts of shoots that have been infected by mildew, but if you closely examine them you will find that the surface has turned brown, whereas American mildew infected shoots have a brown covering which consists of the spawn of the fungus bearing the fruit receptacles and can be readily removed. We advise you to cut out all the weakly shoots of last year, and to prune the others far enough back to remove the whole of the aphis-injured wood and burn the prunings. A moderate dressing of partly decayed manure may be applied during the next few weeks with much advantage. As the soil rests upon gravel it is not surprising the growth should have been so checked by the drought during the summer as to have become a prey to green fly.

BIG ONIONS.—K. H. B., Yorkshire: Large onions that are obtained by sowing the seed under glass early in the year, bringing the young plants along in pots in cold frames, and bedding them out in the spring, are far from worthless for culinary purposes. Whether they would be more suitable for the purposes for which you require them than those of medium size, such as you have hitherto had, can only be determined by yourself. The keeping properties of onions depend in a large measure upon the bulbs having been properly ripened, and those raised from seed sown under glass reach maturity several weeks in advance of those obtained from sowings made in the open beds. Hence they keep well, and, as a proof thereof, we would mention that we have had bulbs weighing between two and three pounds that were ripened in August and were perfectly sound in April. Under ordinary culture you would not obtain onions of so large size.

ANNUALS FOR THE ROCK GARDEN.—W. W. H., Herts: It is necessary to exercise considerable care in the cultivation of annuals in the rock garden because of the risk of their overrunning the smaller-growing alpines, or of their flowers being too strong in colour to harmonise with the more delicate hues of the flowers of the Alps. As your rockery has been recently formed, and you are desirous of deferring the completion of the planting of perennials until early in the autumn, you might in the spring use a few annuals for filling spaces. Among the annuals that occur to us as useful for a rockery are Alyssum minimum, dwarf in growth, and bearing a profusion of sweet-scented white flowers; Calindrinia grandiflora, a rather free-growing plant that should be planted on a rather broad ledge where it will be fully exposed to the sun, the flowers are rose-coloured; Dimorphotheca aurantiaca, a free-branching plant, attaining a height of about twelve inches, and bearing freely and continuously throughout the summer elegant flowers of a brilliant orange hue, should have a sunny position; Inopsidium acaule, a compact growing plant, bearing purplish flowers; and Phacelia campanularia, a handsome species of rather dwarf growth, and producing a profusion of brilliant blue flowers.

CALADIUM CORMS.—J. S., Yorkshire: As we have stated in our answers to correspondents on several occasions, the best way of wintering these corms is to leave them undisturbed in the pots in which they were grown the previous season, and place the pots in the plant stove or other structure in which a temperature of about 65 degrees is maintained. The proper time for shaking them out of the old soil will depend upon the period at which you wish to start them into growth, but they should not be disturbed for some weeks hence.

MUSSEL SCALE. — Young Gardener, Essex: The pear trees from which you send us shoots are badly infested with mussel scale (Aspidestus conchiformis), and we would strongly advise you to take steps to eradicate the pest. This scale is not only injurious to the trees, but the insects spread over the fruits in the course of the summer, and give them a more or less objectionable appearance. Under the old methods of procedure, it has not been a very easy matter to eradicate the pest, especially in the case of old trees, but with the aid of the caustic winter wash, prepared in accordance with the formula recommended by Mr. Spencer Pickering, there is no great difficulty in clearing the trees of it. To make ten gallons of wash, take iron sulphate ½lb., libe ¼lb., caustic soda 2lb., paraffin 5 pints, and water to make ten gallons. To prepare the wash, dissolve the iron sulphate in about nine gallons of water, slake the lime with a small quantity of water, and sufficient to convert it into a milk of lime, strain this through a coarse sacking, and add to the iron sulphate solution. Then churn the paraffin into the mixture, and add the caustic soda, and on this being dissolved, the wash will be

SEED POTATOES A SPECIALITY.

Write at once to

FIDLER & SONS, READING.

Established 1850.

ready for use. Spray the trees at the end of this month, or early in February, and be careful to have the work thoroughly done. It will be advisable to wear a stout pair of leather gloves when spraying the trees to prevent injury to the hands.

SWEET PEAS IN FRAMES.—Amateur, Sussex: During such mild weather as that we are now experiencing it will be advisable to withdraw the lights from the frames during the daytime to fully expose the sweet peas to atmospheric influences to ensure a stout, short-jointed growth. When the lights are withdrawn take such measures as will prevent sparrows doing any damage to them.

PLANTING ROSES.—T. W., Dorset: The best month in which to plant roses is, as a rule, November, but when the planting is not done in that month there is no occasion to wait until the early days of spring when the weather is open, as is now the case. We suggest that instead of waiting until the middle of February, in accordance with the advice that has been given you, that you purchase and plant the roses at once. Should there be a change in the weather, and the soil be frozen when you receive the roses, place them in a cool shed, and allow them to remain in their packages for a few days. If they have to remain in the package for more than three or four days, remove the packing materials from about the branches and dip the lower part of the bundle into a tub of water for a short time to moisten the roots.

REPLANTING COREOPSIS GRANDIFLORA.—N. E. A., Limpsfield: You will probably lose a very large percentage of the plants if you move them to their flowering quarters now. If they are over-thick in the nursery bed, and liable to suffer from damping, lift half the stock—the alternate plants—and pot them up, placing them in a cold frame, and affording them abundance of air on all favourable occasions. Under such conditions they will make excellent stuff for planting out next spring, while those left in the bed, if filled round with light soil, should also better stand the winter. If you have abundance of cold frames you might pot up the lot, always remembering that a close atmosphere will defeat the end in view, and that the lights should be used chiefly for the purpose of shielding the plants from rain and snow, and severe frost, rather than for the encouragement of growth.

LAVENDER SWEET PEAS.—H. M. S., Gosport: You can make no mistake in growing Asta Ohn and Masterpiece, as both are excellent lavender coloured varieties, and the first-named is now practically fixed, whereas it was badly mixed when first sent out. Frank Dolby, Florence Nightingale, and Lavender George Herbert are other good lavender varieties, and the last-named, when at its best, is very difficult to beat.

CRIMSON RAMBLER ROSE.—R. F., Bude: This fine rose is not usually a success against a south wall, because during bright, hot weather, it suffers terribly from thrips and mildew in such a situation. Perhaps in your favoured climate, with a moist atmosphere, it would not be so subject to these attacks; nevertheless, we should advise you to grow the variety in a more open position. Dorothy Perkins and Lady Gay are both capital roses for weeping standards.

EDELWEISS.—M. S., Torquay: There is no occasion to visit Switzerland and make dangerous mountain ascents to obtain flowers of this distinct and interesting plant. It can be most successfully grown in this country, and many of our friends who give attention to alpines cultivate it, either on the rockery or in borders. The best results are obtained by growing it on a ledge of rockery where the roots will have the run of gritty soil, from which surplus water can readily escape. The Edelweiss can readily be raised from seed sown under glass early in the spring, and the seed is not expensive.

SHODDY.—S., Dewsbury: Shoddy manure, of which you have heard much during the short period you have been in the North, is the refuse of woollen rags that go first to the manufacturer to be torn up and again made into cloth. We have used shoddy with good effect in the cultivation of various kitchen garden crops, but we do not consider it equal to stable manure because it is somewhat slow acting. Shoddy manure varies considerably in the percentage of ammonia, ranging from 17 per cent. in the higher grade to about 3 per cent. in the lowest grade.

## CATALOGUES RECEIVED.

SUTTON AND SONS, READING.—As usual, the first of the new seed catalogues to arrive was the handsome one from Reading. It is an imposing book, volume almost, or over two hundred pages and well nigh a picture on every page. Needless to say, the get-up of the catalogue is first rate, as are the selections of seeds offered within it.

E. WEBB AND SONS, WORDSLEY, STOURBRIDGE, issue a very finely illustrated and capitally arranged catalogue of seeds, the illustrations representing the firm's specialities in flowers, vegetables and fruits, and, in many cases, the growing crops of these special selections.

JAMES VEITCH AND SONS, LIM., CHELSEA.—This firm maintains its reputation for a comprehensive and freely-illustrated catalogue, as well as for the merit of its specialities and the excellence of its seeds. With the seed catalogue come lists of chrysanthemums and specialities in herbaceous plants.

## FORTHCOMING ENGAGEMENTS.

MONDAY, JANUARY 8.—Royal Horticultural Society. Examination of Employees in Public Parks and Gardens, 10 a.m.

TUESDAY, JANUARY 9.—Royal Horticultural Society. Meeting of Floral Fruit and Orchid Committees, noon. Exhibition, 1—5 p.m. Scientific Committee, 4 p.m.

WEDNESDAY, JANUARY 10.—Croydon Chrysanthemum Society.—Annual Meeting.

THURSDAY, JANUARY 11.—Britsh Gardeners' Association (London Branch), Address by Mr. E. C. Cooper on "The Cultivation of Chrysanthemums."

## Situations Wanted.

GARDENER (Head Working), thoroughly experienced in all branches; excellent references; married; disengaged through establishment being given up. G. HALL Hermitage Cottage, Minchinhampton, Glos.

GARDENER (Head Working). — Mr. H. HEMSLEY, Rock Expert, Crawley, Sussex, would be pleased to highly recommend a thorough competent man in all branches of the profession; highest references; age 36; married. Address as above.

GARDENER (Head).—Lord Ashburton highly recommends his late Gardener; life experience in fruit, flower, vegetable culture, and landscape work; good manager; age 39; married, one child. GARRATT, 14, Kitchener Road, East Finchley, London, N.

GARDENER (Head Working) (Scotch) requires SITUATION where 2 or 3 are kept; 20 years' experience in all branches of gardening; 5 years present situation; married; age 36; 2 children; excellent testimonials. H. McCARTNEY, 14, Icklingham, nr. Mildenhall, Suffolk.

GARDENER (Head Working, where one or two kept); 10 years in present situation; 5 years as second; age 31; married when suited. A. GIBBS, The Gardens, Farrants, Bickley, Kent.

GARDENER (Head) seeks SITUATION where three or more are kept; practical experience in all branches; excellent references; age 31. Address, S. DOUGHTY, Overstone Park Gardens, Northants.

GARDENER (Head Working).—Mr. COLLEDGE, Gardener to the Earl of Darnley, highly recommends F. BISHOP as above; 4½ years as Foreman here. Cobham Hall Gardens, Gravesend, Kent.

GARDENER (Head Working), where several kept; three years present situation; leaving through estate being sold. CHEAL, Bridley Manor, Worplesdon, Surrey.

MR. H. BLAKE, Head Gardener to the Earl of Onslow, Clandon Park Gardens, Guildford, will be pleased to recommend strong, active YOUNG MAN; Inside and Out; age 19; can take duty.

GARDENER (Head Working).—H. ESSAM can confidently recommend his Foreman to Lady or Gentleman requiring the services of a thoroughly practical and reliable Head Gardener; age 31; married when suited; excellent references. Closes Hall, Gisburn, Clitheroe, Lancs. No circulars.

GARDENER (Single-handed, or where help is given; life experience, Inside and Out; good references, and can be well recommended; age 31; married, no family. W. WEST, The Lodge, Pyrford Court, Woking.

GARDENER (Single-handed, or where help is given); 12 years' practical experience; 4 years in last situation; good references; single; age 36; abstainer. J. CHAPMAN, Ferry Hill, Chatteris, Cambs.

GARDENER (Single-handed or otherwise); 14 years' experience Inside and Out; good reference; age 32; married, two children; Midlands preferred. J. WORLOCK, Newtown, Buckland St. Mary, Chard, Somerset.

GARDENER (Single-handed or good Second); 4 years' good character; age 23; single; abstainer. Apply A. F. ROOKE, Houndean, Lewes, Sussex.

GARDENER (Single-handed); experienced; good reference; age 33; married, 1 child; disengaged. ARCHER, c.o. Gardener, Kingsbury House Gardens, Kingsbury, N.W.

GARDENER (Single-handed or with help); married, no family; 7 years present place; 10 years previous; left through death. C. LAWRENCE, The Highlands, Gipsy Hill, Upper Norwood, S.E.

GARDENER seeks SITUATION as Single-handed or good Second; 4½ and 1½ years' experience, Inside and Out; well recommended; age 23; married when suited. C. B., 9, Pope Road, Bromley, Kent.

GARDENER seeks SITUATION as LEADING MAN in Kitchen Garden, and would assist in Pleasure Grounds if required; age 32; married, one child; good references. KENCH, Brook House, Bollington, near Macclesfield.

SITUATION required as FOREMAN or HEAD: 20 years' practical experience in all branches; nine years present place; good testimonials; age 33. W. HURST, Hale Cliffe, Hale, Liverpool.

GARDENER.—Young Man as IMPROVER (inside, or Inside and Out); highest references; 2½ years last place; Bothy preferred. A. STEVENS, 21, Arnold Road, Woking.

GARDENER (Single-handed, or where help is given); life experience in all branches; highest references; thoroughly understands Oil Engine; age 40; strong and active; married; 3 in family, youngest 12½. E. STEVENS, 13, Connaught Road, Newbury, Berks.

GROWER; age 25; life experience in Chrysanthemums, Carnations, Bulbs, Ferns, Marguerites, Tomatoes, and Bedding Stuff; married when suited. E. DICKINSON, Shripney, Bognor, Sussex.

UNDER GARDENER, age 19, three years in present place, with excellent character, seeks SITUATION where experience can be gained in greenhouse and garden; total abstainer. Apply P. SAULT, Station Road, Kegworth, Derby.

YOUNG MAN (22) seeks SITUATION as GARDENER (Under); Inside and Out; 7 years' experience; 4 years last place; Bothy preferred; good references; abstainer; disengaged. WILLIAM ALLENBY, Whiston Cross, Albrighton, Wolverhampton.

YOUNG MAN seeks SITUATION in Gardens; willing to be useful; abstainer; good references; Bothy preferred. H. ABRAHAM, Bridge End, Brampton, Huntingdon.

YOUTH, aged 17, seeks SITUATION in Garden; strong, willing; 3½ years in last place; highly recommended. E. ROBERTS, Gate House, Nuttall, Nottingham.

LAD, age 17, seeks SITUATION in Garden; some experience; wish to improve; good character; Bothy preferred. S. RAYNER, Chart Road, Sutton Valence, Maidstone.

## Situations Vacant.

CANADA.—Wanted, strong, active GARDENERS for large Nurseries; steady work; good wages; sail March. UNION TRANSIT CO., 381, Argyle Street, Glasgow.

## SITUATION COUPON

**ROBERT BOLTON**, The Sweet Pea Specialist,
Warton, Carnforth,
*Catalogues post free.*

## ORCHIDS.

**EDWARD V. LOW**, Vale Bridge, Haywards Heath.
*"White" Cattleyas and Choice Cypripediums are leading features. Inspection solicited.*

**HASSALL & CO.**, Southgate, London. N.
(Tel.: 59, Palmers Green.)
*Catalogues post free on Application.*

## PHLOXES.

**GUNN & SONS**, Specialists,
Olton, Warwickshire.
*New and Standard varieties. Lists Free.*

## ROSES.

**R. H. BATH, Ltd.**,
The Floral Farms, Wisbech.
*The best New and Standard varieties of Roses.*

**FRANK CANT & CO.**,
Braiswick Rose Garden, Colchester.
*The World-famed Champion Rose Growers.*

**JOHN MATTOCK**, Headington, Oxford.
*Winner Gold Medal President's Cup. 11 1st Prizes. 3 2nds, at N.R.S. Shows, 1910. Ctlg. Free.*

**D. PRIOR & SON**, The Nurseries, Colchester.
*World-renowned Champion Rose Growers.*
*1911 Awards: 81 Prizes. Illustrated Catalogue free.*

**Terms for the insertion of these Business Card Advertisements may be obtained on application to W. H. & L. COLLINGRIDGE, 148 & 149, Aldersgate St., London, E.C.**

## SELECTED SEED POTATOES.

**All varieties, grown on finest soil in Scotland and Lincolnshire. Any weight supplied at low prices. Prizes given for best results. Before ordering elsewhere write for catalogue. Best Eating Potatoes also supplied in small or large quantities.**

**A. J. SOLE, Seed Potato Grower,**
**PETERBOROUGH.**

## ORCHIDS EIGHT MILES BY ROAD FROM THE CITY.

A visit of Inspection invited of our well grown stock of Thousands of **CATTLEYAS, DENDROBIUMS, ODONTOGLOSSUMS**, and an endless variety of Choice **ORCHIDS.**

Nurseries easily reached by Rail to BUSH HILL PARK Station, or by Road.

Telephone:—Enfield, No. 1 and 2.

**STUART LOW & CO.,** Royal Nurseries, BUSH HILL PARK, MIDDX.

## *PERPETUAL FLOWERING CARNATIONS.*

My Novelties for 1912 are Lady Northcliffe, Triumph, Rosa, Elektra, Salome, and Sunstar. Also 80 other varieties grown. My stock is the largest in Europe. Inspection invited.

**CATALOGUE FREE.**

**C. ENGELMANN, SAFFRON WALDEN.**

## ORCHIDS, ORCHIDS.

Clean, healthy, well-grown Plants at reasonable prices. Many large specimens and rare varieties.

**STOVE AND GREENHOUSE PLANTS OF ALL KINDS**

Please Write for List.

**JAMES CYPHER & SONS,**
**Exotic Nursery, Cheltenham.**

**SCOTCH GROWN HERBACEOUS AND ALPINE PLANTS.** Our New Catalogue, describing 1,500 grand varieties, including many New and Rare, at reasonable prices, sent post free on application.—THYNE and SON, 88 Union Street, Dundee.

## NATIVE GUANO

**BEST and CHEAPEST MANURE for VEGETABLES, FRUITS and FLOWERS.**

Price **£3 10s.** per ton in bags at works. Lots under 10 cwt. **4s.** per cwt. at works; or **5s.** per cwt., carriage paid to any station in England.

Extracts from 35th annual collection of reports:—

NATIVE GUANO for POTATOES, VEGETABLES, etc.

A. J. Beard, Erdington: "Potatoes, splendid, free from disease. Best I ever had."—H. Chester, Nantwich: "Best onion manure I ever used. Grand for onion fly."

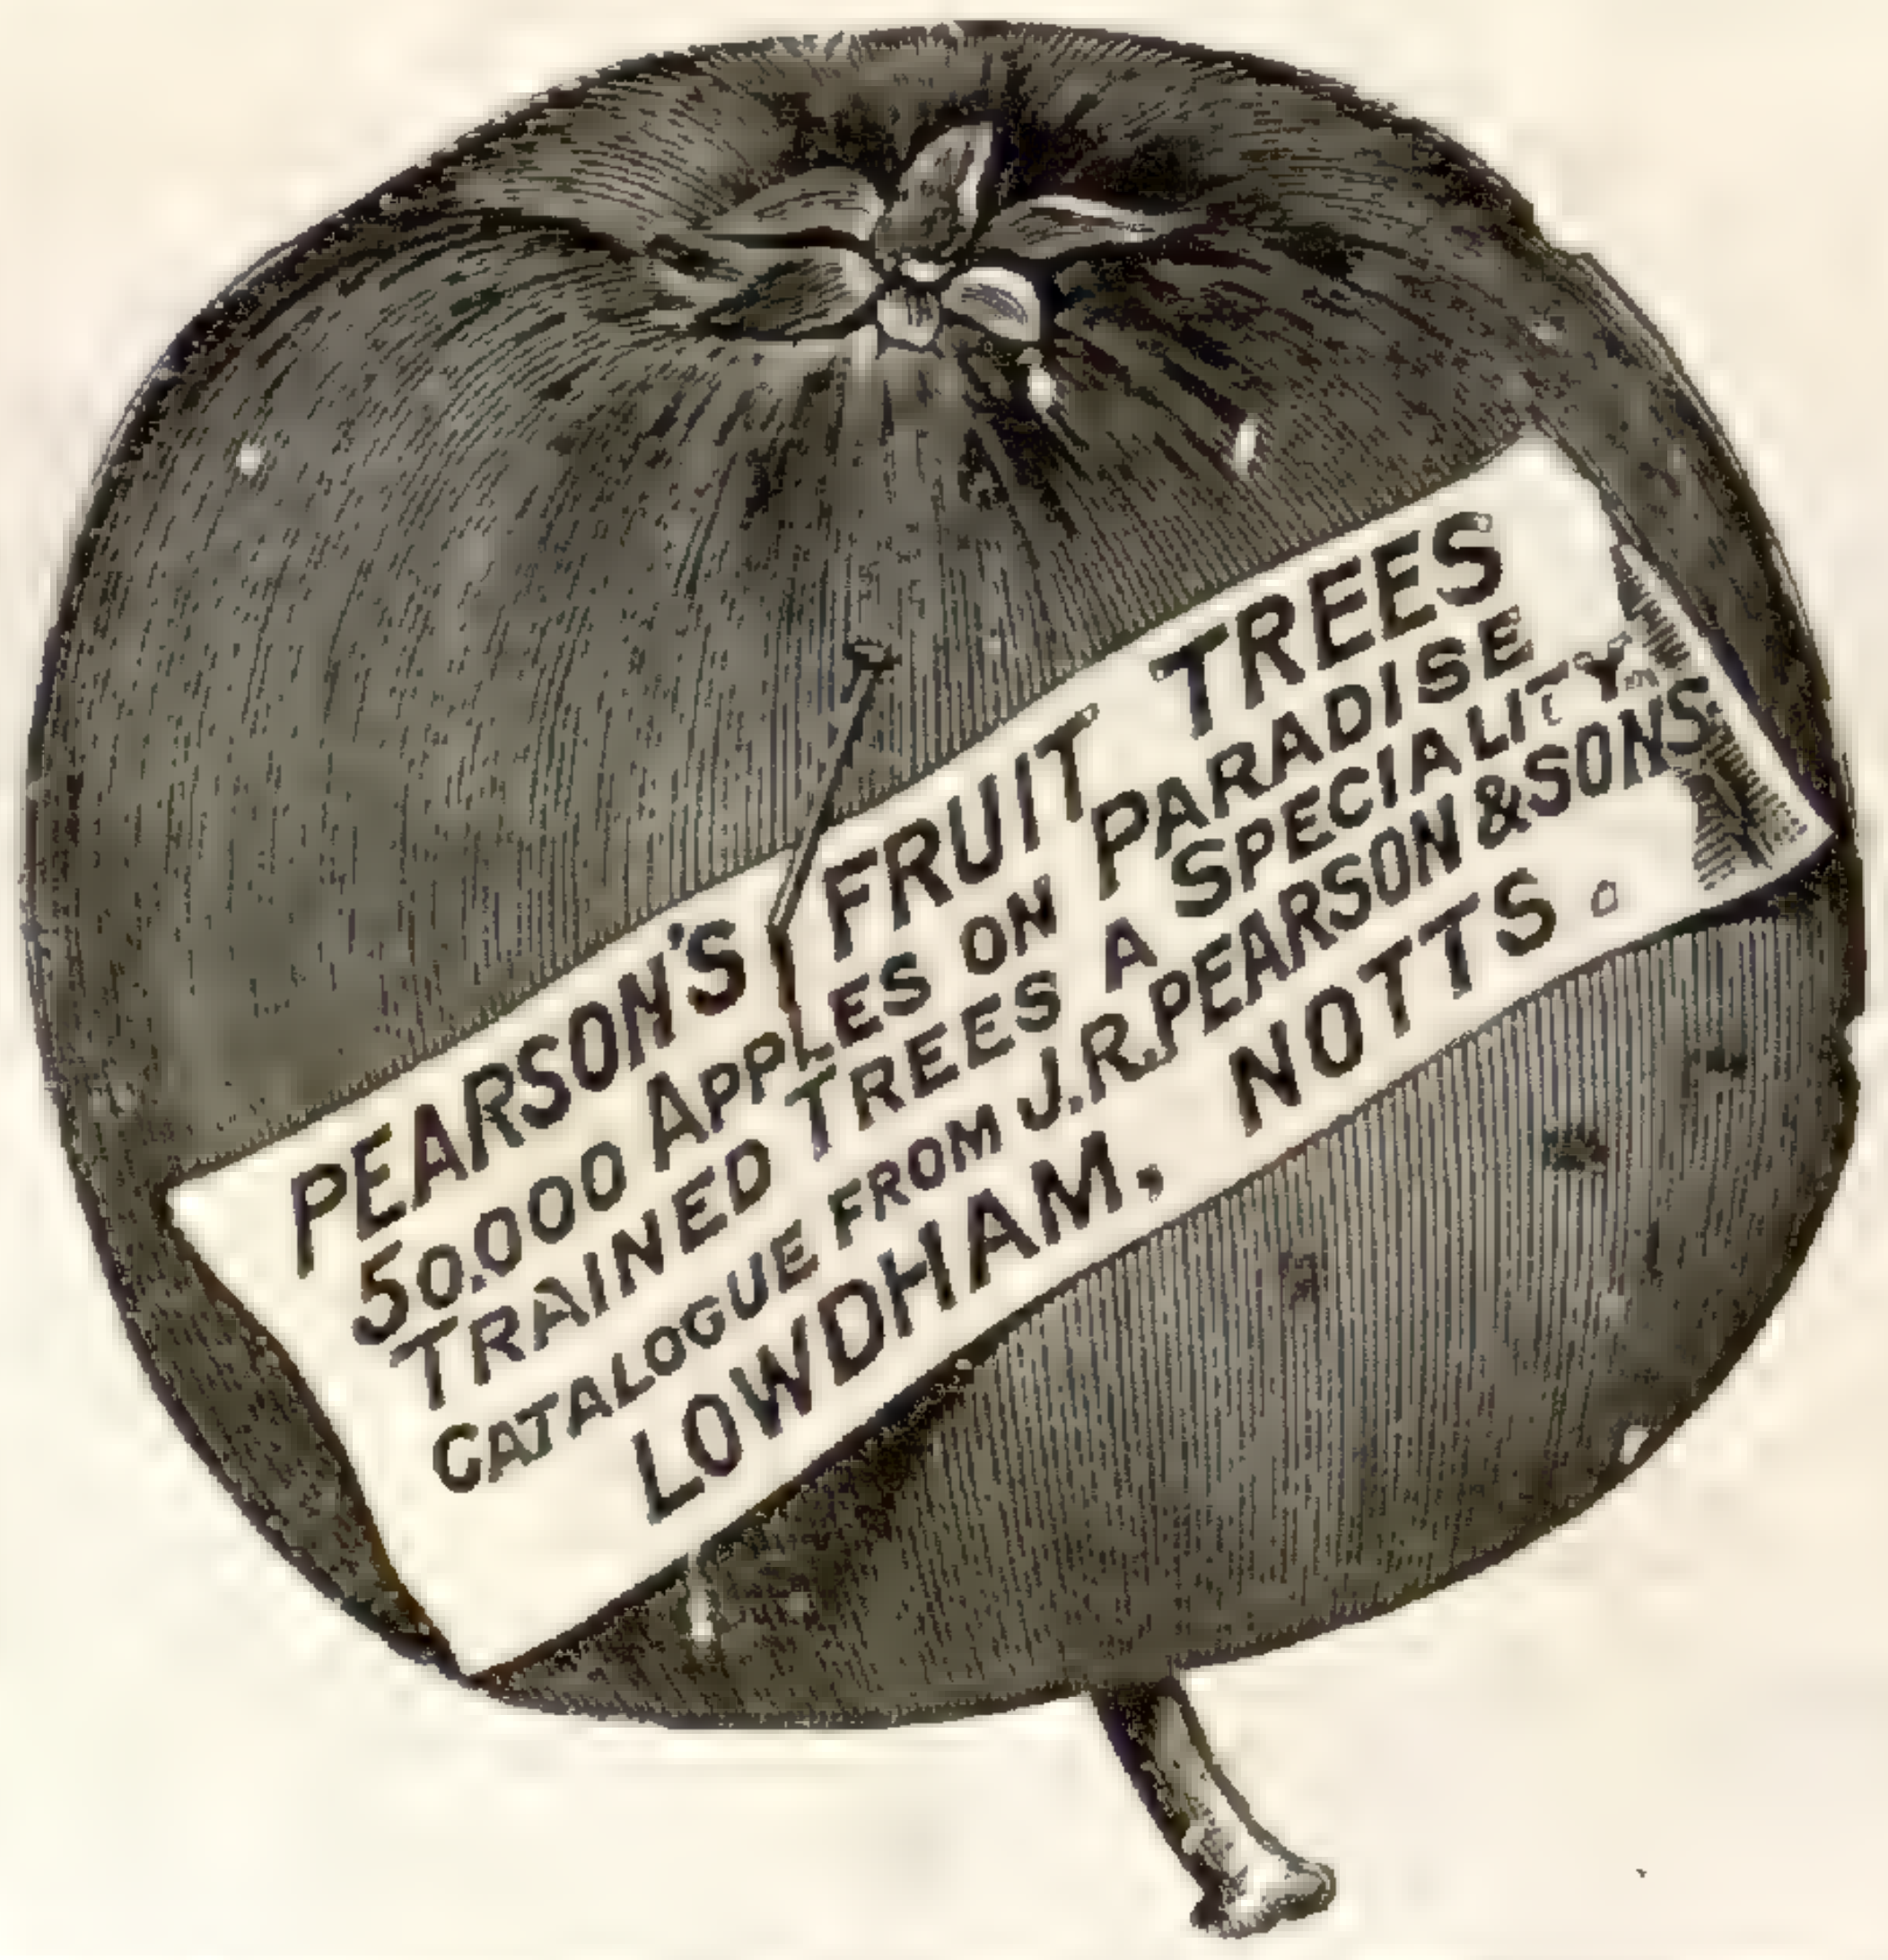
NATIVE GUANO for FRUIT, ROSES, TOMATOES, etc.

J. Cant, Ipswich: "Tomatoes excellent. Roses grand. Cheapest manure in market."—W. Frampton, Titchfield: "Strawberries, splendid crop."

Orders to the **NATIVE GUANO CO., LIMITED,** 29. New Bridge Street, London, E.C., where 35th year's testimonials, etc., may be obtained. Agents Wanted.

Select & most reliable
Vegetable & Flower Seeds
Seed Potatoes, Gardening Tools &c
Carriage paid. Catalogue post free.
—all prices strictly moderate.

**Dicksons**
**Chester.**



PEARSON'S FRUIT TREES
50,000 APPLES ON PARADISE
TRAINED TREES A SPECIALITY.
CATALOGUE FROM J. R. PEARSON & SONS.
LOWDHAM, NOTTS.

## NEW CHRYSANTHEMUMS.

Ready shortly our new list with full descriptions of best varieties from the principal Raisers. Contains 24 illustrations. Post free, 2d.

Our Chrysanthemum Catalogue, containing much useful information, including Stopping and Timing, all the best Japs. and Incurved varieties. Post free, 2d.

**H. J. JONES' NURSERIES, Ltd.,**
**RYECROFT, LEWISHAM.**

## EPPS'S SELECTED PEAT

For Choice Plants, Ferns, Rhododendrons, &c., &c.

**SPECIAL ORCHID PEAT.**

Loam, Leaf-mould, Sand, C.N. Fibre, Sphagnum. Charcoal, and all kinds of Garden Sundries.

Prices on application to

**EPPS & CO., Ringwood, HANTS.**

**Orchids! Orchids!! Orchids!!**

The undersigned begs to announce to the Public that he is in a position to supply, wholesale or retail, **Burma Orchids** of 50 varieties at a moderate price. Further particulars on application.—**J. C. PRAZER, Orchid Collector, KALEWA, BURMA.**

N.B.—Please register orders early for Dendrobium Nobile, thick-bulbed variety; Dendrobium Jamesianum, Dendrobium Bensoni, Renanthera imschootiana, Vanda Cœrulea Lushai Hill variety, dark blue type; Cypripedium spicerianums of five and six growths, as these are scarce and expensive collecting.

PITT'S IMPROVED LYON LEEK.—Two firsts, two seconds, two thirds, Glasgow National Exhibition. Testimonials on application. 1s. 6d., 2s. 6d. per packet. PITT, Eccles, Kelso.

SEED POTATOES.—Send me your name and address, and I will send you my full list of good sound Lincolnshire and Cambridgeshire Seed, also particulars of my cash prizes, open to all purchasers. HORACE TAYLOR (9), High Street, Chatteris, Cambs.

IVIES! IVIES!—Extra strong plants, with numerous long shoots, suitable for covering fences, unsightly buildings, and ground under trees where grass fails. 1s. each; 10s. per dozen; package free. J. J. MARRIOTT, Sutton Coldfield.

VOL. LV.—No. 3,037. SATURDAY, JANUARY 13, 1912.

# THE GARDENERS' MAGAZINE.

## NOTE OF THE WEEK.

◆

### Cross Fertilisation.

Nature, in the process of evolution and the development of species, has simultaneously devised many methods of maintaining the integrity of the latter when established by means of differences of structure of the reproductive apparatus, attractive or repulsive capacities in the stigmatic surfaces, different times of maturity, and so on, so that normally natural hybrids occur but rarely, and when they do occur are usually non-reproductive, the unnatural alliance going no further than the individual. Man, however, has by artificial cross-fertilisation, due to the removal of some of these obstacles, found it possible to combine not merely species, but even widely distinct genera, especially in the case of orchids, and since there is no such antagonism between varieties of a single species as exists between species and genera, despite the fact that "sports" may depart so widely from the normal specific type, as to differ therefrom more even than distinct species may do, cross fertilsation between such has contributed enormously to the floral wealth we possess. In other directions, too, fruits, vegetables, and foliage plants, and last, but by no means least, our cereal crops have benefited greatly by judicious alliances and combinations of qualities and constitutional differences, which has increased their yield, improved their flavour, or rendered greater their commercial and industrial value as the case might be. Non-sexual "sports," of course, have played probably an even more important rôle in what may be termed human selection as distinct from natural selection, since in the vast majority of cases, these form the starting point for the selective cultivator. Judicious crosses, however, between normal species, as in the wonderful case of the tuberous and other begonias, have had marvellous results, the original combination of two species resulting in a sportive capacity in the offspring of which the cultivator was not slow to reap the benefit, cross fertilisation between the offspring fortunately not being handicapped by infertility in this case, though the original parents were very distinct. Apart from the benefits to which we have adverted, it is a recognised fact that while, as we have said, Nature has barred to a very great extent cross fertilisation between species in their wild state, she has contrived innumerable methods of facilitating or even securing it between the individuals of a species as a means of strengthening the constitutions of the resulting offspring which self-fertilisation is apt in the long run to weaken. In-breeding tends to degeneration in all forms of organic life, animal or vegetable. New blood from time to time appears to be essential, and it is in this connection that the insect-world has been of incalculable service in vegetative evolution, not only by conveying the fertilising pollen from one individual to another, generally of the same species, but by some subtle powers of discrimination, choosing the more conspicuous or more brightly coloured and by such favouring of their reproduction, gradually improving their beauty until even before man came in as a more potent selective factor, the world was full of floral gems for him to begin his work upon. The proof that we owe so much to insect choice is seen in the fact that wherever Nature in her infinite versatility has evolved plants whose pollen is distributed by other means, by wind or water, the flowers are small and inconspicuous as seen in the great wind-fertilised family of the conifers, willows, etc., and in vallisneria as an aquatic. A further proof of the value of insect agency is undoubtedly seen in the fact that cryptogamic plants, bearing no obvious flowers at all, have, to all intents and purposes, stood still from the inconceivably remote period of the coal age, when they represented the great bulk of the world's vegetation. In time some of these contrived to vary in such a way that primitive flowers were evolved, the cycad was followed or accompanied by the conifer, and presently some inventive individuals developed flowers proper to suit dull environments, and we may then assume that the insect work began, and that more rapid strides were possible. Unfortunately, flowers are the most fugitive and transient parts of vegetation, and hence geologic records, which teach us all we know of these long past epochs, can tell us next to nothing about them, though rich in the remains of their flowerless predecessors, or even the solid residues of some primary flowering ones.

MR. J. COLLIER.

---

**Mr. J. Collier,** whose portrait we have the pleasure of giving herewith, has for some three or four years occupied the position of head gardener at Gatton Park, the fine Surrey seat of Sir Jeremiah Colman, Bart., and during that period has given ample evidence of his great abilites in the management of the garden. Although best known to the general body of horticulturists for the success achieved in connection with the magnificent collection of orchids that has made the Gatton Park gardens famous far beyond the boundaries of the United Kingdom, he is not less at home with the many ornamental plants and the useful crops that have a place in an establishment of the first class. Therefore, the visitor to Gatton Park finds well-furnished and highly-kept fruit and kitchen gardens, glass structures devoted to fruits and miscellaneous plants in a condition that indicates cultural skill of a high order, and pleasure grounds of wondrous beauty as well as orchid houses filled with the choicest forms of these beautiful plants. Sir Jeremiah Colman is too keenly interested in horticulture to devote his attention wholly to one aspect of it, and as a consequence Mr. Collier has had full opportunities for the display of his varied ability.

The orchids are, of course, the predominant feature at Gatton Park, and it is therefore of interest to recall the fact that the fame they have so long enjoyed has been fully maintained since they have been under Mr. Collier's charge. During this period two gold medals have been awarded by the Royal Horticultural Society for collections of dendrobiums from Gatton Park. Last year the society's gold medal was awarded at the Temple Show for a general collection, and in 1910 the Sherwood Cup was won at the Temple Show, and a gold medal at Holland Park by collections which were greatly admired by visitors, and in our reports were referred to in highly appreciative terms. Before assuming charge of the Gatton Park gardens Mr. Collier was head gardener at Camden Court, Coventry, and at Manningham Thorpe, Bradford, and in both establishments orchids were strong features.

**Another £1,000 for Sweet Peas.**—Those who are interested in the cult of the sweet pea, whether owners of ducal or cottage gardens, will this year have sufficient encouragement to sustain their interest in their favourite flower. We have received information from various parts of the country to the effect that sweet peas will be more liberally encouraged by the various societies than has yet been the case, and now comes the announcement that Mr. Henry Eckford, of Wem, whose great work in connection with sweet peas is known to all, offers £1,000 in cash prizes to be competed for in the month of July. Mr. Eckford has very wisely so arranged this large amount that, while the prizes will be more than sufficient to secure an enormous competition, the various sections of cultivators will compete on equal terms. There are three classes, in each of which the first prize is £200, with fifty prizes of £1 each for the next best fifty bunches. In each of the other two classes the first prize is £100, and there are twenty-five prizes of £1 each for the next best twenty-five bunches. The first three classes are as follows: A, open to a lady or gentleman employing regularly one or more gardeners; B, open to professional gardeners; C, open to amateurs, i.e., a lady or gentleman not employing a gardener or only occasional help in the garden. In each of these classes the stipulation is "For the best bunch of sweet peas containing twelve stems of blooms, each stem a distinct variety." Class D is open to cottagers or single-handed jobbing gardeners, and all others whose rent does not exceed £16 per annum, and Class E is open to a girl or boy under 16 years of age, irrespective of status, who must grow the flowers without assistance. The show will be held at Wem, unless further notice is given, and the judging will take place on Thursday, July 18, and each competitor must send the bunch by parcels post to reach Wem on Wednesday, July 17. The conditions governing the competition are fully set forth in Mr. Eckford's catalogue, which has just been published.

**Natural Science at Oxford.**—It is interesting to observe that the natural sciences will receive a full share of attention at Oxford during the term which commences on the 22nd inst. Mr. Vaughan will lecture on Palæontology and evolution. Professor Vines, F.R.S., will give courses on botany for students of forestry and agriculture respectively, and a preliminary course for elementary students. Practical instruction at the Botanic Garden will be given by Dr. Church and Mr. Hiley. Professor Somerville, F.R.S., will lecture on the principles of agriculture and on forest botany, Mr. Curtler on the history and economics of agriculture, and Mr. Morison on agricultural chemistry.

**Royal International Horticultural Exhibition.**—We are asked to remind intending exhibitors that applications for space for non-competitive exhibits must reach the secretary, T. Geoffrey W. Henslow, Esq., 7, Victoria Street, Westminster, S.W., on or before January 15. Also that entries for the competitive classes must reach Mr. Henslow not later than February 1. A conference of horticulturists will be held, by the permission of the Mayor, in the Council Chamber, Town Hall, Preston, at 6 o'clock p.m. on Thursday, the 18th inst. His Worship the Mayor will preside, and E. White, Esq., and other gentlemen will address the meeting on the Royal International Horticultural Exhibition.

**Weather in December,** 1911.—With regard to the climatic conditions that obtained during the month, December proved in every way worthy of a record year. It was one of the mildest and wettest Decembers that has been experienced within the past quarter of a century, and the duration of sunshine recorded, if not quite equal to that of 1893 and 1909, was more than double the average for the past quarter of a century. In London the highest temperature was 55 degrees, the mean of the maximum readings 50.5 degrees, and the mean of the night minimum readings 40.8 degrees. There was no day on which the maximum temperature was less than 40 degrees; the lowest temperature was 30 degrees, and two frosts were recorded in the screen. The duration of sunshine at Westminster amounted to 28.6 hours or more than double the average. In the corresponding month for 1893 this amount was exceeded by 1.2 hours, and in 1909 by .80 hours. The rainfall for the month was at Westminster 3.9in., nearly twice the average, and .75in. greater than in any year since 1870. In the Royal Botanic Society's Gardens, Regent's Park, there were in December 21 rainy days, and 4.18in. of rain were registered.

**Education in Horticulture.**—The papers read by Mr. F. G. Drew and Mr. W. B. Little before the North of England Horticultural Society on "The Ideal Education of a Gardener" and "A National Diploma in Horticulture," respectively, have been published in pamphlet form (price 6d.) by the Horticultural Education Association, and may be obtained from the hon. secretary, The Grey House, Lyminge, Folkestone.

**The Importation of Bananas** of West Indian growth into the United Kingdom has assumed such large proportions that the North Western Railway Company has found it necessary to make special provisions at their Stalbridge Dock at Gorston for dealing with the cargoes of these fruits that are landed by the weekly service of steamers. The company has built and fitted up a banana warehouse, 400ft. long by 90ft. wide, and to facilitate the handling of the bananas some ingeniously constructed elevators have been provided for the landing of the fruit. By means of endless chains fitted with canvas pockets and worked by machinery, the bunches are conveyed from the hold of the vessel to the deck, thence to the quay and along the quay to the doors of the railway vans. For the conveyance of the bananas from the dock to various parts of England, the railway company has had built 500 insulated vans fitted with steam-heating appliances and vacuum brake pipes. What has been done by the London and North Western Railway is of interest as evidence that the railway companies are beginning to appreciate the importance of the fruit trade. With this evidence before us there is some justification for the hope that in the near future provisions will be made for the carriage on the railways of this country of home-grown fruit and vegetables in such manner as to ensure their reaching the consumer in the best possible condition.

**Memorial to Stephen Hales.**—Within the past few days a tablet, erected in the old parish church of St. Mary's Church, Teddington, has been dedicated to the memory of the Rev. Stephen Hales, a former vicar of the parish, who lived in the 18th century, and specially distinguished himself by his investigations in animal and plant physiology. For some years past a number of scientists, who appreciate the importance of Hales' investigations, have been endeavouring to discover his burial place in order to preserve his memory, but not until a short time since were they successful. The stone recording his death was found in the floor of the porch of the church, with nearly the whole of the lettering obliterated. The tablet has been placed on the wall of the west porch beneath the tower of the old church, and bears the following inscription "Beneath is the grave of Stephen Hales. The epitaph, now partly obliterated, but recovered from a record of 1795, is here inscribed by the piety of certain botanists, A.D. 1911. 'Here is interred the body of Stephen Hales, D.D., Clerk of the Closet to the Princess of Wales, who was minister of this parish 51 years. He died 14th January, 1761, in the 84th year of his age.'" Stephen Hales has been called the "father of physiology," and he well deserves this title in regard to both animals and plants. Mr. Francis Darwin describes his experiments in the blood pressure of animals as second only to Harvey's work on the circulation, and expresses his opinion that in the domain of plant physiology, he is equally great. That his investigations in connection with plant life were of far-reaching importance there can be no question, and there is full justification for considering him the founder of a knowledge of plant physiology and of a rational science of biology.

**The N.S.P.S. Floral Committee.**—The Floral Committee of the National Sweet Pea Society for 1912 is as follows: Mr. Robt. Bolton, Warton Carnforth; Commander Humphery, R.N., Caversham; Mr. George Herbert, Twyford; Mr. Andrew Ireland, Marks Tey; Mr. Thomas Jones, Ruabon; Mr. A. Malcolm, Duns; Mr. A. G. Stark, Great Ryburgh; and Mr. W. J. Unwin, Histon, Cambs.

**Sootfall of London.**—The results of the investigation which has been made by the "Lancet" as to the amount, quality, and effects of the soot falling in London, have been published, and from these it is calculated that the deposit falling annually upon the Administrative County of London, including the City, amounts, on the basis supplied by the soot gauge at the City station, to the enormous quantity of 75,050 tons. The investigations were made at four stations; two were situated in the S.W. district, near Westminster, one in the City area, and one at Sutton, Surrey. The collections were made each month through the year June-May, 1910-1911, and a soot gauge was installed at each station, which caught both soot and rain. Taking the City station as the basis of calculation as to the amount of soot falling annually upon the Administrative County of London, including the City, the deposit amounted to 75,050 tons. In this deposit there were present over 6,000 tons of ammonia, about 8,000 tons of sulphates, 3,000 tons of chlorine in chlorides. Taking the S.W. metropolitan station as a basis, the total deposit per year over the same area would average 53,820 tons, in which were present 4,000 tons of ammonia, about 5,000 tons of sulphates, and 4,000 tons of chlorine in chlorides. As pointed out by our contemporary, the soot gauge discloses in a striking manner the defects of the coal fire, but, having regard to the large deposit registered at the City station, it is reasonable to assume that the factory chimneys contribute more freely to the impurities of the atmosphere, and especially to the acids present, than is generally supposed to be the case.

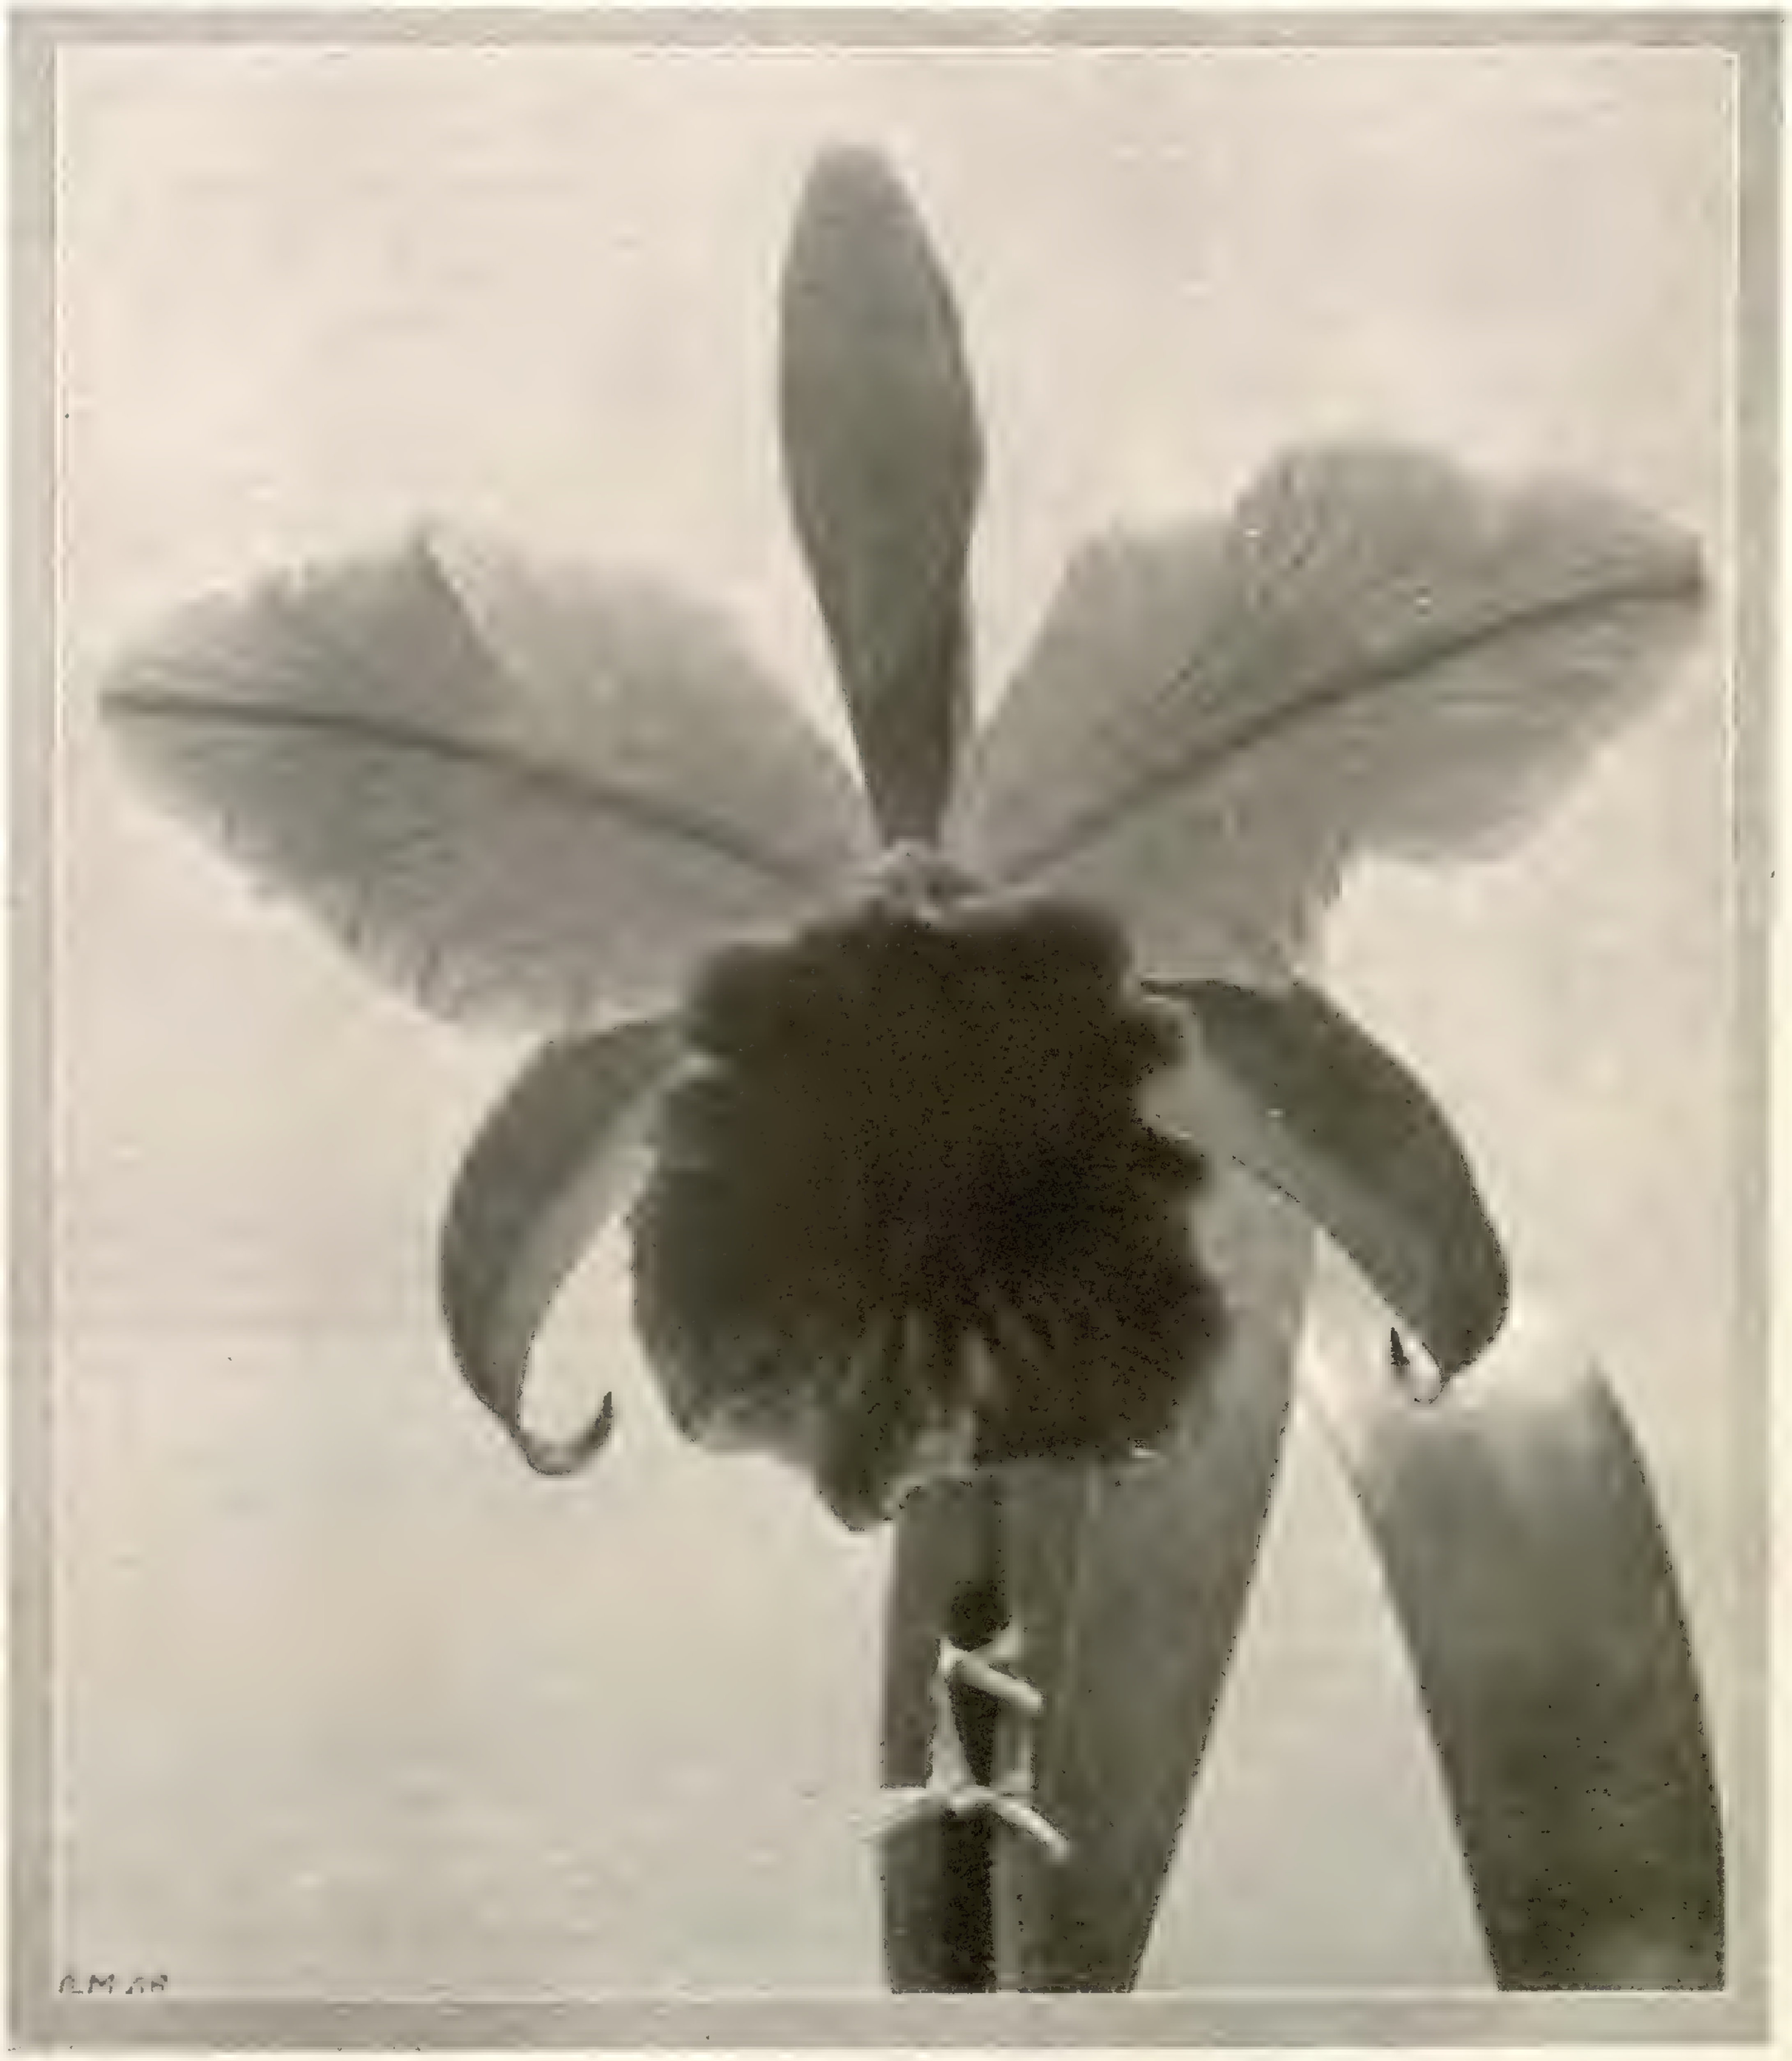
**The Greater Birmingham Show of** 1912.—The famous Handsworth Floral Fete will in future yield name and place to the new society created as a result of the great extension of Birmingham City. Mr. W. G. Carradine, the secretary of the Birmingham Horticultural Society, is making great efforts to secure the success of the first show under the new conditions. An attractive schedule is in course of preparation, and everything points to a great exhibition. The Lord Mayor of Birmingham (Alderman W. H. Bowater, Esq., J.P.), has accepted the Presidency for 1912.

**Barnsbury Square.**—The Islington Borough Council have, in terms of a lease held for many years past, maintained Barnsbury Square as a public garden. The lease has now terminated by effluxion of time, and the land has reverted to the owners of the houses abutting on the square. The Council being desirous of keeping the square as an open space, have decided to purchase under the Open Spaces Act, 1906, the land for £2,000, less one 29th part, and to dedicate the square to public use as an open space.

**The National Hardy Plant Society's** first exhibition will be held in the Royal Horticultural Hall, Vincent Square, Westminster, on Wednesday, June 19, 1912. A preliminary schedule of open and amateur's classes has been prepared, and may be had post free on application to Mr. A. J. Macself, show secretary and organiser, 52, Beechfield Road, Finsbury Park, London, N.

**Sweet Pea Trials in** 1912.—The National Sweet Pea Society will hold trials of sweet peas at the "Times Experimental Station," Sutton Green, Guildford (conducted by Mr. Harry Foster), and at Burbage Experimental Station, Leicestershire (conducted by Major C. C. Hurst, F.L.S.), in 1912. No Awards or Certificates will be granted to novelties unless they are sent for trial. For the novelty trials a charge of 5s. per variety will be made, and novelties will be accepted only from the raiser or introducer. Forty seeds of each novelty must reach the hon. secretary, Mr. C. H. Curtis, Adelaide Road, Brentford, Middlesex, not later than January 20, 1912. The seeds must be divided, and placed in plain packets, 20 seeds in each; and every pair of plain packets representing one variety must bear the same number or letter, for purposes of identification. With each set of seeds there must be a letter, bearing the sender's name at the top, the number or letter of each variety sent, and, opposite such number or letter, the name of the variety (if any), the colour section to which it belongs, and (if orange or salmon) whether it should be shaded. Sweet peas will also be tested for purity at a charge of 10s. per stock or variety sent; not fewer than two dozen seeds should be sent, and the sender may elect at which set of trials these be tested. In every case the amount due for trial charges must be sent with the seeds. The proceedings of the Floral Committee will be printed in the autumn of 1912, and a copy will be sent to every person or firm sending seeds to the trials.

**Horticulture at Oxford.**—We are very sorry to learn that the financial results of the Oxford Horticultural Society's work during the past year were not satisfactory. The chairman at the annual meeting stated that the gate money taken at the two shows was about £70 less than in 1910, and this decrease had necessitated the use of the whole of the reserve fund in meeting the liabilities. The total income was only £190, and it appears to us such change in policy should be made as would ensure the exhibitions proving more attractive to the residents than they were in the summer of 1911.



LÆLIO-CATTLEYA MRS. W. HOPKINS.

A handsome variety with medium-sized flowers, crimson-purple lip, and rich yellow sepals and petals, the latter mottled with purple. A.M., R.H.S., January 9. F. Wellesley, Esq., Westfield, Woking.

**San Jose Scale in the Transvaal.**—From the current issue of the "Agricultural Journal of the Union of South Africa," we learn that the much-dreaded San José scale (Aspidiotus perniciosus), has found its way into the Transvaal. The pest was discovered by Mr. J. W. Moore, of Potchefstroom, in working up a collection, and steps were at once taken to effect its extermination.

**Royal Society.**—M. Klement A. Timiriazeff, professor of botany in the University of Moscow, has been elected a foreign member of this society.

## EVERGREEN SHRUBBY CLIMBERS.

For covering walls, or where a screen is required all the year round, the deciduous climbers cannot compete with evergreens during the winter. Many of the latter also have most beautiful flowers. As pillar plants, and for furnishing pergolas to give variety, especially during the winter, evergreen subjects are most useful, particularly some of the ivies. Some object to these latter on account of their sombre appearance, but what could be more handsome than the entrance to a pergola draped with Hedera dentata, clothed with flower and fruit?

Some few subjects that I shall name require somewhat different treatment, but as a general rule, any deeply-dug, well-manured soil will grow the several subjects well. I need hardly say that extra care when planting, such as adding mould, old potting soil, or the spent refuse from a mushroom-bed, will give the plants a good start into growth. Abundance of moisture to the roots and overhead during dry weather is important to secure satisfactory growth. The more free growth is the more handsome will be the leafage and the finer the effect produced.

Berberidopsis corallina is an interesting and showy climber, not enough grown; true, it requires a little extra care to obtain success, and a wall 6ft. or more high. with an eastern aspect, suits it well; good drainage and a compost of peat, leaf-mould, and light loam (free from chalk) is what it delights in, with abundance of moisture during the summer. Free growth then is thus assured, with a full crop of handsome coral-coloured blossoms. Cotoneaster microphylla is usually seen on a rockery or as a shrubbery plant, but many sites are quite unsuitable for its proper display. Through the autumn, winter, and spring, thickly clothed with its crimson berries, it is most attractive when trained up a wall from 10ft. to 20ft. high. It is under such conditions that one can appreciate the great beauty of this much neglected shrub.

Escallonia macrantha and E. Lamgleyensis are two subjects that should be more often planted in the south of England than they are; the deep green leaves and pretty pink blossoms are handsome, and the plants form a thick, attractive covering for a wall or fence, and are quite amenable to close pruning to obtain a neat appearance. Euonymus radicans variegata is usually associated with the rockery or used as an edging to paths, rather than as a wall plant, yet no subject I know is better adapted for covering high or low walls under a verandah where light is partly obscured; 20ft. high is not an unusual height for it. E. japonica aurea also makes an excellent wall plant, growing 15ft. high, and when thickly clothed with its golden leaves it is very handsome on a south wall.

Cistus ladaniferus is seldom seen as a wall climber, but that is just the place for it, with a southern aspect. The full beauty of its large flowers is here shown as the wood becomes thoroughly matured, and consequently gives a heavy flower crop. Eugenia Ugni, known as the Chilian Myrtle, is a desirable plant to grow at the foot of a south wall, as its pure white blossoms are abundantly produced in summer. Fabiana imbricata may not be a climber, in the strict sense of the word, but it is an interesting subject for the base of a wall facing south, east, or west, where it flowers profusely, much more freely than when in the open shrubbery; indeed, it is difficult to grow in some open sites. A plant growing here at the foot of a south wall in quite a narrow border, gives such a crop of its pure white tubular heath-like blossoms annually as to hide its leaves, showing that maturity of growth has a large influence upon it. This plant belongs to the heath family, and will not grow in soil impregnated with lime; it enjoys peat. The rosemary is much better for walls than is generally supposed, and it grows quite compactly with judicious pruning, on any site, and has a pleasing appearance.

Where a thick, rapid covering is required on a north or west wall, Garrya elliptica is a fine subject, growing vigorously and giving a full crop of its catkin-like flowers during the dull months of the year. Cratægus pyracantha Lelandi is one of the most useful subjects we can employ; it will grow high or low, can be pruned in quite close or allowed to grow freely, and still give annual crops of its orange-red berries. Ceanothus azureus, C. Veitchianus, C. divaricatus, and C. Gloire de Versailles embrace the best of this family, and they have no superiors as wall plants, especially on a southern aspect. The first-named is of close growth; C. divaricatus grows vigorously, and soon reaches a height of 30ft.

Among ivies we have abundant material to choose from, and for quickly covering high walls or screens in any aspect Hedera Helix Rægneriana is the best, making growths 6ft. long when liberally supplied with manure and moisture. H. dentata, previously alluded to, is most handsome with its drooping heart-shaped leaves. H. maderensis is of medium growth as compared to the other two, yet it is one of the best. H. canariensis (Irish ivy) is the well-known variety most often employed. H. Helix atropurpurea, a form of the English ivy, is excellent for walls where a close growth is needed; for instance, around porches or windows, it has a particularly neat appearance, and as the autumn comes round it assumes a dark purple hue.

Swanmore Park. E. MOLYNEUX.

## THE IDEAL IN GARDEN-MAKING.

It is when the autumn and winter are upon us that we find ourselves face to face with the everlasting problem, the possibility of creating ideally beautiful gardens out of small plots or extensive areas; we must ask ourselves how far we have as yet accomplished this purpose, in what manner we have failed, and define at once our desires and the limitations of our circumstances. It is not money alone that will succeed. The true flower-lover with scanty means will often achieve triumphs that the wealthy owner of fine grounds has never wrought either personally or by proxy.

A thicket of hollyhocks, sunflowers, and Pyrethrum uliginosum, of delphiniums and Oriental poppies, of Crown Imperials and tall tulips, around a rustic summer-house or a thatched cottage, will offer as fair a scene in spring, summer, and autumn as heart can desire. The simplest annuals, too, such as sweet peas and larkspurs, are capable of giving perfect colour schemes and grace. The costliness of plants has no real relation to the beauty of a garden, being only of value as showing how much culture and discovery have done in bringing exotic glories to our land and improving upon their natural forms.

Just as a thin, pale, delicate child from a London alley will develop into health and loveliness after being given for some years the food, air, and atmosphere of a country life, so an exotic or an alpine plant may attain improvement when translated to a region in which it does not have to battle against the former local ills. It is a mistake, surely, to suppose that all flowers open just where the conditions are most fit for them; there is a struggle for existence always going on; the luxuriance of a Mexican forest chokes the gorgeous climbers that mount the tallest trees, the ice does not invariably melt away when the mountain blossom needs moisture. The skilled florist, and, in a minor degree, the patient gardener, work to render conditions ideal for the plants, and, by learning how to suit their wants, are enabled to employ them in the fairest combinations and environments.

Probably the great secret of fashioning a really beautiful garden is the acceptation of its form, climate, levels and valleys, sun-stretches and shadows, not regretfully as evils with which to fight, but gladly as the true opportunities. When this truth is realised we shall find Nature's charm imitated without slavery. At present the natural style of gardening is as monotonous as the formal methods it has largely ousted from favour; the ideal arrangement of trees, shrubs, and plants is their allotment to spots just suited to their needs; a group of crimson-tinted blue-berried berberis may crown a rugged bank summit, a gulley at the sunniest base of the same bank can be blush apricot-rose with masses of hardy azaleas. Where the moist ground lies further excavation will result in water lying outspread among islands and shores of emerald turf. This is the ideal form of water garden, just as natural sides of old quarries are the ideal rockeries. Some day we shall have learnt to shudder at the symmetrical basins and stone heaps that we manufacture so laboriously to-day.

Pillar roses of rampant habit, such as The Dawson, Rose Euprdosyne, Aglaia, etc., placed opposite one another on a path do not need any stiff wire or wood arch to induce them to span the walk. Their luxuriant boughs can be tied by cords together. The natural pergola is but an extension of this principle, the side boughs being turned in and out, and fastened thus will form hedgelike boundaries that will require thinning out to check the shade ere long. A wide expanse of grass—sloping if not devoted to tennis or croquet, for which special courts made out of fields are more suitable—looks best when of irregular boundaries and very sparingly adorned by specimen trees or shrubs, or a few groups of those. The prim beds that are the joy of the suburban dweller's heart never improve bold lawns; their sole raison d'être is to enable flowers to be possessed in small pleasure-grounds. An almond tree, rosy in spring, verdant all summer, crimson-fruited, too, is lovelier, casting flecks of shade on the green, than any level spash of geranium or begonia colour could be.

It has been said that the orchard is the most beautiful of gardens. Why should we not station our fruit-trees in companies, allowing healthy space between, but making no pretence at formality, leaving large glades and stretches of lawn here and there, instead of congregating them in aisles far from the flower garden? Hosts of shade-loving plants may flourish in cuttings out of the turf beneath the branches; beds, and borders, that is to say, only of sufficient size to be covered and hidden by the herbaceous subjects they contain. Myriads of daffodils, hardy tulips, ornithogalums, lilies, iris, etc., can rise out of the grass itself, and climbing roses may mingle blossom with the tips of the apple, pear, and plum boughs, or lie over banks that serve partly as boundaries.

Each man or woman will own a different mental vision of an ideal garden; these suggestions are but offered to assist, not limit, originality. Let us all realise, however, that the crowding together of the greatest possible number of flowers into the given space is not an artistic object of ambition, and that emptinesses are to lavish fillings as necessary to perfection as are shadows to sunshine. M. H.

**Begonia Gloire de Lorraine.**—It is not unusual to meet with well-flowered specimens of this begonia during autumn and early winter, and occasionally extra good specimens are seen, and this was the case at the show of The Ancient Society of York Florists, held at York recently. In a class for six begonias, the first prize was awarded to Mr. Folkard, gardener to Sir J. Walker, Sand-Hutton. The exhibit was an excellent one, the plants being perfect pyramids of bloom, grown in six-inch pots. Judging from the number of prize cards bearing his name, Mr. Folkard was a most successful exhibitor.—PAUL T. MORE.

**Lapagerias.**—Some cultivators find a difficulty in securing and establishing climbers on the trellises in houses on the north side of a high wall. Lapageria alba and L. rosea do remarkably well in such positions. Some plants which have been growing in a cool north aspect all through the past summer, have rarely been without a nice lot of flowers on them during the whole of the time, and still bear many blossoms, clear and rich in colour. The plants, too, are very healthy. Fibrous loam forms the principal ingredient in which the roots are growing, only a small quantity of leaf-soil and peat being used.—G. B.

## CHOICE PLANTS FOR THE ROCK GARDEN.

Although the plants suitable for rock garden adornment are numerous, there are several which stand above the general crowd from an enthusiast's point of view. They do not create such brilliant effects in their flowering season as do many others, such as aubrietias, helianthemums, arabis, alyssums, etc., yet they are extremely interesting and deserve prominent positions. Many are of rather difficult culture, and consequently have often to give place to more easily grown subjects on account of the care and attention which have to be bestowed upon them.

The androsaces are gems of the first water, and every endeavour must be made to keep them in a healthy condition. A. lanuginosa, A. sarmentosa, and A. Chumbyi are perhaps three of the best, although the others are exceedingly pretty and worthy of a place. The first mentioned is an excellent plant for hanging over a ledge, so that the trailing growths are not subjected to much moisture in the winter; they all require to be protected from the winter rains. The Shortias are choice subjects, delighting in a half-shady position, and should be grown in sandy loam and peat. They need abundance of water during the summer, and should be occasionally top dressed; the foliage is very pretty, dark shining green, sometimes having a bronzy tint. S. galacifolia is a North American species, and S. uniflora a native of Japan. The grandiflora variety of S. uniflora is the most robust, and will thrive where S. galacifolia fails.

Tanakaea radicans is an interesting plant for a north fissure; it is similar to a miniature white spiræa when in blossom. Omphalodes Luciliæ, although an old plant, is not common by any means; it delights in a partially shaded position, and should be planted in a mixture of sandy loam and peat, with plenty of chippings added. Mertensia echioides is a beautiful Himalayan species, with graceful sprays of blue flowers. Cynanthus lobatus is not frequently met with. Yet it well deserves a position in a choice collection. A half shady spot should be afforded it, and one where its slender trails can hang down. A mixture of loam, leaf-soil, and chippings will meet its requirements regarding soil, and abundance of water must be given during dry weather. Soldanella alpina, S. montana, and S. pusilla are dwarf gems from the Alps, and are extremely interesting and pretty; a fairly moist crevice or pocket should be devoted to them, which has been filled with a compost of loam, peat, and stone chippings. They require protection from excessive wet during the winter, and should be carefully guarded from the ravages of slugs, or these pests will destroy every flower spike.

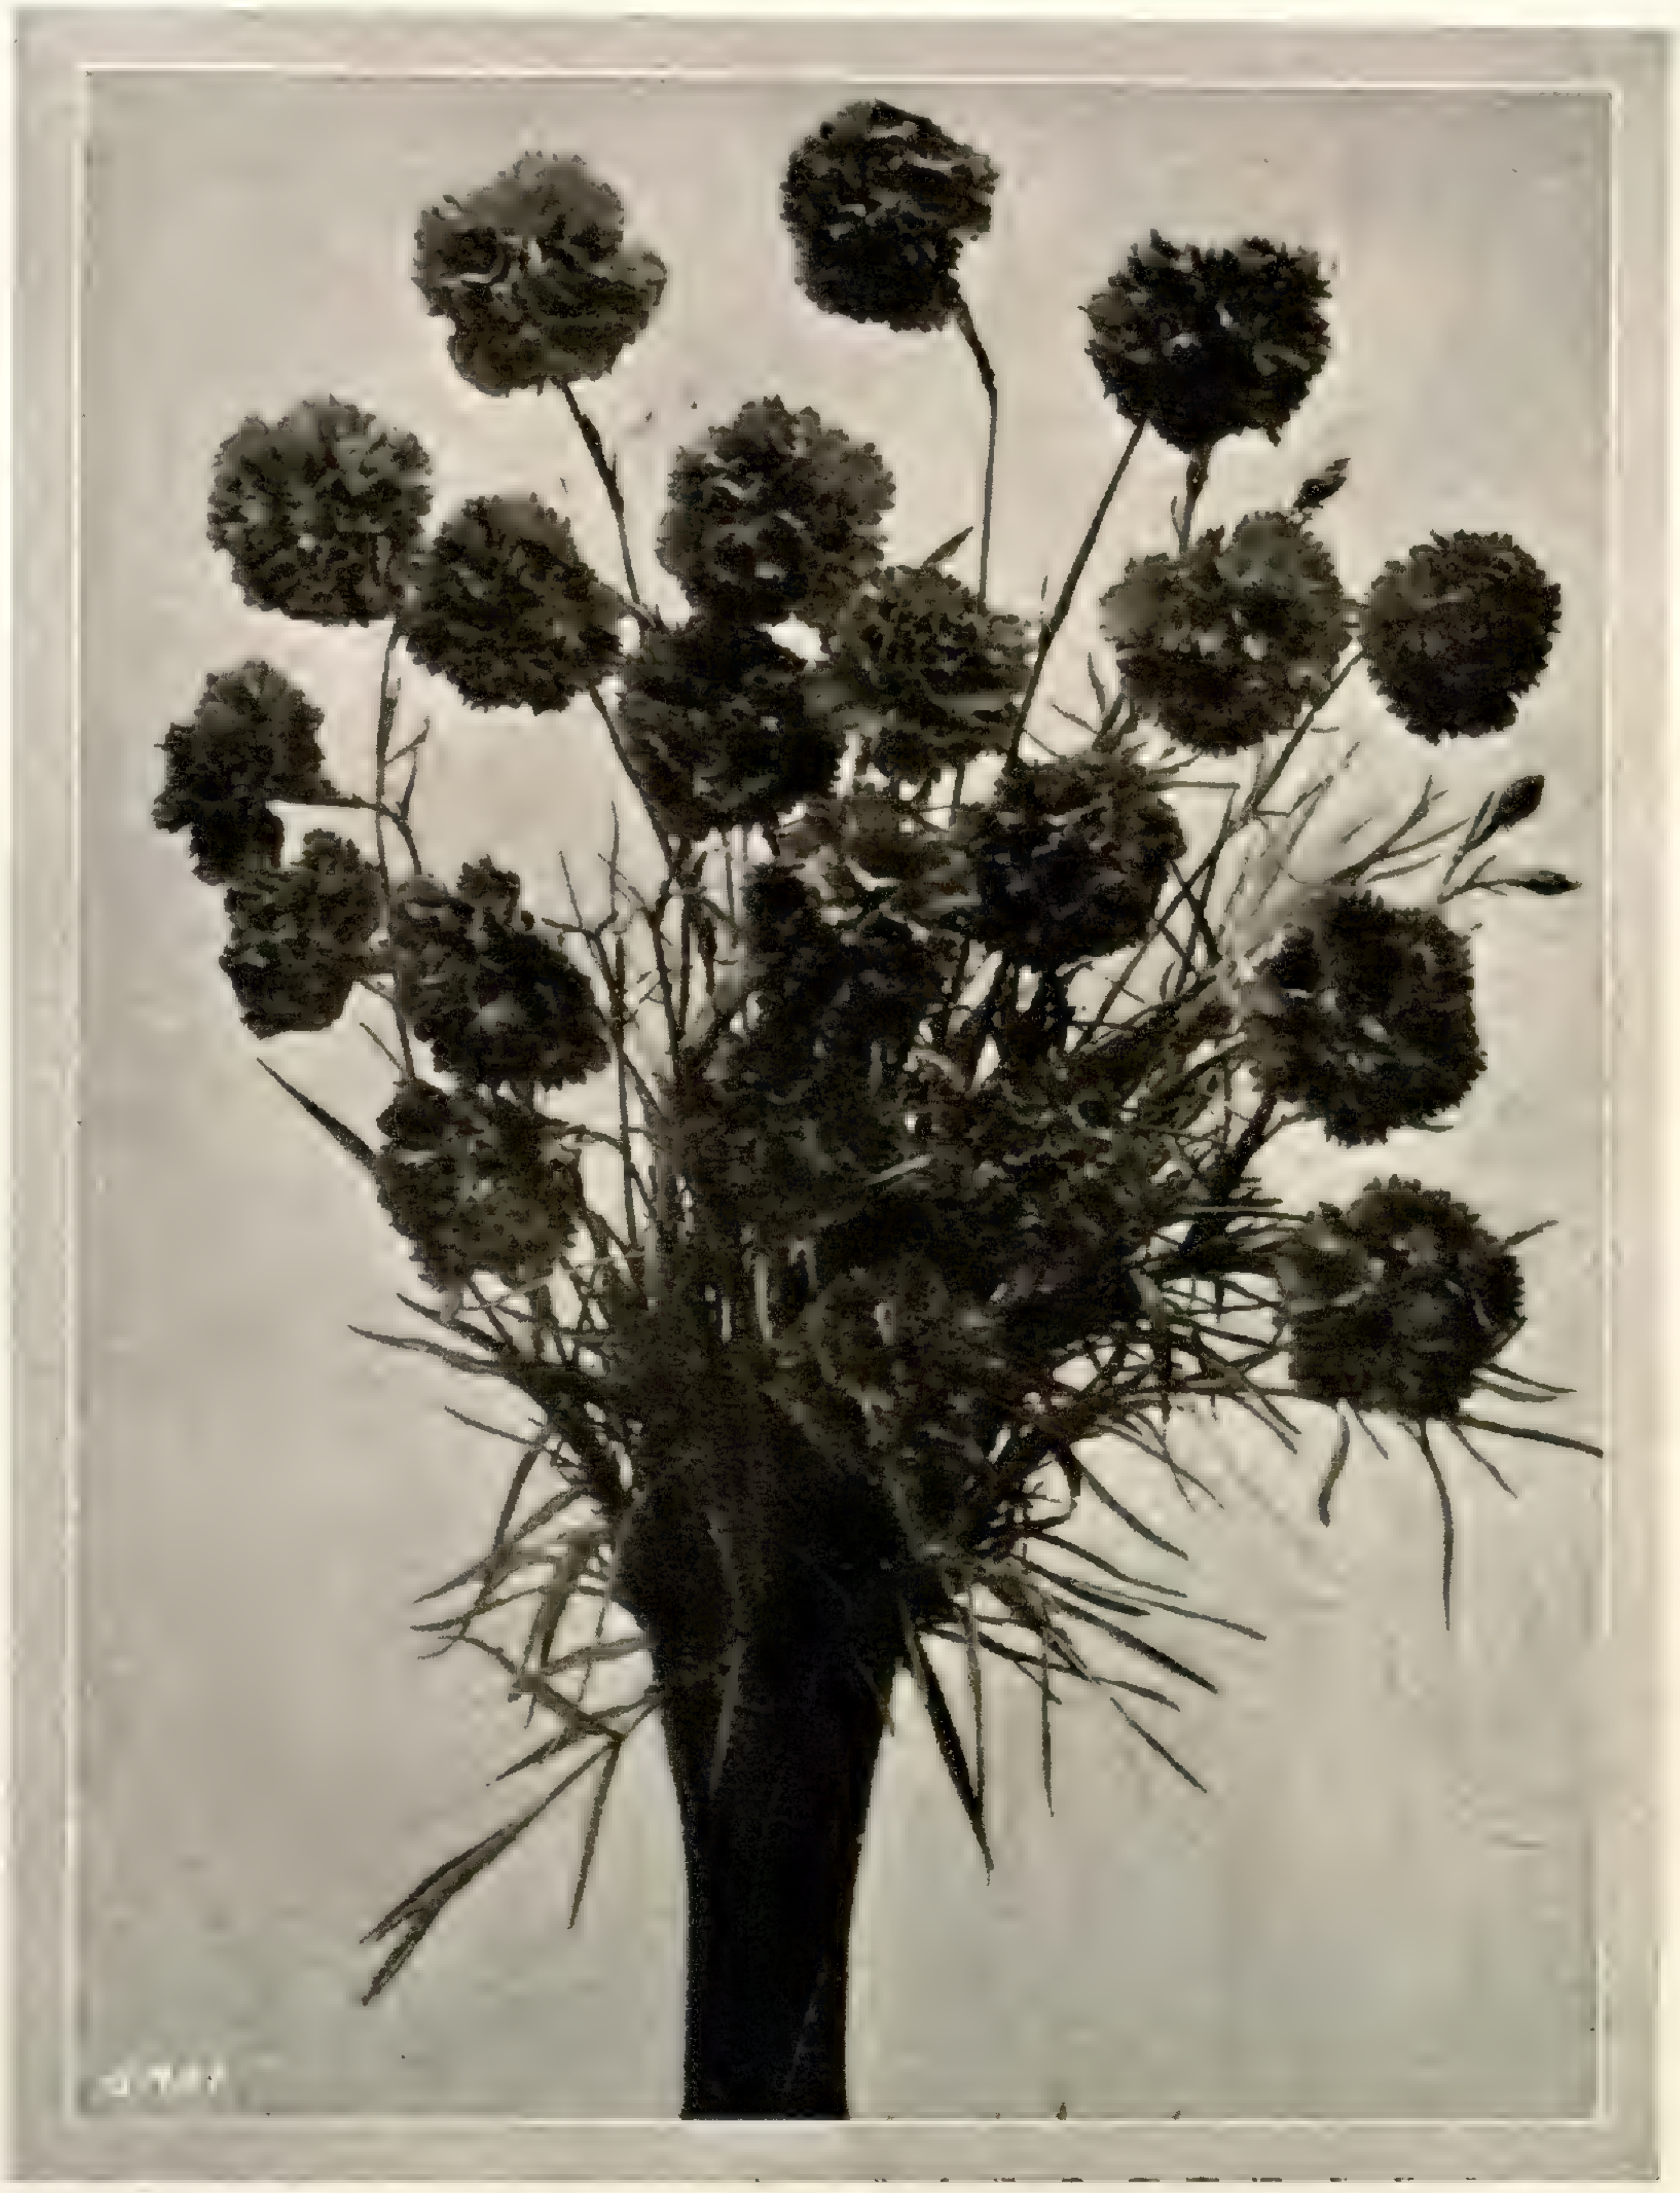
Calceolaria polyrhiza makes small rosettes of foliage from underground shoots, and from these spring the flower spike which carries one or two flowers that are pale yellow, slightly spotted with brown. The family of the saxafrages is a large one, and contains many rare and beautiful plants, among which may be mentioned S. Griesbachi, S. Boydi, and S. Boydi alba, S. Ferdinandi Koburgi, S. Bathoniensis, S. sancta, S. Burseriana major, S. porophylla, and S. oppositifolia splendens. Oxalis enneaphylla is a good plant, with glaucous foliage and large white flowers; it requires a position where it does not feel the full effects of the sun. Gentiana bavarica and G. verna are two choice gems, and should have a place in every collection; the former delights in a moist situation, while the latter is more at home in a dryer one

Among the recent introductions of primulas there are several of high merit, such as P. Veitchi, P. Cockburniana, P. Bulleyana, P. malacoides, P. Forresti, P. pulveruleuta, and the hybrid P. Unique. Schizocodon soldanelloides has fringed flowers, similar to those of the soldanellas, and handsome evergreen foliage. Codonopsis ovata is an interesting plant, having pendant, bell-shaped flowers, beautifully marked on the inside; it should be grown in a position where the inner colouring can be easily seen. Edraianthus serpyllifolius has purple, bell-shaped flowers resembling a campanula; it is very dwarf in habit, and delights in sunny crevies. E. dalmaticus, E. pumiliorum, and E. pumilo are all choice species. Morisia hypogæa delights in a well-drained sandy loam in a sunny situation. It forms rosettes of evergreen foliage, and bears numerous yellow flowers. Ourisia coccinea, with its spikes of bright scarlet flowers is a striking subject. It thrives in sandy loam and peat in a moist yet well-drained situation. Stones should be laid on the surface of the soil for the stems to creep over, and it should be given plenty of water during dry weather. One of the most curious and interesting of plants is Phyteuma comosum; this has blue and white flowers, and should be planted in crevices and guarded against slugs. Perhaps the most difficult of all plants to establish is Eritrichium nanum, and it is one of the most lovely of alpines. It must be kept dry from late in autumn until the end of February, and even after then water must be sparingly given for some time until growth advances.

E. C. Pooley.

## CARNATION GEISHA.

Prominent among the novelties contributed to the exhibition held by the Perpetual Carnation Society on December 5 and 6 last, was the variety Geisha, which is remarkable for its high quality, and belongs to a class that, as yet, is comparatively small. The large finely fringed mauve or light heliotrope coloured flowers, borne erect on stiff stems, attracted much attention, and the variety was generally considered to be a marked advance in the mauve section of colours. The blooms are larger in size than those of Mikado, the colour is pure, and the calyx and stem are such as to contribute materially to the merit of the variety. The raisers are Messrs. George Fairbairn and Sons, The Croft Nurseries, Botcherby, Carlisle, and the blooms open perfectly throughout the winter. The plant is vigorous in growth and free in flowering, and otherwise satisfactory. On expanding the colour is a warm shade of heliotrope with salmon suffusion at the base of the petals, but, as the bloom acquires age, the colour passes to light heliotrope or mauve. The variety had an Award of Merit conferred upon it at the exhibition of the Perpetual Carnation Society, held on the dates mentioned above, a distinction that was well deserved.



CARNATION GEISHA.

A beautiful perpetual variety, raised by Messrs. G. Fairbairn and Sons; the flowers large and of fine form, the colour a pleasing shade of mauve.

## THE HORTICULTURAL EDUCATION MOVEMENT.

The importance of a well-devised scheme of horticultural education is now fully recognised by those who are keenly interested in the gardening art, and as the result of the strong feeling that exists among the more advanced thinkers with regard to the necessity for a reform in the existing methods a movement is now on foot that can hardly fail to have a far-reaching effect upon the progress of horticulture. Whether the movement will bring about results that will prove advantageous to the art, and those engaged in the several branches thereof, belongs to the future, but there need be no apprehensions as to their proving otherwise than satisfactory. Public opinion has undergone a remarkable change in relation to educational matters within the last two decades, and there is very little, if any, danger of those, who are actively interested in the question suggesting schemes in which paper work will have undue prominence. Twenty years ago text books were regarded as all sufficient for the purposes of general education, but now it is regarded as essential that pupils should be taught to use their powers of observation, and take some part in such practical work as may be associated with the subjects that are being studied. In connection with the teaching of gardening in elementary schools, the value, and, indeed, the necessity for practical work, has obtained the fullest recognition, as evidenced by the fact that there are now not less than 2,000 school gardens in this country. At the University College, Reading, the Royal Horticultural Society's Gardens, Wisley, and some other institutions where systematic instruction is given in horticulture, the utmost importance is attached to the practical details of cultural methods, and it, therefore, occupies a prominent position in the several curricula. With these facts before us we may safely assume that as the advantages of the newer educational methods become still more manifest, the opinions held with regard to a proper combination or practical and theoretical work will be greatly strengthened, and have practical effect given to them.

The feelings that have prompted those who have been instrumental in calling attention to the necessity for the higher education of those engaged in the several branches of horticulture are such as to merit the fullest sympathy. It is felt that to achieve success in the management of a private garden, or a commercial establishment of any considerable size, something more than an acquaintance with the practical details is necessary. A practical acquaintance with the multiferous details of garden and nursery work is acknowledged to be essential, but the opinion is held that those whose equipment is limited to them, are placed at a considerable disadvantage, as compared with those who have also a knowledge of the scientific aspects of horticulture. In the case of those who aspire to the management of a private, or nursery establishment of the first class, or to the position of a park superintendent, the combination of science with practice is a necessity. It is also recognised that as a body gardeners are not recognised in accordance with their abilities, and it is felt that the result of an improved method of training would so raise their status as to bring about an amelioration of their financial position. These, briefly stated, appear to be the considerations that have influenced those who are taking a leading part in the movement, and they are well deserving of the most careful attention.

It will be readily understood by those who are careful to examine questions, as they arise, from all sides, that any material change in educational methods, in their relation to horticulture will involve some additional sacrifice on the part of the parents of those who purpose entering on a gardening career, and reduce during the period of training the time the students will have for recreation. In other words, the boys will have to remain longer at school, and also to devote more time to study after they have entered the garden or nursery, if they have a desire to obtain positions in the front rank. Having regard to the increased cost of education, and the strenuous endeavour to master the principles, as well as become proficient in practice, it is not unreasonable to ask whether the probable advantages will be a sufficient compensation. Should the question be asked the answer must be in the affirmative. All knowledge that is properly understood and rightly applied is an advantage, inasmuch as it expands the mind, broadens the outlook, and creates a greater interest in life. But a knowledge of the principles on which good practice must be based will be of much assistance in the endeavour to achieve a high degree of success in the management of horticultural establishments.

It should be understood that the educational movement is not a matter that only affects one branch of horticulture. It concerns all who are connected therewith, and is, therefore, of much interest to those connected with commercial establishments, as well as those engaged in private gardens, and especially to those who are desirous of engaging in the teaching of gardening, whether as horticultural instructors or teachers in training colleges. There are at present some 2,000 school gardens, and it is reasonable to assume that this number will be largely increased at no distant date. These gardens are cultivated under the direction of school teachers, who have, for the most part, had to obtain their knowledge of gardening by attending vacation classes, Saturday afternoon lectures, and so forth, and they have done very well. There is, however, room for improvement, and it is recognised that gardening should be included in the curricula of training colleges. Consequently, it may be assumed that this will be done within a few years hence, and that a demand will arise for men fully qualified to teach both principles and practice. It may be that with a fuller appreciation on the part of County Councils of the importance of gardening to the community there will be some extension of the demand for the services of horticultural instructors, and that those who by strenuous endeavour have obtained such distinction as may be regarded as the hall mark of efficiency will be able to command a higher rate of remuneration than that which now in many instances obtains. It is most important horticultural instruction in the counties should remain in the hands of men who are masters of the practical details, as well as of the principles, but to ensure this horticulturists must undergo a course of training that will enable them to obtain such distinction as will be accepted as a proof of efficiency. At present there is no such distinction, but it may be anticipated that a scheme for the provision of a suitable diploma will be formulated as the result of the labours of the committee recently appointed by the Royal Horticultural Society for dealing with this important question, and of the conference on education that will be held in conjunction with the Royal International Horticultural Exhibition in May next.

There has yet to be formulated a scheme of horticultural education on systematic lines, and yet sufficiently elastic to admit of it being adapted to the requirements of the various classes engaged in horticultural pursuits. We may have to wait some time for it, but it will come in due course, and if fully suited to the needs of the case it will in a few years hence given to gardening increased interest, and to those engaged therein a much improved status. There is ample justification for the hope that the anticipated scheme will prove beneficial, because of the remarkable consensus of opinion as to the importance of a proper co-ordination of practice and science in horticultural education. G.

BUSH APPLE TREE CLAYGATE PEARMAIN
That has been properly root-pruned.

# CONTROLLING THE ROOT SYSTEM OF FRUIT TREES.

There is no practical operation associated with fruit culture so absolutely violated as is that of unnecessarily tampering with the roots of fruit trees. The roots of young apple trees undoubtedly come in for more than a due amount of mutilation, and it is astonishing to what extent the roots can be hacked off without causing the death of the tree. The experienced grower knows just how far to go, but, as in other professions, and perhaps more so in gardening, young men are appointed as head gardeners who may not have had the opportunity during their apprenticeship, or as journeymen or foremen, of observing the effects of root pruning, and particularly so if their duties were largely confined, as is so often the case, to the cultivation of plants under glass, and not that of fruit trees growing in the open.

## Apple Trees.

Given a retentive loam, young apples on the crab or the broadleaved paradise or similarly constituted stock will, as soon as established, proceed to make vigorous wood growth, which, if allowed to continue, will undoubtedly make it difficult for the pruner to regulate the branching system and control the formation of fruiting spurs, unless he first inspects and regulates the root system of the tree. Bushes or pyramids on the French paradise do not demand the same attention, as here we have a stock which by nature is fibrous and surface rooting, and even though the tree does attain a reasonable amount of vigour in the third or fourth year after planting, the branches can usually be controlled without any manipulation of the roots, but not so with strong-growing varieties of apples on equally vigorous stocks.

An all too common practice is to allow bushes to attain to large proportions, and to assume a naked condition of the lower branches before an attempt is made to root prune; and when such operation is commenced, insufficient care is taken in laying bare the roots. The process adopted is akin to grubbing up a tree rather than to transplanting. Where the tree has been carefully lifted, the stronger roots should be severed with the greatest care, as very often, when the leading roots are cut back very severely, the corresponding branches of the tree receive a check from which they do not recover. As far as possible, root pruning should be done at the fall of the leaf, or while the soil is sufficiently warm to encourage the formation of new roots before winter, cannot be overestimated. The trees may be lifted late in the year, or as is sometimes done, early in spring, but it is essential to use the greatest care in carrying out the various details. Where subsoils are cold and wet, no better opportunity is afforded of improving them than at this stage, and before commencing the operation of lifting, an ample supply of suitably prepared soil should be at hand, and the more this compost facilitates the formation of young fibrous roots, the more satisfactory will be the results.

The two trees herewith illustrated are of interest as showing a proper balance between the growth of the roots and branches.

## Pear Trees.

The method of root pruning pears is practically identical with that recommended for apples. Dwarfing stocks like the quince, of which, by the way, there are two varieties, the "Angers" and the "Portugal," are of somewhat similar habit to the paradise stock, which has its origin from a dwarf trailing species of the Pyrus family. Before the introduction of these fibrous rooting stocks, very little attention was given to root pruning, nor was the subject sufficiently well understood. For a few years after planting, the balance between root and top is about equal, but as soon as the allotted space is filled up, and the roots penetrate into a strong fertile soil, a disproportion between the two soon takes place.

## Plum Trees.

Much difficulty is experienced in the management of plums. As to soil conditions, I have found that these fruits thrive where apricots have proved a success, whereas if planted in cold, damp clays, failure is sure to attend their cultivation. It seems difficult for some growers to realise this fact, and so we come across plantations of plums in heavy retentive soils in which they make a luxuriance of growth for several years, but never show any inclination to bear fruit, however favourable climatic conditions may prove.

BUSH APPLE TREE, SANDRINGHAM,
With roots that are well under control.

Probably, like others, I have had some remarkable results attend the judicious root pruning of plums. In the case of gross-growing trees the usual practice with many is to stop the shoots in May or June, followed up by a more severe pruning when the growths push forth for the second time in July. If, in addition to this, the roots are examined, and the strongest of them removed, particularly those with a tendency to make a downward growth, and the space below well filled and made firm with lime rubble or suitable compost, in due course, it will be found that the young season's wood soon becomes firm and hard, and that fruit buds are freely developed. To be successful this regulation of the roots must be performed late in July or early in August, and not delayed until the soil loses its heat; should this occur new roots will not be formed before the following spring, and the preparation for next year's fruiting will be incomplete. Further, if the roots are pruned too late, disease is more likely to make its appearance, whereas if the operation is performed early, disease is unknown, although the trees retain their foliage, and go to rest early.

Plums, the finer varieties of which are grafted on stocks of the mussel plum, are rarely subject to disease if afforded a healthy root run in suitable soil. If proper control is not kept over the roots the branches soon assume an irregular form and abstract nourishment from the soil, which should go towards maintaining the fruiting spurs in health and vigour of growth. In the case of the Victoria and other robust-growing varieties of plums, the bending or tying down of the branches is often recommended, and, while tending to check such growths and to promote the development of fruiting spurs, very considerable assistance will be afforded if young trees are taken up and their roots systematically pruned before they have an opportunity of growing downward.

Wroe.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## THE MAIDEN PINK.

The Maiden Pink (Dianthus deltoides) is no new introduction to this country, and, so far from this being the case, it is a member of our native flora and plentiful in various parts of the United Kingdom. One of the most beautiful of wild plants, it has long been grown in gardens; how long it is not possible to say. The Maiden Pink was cultivated by Gerard in his garden upwards of three centuries ago, and with reference to it he writes in his "Herbal": "The Virgin is like unto the rest of the garden pinkes in stalkes, leaves, and rootes. The flowers are of a blush colour, whereof it tooke its name, which sheweth the difference from the other." The plants of this pink range when under cultivation from six to twelve inches in height, according to the conditions under which they are grown, and the flower stems are freely produced, and, as they divide near the top, and produce several blooms each, the effect produced by a well-developed specimen is very pleasing.

A GOOD SPECIMEN OF THE MAIDEN PINK (DIANTHUS DELTOIDES).
The flowers are blush pink, and freely produced.

While worthy of a place in rock gardens that are under the charge of cultivators of exceptional experience, it is especially adapted to the requirements of those to whom plants that thrive under simple treatment are of value. It will flourish on the ledge of a rockery or in the mixed border, but where the soil is naturally heavy and tenacious, it is an advantage to provide the plants with specially prepared stations, and to raise the surface a few inches above the surface. Good turfy loam, to which have been added small proportions of broken limestone or sandstone, coarse sand, and lime rubble, should be used in the preparation of rock ledges or stations in the borders. Planting may be done at the close of the winter or early in the autumn.

## PROGRESS IN SWEET PEAS.

(Continued from page 4.)

Among the yellow or cream varieties Queen Victoria was the first I made particular note of, and it was followed by Mrs. Eckford, The Hon. Mrs. E. Kenyon, and, later still, by Mrs. Collins, the latter being probably the best in the old type. However, the introduction of Clara Curtis put these varieties out of court, and, as an exhibition flower, it seems likely to keep its place for some time to come. Paradise Ivory and Isabel Malcolm are both good flowers, but they do not exhibit that improvement on the old type that Clara Curtis does. Orange-scarlet is a colour in which much improvement has been made; in fact, one might almost say the most improvement has been made here. Thomas Stevenson, Edna Unwin, and others are far in advance of the old type, not only in size and colour, but also from the fact that the flowers will stand the sun, a virtue not possessed by Evelyn Byatt or Gorgeous, which were the best of this colour in the old type.

Among the rose-coloured varieties, John Ingman and Rosabella may be said to excel, and here again it must be acknowledged they are far in advance of Splendour and Lord Rosebery, while Lady G. Hamilton and Countess of Radnor would hardly now be pitted against such varieties as R. F. Felton and Florence Nightingale in the lavender class.

The bicolor varieties also have made considerable progress, and Mrs. A. Ireland, Colleen, and Mrs. Cuthbertson may be said to quite oust Apple Blossom, Triumph, and Jeannie Gordon, though I have still a love for the two first because of their delicacy of colouring. The flaked varieties are now amongst the best of sweet peas in form and substance, and Mr. W. J. Unwin, Spencer America, May Campbell, and Loyalty are far in advance of anything we had in the old type, either in colour, form, or size, though Aurora, Grey Friars, Gaiety, and Senator were all good representative varieties in their time. In Lottie Eckford and Dainty we had two very pleasing picotee-edged varieties in the old form, but with the introduction of Evelyn Hemus and Elsie Herbert we made certainly one of the greatest advances in sweet pea raising, and this in the early days of the waved forms; since then distinct picotee varieties have been slow to come, for though there have been two or three others, these much lack the form and substance of the two named.

Henry Eckford was, to the best of my knowledge and remembrance, the only salmon variety of the grandiflora type, so here again distinct advances have been made, for Earl Spencer, Barbara, and Melba each are good waved sweet peas, and when well grown make wonderfully effective bunches. I have no doubt our raisers will soon give us these in sunproof form, which will be a notable advance. Stirling Stent is deeper in colour, and does not turn so much as the preceding varieties, but it lacks size. In lilac, mauve, and fancy varieties much improvement has been made, and Charles Foster, Prince George, Marquis, Tennant Spencer, Marchioness of Tweedale, etc., etc., are much in advance of the older varieties, the delicacy of colouring being even more marked than the advance in size and form, though these two qualities are in no way lacking.

These few comparisons will show the great advances that have been made, but there is still room for improvement. We should like a flower of the same colour as Coccinea, of good size and Spencer form, of, say, the same style as Tom Bolton is when grown well. The variety Admiration always pleased me, and we could do well with one of this colour in Spencer form. Prince Edward of York was a good exhibition flower in the old type and very striking in colour, so that its appearance in waved form would be welcome. The blue and yellow sorts, it goes without saying, we desire to see improved, and it can only be a question of time, as there are many capable men who are giving these matters very serious attention, both for the love of the flower and from a commercial point of view.

During the past season or two many of the varieties introduced have given rather a large percentage of double standards under good cultivation, and though some growers look with favour on this, I am bound to say that I do not, as the delicate outline of the flower is quite lost; further, in wet weather the flowers are apt to be rather too heavy for their stems. For market purposes the double standards may be found useful, as it will take fewer flowers to make up a bunch, but for really light and elegant decorations, good single-standard flowers will always be welcomed.

The cultivation and methods of exhibiting sweet peas have also advanced, and one only needs to visit any or either of the large summer shows to see a striking example of this; many of the sweet pea specialists' groups are striking examples of artistic decoration, while the individual blooms give distinct evidence of good cultivation. The competitive classes are also usually very well filled, and it is a rare thing to see a poor or slovenly exhibit, but the amount of space allowed an exhibitor is very often far short of what is required to show off his flowers to advantage. In good competition nowadays 18in. square is the least that should be allowed for a vase of from 20 to 25 spikes, and where the staging is in tiers there should be at least 8in. rise in each of the two back tiers; this would allow the exhibitor to make the most of his flowers, and also allow the judges to see the blooms without having to move some of the front vases.

Sweet peas are still progressing, and likely to continue, providing our raisers can keep the public interested by putting a few really striking novelties on the market each season, and these in a fairly well fixed condition, as nothing is so vexing to a grower to find (after he has taken a lot of trouble) that a very poor percentage of the plants are true to name, but things are much better in this respect than formerly, and when the seeds are obtained from well-known growers there will not be much cause for grumbling, so that progress is being made in this direction also.

THOMAS STEVENSON.

Woburn Place Gardens.

---

**Crassula Schmidti.** — This very pretty member of the crassula family was introduced from South Africa a quarter of a century or so ago, but it is even now very little plant for the greenhouse, and retains have been noted this autumn at the meetings of the Royal Horticultural Society. It forms a mass of erect stems about three inches high, each terminated by a branching corymb of small red flowers. The succulent leaves and the stems are also suffused with the reddish tint, so that the entire plant is more or less of a ruddy hue. It is a really pretty little plant for the greenhouse, and retains its beauty for a considerable time.—W.

THE ROSE GARDEN AT BAGATELLE.

# THE BAGATELLE ROSE TRIALS.

The trials of new roses that have been in progress during the past six or seven years in the rosery of Bagatelle, which is situate on the western boundary of the Bois de Boulogne, have proved so successful as to have created much interest among the leading rosarians of Europe and America. These trials were commenced on the initiative of M. Jules Gravereaux, the eminent amateur rosarian, and have been carried out under the direction of M. J. C. N. Forestier, the able chief of the public gardens of Paris. Bagatelle is remarkable for the charm of its grounds, and is of some historical interest. The villa was originally built by the Count d'Artois, who subsequently became Charles X., for a wager between himself and the Prince of Wales that he would have it built in sixty days. It was completed in fifty-nine days, and the Count was accordingly the winner. After several changes in ownership, the villa and its grounds were purchased by Richard Wallace, and subsequently became the property of the municipal authorities of Paris.

The rosery is not the least attractive feature of the grounds, and during the summer months, when the roses are in bloom, they possess much interest to those who are desirous of seeing the more noteworthy of the new roses growing under ordinary conditions at the earliest possible moment. Usually there are some fifty or sixty roses under trial, and the manner in which they are grown is clearly indicated in the accompanying illustration. The course of procedure that has been adopted is for M.

Forestier to issue annually a circular letter inviting raisers of roses to send any varieties they may wish to be included in the trial to the Roseraie de Bagatelle not later than April 15. Five plants in pots have to be sent of each variety, accompanied by their name, place of origin, and their parentage. The plants are bedded out on their arrival, and grown for two years, and during that period are inspected twice by an international jury. The inspection is made during the month of June in each year, the date being arranged to coincide, as far as possible, with the period of the roses being at their best. By this arrangement the members of the jury are placed in the best possible position for determining the merits of the varieties on which they have to express an opinion. They are all grown under the same conditions, the number of plants obviates the risk incidental to trials in which there is but one plant of each variety, and the jury have an opportunity of seeing them two seasons in which the climatic conditions may differ greatly, as, for example, in 1910 and 1911. The first season after planting it is not easy to determine the merits of novelties so exactly as could be wished, but in the second year it is possible to form an estimate sufficiently near for practical purposes of the habit of growth, freedom of flowering, and the quality of blooms. During the period over which the trials have extended, the following roses have received awards:

In 1907 the Bagatelle Gold Medal was awarded to Marquise de Sinéty, (M. Pernet-Ducher, Lyons) and Mme. Edmond Sablayrolles (M. Bonnaire, Lyons), Mme. Constant Soupert (MM. Soupert et Notting, Luxembourg), and Mrs. Peter Blair (Messrs. Alex. Dickson and Sons, Newtownards) were commended.

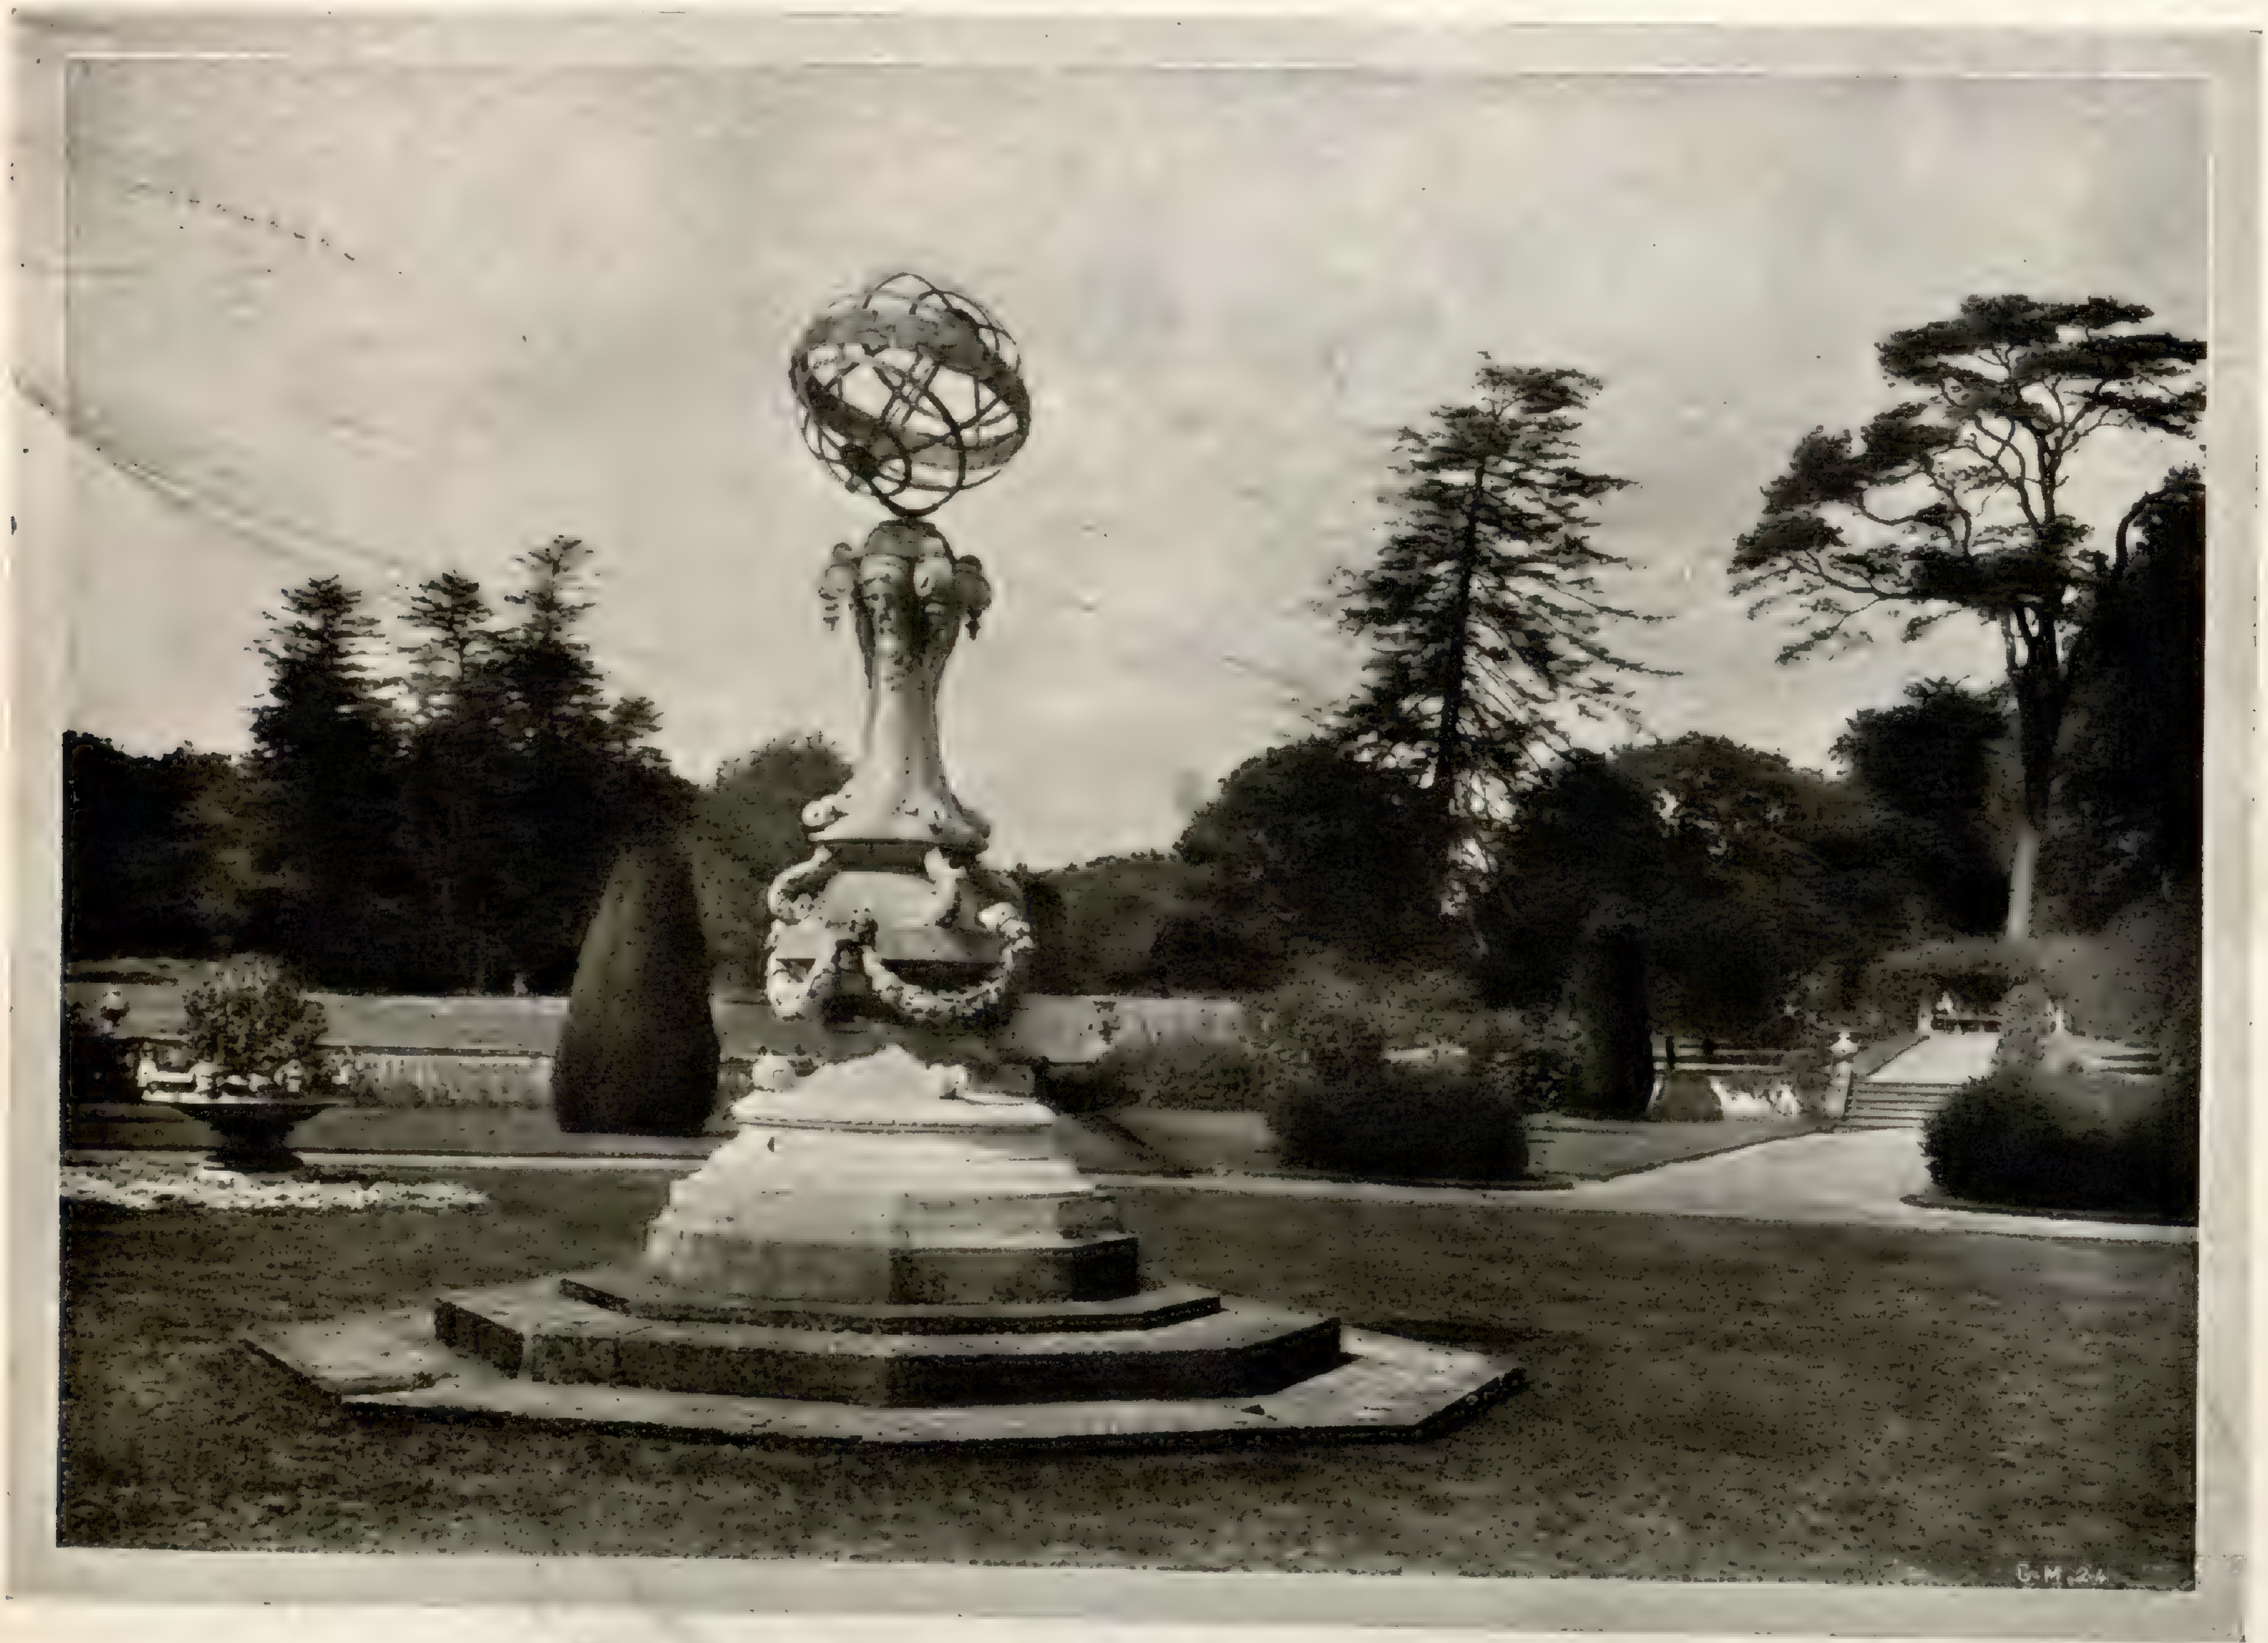
In 1908 the Bagatelle Gold Medal was awarded to Rhea Reid (Messrs. E. G. Hill and Co., Richmond, U.S.A.), and silver-gilt medals to Mrs. Dudley Cross (Messrs. W. Paul and Son, Waltham Cross), Dorothy Page Roberts (Messrs. Alex. Dickson and Sons), Mme. Segond Weber (MM. Soupert et Notting), and Frau Oberhofgartner Singer (Mr. P. Lambert, Germany).

Subsequent to 1908 the only medals offered have been of gold, and these have been offered in separate classes, one for French raised roses and the other for roses raised in any country other than France. The silver-gilt medals were replaced by certificates.

In 1909 The Bagatelle Gold Medal for roses raised in France was conferred upon the Lyon Rose (M. Pernet-Ducher), and that for roses from other countries to Mme. Segond Weber (MM. Soupert et Notting).

No gold medal was awarded in 1910, but Certificates of Bagatelle were conferred upon the following roses: Molly Sharman Crawford (Messrs. Alex. Dickson and Sons), Madlle. Marie Mascuraud (M. Bernaix, Lyons), Lady Alice Stanley (Messrs. McGreedy and Sons, Portadown), and Commandeur Jules Gravereaux (M. Croibies Lyons).

Last year (1911) was more prolific in good varieties, or the weather that was experienced in Paris was more favourable to roses, for two gold medals were awarded and several certificates. The several awards were: A Bagatelle Gold Medal to Beauté de Lyon (M. Pernet-Ducher) and to Jonkher J. C. Mook (Mr. Leenders, Holland), and certificates to Viscountess Enfield (M. Pernet-Ducher), May Miller (Messrs. E. G. Hill and Co.), William Speed (Messrs. Alex. Dickson and Sons), and Desiré Bergeia (MM. Barbier et Cie, Orleans).



THE HANDSOME SUNDIAL AT SOMERLEYTON HALL. [Photo: H. N. King.

## THE SUNDIAL AT SOMERLEYTON HALL.

Occupying a prominent position in the flower garden on the western side of the mansion, the handsome sundial contributes so materially both to the interest and attractiveness of the wondrously beautiful scene that our illustrations of the gardens of Somerleyton Hall would have been incomplete had they not included a representation of it. Appreciating this fact, when visiting the gardens, we had an illustration prepared, and this we intended using with the others in our issue of the 6th inst., but the great pressure on our space prevented this being done. We have now the pleasure of giving the picture, and we have no doubt that our readers will readily appreciate the object-lesson it affords on the value of a tastefully designed sundial in garden scenery of a more or less formal character.

---

**Grevillea alpina.**—As a foliage plant Grevillea robusta is well known, but those species whose beauty depends principally upon their flowers are much less in evidence. That under notice forms a little dense bush, whose flowers, borne in clusters at the points of the shoots, are rosy-red tipped with yellow, and borne throughout the winter months.—W. T.

**Zonal Pelargonium Paul Crampel.**—Apart from its being one of the best of all the bright coloured zonal pelargoniums for summer bedding, this is also good for winter flowering. Of course, it needs to be specially grown for this purpose. The salmon-coloured sport therefrom is now becoming generally distributed, and is liked by many. The double form, which was so much boomed, I personally am not an admirer of.—W.

# REVOLUTION IN VEGETABLE GROWING.

(Continued from page 14.)

## Shows, Showing, and Judging.

For the purpose of this article we may take two types of shows; first the one at which professional gardeners compete with each other (for some reason or other exhibiting has little attraction for the market gardener); and secondly the cottagers' and village show. Of the former it must be said that a vegetable show pure and simple does not attract the public like a flower show. At any rate, in London, and if this were the case there would have been no need for the National Vegetable Society to have changed the place of its next exhibition to Watford, but at the big mixed shows in the provinces vegetables play a conspicuous part, and they never fail to arouse interest. You see three things which strike you in a keen vegetable competition at a big show. First, there is the obvious evidence of the wonderful improvement in types of vegetables, and shows have done much to bring improved varieties to the front. Secondly, as compared to former days, there is a marked absence of coarseness. In short, exhibitors have learnt that size is not, nor should it be, the first consideration, and every winning dish is stamped with the hallmark of quality. Lastly, there is arrangement of vegetables at shows, and to such men as Messrs. E. Beckett and Gibson must be given credit for raising this to a fine art. In fact, the methods of arranging collections of vegetables at shows has improved out of all knowledge in recent years, nor do I think we have reached the limit of possibilities in this direction. If another word may be added, it is that vegetables at a modern show bear tribute to the skill of raisers, and prove the British gardener to be a master hand at the cultivation of utility crops. In passing, a special tribute must be paid to the trade exhibits at modern shows, and, even if they are set up for the purpose of advertisement, those wonderful displays of vegetables staged from time to time by the leading firms afford evidence of the revolution that has taken place in vegetable culture.

Vegetables, of course, take pride of place at the village show, and when at one of these events you see a horny-handed son of toil going round after the judges, jotting down with a half-inch stump of lead pencil on the margin of a soiled catalogue the amount of his winnings, you observe a humble champion of the cause at the hour of his triumph, but you should also think of the hours he has spent in the garden at home, early and late, growing those vegetables that adorn the show board. Now and then you see the exhibitor pucker his brow and look astonished when he observes specimens the like of which won first prize the year before passed over, but this is where judges are at fault. More consistency is wanted amongst the gardeners who adjudicate at village shows. There are too many of them who still act on the principle that in a cottagers' class the prizes must necessarily be given to the biggest specimens, and they tempt exhibitors to aim for size alone. Then when a change of judges takes place, and men come along who have studied the Royal Horticultural Society's rules for judging, the big things which lack quality are left out, and the exhibitor is naturally puzzled and disappointed. Let us then have consistency amongst village show judges, and in the case of collections of vegetables I would go one better and have point cards placed on the exhibits, showing the marks accorded to each dish. In other respects village shows are not yet perfect; perhaps they never will be, but nevertheless they figure conspicuously amongst the national institutions of the country, and have, perhaps, done more than anything else to raise the standard of gardening in general, and vegetable growing in particular, amongst the working population of rural Britain.

## Stocks and Types.

After admitting everything that growers and exhibitors have done in bringing vegetable growing up to its present high standard there remains the raiser, the skilled expert, who, by crossing, selecting, and rogueing, has put material in the shape of modern varieties in the hands of cultivators. It is a wonderful story this evolution in the vegetable world, and no one man or one generation of men can claim credit for it all. Take the cosmopolitan potato, for instance. Sir Walter Raleigh introduced it, so the story goes, but that famous old gardener, Gerard, was amongst the first to realise its value, and he figured the potato in his "Herbal," published in 1597. But what of the ups and downs in potato culture since? There were those black years of disease and potato famine which began in 1845, when it was seriously thought that the vegetable would drop out of cultivation. Fortunately, however, it did not, and why not? Largely because raisers saw the necessity of introducing new blood in the shape of varieties with vigorous constitutions that had some capacity for resisting disease, and so the situation was saved. Some varieties have made history. Amongst them Sutton's Magnum Bonum, which came just at the moment when a potato of its splendid type was wanted, and when it waned Findlay's Up-to-Date and other varieties of the type stepped into the breach. The wonderful boom in potatoes, when Northern Star and Eldorado appeared, and single tubers were worth their weight in gold, is a matter of modern history, and the same may be said of the ill-fated National Potato Society, but the position so far is that the growing of potatoes is a more important industry now than ever before in the history of the world.

We are told that green peas were first imported from Holland in the days of Queen Bess, but for years they remained a luxury for the few, not, as now, a commodity for the million. Now the varieties of peas are legion, and the cottager can have as good peas on his table as the millionaire. We have passed through the period of small rounded seeded peas, which are now considered to be only good enough for field culture, and we have seen how the raiser has introduced into the dwarf section the long pods and flavour of the Marrowfat type. Take Sutton's Little Marvel as an illustration, and compare, say, Early Giant, introduced by the same firm, with the best first early of half-a-century ago. In Carter's Quite Content we have a pea that might have been specially designed for the exhibitor, with Veitch's Autocrat as a standard variety, with others of the Duke of Albany type, for those who want big quantities, and have room for growing tall peas. Truly it is a story of progress, this revolution in pea culture!

Go into any vegetable show you like, even a cottagers' show, and note the scarlet runner beans—long, straight, fleshy pods of first-class quality, having little in common with the original type of scarlet runner. What are they? Here again give the raiser credit, for, ten to one, they are Sutton's Prizewinner, Carter's Emperor, or some similarly selected type.

It occurred to some enthusiastic gardener in the years gone by that, by getting his spring onions a bit bigger he would stand a better chance of winning first prize, so he devised the method of sowing seeds early under glass and transplanting. This marked the beginning of the big onion craze; the result is the magnificently-grown specimens that are now seen on show boards, but the varieties, the Ailsa Craig, Cranston's Excelsior, etc., were supplied by the trade, and one of the latest introductions which is growing in favour is the Premier, a variety sent out by Messrs. Dickson and Robinson, Manchester. It may further be said of the exhibition method that, in a modified degree, the indoor raising and transplanting of onions is now largely employed in the culture of crops for purely utility purposes.

The members of the brassica tribe have lent themselves to wonderful improvement, and it is hard to think that the wild cabbage, which one finds flourishing on the cliffs at Dover, and in some other parts of this country, could have been the possible parents, say, of Ellam's Early or Flower of Spring, and in addition to this section raisers have presented us with splendid autumn cabbages of the type of Dobbie's Winningstadt. Savoys have been known in gardens for hundreds of years, but the plant has shown its willingness to lend itself to further possibilities, for recently Messrs. Sutton and Sons sent out a type which produces a savoy on the top, with sprouts up the stem that resemble small savoys. A collection of modern kales—green, variegated, plain curled, and hearting—bear tribute to the skill of raisers, and in the days of Gerard, who mentions them in his "Herbal," the cauliflowers were doubtless of a different stamp to Veitch's Autumn Giant and Sutton's Magnum Bonum; while in the way of broccoli, which is said to have made its appearance at the beginning of the eighteenth century, from out of the early types have come the splendid self-protecting varieties, and white and sprouting forms. Every grower of Brussels sprouts knows the advantage of sowing seeds of a selected type, because in the case of a superior variety one can rely on obtaining firm hard sprouts all the way up the stems.

In the above instances, we see evidence of the most marked improvements, but no crop in the kitchen garden has been overlooked. For instance, the types of modern lettuces are quite a study, tomatoes may be described as a creation of recent years, and every other grower you meet has his own selection. The introduction of what is called French gardening has prompted raisers to turn their attention to types suited to this class of culture. Even with the most commonplace vegetables the gardener to-day can choose between ordinary types and improved relations, and, generally speaking, it is to his advantage to take the latter. In short, by an equal display of skill and intelligence these two great parties, the seedsmen on the one hand and growers on the other, have joined hands with wonderful effect in bringing about the revolution in vegetable culture, the effects of which are to be seen in gardens of every description at the present day.

G. H. H.

---

**Primula obconica.**—Anyone acquainted with this little primula thirty years ago, when it was figured in the "Botanical Magazine" as Primula poculiformis, can fully appreciate the great improvements that have been effected by a gradual process of selection. Now not only are the flowers large and boldly displayed, but there is also a wide range of colour among them.—W. T.

## NOTES FROM KEW.

### Clerodendron cephalanthum.

There is a large amount of variability among the different species of clerodendrons, some being vigorous climbers, while others form more or less compact shrubs or trees. The species at the head of this note is stated to be a climber, but it is flowering in a small state in the intermediate portion of the T range. The ovate leaves are of a dark green tint, and the flowers are disposed in dense terminal heads. Like many members of the genus, the calyx is large, being white, with slight purplish suffusion. The flowers, which protrude therefrom, consist of a slender tube, nearly three inches in length, greenish white, while the spreading segments, which are about an inch across, are white, very slightly tinged with purple. The much-exserted stamens are of a pinkish tint. This clerodendron is a native of Zanzibar, and was, according to the "Dictionary of Gardening," introduced in 1888. Outside of a botanic garden it is a very uncommon species.

### Jasminum Maingayi.

This uncommon warm-house species of jasmine is exceedingly valuable from the fact that it flowers throughout the winter, as may be seen by a specimen trained to a rafter in the T range. The foliage is of a neat tint, and the starry white flowers are borne freely in clusters at the points of the shoots. Though but little known, and, I believe, comparatively new, it well merits more extended cultivation.

### Plumbago rosea superba.

This plumbago, which is often known in gardens as P. coccinea, and is usually grown in bush form, is, in the T range, trained to the roof, and in this way it forms a really striking feature, the long spikes of bright-coloured blossoms disposing themselves in a pleasing and informal manner. It is not sufficiently vigorous to be trained to the roof of lofty structures, but, as grown at Kew, it is really most striking. Being a taller grower than P. rosea itself, this brighter-coloured variety is better adapted for training to a roof or rafter. Plumbago rosea is a very old occupant of gardens, and its variety superba has now been grown for many years.

### Tupistra grandis.

The tupistras form a very singular group of the order Liliaceæ. From the thickened rhizome leaves somewhat resembling those of an aspidistra, but narrower, are produced. From a flowering point of view, T. grandis, now in bloom in the stove portion of the T range, is well worthy of consideration. The flowers are borne in an erect, closely-packed spike, and are deep shining purple, against which ground the lighter-tinted disc-like stigma stands out in a marked manner. The general effect of the inflorescence, which stands about fifteen inches high, is that of a very narrow, elongated spike of hyacinth.

### Exacum zeylanicum.

As seen in the T range, this is quite distinct from E. macranthum, with which it is sometimes confounded. This last-named is now generally well known, for it has been extensively shown at Westminster within the last few years. A notable feature of this beautiful flowering plant is the intense bluish-purple colour of its blossoms. From this better-known kind the specimen of E. zeylanicum differs in its far more vigorous growth, being four feet high or thereabouts, while the flowers are of a much lighter blue than those of E. macranthum. Close by is a specimen of the small lilac-flowered E. affine, which is interesting as being one of the discoveries on the Island of Socotra, at the same time as Begonia socotrana. While E. affine is a pretty little flowering plant, it is much less showy than E. macranthum.

### Aphelandra Fascinator.

This species of aphelandra is a native of Colombia, but is not known to anything like the same extent as some of the others. A distinguishing feature is the way in which the leaves are striped with silvery-white on an olive-green ground, while though the flowers of many members of the genus are scarlet, those of A. Fascinator are of a vivid and uncommon shade. Like the others, it is of comparatively easy culture, and may be seen in good condition in the intermediate portion of the T. range.

### Jacobinia coccinea.

This, one of the oldest of the jacobinias, is more often met with in gardens as Justicia coccinea. Of stout, upright growth, with a terminal head of scarlet blossoms, it is just now very noticeable. Where a display of flowers has to be kept up at all seasons, this is particularly valuable from the fact that its bright-coloured blossoms are borne in the winter months. Now in flower in the T range. A desirable feature of the jacobinias is that they are for the most part of easy culture.

### Aloe Thraski.

A couple of fine specimens of this noble South African species of aloe are flowering freely in the Succulent House. They show well the distinctive character of the vegetation which so frequently occurs in South Africa, and, furthermore, they are, from a flowering point of view, most attractive. This aloe must, I should say, be classed with the larger-growing members of the genus, the erect, stout, naked stem being several feet in height, and crowned with a handsome head of leafage, which is, in its turn, overtopped by numerous spikes of blossoms, disposed in an erect branching panicle. The leaves recurve in a very regular manner, and are from three to four feet in length, and six inches wide at the base, from whence they narrow gradually to a point. The flowers are yellow, and suggest those of a tritoma.

### Eupatoriums.

The value of these at this season is well shown in the greenhouse, where a large ground of Eupatorium Weinmannianum. This, often known as E. odoratissum, is in full bloom. Rapidly approaching that stage are some examples of Eupatorium petiolare, whose daisy-like flower heads have, as they are developing, a pinkish tinge. This last forms very handsome specimens, and in a cut state the flowers last a long time in water, added to which they emit a pleasing fragrance.

### Crassula lactea.

This might well be more often grown for the sake of its winter-flowering qualities than it is, for it is just now very pretty. In the greenhouse small-flowering specimens in four-inch pots are employed for the edging of one or two groups, and well suited they are for this purpose. It is a free-growing plant, the stem being stout, and the ovate leaves of a thick fleshy nature. It reaches a height of a foot or so, and branches out towards the base, so that it forms a mass or clump. The starry flowers are white, and freely produced in spreading panicles. Though not very much known in gardens nowadays, it is quite an old plant, having been introduced from South Africa in 1774. A second species of crassula, namely, C. spathulata, is largely used as an edging to the stages of the Succulent House. It is of free growth, and the decumbent stems, which spread a considerable distance, hang down from the stage, and thus form a living fringe. The leaves are small, almost round, and of a dark green colour. The flowers are white, tinged with pink, but they do not add much to the merits of the plant, its principal claim to recognition being its free growth and neat leafage.

### Luculia gratissima.

A large specimen of this magnificent Himalayan shrub, planted out in one of the beds of the Temperate House, is now in flower, and in this stage its beauty is unsurpassed. It succeeds much better planted out than when grown in pots or tubs, as under these latter conditions it is not always satisfactory. When laden with its large bright pink flower heads it is a sight to be remembered. Of all the different subjects that I have propagated from cuttings, this luculia is affected more than any other if the cuttings are allowed to flag before expansion, though Coprosma Baueriana variegata is nearly as bad.

### The Alpine House.

As might be expected, there is not a very long list of plants in flower thus early in the year, though some very beautiful and interesting subjects are already in bloom. The charming, and withal fragile-looking, Narcissus bulbocodium monophyllus serves to remind one of the coming daffodil season, while snowdrops are represented by the noble-looking Galanthus Elwesi Whittali, by Galanthus Elwesi itself, and Galanthus byzantinus. Helleborus niger (Christmas Rose), and its tall-growing variety, H. niger altifolius, supply bold masses of white, while the golden flowers of Crocus vitellinus and Sternbergia Fischeriana are very bright and effective. Beside these there are the distinct white-flowered Colchicum libanoticum, Merendera caucasica, Cyclamen ibericum, Alyssum Bornmuelleri, with tiny white flowers; Saxifraga Burseriana grandiflora, one of the finest of white-flowered saxifrages; the yellow-flowered Saxifraga apiculata, and Saxifraga Haagi, a pretty hybrid kind. Some pots of the Winter Heliotrope (Petasites fragrans) enabled one to enjoy the sweet-scented flowers better than when they are growing in the open. A word of caution must, however, be given with this last, as if planted out in good ground it will soon become a terrible nuisance.

K.

---

## CHRYSANTHEMUM MRS. L. THORN.

There are very few more reliable varieties than this; every small bud will develop into a clean flower, and every small shoot will bear a bud. The colour is a clear, rich yellow; the variety being classed with the Japanese incurved. I do not know of many varieties that bear flowers which will last fresh on the plants or in a cut state for a longer time. There is only one fault, not a serious one, namely, the young buds are very brittle and soon break off. The stems harden and do not readily snap off as the flowers develop; the leaves are usually mildew-resisting, and last fresh for a long period, even in semi-dark conservatories—a good point.

Geo. Garner.

## A BEAUTIFUL SINGLE CHRYSANTHEMUM.

The high degree of popularity to which the single-flowered chrysanthemums have attained within recent years was admirably exemplified during the past season by the many new varieties that were submitted to public notice during the past season. There were, it need hardly be said, some that failed to find favour with the Floral Committees of the Royal Horticultural Society and the National Chrysanthemum Society, but a considerable proportion were of so high an order of merit as to obtain distinction from one or other of the two committees or both, and to immediately attract the attention of those who appreciate the claims of chrysanthemums with single flowers. To the latter class belongs the beautiful variety Percy Arnold, illustrated herewith. The form of the blooms is so well shown as to render description unnecessary, and it will suffice to say that grown under ordinary culture the blooms are a trifle larger than they are represented in the illustration. Their elegance and adaptability for decorative purposes in a cut state is evident, and it remains to be said that the colour is rich pink, with a white zone round the disk. The variety was raised by Mr. W. Rigden, Englefield Green, and had an Award of Merit made in its favour at the meeting of the Royal Horticultural Society held on November 9 last.

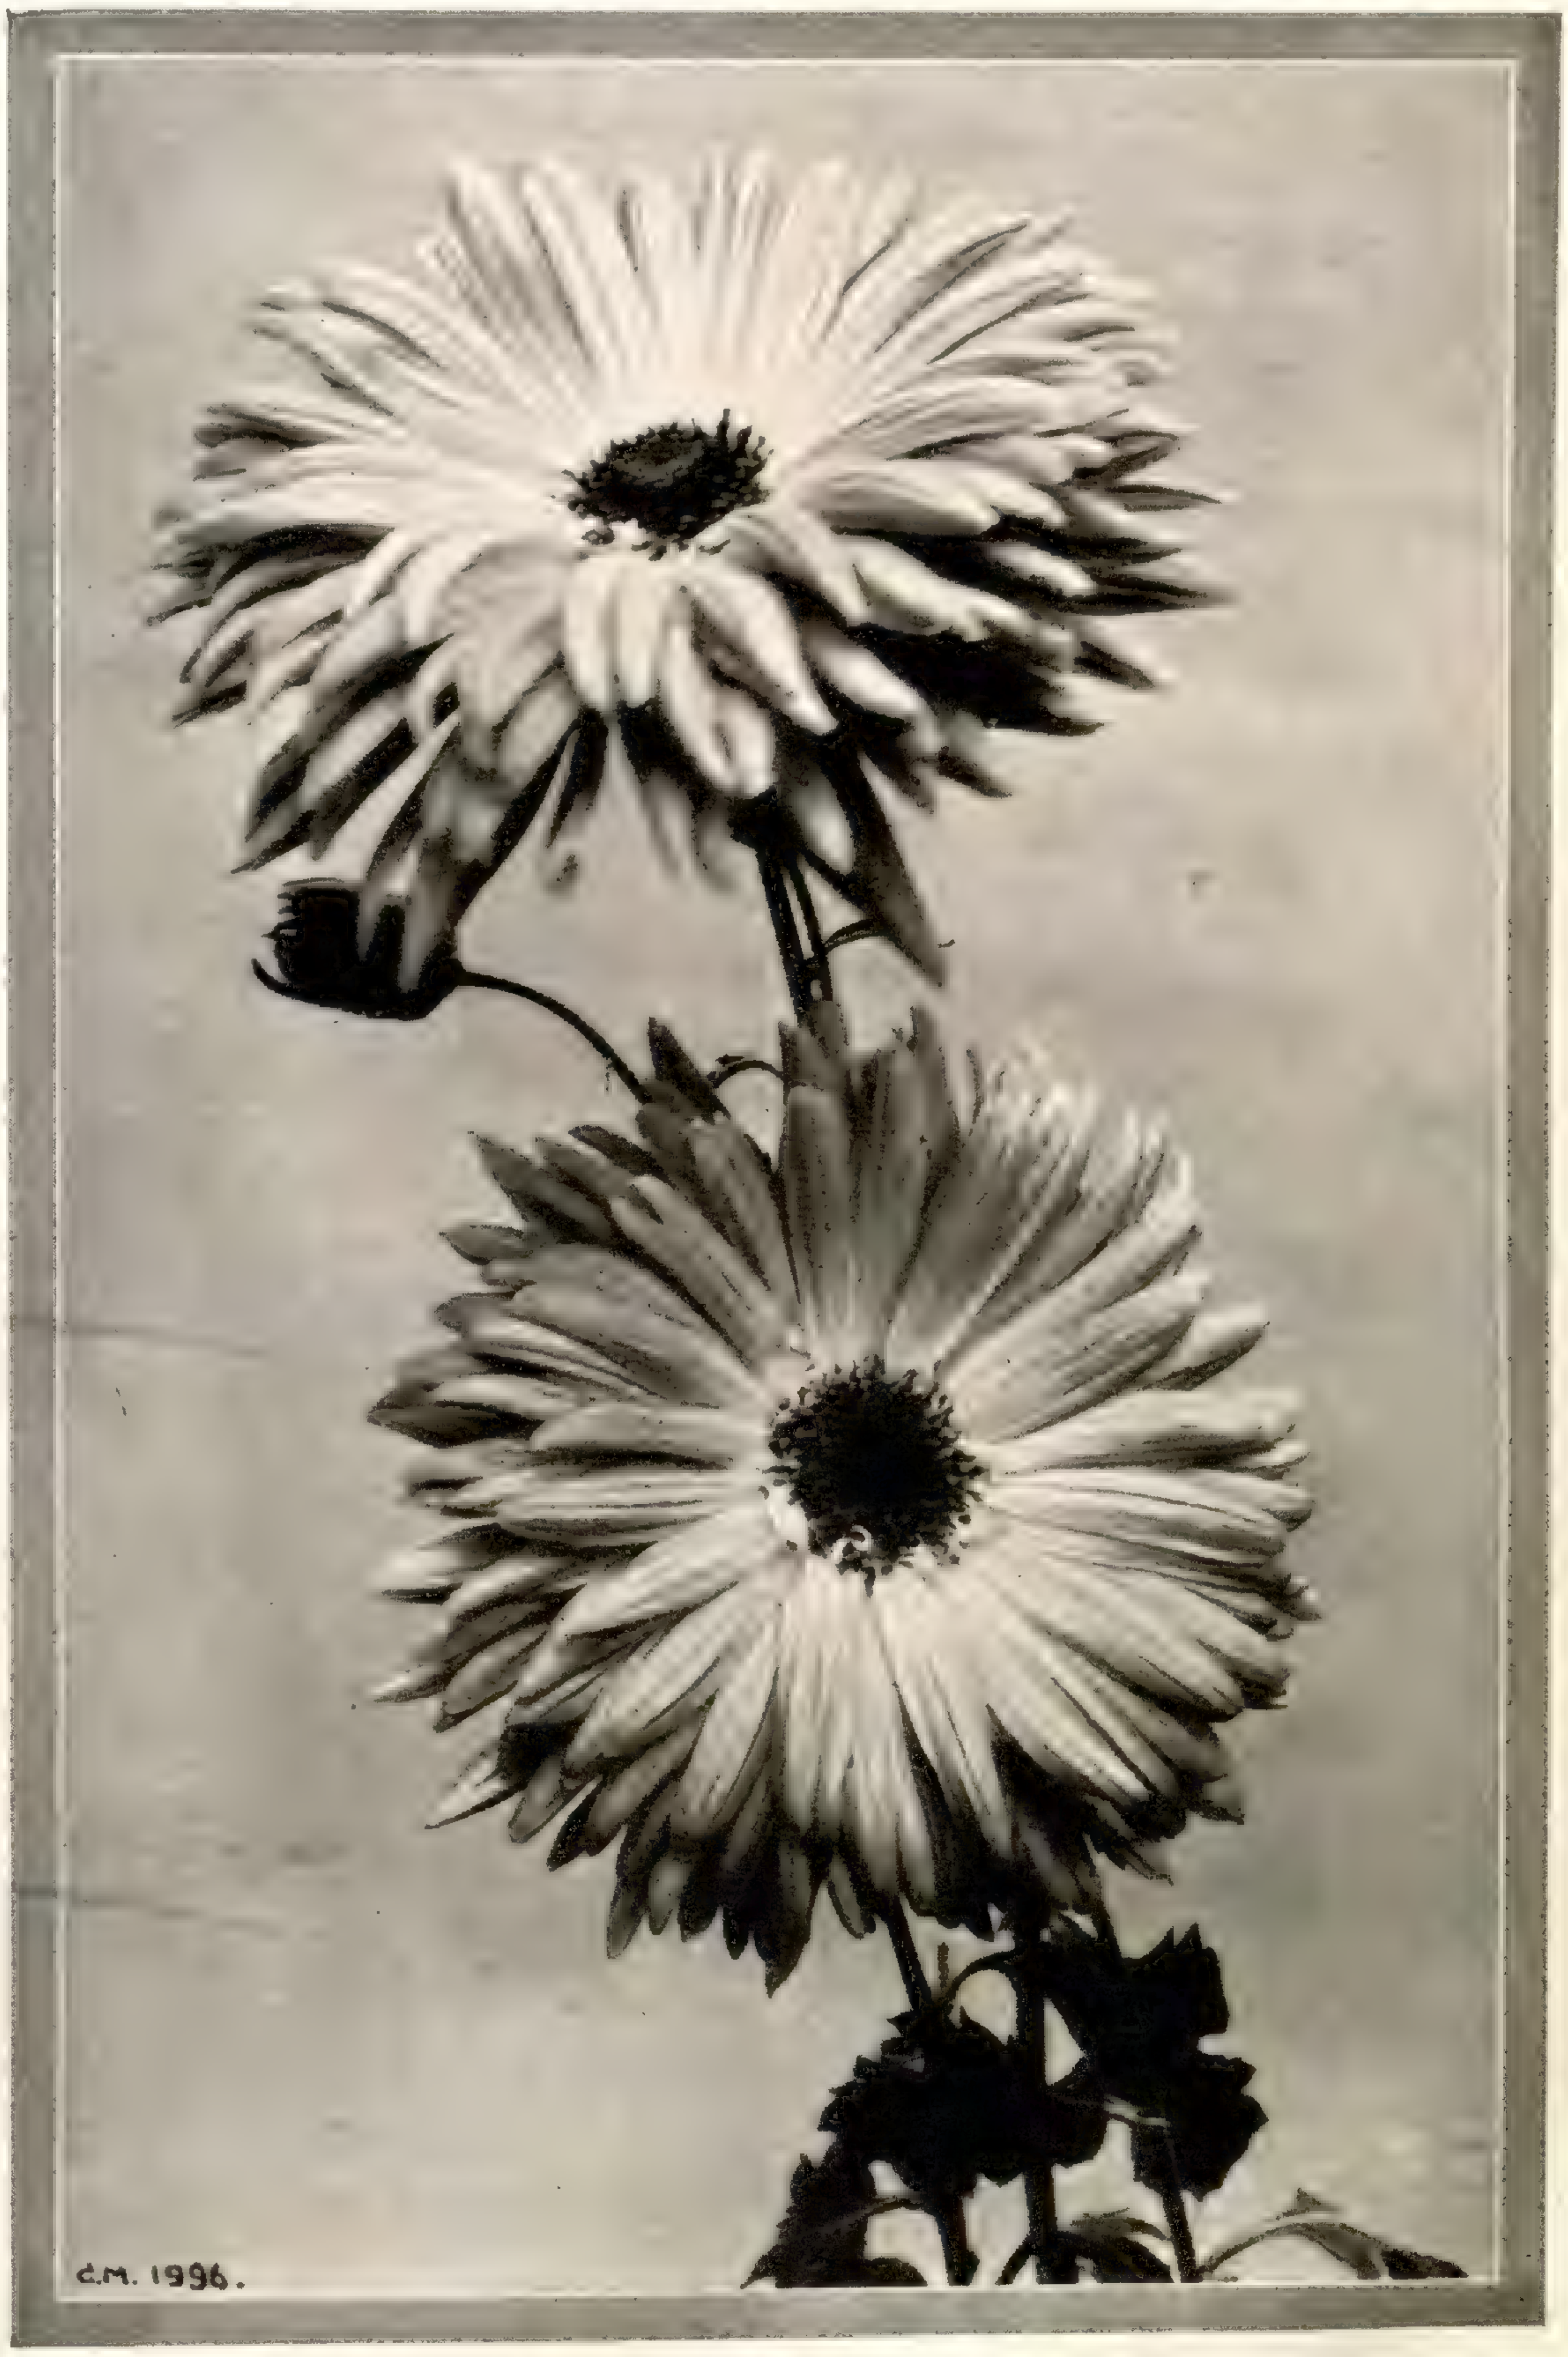
## APPLE COX'S ORANGE PIPPIN.

Many readers, besides myself, will have read "E. M.'s" experience with this variety as grown in a clayey soil, with much interest. I have never grown the variety in a really heavy loam, even; but in a light and medium heavy one only. I have, however, seen trees badly cankered in a clayey rooting medium. I confess to being extremely fond of Cox's Orange Pippin. My trees never cankered, but they made too much growth, and had to be root-pruned a little.

A gentleman living near had one tree of this variety in his garden, the soil of which was a very clayey one. He saw my trees, and asked me what he should do to his as it did not bear fruit, and was badly cankered, and after my suggestions had been made he said I could experiment with the tree, and kill or cure it. A trench was opened, roots cut off, some brought up nearer the surface, and some lighter soil was mixed with the original in filling up the trench again. "E. M." rightly draws attention to the fact that the roots will go down in such uncongenial soils, as in the case of the tree in question, nearly all the roots were found very deep down in the cold, hard sub-soil. We freely cut out all cankered parts of the branches, so much so that I could see through some of them near the junction of the main branches with the stem of the tree. Then the pared parts were twice painted with pure (undiluted) fir-tree oil. The following year a nice crop of fruit was gathered from the tree; the second year a heavy crop, and the healthy bark had covered all the wounds. The tree continued to bear satisfactory for several years, but I have not heard how it has behaved since I left the district. It presented a sorry appearance when first cut and dressed with the oil. This reference may be of some use to those persons who are growing a few specimens in a clay soil.

In my light soil the trees of Ribston Pippin cankered badly, and all my efforts only resulted in a very partial cure.

GEO. GARNER.



CHRYSANTHEMUM PERCY ARNOLD.

A distinct and beautiful single variety, raised by Mr. W. Rigden, with rather large blooms, which are rich pink with white zone round the disc.

# WORK FOR THE WEEK.

### THE ORCHID HOUSES.

CLEANLINESS. — It is desirable the cleansing of the houses, both inside and outside, should be brought to a conclusion as soon as possible, so that everything is ready when the busy season commences. It is essential that all wood work, walls, glass, stages, should be scrubbed thoroughly clean, as cleanliness is one of the greatest aids to good cultivation. The inmates of the various houses should also be thoroughly cleansed. Every plant before being put back in its quarters should be dipped overhead in a solution of some approved insecticide, and all dirt, insects and other pests removed. Many growers object to removing the outer sheaths of cattleyas, and other plants of that class, but when they are dried up and easily removed, I do not hesitate to remove them. By doing this, a nice stock of scale and other insects, which infest this class of plant, is exposed. If these are not eradicated, the plants will succumb sooner or later. Light is a necessity in the cultivation of orchids as of other plants, therefore the glass at all times should be kept scrupulously clean, so that the maximum amount of light may pass through it.

WATERING.—Success in plant cultivation in their artificial homes depends entirely on the application of water, or the withholding of it. Each family of plants will require different treatment in this respect, and in many cases different plants of the same kind will vary in their requirements in the amount of water they require. In some cases the error is made of giving too much water at the roots with the idea of keeping the pseudo-bulbs plump and hard, and in not a few instances they are seriously injured. On the other hand excessive dryness is quite as harmful, and anyone studying this question must take pains to understand his plants. In the warmest division (East Indian house) such evergreen epiphytal orchids as ærides, saccolabiums, renantheras, angræcums require water in sufficient quantities to prevent loss of foliage. When the sphagnum moss on the surface assumes a whitish colour, it will show at once that water is required; therefore the compost should be thoroughly soaked, and left until it becomes dry again. The species of phalænopsis at this season should have close attention in the matter of watering. Cypripediums of all kinds require water whenever they appear in the least dry. Catleyas and lælias require less moisture at the roots now than at any season, excepting those plants which are now making new growths, or developing flower spikes. The object at this season should be to induce the development of roots, but not growth, and to ensure this give just sufficient water to keep the pseudo-bulbs and leaves green and plump. Cattleyas and lælias will not root in a compost that is heavily charged with moisture. Vandas of the V. tricolor and V. suavis section occupying the cooler end of the cattleya house, should, as soon as they are rooting freely, have sufficient water to encourage the sphagnum moss to grow luxuriantly. Vandas of the terete-leaved section, such as V. teres and V. Hookeriana, should have sufficient water to prevent shrivelling, as this in any orchid is a source of much danger. The various genera which occupy the cool houses, such as odontoglossums, oncidiums, masdevallias, and maxillarias, are in a growing state almost at all times, and should be watered often enough to keep the compost moist, but in no case should the latter be allowed to become saturated. Cochliodas, odontiodas, and plants of this class must have water whenever the compost appears dry.—J. T. BARKER, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

PREPARATION WORK.—With the opening of the New Year, the successes and failures of the one that is past should be carefully considered, and the lessons of the most recent experience be taken advantage of. Plant life under glass with the slow return of sunlight and lengthening days will gradually become active, and many things will need attention. Chrysanthemums will have yielded their blooms, and cuttings will be in demand. The first batch of these put in small pots in November will now be rooting freely, but some of the varieties are slow in producing new growths suitable for cuttings. Where the stock of plants of any of the varieties is limited, the stools should be placed in a light, airy house, with a genial temperature, and as near to the glass as possible, and sprayed occasionally to encourage them to produce strong cuttings, as those which are drawn seldom make vigorous plants. The best results are obtained by placing four cuttings in each three-inch pot; the compost should be two parts fine sifted loam, one part leaf-soil, one part coarse silver sand. Place the pots in a propagating frame in an unheated house, keep close for a few days, and when the cuttings commence rooting admit air gradually.

BULBOUS PLANTS.—Roman hyacinths are plentiful and good; hyacinths and tulips are growing freely, and should be removed from the ash bed and, if well rooted, started in batches. Paper White and Gloriosa narcissi will also be soon in bloom; freesias and lachenalias are also showing their flower spikes. Liquid manure is very beneficial to all bulbous plants, commencing with small quantities and gradually increasing the supply as the flower spikes develop.

HIPPEASTRUMS.—These should be carefully examined, and those showing flower spikes should be top-dressed and transferred to a warmer house; top-dress if necessary with a mixture of fibrous loam and well-rotted manure and coarse sand. Do not give any water until the flower spikes are well above the top of the bulb, or the foliage will grow and the flower spike remain dormant.

BEGONIAS.—Gloire de Lorraine and its varieties are now making a glorious display. As the plants go out of bloom they should be cut down and given a short rest for a couple of weeks by withholding water. Subsequently they should be top-dressed and placed where they will have the assistance of a warm temperature and moist atmosphere. An early vinery is an ideal place for the plants, giving frequent syringings overhead.

WINTER-FLOWERING CARNATIONS.—These will now be producing plenty of flowers which will improve with the increased light. Give liquid manure every alternate time of watering, as carnations are gross feeders. Cuttings of these should now be put in whenever procurable. These are best inserted in three-inch pots, four or five in each. The pots should be washed and filled with silver sand, watering each thoroughly. Insert the cuttings when ready, press firmly, and place in the propagating frame in a temperature of 60 degrees, keeping close until rooted, which will be in from ten to sixteen days. Directly the cuttings are rooted they should be potted off singly, using small pots, and a mixture of fine turfy loam and sand, a dash of leaf-soil, or peat will be beneficial. The soil should be raised to the same temperature as the house in which the cuttings are already growing before using.—LEWIS SMITH, Shotesham Park Gardens.

## HARDY FRUITS.

PLANTING AND PRUNING.—The excessive rainfall of the past few weeks has considerably retarded the work of pruning and planting. It is to be hoped that as we have now entered the New Year the climatic conditions will be favourable to the completion of such operations as are in arrears. The soil in this district being of a light sandy loam does not feel the effects of a heavy rainfall, as in the case of heavy loams, and consequently we are enabled to carry on the work of planting and pruning, etc., when others who have to deal with loams of a stiffer nature can make but little, if any, progress. In the latter case it will be necessary to take advantage of every favourable opportunity for speeding up operations.

SPRAYING.—It will soon be time to prepare for spraying the trees. For the winter spray I have for several years used caustic alkali wash with excellent results. This I procure in tins, as I find it saves a certain amount of time and trouble, and is a convenient method where spraying operations are spread over a considerable area. To those who prefer to mix the materials for themselves I append the recognised formula: 3lbs. soda carbonate—(1 p.c. 98), 1lb. potash carbonate, 3lb. soft soap, 10 gallons of water. Indiaruber gloves should be worn during spraying operations to protect the hands.

GENERAL REMARKS.—During wet days coping boards (where used) may have a coat of paint, shreds cut ready for use, gooseberry and currant cuttings prepared and laid in for insertion when a favourable opportunity occurs. Rake up and burn all prunings as the work proceeds. A short length or two of trellis will be found very handy for wall tree work; the soil does not become panned down by the constant movement of the feet, and the operator works under more comfortable conditions. The pieces of bark used as a protection against excessive sunheat should be removed from the stems of wall trees, and if sound and serviceable, plunged into boiling water for a few minutes. Fresh pieces should receive the same treatment to kill any insect life which may be present.

PEACHES AND NECTARINES. — The pruning, spraying, and tying-in of peaches and nectarines is usually left over until all other kinds of fruit trees have been attended to, with the result that, owing to pressure of other work, the above operations are unduly hurried over. If the trees were carefully pruned immediately after the fruits were removed, very little pruning will now be needed, merely cutting out any faulty shoots which may have been overlooked with the trees covered with foliage. The trees should be loosened from the wall, tying the bunches into convenient sized bundles, and then sprayed with a suitable insecticide, thoroughly damping every portion of the tree. The wall should also be thoroughly cleansed to destroy any insect life which may be hidden in the holes and crevices. This applies more particularly after the experience of the past hot summer, when red-spider was so very much in evidence. The arrangement of the branches and shoots may follow closely on the heels of the spraying. The distance between the shoots should be ample for the laying-in of young growths without undue crowding. To obtain fruits of the best quality, and well-ripened shoots for the following season it is most essential to train thinly. Apart from peach cases, blinds, and netting are the usual means of affording protection. If these are early placed in position the flowering period may be considerably retarded. — W. MESSENGER, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

SOIL PREPARATION. — The weather of the past month will be remembered in this locality for its abnormal rainfall; a record month's fall for the last ten years here, viz., 10.76in. As the result, trenching and digging will be in arrears. With fairer weather these operations must be pushed on with all possible speed, bearing in mind in carrying out this work the many lessons of the past excessively hot and dry season. A system of deep digging, whether "bastard" or double digging, should be practised as far as one is able, as deep cultivation will promote a lasting and steady growth throughout any trying period that may occur. Manure, both long and decayed, should be used, as the work proceeds, where the ground is intended for peas, beans, onions, cauliflowers, and such gross feeding plants. Other plots, provided they were manured for the previous crops, and are now intended for parsnips, carrots, beet, and even potatoes, will only require trenching. Then previous to sowing the seed give a good dressing of old leaf-soil, burnt garden refuse, soot, and lime, and harrow it in. When digging or trenching always leave the surface as rough as possible, to enable the action of the weather to pulverise and sweeten it.

BROCCOLI.—These have up till now produced a regular supply of excellent heads, due to the mild weather we have experienced. Precautions should now be taken to maintain a constant supply by lifting the most forwardest plants with a nice ball of earth, and plant them thickly in pits or even cold frames. In open weather remove the lights entirely, unless "curds" are scarce, when every encouragement must be given to maintain a steady growth. It is remarkable what nice heads are obtained in this way. Winter Mammoth and Snow's Winter White are two excellent kinds at this season.

SEAKALE.—This is so important a crop that it might be regarded as indispensable. At this season it will force quite easily if placed in pots or boxes with light soil, and placed in a dark and warm place; a daily syringing is all that is required. Insert the crowns at intervals of ten days. If the whole are not consumed, cut when about eight inches long and stand in shallow water. It will keep a few days treated thus in a cool dark place.

TOMATOES.—The autumn sown plants have made a fine steady growth this season, and will now benefit by a shift into 5 or 6-inch pots. Use a rather light compost of loam, leaf-soil, and a dash of sand. Do not pot too firmly; and when potted place near the glass in a structure with a temperature of 55 degrees. Be sparing with water.

GENERAL REMARKS.—Maintain a constant supply of salads. Chicory and dandelion can be placed in the mushroom house at intervals of ten days; mustard and cress sown in boxes in gentle heat. Endive is far crisper and nutty if blanched in a cool temperature, a cold frame for preference, where a clean mat can be placed over it in the frame besides matting the glass also. In frosty weather litter may be required. Procure protecting material, such as long litter, bracken, or fir boughs, which can be used as a protection against wind in exposed places. Have under cover loam, sand, leaf-soil, and burnt garden refuse, as many seeds should be sown from the middle of the month onwards. Make boxes suitable for seed sowing during wet weather; prepare early potatoes by standing them up in boxes in a light warm position to sprout previous to planting in pots, boxes, and frames.—G. ELLWOOD, Swanmore Park Gardens.

## WEATHER OF 1911.

The first nine months of the past year will long be remembered by gardeners and farmers alike, especially in the Midland and South-Western counties, as being by far the driest period on record. There was nothing approaching it since 1847, when the rainfall in the south for the first nine months of that year was 11.40 inches, and as the remaining three months in 1847 were also dry, the total fall for the year was only 17.58 inches.

But, though the first nine months of 1847 were so dry, the same period this year even beat that record, for only 10.41 inches of rain fell as measured in my rain guage, which is 157 feet above sea level, and is too far from the hills to be affected by them. But the last three months of the past year were wet, and in some places the rainfall was so heavy as to bring the total up to near the average; while in other districts it has even been over the average. With us, however, not far from the city of Gloucester, the rainfall for the year up to December 29 was very near the normal, being 22.69 inches.

Those whose memories will carry them back as far as 1851, may recollect the dry period that was then experienced, for during the last four months of that year there was only 5.63 inches of rain. This was followed by the wettest year on record, when there was a fall in the South of England of over fifty and a-half inches. There are many who can recollect as far back as 1858, who will no doubt remember that extraordinary year, when July was by far the wettest month of the whole twelve. Up to the end of September there was a fall of 13.57 inches, of which more than a quarter was contributed in July. The fall for the whole year being 19.36 inches. Well do I remember the dry summer of 1868, but it was only of short duration, for the rainfall of that year up to the end of September was 19.97 inches. It must, however, be mentioned that January, 1868, was a very wet month, contributing nearly four and a-half inches, and December 6.51 inches, bringing up the total fall for the year to 30.51 inches. This was followed by one of the mildest winters on record.

We next come to 1870, which, up to the end of September, had produced only 13.37 inches, but the three last months brought up the total to 24.99. Again, in 1874, we had a dry period, the rainfall to the end of September being 15.49 inches, and the fall for the whole year 24.65 inches. There have been several dry periods since, but none of very long duration; the driest of all was in 1893, when in some places, between the first week in March and the end of June, hardly any rain fell; but July of that year was very wet, there being heavy thunder storms in places. January and February were also wet months, there being a fall of over seven inches, but the weather cleared up in March, and there was but little rain between that month and July, but by the end of September there had been a fall of 17.69.

I mention the foregoing as showing that there has not been such a long period of drought since a record of the rainfall was kept; and, having compared these with that of the present year, it will be seen that no season approaching it is to be found since 1847. But there are other conditions besides the rainfall that make the year 1911 a remarkable one, as will be seen by looking more fully into the details of the conditions of each month separately. January was mild up to the end, when there was a sharp frost. Our thermometer registered 15 degrees. Between the 12th and the end of the month the weather was fine, which enabled us to proceed with all outside work. The readings of the barometer were very high, only on one occasion did it fall below 30. The rainfall for the month was .91 inches.

February opened with frost, but this was of short duration, only lasting a few nights, after which the temperature rose, and the month throughout was comparatively mild and dry, especially up to the 13th, after which there were slight showers most days until the end, the total rainfall being 1.28 inches. The barometer for the first half was very high.

March was a showery month, rain falling on fifteen days the total fall being 2.15 inches. During the latter part the prevailing wind was from the north, and, though there were no severe frosts, the nights were cold, as only on two occasions did the minimum exceed 40 degrees, and this in the early part of the month.

April was a dry month, there being only .78 of rain. The wind for the first half was northerly, and the night temperature was low. The barometer was high throughout the month.

In May genial weather as a rule prevailed, but there was no exceptionally high temperature until the latter part of the month, when on several occasions the thermometer rose in the shade to over 80 degrees. The month throughout was very dry, the total rainfall being .77 inches.

June was a fine genial month, and only on six occasions did the maximum fail to reach 70 degrees in the shade. The night temperatures were for the most part also high, the average being 48 degrees, though on the 10th the temperature fell to 36 degrees. Rainfall was partial, but here we registered 2.24 inches.

The weather in July was quite exceptional; day after day the skies were like steel, not a cloud to be seen. The temperatures in the daytime were very high. On nineteen days it exceeded 80 degrees in the shade, in addition to five others when we registered over 90 degrees. It was remarkable that, although the weather was so hot, and at times very close, there was no thunder storms. The barometer was steady throughout the month, and the only rain we registered was .07 inch, and this at the end of the month.

In August, also, the day temperature was very high. On six occasions the maximum exceeded 90 degrees in the shade, the highest being 99 degrees, on the 9th; while on twelve others it was over 80 degrees. The rainfall for the month was 1.35 inches, and the barometer was steady.

The maximum temperature for the first twelve days in September were also very high, on eight occasions the reading exceeded 80 degrees in the shade, and on two over 90 degrees. After the 12th there was a considerable fall in the temperature both day and night, this was especially so from the 14th to the 17th; while on the 21st we registered one degree of frost. The barometer was high throughout the month. Rainfall, most of which fell after the 19th, was .86 inches.

The early part of October was fine though somewhat foggy; on the 13th we had .64 inches of rain, and from the 19th to the end of the month there was rain more or less every day, though only in small quantities, the total fall being 2.95 inches. The temperature was not high during the month, the highest reading being 59 degrees. Only on two occasions did the temperature fall below 32 degrees, consequently the month throughout was mild, and the pastures resumed somewhat of their usual appearance.

In November there were only nine days in which there was no fall of rain, the total fall being 3.07. The heaviest fall in any twenty-four hours was on the 11th, when we registered .49 inches. The month for the most part was mild, but on the 21st eleven degrees of frost were registered, which considerably checked vegetation; excepting for that check grass continued to grow, and the fields once more looked fresh and green.

During December the weather was mild throughout. On eight occasions the maximum readings were over 50 degrees in the shade, while on only three occasions was there any frost registered. Rain fell more or less on twenty-eight days, the total fall up to the 29th being 6.26 inches. The barometer was very irregular, and only on occasion did the reading exceed 30; while the wind for the most part was south or south-east. So endeth one of the most remarkable years on record.

H. C. Prinsep.

# EXHIBITIONS AND MEETINGS.

◆

### Royal Horticultural Society.

The first meeting of the year was a good one, but the hall was not crowded, either with exhibits or visitors. Orchids were a good feature, while carnations, apples, home-grown oranges, and ferns were other notable subjects on view. The Orchid Committee had much business to transact, about forty plants being submitted for awards. The Chairman of this committee, with his usual generosity, added to his New Year's wishes a printed copy of the orchid awards granted in 1911, and a printed copy of new hybrid orchids and their percentage, for the year 1911; needless to say, his kindness was greatly appreciated. Novelties on Tuesday, January 9, included a good new pear, named Mrs. Seden.

FLORAL COMMITTEE.

Mr. H. Burnett, Guernsey, brought over some beautiful carnations, and exhibited bunches of charming flowers of Scarlet Glow, White Enchantress, Mrs. C. F. Raphael, Marmion, White Perfection, May Day, Mikado, Marmion.

Messrs. Barr and Sons, Covent Garden, had on view a number of snowdrops, freesias, gerberas, primulas, and a collection of small-leaved ivies.

Lady Northcliffe, a fine rich pink perpetual carnation, with fringed petals, and a sweet fragrance, was capitally shown by Mr. C. Engelmann, Saffron Walden. The flower is carried on a good stem, and has a perfect calyx.

Very beautiful were the camellias from Messrs. Wm. Paul and Son, Waltham Cross, which filled one corner of the hall. The plants were pictures of health, and carried abundance of flowers; the older double forms were well in evidence, but the single or semi-double Apollo, Adelina Patti, Mars, Donckalaari, Waltham Glory, and Festa were especially admired.

Messrs. H. B. May and Sons, Edmonton, contributed a collection of adiantums, the newer plumosa nephrolepis, davallias, and a collection of elegant hardy varieties of Polypodium vulgare, P. v. pulcherrimum, P. v. cambricum, P. v. multifidum, and P. v. cambricum Barrowi were all charming.

Perpetual carnations were admirably shown by Messrs. Wm. Cutbush and Son, Highgate, and the charming flowers in a variety of colours, well set up; the same firm showed hellebores, early irises, the pretty witch hazels, heaths, liliums.

Messrs. W. Wells and Co., Merstham, had a small exhibit of carnations, and showed White House and White Wonder in good condition.

Zonal pelargoniums came from Messrs. H. Cannell and Sons, Swanley, and these, set up in big bunches, contributed a fine bank of colour, and served to indicate varieties useful for winter flowering.

Mr. E. Guile, The Gardens, Short Grove, Newport, staged a pretty rose-pink perpetual carnation, named Lady Meyer, a variety of great promise.

Messrs. Young and Co., Hatherley, also showed perpetual carnations, and their chief variety was a new seedling, named A. H. Montgomery, a shapely flower of a particularly bright purplish-lavender hue, quite distinct, and very attractive.

A bright exhibit from Messrs. Jas. Veitch and Sons included greenhouse rhododendrons, the beautiful and rare Urceolina aurea, freesias, the fine Winter Cheer begonia, Indian azaleas, and camellias, the useful winter-flowering Moschosma riparia, and Coleus thyrsoideus.

Messrs. Stuart Low and Co., Enfield, displayed carnations in great variety, and made a feature of Lady Alington and Baroness de Brienen; with these were fine strains of cyclamens, the plants staged in baskets of a variety.

Primula malacoides and Indian azaleas were largely shown by Mr. L. R. Russell, Richmond, who also had a number of Witch Hazels and Garryas.

Messrs. Allwood Brothers, Haywards Heath, staged carnations, and put them up in stands and vases of varying heights; Lady Alington and Wivelsfield Wonder (A.M.), recently figured in our pages, were prominent varieties.

Messrs. J. Cheal and Sons, Crawley, put up models of garden screens, garden seats, arbours, tea houses, etc., and also staged a small rock garden.

Mr. G. Reuthe, Keston, and Messrs. J. Peed and Sons, each staged alpines.

From the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, came an attractive stall of useful works on gardening, these covering a wide range of subjects.

### ORCHID COMMITTEE.

A handsome exhibit of orchids from Messrs. Sander and Sons, St. Albans, contained some fine forms of Lælia anceps, a large plant of Lælio-cattleya Charlesworthi, L.-c. Ophir, the interesting Cypripedium caudatum Sanderæ, with "tails" over 18 inches long, Cymbidium Holfordianum, Cœlogyne Gardnerianum, and such fine cypripediums as C. Golden Oriole and C. Jucundum, and a few odontoglossums.

A pretty exhibit of orchids from Messrs. Jas. Veitch and Sons, Chelsea, consisted largely of the useful old Zygopetalum Mackayi, several dozen spikes being presented. Cypripediums, notably C. insigne Sanderæ, were shown in force, and a few odontoglossums were exhibited.

Calanthe Veitchi was prominent in the group displayed by Messrs. Stuart Low and Co., Bush Hill Park, Enfield; with these were Cypripedium callosum Sanderæ, C. Euryades, C. Niobe, Vanda cærulea, and some white forms of Lælia anceps.

The bank of orchids set up by Messrs. Armstrong and Brown, Tunbridge Wells, was a very attractive one, and a few of its leading features were Odontioda Vuylestekeæ, O. Bradshawæ, Cymbidium Gattonense, Calanthe Harrisi, the strong C. bella, Cypripedium Cupid, C. Helen, C. Armstrongæ, C. nitens Queen of Yellows, C. insigne Aberdeen, C. eboraicum, Cattleya Maggie Raphael alba, and some splendidly marked odontoglossums.

The five-lipped Lælia anceps Schroderæ was splendidly shown by Messrs. J. and A. McBean, Cooksbridge, who presented nearly three dozen spikes of this fine orchid. The odontoglossums were excellent, particularly a form of O. Lambeauianum, and the light varieties of O. crispum.

From Gatton Park, Mr. J. Collier, gardener to Sir J. Colman, Bart., brought a big specimen of Dendrobium speciosum nitidum, with about thirty spikes of yellowish flowers; Masdevallia macurua, Lælio-cattleya Epicasta Gatton var., Lælia bella, and Phaiocalanthe Colmani were also well shown.

Lælio-cattleya bella alba, a fine Cattleya Octave Down, with four beautiful flowers, and the bright yellow L.-c. Ariel and Odontioda Schroderiana were shown by Messrs. Charlesworth and Co., Haywards Heath.

Mr. W. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, showed some splendidly grown cypripediums, the fine C. San-Actæus Westfield var. gaining an A.M.; C. D. S. Mills carried six splendid flowers; Lælio-cattleya Mrs. W. Hopkins (L.-c. Haroldiana magnifica and L. Iona nigricans), with intense crimson-purple lip and yellow sepals and petals, the latter mottled with purple, was very fine, and gained an A.M. unanimously.

From the Dell, Mr. Shill, gardener to Baron Schröder, brought up a superb plant of Lælio-cattleya Bella alba, The Dell var. (F.C.C.), carrying six splendid white and purple flowers.

Mr. H. Alexander, grower to Sir G. Holford, Westonbirt, Tetbury, showed Cypripedium Brouyena, with a wonderful crimson-purple dorsal sepal; and C. nitens Leeanum. Cypripediums were well displayed by Messrs. J. Cypher and Sons, Cheltenham, and C. Mrs. W. Mostyn, C. Felicity, C. Minos Youngi, C. aureum Surprise, C. Euryades splendens, and C. Fascinator were all in fine form.

M. Firmin, Lambeau, Brussels, sent a new orchid named Odontiona Firmini, and said to be a cross between Miltonia vexillaria and Odontoglossum crispum, but doubts were expressed as to M. vexillaria being one parent; the white flowers were very pretty.

Walter Cobb, Esq., Normanhurst, Rusper, gained an A.M. for Odontoglossum crispum Queen of the Morn, with rosy flowers; and J. Gurney Fowler, Esq., Glebelands, South Woodford, gained an A.M. for Cypripedium nitens Beckensis, a bold and big flower, evidently of C. Beckmanni parentage. A fine form of C. Hera came from Sir Trevor Lawrence, Bart., Dorking.

Messrs. Hassall and Co., Southgate, showed a good specimen of Masdevallia Schrœderæ, and bright forms of Odontoglossum amabile and O. laudatum.

Mr. Edward V. Low, Vale Bridge, Haywards Heath, exhibited the lovely Dendrobium Phalænopsis album G. S. Ball's var., of purest whiteness; Cypripedium Leeanum Clinkaberryanum, C. The Nizam, C. Minor Youngi, etc.

Mr. Hunter, gardener to the Duke of Marlborough, Blenheim Palace, Oxford, gained an A.M. for Cypripedium Cataline, which has a bright rosy dorsal sepal. Cymbidium Rosefieldiense, a fine hybrid between C. Tracyanum and C. gigantea (A.M.), was shown by Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks, who also exhibited some beautiful dark-coloured forms of Lælia anceps.

### FRUIT AND VEGETABLE COMMITTEE.

Apples were magnificently shown by Messrs. Jas. Veitch and Sons, Chelsea, this firm filling one long table with one hundred and three dishes or baskets of splendid fruits, each dish or basket representing a distinct variety. The individual fruits were fine in size, handsome in colour, and quite free from blemishes. A few varieties that were of outstanding merit were Blue Pearmain, Belle Pontoise, Reinette du Canada, Lane's Prince Albert, King of the Pippins, King of Tompkin's County, Blenheim Orange, Barnack Beauty, Bismarck, Wadhurst Pippin, Sandringham, Newton Wonder, Bow Hill Pippin, Gascoigne's Seedling, Cox's Orange Pippin, and Annie Elizabeth. The firm showed a new pear, a highly-flavoured rounded fruit, crimson flushed, obtained by crossing Seckle with Bergamotte d'Esperen; the name is Mrs. Seden, and an A.M. was granted it.

Of unusual interest was the big exhibit of oranges contributed by Messrs. T. Rivers and Son, Sawbridgeworth. Large trees laden with fruits, were staged, as well as a host of picked fruits. Lemons and grape fruits were also shown, but the White, Achilles, Excelsior, Silver, Egg, Bittencourt, and Navel oranges were by far the most interesting and attractive items in a splendid exhibit that was a fine feature of the show.

Messrs. Sutton and Sons presented a collection of New Year salads and vegetables; the savoys, cabbages, Winter Mammoth broccoli, and Brussels sprouts were especially good. There were climbing French beans (Tender and True), forced dandelion, Batavian endive, and Christmas salad.

Mr. T. Taylor, gardener to Frank Bibby, Esq., Hardwicke Grange, Shrewsbury, showed a good collection of well-preserved apples and pears, the latter including Easter Beurre, Glou Morceau, Beurre Rance, Oliver des Serres, and Josephine de Malines.

Mr. Gentle, gardener to Mrs. Denison, Little Gaddesden, Berkhamstead, put up two dozen dishes of wonderfully clean and well-kept potatoes; The Factor, The Provost, Ideal, Up-to-Date, Monarch, Satisfaction, and Goldfinder were the pick of a good set.

### CERTIFICATES AND AWARDS.

First-class Certificate.—To Lælia-cattleya Bella alba, Dell var., from Mr. Shill, grower to Baron Schroder, The Dell, Egham.

Awards of Merit.—To Pear Mrs. Seden, from Messrs. Jas. Veitch and Sons, Chelsea; to Lælio-cattleya Mrs. W. Hopkins, from Francis Wellesley, Esq., J.P., Westfield, Woking (gardener, Mr. Hopkins); to Cypripedium San-actæus Westfield var., from F. Wellesley, Esq.; to Odontoglossum crispum Queen of the Morn, from Mr. C. Salter, gardener to Walter Cobb, Esq., Normanhurst, Rusper; to Cypripedium Jucundum, from Messrs. Sander and Sons, St. Albans; to Cattleya Maggie Raphael, Orchidhurst var., from Messrs. Armstrong and Brown, Tunbridge Wells; to Cypripedium Catalina, from Mr. Hunter, gardener to the Duke of Marlborough, Blenheim Palace; to Cymbidium Rosefieldiense, from Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks; to Carnation Wivelsfield Wonder, from Messrs. Allwood Brothers, Haywards Heath.

### MEDALS.

Gold.—To Messrs. Jas. Veitch and Sons, Chelsea, for apples.

Silver-gilt Banksian.—To Messrs. W. Cutbush and Son, Highgate, for carnations and greenhouse plants; to Messrs. Wm. Paul and Son, Waltham Cross, Herts., for camellias.

Silver Flora.—To Mr. H. Burnett, Guernsey, for carnations; Messrs. H. Cannell and Sons, Swanley, for cut pelargoniums; Messrs. Stuart Low and Co., Enfield, for carnations and cyclamen; Messrs. H. B. May and Sons, Edmonton, for ferns; Messrs. Jas. Veitch and Sons, Chelsea, for greenhouse plants; Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; Messrs. Stuart Low and Co., Enfield, for orchids; Messrs. J. Veitch and Sons, Chelsea, for orchids; Messrs. J. Cypher and Co., Cheltenham, for orchids; Messrs. J. and A. McBean, Cooksbridge.

Silver Knightian.—To Messrs. Sutton and Sons, Reading, for vegetables and salading; and Mr. Taylor, gardener to Frank Bibby, Esq., Hardwicke Grange, Shrewsbury, for apples and pears.

Silver Banksian.—To Mr. A. Gentle, gardener to Mr. Denison, Little Gaddesden, for potatoes; to Mr. Collier, gardener to Sir J. Colman, Bart., Gatton Park, for orchids; Mr. E. V. Low, Haywards Heath, for orchids; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Mr. L. R. Russell, Richmond, for flowering trees and shrubs.

Bronze Flora.—Messrs. Allwood Brothers, Haywards Heath, for carnations.

Bronze Banksian.—To Mr. E. Guile, Newport, for carnations; and to Messrs. Hassall and Co., Southgate, for orchids.

## GARDENING ENGAGEMENTS.

Mr. H. H. Mills, late gardener at Holmwood Park, has been appointed gardener to Hugh Morrison, Esq., Fonthill House, Tisbury, Wilts.

Mr. F. F. Street, late of King's Walden, Bury, has been appointed gardener to G. Oakley, Esq., Lawrence End, Luton.

Mr. William Barrie, for some years foreman in the gardens, Sandringham, has been appointed head gardener to the Dowager Countess of Leicester, Weasenham, Swaffham, Norfolk.

Mr. John Clark, during the past three years foreman at Latherton Hall, Aberford, has been appointed gardener to F. J. Gould, Esq., Avenue Picard, Maisons Lafitte, Paris.

**The Women's Agricultural and Horticultural International Union.**—With regard to women's work, which is claiming so much attention at the present time, it is interesting to note the steady progress made by the above association, founded in 1899. So important has the work now become that the room which has been placed at its disposal for office use, etc., by the hon. secretary, Mrs. Chamberlain, has now become quite inadequate for the requirements, and a new and enlarged office has been secured at 45, Queen Anne Chambers, Westminster, S.W., where full information concerning the Union may be obtained

## NEW BOOKS.

### THE CITY DIARY AND ALMANACK, 1912.

(The "City Press" Offices, 148 and 149, Aldersgate Street, London, E.C.). Price 1s., by post, 1s. 3d.

A more valuable work of reference to the City man than the "City Diary," the 1912 edition of which has just been published, it would scarcely be possible to compile. The annual is, indeed, a veritable philosopher and friend, and constitutes an up-to-date and reliable guide to the City in its many ramifications. It contains among other matters of interest a complete list of members of the Corporation; the names and addresses of the Clerks of the Guilds; particulars of the City churches, with the names of the clergy; detailed data concerning the Territorial Force of the City; and full information as to the personnel of the various municipal and parochial organisations of the one square mile. The "Diary" proper gives three days to a page, and is interleaved with blotting paper.

### THE GARDENING YEAR BOOK, 1912.

Edited by George Gordon, V.M.H. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, E.C.). Price 1s., post free, 1s. 3d.

The Gardening Year Book, which has now reached the fifty-fourth year of publication, appears in covers of a somewhat brighter shade of green than for some years past. The appearance of the book is a point of some importance, but it is far more important to know that the contents are not less remarkable for their freshness, interest, and usefulness than in the fifty odd editions that have preceded that for the current year.

In the opening pages the reader is provided with a diary that will be found of great value for recording facts specially concerned with the garden, and facing the diary pages are reminders of the work that should have attention, and if the value of these is fully appreciated, the numerous details involved in the management of a garden will be carried out at the time when the greatest possible advantage can be derived from them.

Immediately following the diary pages is the section which has long been highly appreciated by readers, in which the year's work in the garden is detailed in such manner as to enable readers to at once refer to the information of which they may be in need. In common with other of the standing features, this section has been thoroughly revised, and there is much new matter, and as the result the information is in every way up-to-date. The lists of new plants and flowers that were introduced during 1911 form as usual an important feature, for they are not only valuable for purposes of reference, but they indicate the trend of public opinion in relation to the garden, and also show the directions in which the activities of raisers are at the present time chiefly directed. The lists of new orchids show in a striking manner how strenuous is the endeavour of those who are engaged in the raising of new orchids. The chapters on annuals and biennials, hardy perennials, bulbous and tuberous plants, conservatory and greenhouse plants, not only contain ample information on the propagation and cultivation of an immense number of genera, and these the most important, for beautifying the garden, but selections of species or varieties, as the case may be, are given, and these, we know from past experience, prove of great assistance to those who have not the opportunities for obtaining that fulness of information essential to the avoidance of mistakes in making selections of plants. Hardy fruits and vegetables are dealt with in a similar manner, but the cultural details are somewhat fuller.

The chapters on insect pests and fungoid diseases are so arranged as to place readers in possession of the information necessary to successfully combat the various insects and fungi that are destructive to plant life. The chapter devoted to recipes is closely related to the two last-named, for therein are directions for the preparation of the various spray fluids, etc., that have in practice been found the most effectual in the prevention of fungoid attacks and the eradication of insect pests.

The directories of the public parks and gardens and horticultural societies maintain the important positions they have so long occupied, and, as in past years, have been subjected to the most thorough revision, with the aid of returns obtained from the municipal authorities and secretaries of societies.

"Histoirê des Légumes." By Georges Gibault. (Librairie Horticole, 84bis, Rue de Grenelle, Paris.) Price 5 francs.

For many years past our old and valued friend, M. Georges Gibault, the erudite librarian of the National Horticultural Society of France, has occupied a foremost position in the horticultural world as an authority on the history and literature of gardening. We do not forget his very valuable and instructive essay on ancient horticultural literature published some few years ago, nor the many contributions from his pen in the journal of his society, and the other organs of the French horticultural Press, all of which to the curious student of horticulture have a charm and a value peculiarly their own, for, as we have already hinted, M. Gibault is *facile princeps* in this special department of horticultural literary work.

The book now before us is of great interest. It will not, and does not pretend to, teach the tyro how to grow the "gros légumes" for show. It is frankly and undisguisedly a book for the student, the writer, the lecturer, and the literary amateur interested other things than mere cultural details. M. Gibault takes the whole series of well-known vegetables, and, we might add, to some English people, even unknown vegetables, and traces far back into the remote mists of antiquity the numerous references by the classic writers, and the descriptions and allusions by those of mediæval times right through the ages down to modern days. The process by which all this literary, historical, and even etymological material has been gathered, collated, and classified, must have extended over many years. And the patience, skill, and determination necessary to put it all into readable and instructive book form needs the capacity of a past master in such work.

Briefly, we may say that the contents include somewhat more than 400 pages of excellently printed matter; the type clear and readable. The text is divided not so much perhaps into chapters as into a series of practically independent essays, of which only a very few are illustrated. The subjects dealt with by our author are ninety-five, and among them we may mention the garlick, carrot, asparagus, artichoke, beet, celery, chervil, cabbage, lettuce, spinach, seakale, turnip, onion parsnip, potato, leek, pea, bean, radish, etc., among the more popular of our vegetables. In some of these essays, notably that on the potato, there is quite a large space devoted to it, and the references are very numerous. Thus he quotes the Spaniard Pietro Cieza de Léon, who mentioned it in 1532-35, and other Spanish authors of later date. Sir Walter Raleigh, Admiral Drake, John Gerarde Clusius, Bauhin, Parmentier, Olivier de Serres, are others called into requisition on the subject.

To the student of horticultural literature and history, M. Gibault's most recent work will appeal not only for its references, and quotations, but also on account of its readable and interesting style. The book also has great value as a work of reference, and in this respect it can be recommended for the bookshelf of such as require a horticultural working library, and to whom the reading of such a book in the French language presents no difficulty.

## ANSWERS TO CORRESPONDENTS.

CUCUMBER AND TOMATO CANKER.—W. F. B., Cornwall: In your letter you inform us that in the course of the autumn of the past year you lost a house of tomatoes from a disease which you were unable to recognise, and the cucumber plants in an adjoining pit suffered in much the same way, but not to the same extent. You further tell us that you are anxious to avoid a similar loss, and will be glad of any help we can give you. We are anxious to assist our readers to the fullest possible extent, but to enable us to do this in your case you should not only have submitted your question when the plants showed signs of ill-health, but have sent a portion of one of the stems with a few leaves that we may have been placed in a position to determine the cause of the mischief. But as you are careful to inform us that the first indication of ill-health was the wilting of the leaves, and that this was followed by the collapse and death of the plants, and that the lower nodes of the stems presented a swollen watery appearance and exuded gum, we have no doubt as to the cause. The disease was the cucumber and tomato canker, caused by the fungus known as Mycosphærella citrullina, which has made its appearance in this country within recent years and done considerable damage. The result of any preventive measures that may have been taken in this country has not been published, but there is good reason for believing that free ventilation will render good service in warding off attacks. This disease is very destructive to melons in America, and it has been found there that, while spore inoculation was quite easy in glass structures in which a rather high temperature and a moist atmosphere was maintained, the inoculations of plants growing in the open nearly all failed. It is very probable that occasional sprayings with Bordeaux mixture would be useful in warding off attacks.

FORMING A ROCK GARDEN.—S. B. H., Lancashire: We have within recent years given much information on forming and furnishing rock gardens. Necessarily the information is scattered through several volumes, and therefore to save your time we advise you to obtain "Rock Gardens and Alpine Plants," which we recently reviewed in these pages. The author is a master of his subject, and the information is thoroughly sound, and given with that clearness of statement that is none too common. It may be obtained from the publishers, 148 and 149, Aldersgate Street, London, E.C., price 2s. 9d., post free.

JAPANESE AND INDIAN PINKS.—T. S., Essex: The varieties Dianthus Heddewigi and D. chinensis, which are commonly known as Japanese and Indian pinks, are admirably adapted for contributing to the attractions of the flower garden during the summer months, and we are sorry that you did not succeed with them so well as you could have wished. The severe drought most probably checked the growth of the plants, but their failure to produce flowers until the summer was well advanced was due to your not having raised the plants early enough in the year. These dianthuses are biennials and not annuals, as you assume, and therefore have, when required for the production of summer effects, to be raised at an earlier period in the year than is necessary in the case of annuals. We advise you to obtain supplies of seed at once, and sow it immediately it is received. Sow the seed thinly in shallow pans or in five-inch pots, and place the seed in a pit or house where it will have a temperature of about 60 degrees during the germinating process, and the seedlings can have a position near the glass when they make their appearance above the surface. Prick off the plants into shallow boxes when they are becoming crowded, putting them about three inches apart each way. When established remove to a pit or frame where they will enjoy uninterrupted light and have sufficient warmth to maintain them in a progressive state. By this course of procedure you will have strong plants that will commence flowering soon after they are established in the beds. We need hardly say that watering must have careful attention, and that they must, as in the case of other plants raised under similar conditions, be gradually hardened off during May.

NEW ZEALAND SPINACH. B. K., Lincoln: We should certainly advise you to include sufficient seed of this vegetable in your order to form a bed of moderate size. Last summer it was the only vegetable of its kind available in some places for two or three months, and proved of immense value in many gardens where it was given a place. We trust we may not have so severe a drought next summer, but in ordinary seasons, it is most useful where, as in your case, the soil is light and dry, for maintaining a supply of spinach during July and the early part of August.

GOOSEBERRY SAWFLY.—Amateur Gardener: There is no more destructive pest of the gooseberry than the caterpillars of the Gooseberry and Currant Sawfly (Nematus ribesi), and there is no better plan of protecting the bushes from them than by adopting repressive measures during the winter season. From your description there is no doubt as to their having defoliated the bushes last summer, and thereby greatly reduced their vigour. The life history of this sawfly is of much interest, but it will suffice for your purpose to direct attention to the fact that the late broods of caterpillars go down in the autumn and bury themselves in the soil about two inches below the surface. Here they form small brown cocoons, and remain throughout the winter. At this stage it is a very simple matter to destroy large numbers. We suggest that you open out a large pit near the quarter occupied by the gooseberry bushes, and place the soil taken out in a heap near at hand. Then remove about three inches of soil from the whole of the area, and wheel it to the pit and well tread it in, and cover it with ten or twelve inches of ordinary soil. Having done this, add to the heap of soil an equal quantity of well-rotted manure, well mix, and then spread it over the surface of the soil in which the gooseberries are growing. The manure is not required for the destruction of the caterpillars, but for promoting the growth of the gooseberry bushes.

## OBITUARY.

◆

### MR. A. J. BROWN.

We record with much regret the death of Mr. A. J. Brown, superintendent of the gardens and outdoor department generally of the School of Handicrafts, Chertsey, which occurred on Christmas Day, in his fifty-fourth year. Mr. Brown took a keen interest in the United Horticultural Provident and Benefit Society, and also in the Royal Gardeners' Orphan Fund.

### MR. ARCHIBALD GRAHAME.

We learn with regret of the death, on the 6th inst., of Mr. A. Grahame, who for a long period was superintendent of the Hampton Court Gardens, and, by reason of his taste and skill, did much to popularise them. Mr. Grahame retired some years since, when he was succeeded by Mr. W. Gardiner, now superintendent of Hyde Park.

### MR. J. DEACON.

As we are going to press we learn with regret the death of Mr. J. Deacon, who for many years has been head gardener to the Right Hon. Joseph Chamberlain, M.P., Highbury, Birmingham. As most of our readers are aware, Mr. Chamberlain possesses an exceptionally fine collection of orchids, but Mr. Deacon was also an expert cultivator of Malmaison carnations, and, in fact, of all classes of plants.

## MARKETS.

◆

### COVENT GARDEN.

### Flowers.

Trade is fairly good, and supplies are excellent, carnations being plentiful and of high quality.

## CATALOGUES RECEIVED.

JAMES VEITCH AND SONS, LIM., CHELSEA.—This firm maintains its reputation for a comprehensive and freely-illustrated catalogue, as well as for the merit of its specialities and the excellence of its seeds. With the seed catalogue come lists of chrysanthemums and specialities in herbaceous plants.

DICKSON AND ROBINSON, MANCHESTER.—In this large and freely illustrated catalogue the arrangement is somewhat unusual. First come vegetables and fruits, then horticultural sundries, then flower seeds, flowering roots, trees, fruit trees, and floral designs, and in each and every department there is plenty to interest and instruct the reader.

HASSALL AND CO., SOUTHGATE.—Nowadays orchids are treated individually, rather than collectively, in catalogues, and in the issue before us the number of pseudo-bulbs and leads a plant possesses is recorded, so that a good idea of the size and condition of the specimen is thereby gained. In the case of hybrid orchids the parentage is given.

Hopkins, 23; Carnation Geisha, 25; Bush Apple Tree Claygate Pearmain, 26; Bush Apple Tree Sandringham, 27; A good specimen of the Maiden Pink (Dianthus Deltoides), 28; The Rose Garden at Bagatelle, 29; The Handsome Sundial at Somerleyton Hall, 30; Chrysanthemum Percy Arnold, 33.

The only resemblance between a Pine Spray Syringe and others is in the shape of the barrel. The metal is more substantial. For the rest, the combination spraying head renders Spray, Rose, and Bend instantly obtainable without the addition or removal of a single fitment, while the adjustable leather bucket plunger gives perfect suction, never allows water to escape past it and up your sleeve, and weare interminably.

A written request from your ironmonger or seedsman, and a Syringe will be sent in 24 hours for your approval. Price 10/6. Sole proprietors and manufacturers, Robinson Bros., Ltd., West Bromwich.

## SANKEY'S Famous Garden POTS

**The Best and Cheapest.**

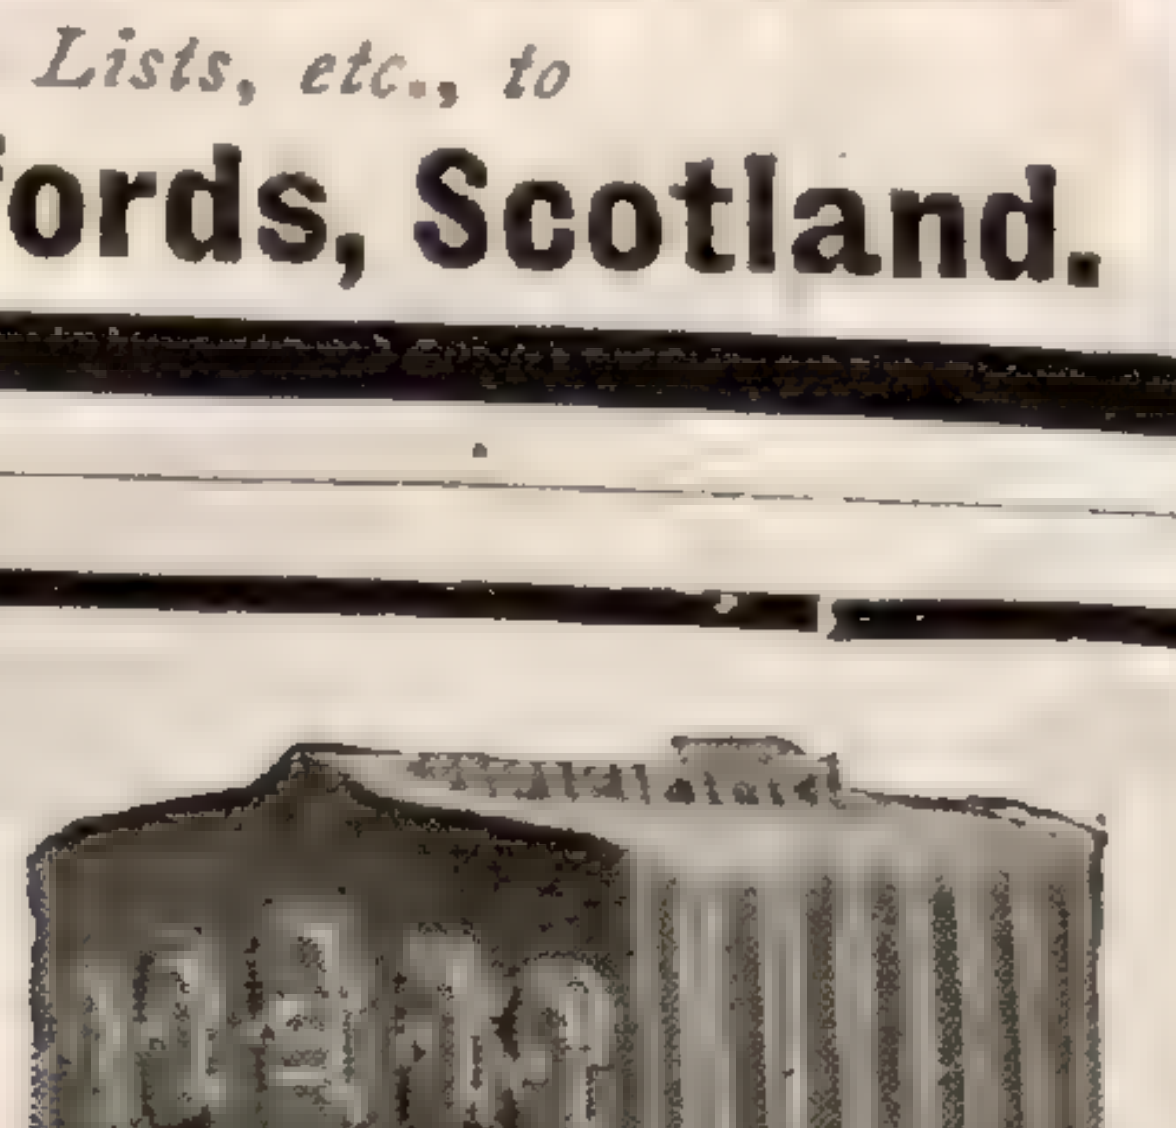
SPECIAL POTS for Chrysanthemums, Roses, Vines, Clematis, Orchids, &c.

FANCY FERN PANS and BULB BOWLS from 2d. each.

State quantity of each size required and have Carriage Paid quotation, or write for Price List, Free, to—

**RICHARD SANKEY & SON, LTD.,**
Bulwell Potteries,
**NOTTINGHAM.**

## Kinnell's Boilers



**THREE LEADING TYPES:—**

*The* **"ANGLIAN," Sectional,** heats 800 to 8,000 ft. 4in. pipe.
*The* **"ROCHFORD," Tubular,** heats 600 to 8,000 ft. 4in. pipe.
*The* **"HORSE-SHOE"** for the small Greenhouse.

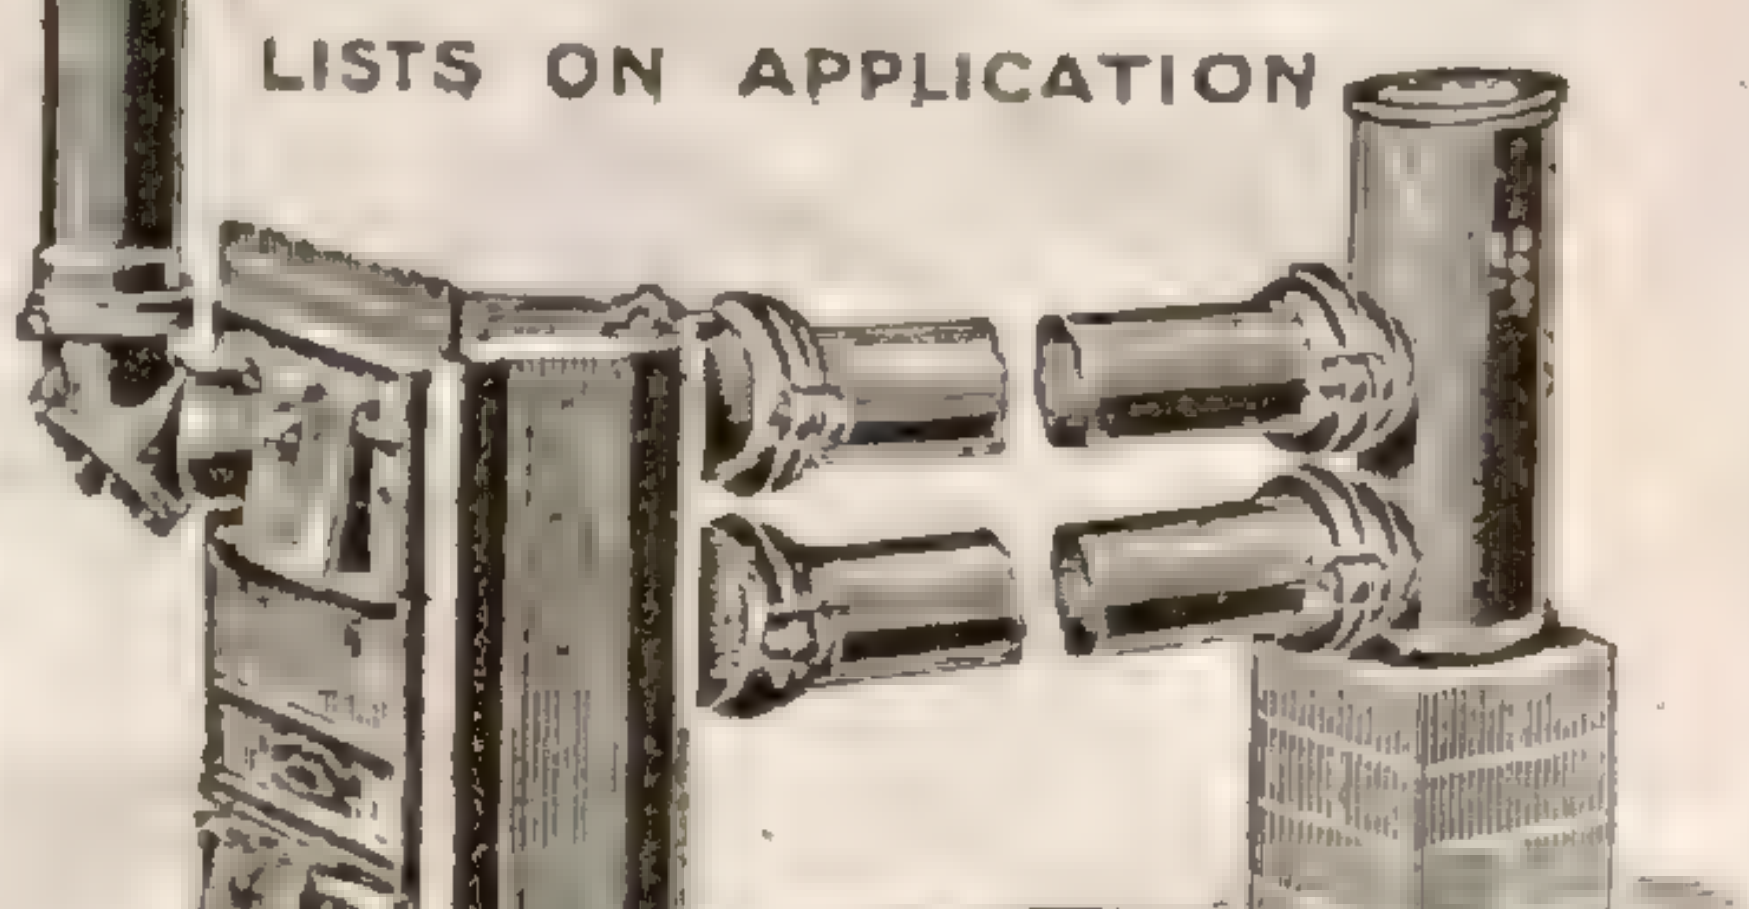
**Saddle Boilers, Trentham Boilers, and all classes of Pipes, Fittings, etc., ready for immediate despatch.**

*Write for List No. 77, post free.*

**CHAS. P. KINNELL & Co., Ltd., 65, & 65a, Southwark St., London, S.E.**

## The Loughborough BOILER

31000 IN USE
LISTS ON APPLICATION



The pioneer of cheap, simple and effective heating for small greenhouses. Complete Apparatus from £3.19. 6. The immense sale of this boiler, and its numerous imitations are the best testimony of its undoubted success

## NOTE OF THE WEEK.

◆

### New Garden Flowers.

At all times the names and descriptions of new plants possessing sufficient merit to obtain awards from one or other of the principal societies are of much interest to those who fully appreciate the charm of novelty, both in the plant house and garden. But they are especially interesting when the whole of the gains for a given period are brought together and arranged in alphabetical order, as, for example, in the "Gardening Year Book," the new edition of which is already in the hands of many thousands of horticulturists. Here cultivators have not only an opportunity of making selections of varieties that, from the descriptions, appear likely to be the best adapted to their requirements, but they can readily institute comparisons between the different varieties. Moreover, by a survey of the complete list of novelties they can determine the trend of public taste in relation to the garden, and form a fairly correct estimate of the direction which the activities of raisers are taking. At the present time it is the general opinion that, excluding the orchids, by far the greatest energy is being shown in the improvement of hardy and half-hardy flowers that are especially adapted for beautifying the flower garden during the several seasons of the year. The list of new garden flowers, which, as usual, forms so important a feature of the "Gardening Year Book," contains upwards of one hundred and fifty varieties that received first-class certificates or awards of merit, and of these less than a dozen require glass culture throughout the year. Those of our readers who closely follow the lists of new plants that we publish from time to time will not be surprised to learn that the number of chrysanthemums which received awards exceeds that of any other class of flowers. This is a point of some interest, as it shows that whatever may be the opinion with regard to big exhibition blooms or the merits of the single-flowered varieties, the chrysanthemum continues to enjoy a high degree of popularity. The list that has a place in this year's edition of the publication mentioned differs materially from the one it contained, say, ten years ago. The latter consisted almost exclusively of varieties that were of value for the production of specimen blooms for exhibition, whereas the present list contains goodly proportions of single-flowered and decorative varieties now so highly appreciated for the supply of flowers for beautifying indoor apartments. Roses rank numerically next to the chrysanthemums, but, notwithstanding the length of the list, it only contains about half the number of varieties that are contained in the enumeration of the preceding flowers. The number of new roses should be sufficient to satisfy the needs of rosarians, and all who are concerned with roses have full justification for feeling proud of the splendid success that has been achieved in this country in the raising of new varieties. As for some years past hybrid teas greatly predominate, and on two of these—Mrs. R. Draper and Mrs. Sam Ross—the National Rose Society conferred its gold medal. Only two new hybrid perpetual roses obtained recognition, and one of these—George Dickson—was awarded the gold medal by the society mentioned. Two English-raised Wichuraiana roses had awards made in their favour, and their promise, as in the case of the other varieties of last year, fully justify the distinctions they received. The list of new dahlias that obtained recognition from the National Dahlia Society and the Royal Horticultural Society is of special interest from the fact that it is lengthy, and dahlias are supposed by not a few wanting in popularity. The dahlia does not enjoy the same degree of popularity as the rose or the sweet pea, but the trade in the plants of varieties in general cultivation is annually very large, and it is reasonable to to assume that, if there was not a fairly brisk demand for novelties, the raisers would be less active in their production. Last year twenty varieties received awards, and it is satisfactory to record the fact that several of the new race of collarette varieties obtained distinction. This is satisfactory as evidence that the authorities on the dahlia are beginning to fully recognise their responsibilities, and to give a welcome to all varieties of merit, no matter to what class they may belong. It is gratifying also to have evidence that the importance of freedom of flowering and long rigid stalks are essential in the case of cactus varieties intended for garden decoration, for not until we have a goodly number of varieties capable of producing rich colour effects will the cactus dahlia take the position it should occupy. Carnations appear to have in no way suffered from the severe competition of roses, sweet peas, and other favourite flowers, for there were three exhibitions in London, and eighteen new varieties received awards in the course of the past year. The border and perpetual-flowering varieties were very evenly balanced, and both classes were greatly enriched by the novelties added to them. The number of sweet peas that obtained recognition during the year was small, as compared with new varieties of some other classes of flowers, but nine really first-class novelties which these new sweet peas unquestionably are in one year should be sufficient to satisfy the large and ever-increasing body of growers of these fragrant flowers. The seven new rhododendrons that have a place in the "Gardening Year Book" list are remarkable for

MR. GEORGE KELF.

their diversity of character, as well as colouring, and include several that have descended from some of the more notable of the Himalayan species. Therefore, they are especially deserving of the attention of those who have gardens in those parts of the West of England where the comparatively tender rhododendrons are known to grow freely, and to produce an abundance of their bold and attractively-coloured flower trusses. Four only of the new narcissi that were presented to public notice in the spring of 1911 were successful in obtaining distinction, which is a comparatively small number, considering how great is the activity in the raising of seedlings. On the other hand, the hardy and tropical water lilies that were shown received awards with only one or two exceptions, and several that failed to find the support necesary to their obtaining distinction were of much merit. We mention this as evidence of the advances that are being made in the development of the nymphæas, and the wider range of selection that is thus afforded when furnishing lake and pool with acquatics.

**Mr. George Kelf,** head gardener to A. W. Merry, Esq., Danesbury Park, Welwyn, Herts, whose portrait we present to our readers in the present issue, is well-known to most horticulturists in the home counties. For many years he was head gardener at South Lodge, Regent's Park, a garden right in the inner circle, and where gardening was carried on under exceptionally difficult conditions. Here Mr. Kelf made a considerable name for himself by cultivating a large number of subjects exceptionally well. Perhaps he was then most famous for his management of fruit trees in pots, and for the first-rate collection of fruits, hardy and tender, that he from time to time exhibited before the Royal Horticultural Society. Mr. Kelf is now working under kindlier conditions of light and atmosphere at Danesbury Park. He is a member of the Royal Horticultural Society's Fruit and Vegetable Committee, and has long held a seat on that body; for a long number of years he was also a most regular and useful member of the Committee of the United Horticultural Benefit and Provident Society.

**Our Sweet Pea Number.**—Consequent on the great desire that is at the present time being expressed for the fullest possible information on the selection and cultivation of sweet peas, we shall devote our next issue (January 27) chiefly to these fragrant flowers. The several articles will be written by well-known experts, and will deal with both the scientific aspects of sweet peas and the practical details of their cultivation, and such information will be given on the novelties and standard varieties as will greatly facilitate the making of selections adapted to the requirements of the various classes of cultivators. The number will be profusely illustrated.

**Plants in Flower at Nuneham Park, Oxford.**—The Rt. Hon. Lewis Harcourt, P.C., writes us, under date of January 9, 1912: "It may be of interest to record, as I did to-day, the plants and shrubs now in flower in the garden here: Iris stylosa, Myrtus apiculata, aubrietia, Leptospermum scoparium, Cestrum luridum (south wall), Daphne indica rubra (west wall), antirrhinum, Andromeda floribunda, A. japonica, Menziesia polifolia, winter aconite, Jasminum nudiflorum, Lapageria rosea (north wall), L. alba (north wall), Lonicera fragrantissima, Veronica Autumn Glory, V. speciosa, V. Gauntletti, V. hybrida Diamant, Daphne mezereum album, D. Blagayana, Cydonia japonica Simoni, Galanthus Elwesi, Iris reticulata, I. Danfordiæ, I. persica Hildreichi, I. alata, Adonis vernalis, Eleganus macrophylla, Colchicum cydrophilum, Scilla sibirica, Erisymum Golden Gem, Helianthemum amabilis, Rosmarinus prostrata, arabis, Leycesteria formosa, Cyclamen coum, C. europæum, auricula, yellow, red, and Wilson's blue primroses, Sarcococca ruscifolia, Potentilla formosa, Achillea tomentosa, Rhododendron Nobleanum, Helleborus niger, H. n. altifolius giganteus, H. n. maximus, violets, winter heliotrope (petasites), Colletia cruciata, Berberis Darwini, Arbutus andrachne, A. Milleri, Photinia serrulata, Hammamelis japonica, H. Zucchariniana, H. arborea, Erica codonoides, E. arborea, E. carnea, E. carnea alba, E. Maweana, E. mediterranea hybrida, Mahonia japonica Beali, Tritoma uvaria, Berberis Aldenham hybrid, Iberis Gibraltarica, Garrya elliptica, Solanum jasminoides, Acacia dealbata (in full bud—almost open), and Laurestinus. Altogether seventy-three kinds of flowers." We are greatly obliged to Mr. Harcourt for this interesting note.

**Horticultural Club.** — The next house dinner of the club will take place on Tuesday, the 23rd inst., at the Hotel Windsor, Victoria Street, Westminster. The dinner will, as usual, commence at six p.m. Following the dinner a lecture will be given by Mr. Charles Pearson, entitled "Birds Eggs: Some Remarks on the Evolution of Colour." The lecture will be illustrated by lantern slides. The annual meeting and dinner will take place on Tuesday, February 20. Ladies are invited to both monthly and annual dinner, but the latter will, in accordance with the usual custom, be a special ladies' night.

**British Gardeners' Association.**—A general meeting of the members of this association will be held at Carr's Restaurant, 264, Strand, London, on Thursday, the 25th inst., "To consider alterations of rules, receive the resignation of the general secretary, and to confirm the sub-committee's report as adopted by the Executive Council." The chair will be taken at seven p.m. Mr. E. F. Hawes, Fortune Green, has been appointed editor, pro tem., of the "Journal" of the association.

**Mr. J. D. Crozier,** forester to Mr. Baird, of Durris, near Aberdeen, has been appointed to the Government Forestry Department in Ireland. A prominent office-bearer of the Royal Scottish Aboricultural Society, and one who has taken a keen interest in the affairs of the Aberdeen, Banff, and Kincardine branch of the society, Mr. Crozier has been a frequent contributor to the "Transactions" of the parent society, and one of his papers on "The Douglas Fir as a Commercial Timber Tree," attracted much attention. Mr. Crozier's opinion of the Douglas fir is aptly summarised in the concluding paragraph. "The practical experience of the Douglas fir in this country points it out as one of the most valuable timber trees ever introduced, and when its suitability for commercial purposes has been fully realised, there can be no doubt it will be one of the most largely planted of all our timber trees." On the occasion of the visit of the English Arboricultural Society to the north-east of Scotland some years ago, Mr. Crozier conducted a large party of the members over the extensive woods of Durris, and showed them a number of new features which he had introduced, and the successful experiments carried out with plantations of the Douglas fir and the Japanese larch. In all matters concerning forestry, Mr. Crozier has manifested a keen and practical interest, and his many friends in the north-east and north of Scotland, while readily congratulating him upon his appointment, greatly regret his departure from Durris. Mr. Crozier was entertained at a complimentary luncheon at the Imperial Hotel, Aberdeen, a few days ago, and was presented with a silver tea service.

**Resignation of the B. G. A. Secretary.** — We have received from Mr. J. Weathers the following copy of a letter sent by him to the chairman of the Executive Council of the British Gardeners' Association:

Dear Mr. Frogbrook,—On January 9 I tendered my resignation as secretary and editor to the Executive Council. To you now, as chairman, I again formally tender my resignation in writing. Kindly place it before the Executive Council at the next meeting. I have taken this step in consequence of what I consider to be the unreasonable, ungenerous, and suspicious attitude taken up by a few members of the Executive Council in regard to the way I have conducted the business of the association. I am not conscious of having done anything that was not for the welfare of the association, and for the cause for which it was instituted, during the six years I have been hon. secretary. I cannot, however, in justice to myself, hold office any longer whilst there is the slightest disposition to suspect the most innocent actions, and to distort the most simple phrases. I am therefore having all the property of the association forwarded to you, and as soon as the accounts have been audited by a chartered accountant, I shall also forward you all receipt books and vouchers, and correspondence that may come to hand. Kindly acknowledge the receipt of this letter, and believe me, yours faithfully,

John Weathers.

**A Conference on Dahlias** will be held under the auspices of the National Dahlia Society at Carr's Restaurant, 264, Strand, London, on Friday, March 8. The proceedings will commence at 6.30 p.m., when several papers connected with dahlias and their cultivation will be read.

**Monsieur Anatole Cordonnier.**—The twenty-fifth annual volume of our contemporary, "Le Jardin," of Paris, is just completed, and we notice that the Editor dedicates it to M. Anatole Cordonnier, of Bailleul, the eminent horticulturist, whose exhibits of grapes and forced fruits attract so much attention at the Continental shows. A portrait and a short biographical notice accompanies the dedication. Some of our readers may remember that over twenty years ago (December 26, 1891) the "Gardeners' Magazine" gave a portrait of M. Cordonnier, and a few notes concerning his horticultural activities. In the light of what has since transpired, our article of that date may be considered almost prophetic.

**Presentation to Mr. W. B. Beckett.**—The recent annual meeting of the Croydon Chrysanthemum Society was of exceptional interest, from the fact that the members had to take leave of Mr. Beckett, who has occupied the position of hon. secretary since the formation of the society in 1887, and to elect his successor. In view of this, there was a large attendance of members, with the president, Alderman Allen, in the chair. At the close of the formal business, the President expressed the regret that all felt at losing the services of their able and highly esteemed secretary, which, they were glad to know, was due to the increase in his business making greater demands upon his time. He said that associated with the regret was a feeling that they could not allow Mr. Beckett's twenty-four years' service to pass without presenting him with some token of their regard and esteem in which he was held by all who were interested in the society. The President, on behalf of the subscribers, presented Mr. Beckett with a silver tea and coffee service, and an illuminated address. The gift was suitably acknowledged by Mr. Beckett, who stated, in the course of his remarks, that during the period he had been secretary the society had disbursed £2,000 in prizes.

**Paris Spring Show.**—In consequence of the Royal International Horticultural Exhibition, London, 1912, opening its doors on May 22 next, the Paris Spring Show of the National Horticultural Society of France will be held somewhat earlier than usual, the date fixed being from May 15 to 22 of the same month.

**Success of Women Horticulturists.** — Miss Lilian Hamilton, of Studley Horticultural College, writing in the Monthly Magazine of the North of England Horticultural Society, says: "All over the country there are women who are either making a good living or increasing their incomes by gardening. One lady in Ireland told a friend of mine, that she could show by her books that she was clearing £1,000 a year from daffodil growing. One of our old students announced, at a meeting of the College Guild, that she and her partner, also an old Studley student, were dividing over £1,000 that year. Others will not tell us what they earn, but when we see new houses going up, and motor vans to carry the produce added to their equipment, we draw our own conclusions, and when at a dinner party I decide that the best dressed woman at the table is an old Studley student, now a market grower, I feel she must be doing well. Now as to posts! At present such is the demand for women gardeners that every year I have to send four or five newly qualified students where £50 a year and all found is offered, where I would rather send girls with greater experience. One year, two girls of twenty were fortunate enough to secure such posts, and one has remained in hers three years. The second has left to take other and more congenial work at an equally remunerative salary."

**Perpetual Carnation Society.**—The spring exhibition of this society will be held at the Royal Horticultural Hall, Vincent Square, Westminster, on March 21, and in connection therewith a conference on perpetual carnations will be held in the afternoon.

**Mr. Oxtoby** was elected secretary of the Croydon Chrysanthemum Society at the recent annual meeting, in succession to Mr. W. B. Beckett, who retired. Mr. Oxtoby has assisted the late secretary for some years past.

**R.H.S. Lectures.**—The following lectures are included in the Royal Horticultural Society's programme for the current year: January 23, Mr. H. Morgan Veitch, on "Horticulture and the Proposed Taxation of Land Values"; February 6, Sir Everard F. Thurn, K.C.M.G., on "Plants of Fiji and other South Sea Islands"; February 20, Mr. W. Cuthbertson, J.P., on "New Sweet Peas"; March 5, Professor H. E. Armstrong, F.R.S., on "The Stimulation of Plant Growth"; March 19, Mr. H. B. May, V.M.H., on "Ferns"; April 2, Mr. R. Irwin Lynch, V.M.H., on "Tender Plants for a Warm Corner"; April 16, the Rev. Professor G. Henslow, M.A., V.M.H., on "Darwin as Ecologist"; April 30, Dr. Redcliffe N. Salaman, on "Potatoes"; May 14, Professor I. Bayley Balfour, F.R.S., V.M.H., on "Gardening and Drought" (Masters' Memorial Lecture); June 4, Professor J. Bayley Balfour, F.R.S., V.M.H., on "Problems of Propagation" (Masters' Memorial Lecture); June 18, Rev. Professor G. Henslow, V.M.H., on "Professor J. S. Henslow as Ecologist"; July 16, Mr. E. A. Bunyard, on "The Flowers of Apples and Pears, and their Aid in Identifying Varieties"; July 30, Mr. Cecil H. Hooper, F.S.I., on "The Pollination and the setting of Fruit Blossom"; August 13, Mr. Pulham, jun., on "The Construction of the Wisley Rock Garden"; August 27, Mr. J. Hudson, V.M.H., on "Recently Introduced Water Lilies"; September 10, Miss Troyte-Bullock, on "Cape Pelargoniums"; September 24, Mr. C. Herman Senn, on "How to Cook some of the Root Vegetables"; October 8, Dr. Charles Crowther, on "The Influence of Atmospheric Impurities on Vegetation"; October 22, the Rev. Professor G. Henslow, V.M.H., on "The Senses of Plants"; November 5, Miss Edith R. Saunders, on "Double Flowers"; November 19, Dr. George Hamilton, on "Some of the Gardens of Bournemouth and Neighbourhood"; December 3, Mme. Tzikos St. Leger, on "The Vegetation of the Islands of Lake Maggiore."

**Societe Francaise d'Horticulture de Londres.**—The annual dinner of this society, which, for many years has taken place in January, will be held at the Café Royal, Regent Street, on March 30, when Mr. N. N. Sherwood will preside. Further particulars may be obtained from Mr. G. Schneider, 3, Meredyth Road, Barnes, S.W.

**M. Viger.**—His term of office having expired, M. Viger has, at the earnest request of a deputation of the National Horticultural Society of France, agreed to allow himself to be renominated as president of that society. Most English and other visitors to the French horticultural shows will rejoice that M. Viger will still continue to take an active interest in horticulture in general, and in the national society in particular.

**The Flowering Time of Apples.**—In an interesting contribution from the Wisley Laboratory to the recent issue of the "R.H.S. Journal," Mr. F. J. Chittenden ably discusses the subject of "Pollination in Orchards," and points out that "the time of flowering of apples varies between rather wide limits, both as to its commencement and as to the period over which the flowering continues. It commences in south-east England about the third week in April in early years, and continues into the second week in June in late years. During the four years 1908-1911 in which records have been kept at the Royal Horticultural Society's gardens at Wisley, the earliest apple to open, Red Astrachan, was in full bloom in 1910 on April 21; in 1911, May 2; in 1909, May 3; and in 1908, May 7; while the most consistently late-flowering variety, Royal Jubilee, was in full flower in 1908 on May 23; in 1909, May 17; in 1910, May 20; and in 1911, May 19. The period during which one variety or other of apple was in full flower (ignoring the few days, about seven or eight, before, and the few, about eight or nine, after full flowering time, during which some flowers were open) was, in 1908, 18 days (May 6 to May 23); in 1909, 20 days (May 3 to May 22); in 1910, 35 days (April 21 to May 25); and in 1911, 18 days (May 2 to May 19).

**Messrs. S. Rivers and Son** were awarded a gold medal for their exhibit of oranges at the Royal Horticultural Society's meeting on January 9.

## THE HEMLOCK SPRUCES.

The various species of Tsuga or Hemlock spruce are useful decorative trees, whilst some of them produce valuable timber. Although all are not generally hardy in the British Isles, there are some which may be grown almost anywhere, whilst the more tender species thrive well in the warmer counties. They are of North American and Asiastic origin; those native of the former country being distributed from Canada to the southern Alleghanies and California, and the Asiatic kinds being found in Japan, China, and the Himalayas. The Hemlock spruces are easily separated from the ordinary spruces by reason of their flat, soft, yew-like leaves and more plumose branches. As is the case with most other cone-bearing trees, they thrive best in places where the climate is fairly moist throughout the growing season, where late spring frosts are not experienced, and where the ground is cool and moist, but not water-logged. Such ideal conditions are not, however, essential to their success, for well-grown specimens are found where conditions cannot be considered to be first rate.

The species available for cultivation are as follows:

### North American.

T. canadensis, the Common Hemlock spruce, is widely distributed through the north-eastern United States and Canada, extending as far north as Nova Scotia. Towards the southern parts of its habitat it grows 100 feet high, but its average height is about 50 or 60 feet. Its oblong linear leaves are one-third to two-thirds of an inch long, and rounded at the apex. In America the wood is used for building purposes, but is considered to be inferior to that of T. Mertensiana. Numerous garden varieties are known, the more distinct being those with weeping branches. These are milfordensis pendula, pendula argentea, and Sargenti pendula. Argentea is recognised by reason of its greyish leaves, variegata by its variegated foliage, and macrophylla by having larger leaves than the type.

T. caroliniana, the Carolina Hemlock spruce, occupies a more southerly range of country than T. canadensis. Its flattened linear leaves are one-third to three-quarters of an inch long, petiolate, dark green and shining, with conspicuous silvery bands beneath. It is not very common in this country.

T. Mertensiana, the Western Hemlock spruce, often called T. Albertiana, is found on the western side of N. America. It grows more freely than the eastern species, and is more valued for timber in its native country. In the British Isles it appears to be the most suitable of all the Hemlock spruces for planting under forest conditions, and there is reason to suppose that it may turn out to be a profitable timber tree in certain localities. The wood is used in America for general building purposes, railway sleepers, etc. When growing with the Canadian Hemlock spruce, it may be distinguished by its more vigorous habit and single trunk; T. canadensis often forming a series of trunks from one root-stock.

T. Pattoniana, the Californian Hemlock spruce.—This is a very beautiful species when well grown, for it forms a shapely bush or small tree with bluish or glaucous foliage. Unfortunately, it is less hardy than the other kinds, and only thrives satisfactorily in the warmer parts of the country. The pubescent branches are well clothed with leaves three-quarters to one inch in length, which are distinctly narrower than those of other species. The two silvery bands on the under surface, which are so prominent in other species, give place in this instance to the rich glaucous colouring which is noticeable on the upper surface. The arrangement of the leaves on the branches also differs somewhat from that of other Hemlock spruces, and is more suggestive of that of the Douglas fir. T. Pattoniana is found wild in the mountains of California, and is well worth planting in any garden where the climatic conditions are not too dry or too severe. It is not seen at its best in the vicinity of manufacturing towns, for the deposit of dirt on its leaves detracts greatly from its appearance.

### Asiatic Species.

T. Brunoniana, the Indian Hemlock spruce.—This is a native of the central and eastern Himalaya, and is one of the more tender kinds. It, however, thrives satisfactorily in Devonshire, Cornwall, and other places where similar climatic conditions prevail. At its best, in the Himalayas, it is stated to grow upwards of 100 feet high, with a girth approaching 20 feet. In this country the best trees are not more than 50 feet high, but there are really good examples to be found here and there, where the graceful widespreading branches clothe the trunk to the ground. Such a specimen is to be seen at Strete-Raleigh, near Exeter. The leaves of this species are longer than those of other kinds, the larger ones being rather more than an inch long. The silvery lines on the under surface are very conspicuous. When growing freely it is one of the most ornamental kinds.

T. diversifolia is one of two Japanese Hemlock spruces. It occupies the more northerly parts of the empire, and, according to Sargent's "Forest Flora of Japan," p. 80, forms an extensive forest on the Nikko Mountains up to an altitude of 5,000 feet. A picture accompanying Sargent's description represents it as a large timber tree, but in England, where it is not common, it is only known as a bush of less commanding presence than the other Japanese species. In addition to its less vigorous habit, it may be distinguished from the southern Japanese Hemlock spruce by its smaller leaves and hairy branches. The leaves are of two distinct sizes, those of the upper rank being a quarter of an inch or less in length, whilst the lower leaves are up to half an inch long.

T. Sieboldi, the second of the two species, is found in the more southern parts of Japan. In this country it grows into a large, handsome bush, or small tree, with somewhat of the appearance of the yew. Its branches are, however, lighter and the foliage is less sombre-hued, therefore, it might well be substituted for that tree in places where the dark leaves of the yew are objectionable. It has ample leafage, the leaves being half to three-quarters of an inch long, and very silvery on the under surface. The more vigorous habit, larger leaves, and hairless branches separate it from T. diversifolia. When cones are obtainable they also offer a distinguishing character, for those of T. Sieboldi are larger than those of the other kind.

T. Yunnanensis.—This is of comparatively recent introduction, as it has only been in cultivation for a few years. Originally collected in Yunnan by Father Delavay, a French missionary, it was named by M. Franchet, and described in the "Journal de Botanique." Other travellers subsequently gathered specimens, notably Henry in Szechuan, Pratt on Mount Omi, and Wilson in Hupeh. The latter collector was the first to send good seeds home, and from them Messrs. Veitch were able to raise plants. The branches are hairy as in T. diversifolia, but it differs from that species by its longer leaves, for the larger ones are quite three-quarters of an inch long, and by the ends of the leaves being usually entire, whilst those of both the Japanese kinds are distinctly notched. The silvery marks on the under-sides of the leaves are also less well defined than in the kindred species from Japan.

Pictures of the cones show them to be rounder than those of T. diversifolia, though they are very similar in size. So far as can be ascertained at present, it is quite hardy, but it is only likely to form an ornamental bush or small tree, in fact, it does not appear as if either of the Asiatic Hemlock spruces will ever be of any value in this country as forest trees. It might, however, be possible to use the stronger of the Japanese kinds as a hedge plant.

W. D.

## THE DECLINE OF BIG CHRYSANTHEMUMS.

This is the headline under which Mr. Molyneux deplores the loss of a few old and good exhibitors of the noble autumn flower. One wonders in reading his communication whether your excellent correspondent is becoming a little conceited (no offence intended) because he and a few other exhibitors feel that they have had enough of it, and that there are no younger growers capable of taking up the running. Whether that be the case or not, I could point to many who grow and show blooms quite equal to those which are seen at the National or other big shows, and the societies at which they compete were not started at the time when Mr. Molyneux was busily engaged in winning cups and other prizes. I should say there are three times the number of shows held now as compared with those held in his exhibition days, and each local society obtains the best flowers from its members, and as each grower can compete in several classes, a magnificent display is the result. Now if we combine three of these local shows, I have no hesitation in saying that the flowers, both in quantity and quality, would equal either of the big shows held at the present time.

But before these local societies were started, exhibitors used to compete at the big shows. I wonder how many chrysanthemum societies there are in Surrey? Let us mentally, of course, take just one exhibit from each of these, and place them side by side at the N.C.S. Exhibition at the Crystal Palace. If this were done, the several exhibits would be found as strong a class as any set of judges need ask for. I would like to ask Mr. Jefferies (who was one of the judges at Reigate) what kind of exhibition three such shows as the one at Reigate would make. (Ask him for his opinion, Mr. Editor.) At Reigate provision was made for boards and vases, and I believe the society has a ten guinea cup to be competed for in 1912.

Another point, and it is a very important one, when a gardener takes flowers to compete at a three days' show, practically a week is spoilt, and the employer cannot enjoy the flowers, for few employers will go to a big show twenty miles from home. Moreover, if there are, say, twelve exhibitors, and about four prizes, eight of the twelve derive so little satisfaction from the competition, that they make up their minds to exhibit only at the local shows, and a reduction in the competitors at the big exhibitions follows as a matter of course.

Then there are the vase classes, and with reference to them I would say, let any of those non-competing members of the committees who would like to see the boards banished from the tables try their hands at exhibiting blooms in vases. I will only suggest they should do this for one year, and make a journey to a show involving three or four changes, and, it may be, a drive across London.

Now with regard to varieties, I would ask Mr. Molyneux not to throw Mme. C. Audiguier and such-like varieties, that attained a height of thirteen feet and produced blooms that a six-inch space would comfortably accommodate. These would surely not compare with blooms that require nine inches square, as in the case of the present-day varieties. Such comparisons would indeed be odious.

A good white, we are told, is wanted to beat Mrs. A. T. Miller. Well, Mrs. Gilbert Drabble does this easily, but perhaps I had better not say much about this variety. If Mrs. G. Drabble will not surpass Mrs. A. T. Miller, Queen Mary will, the blooms of the latter being a pure white, while those of Mrs. G. Drabble are milk white. The variety dedicated to our Queen will not, however, be in the hands of cultivators this spring.

I would like to add that during the time I have been in the chrysanthemum trade we have never had so many orders for Japanese varieties as this season. But I cannot say the same with regard to novelties yet. I will not make any remarks about the singles, they are taking care of themselves. But the anemones, pompons, and anemone pompons do not pay for the paper and printing, much less defray cost of growing and stocking. The public know what they like, and prizes will not make them grow these sections if they do not like them.

W. Wells.

## CLIMBING ROSES.

I have read with interest Mr. E. Molyneux's additional notes (see page 953 of last year's volume) on my selection of autumnal flowering climbing roses (see p. 983). I quite agree with him that Aimée Vibert's habit of retaining its dead blossoms so long is very disfiguring to the plant. When describing this rose this failing did not escape me, and I omitted Flora from my list of summer flowering roses on account of this defect. But Flora is only a summer bloomer after all, and there are many others that can take her place; whereas I know of no autumn blooming climbing rose that can compare with Aimée Vibert in hardiness, vigour, and freedom of bloom. Possibly Sylvia, the new white Wichuraiana, that is said to be perpetual, may prove a substitute for our old friend Aimée Vibert. As regards Tausendschon, Mr. Molyneux will find I reserved that for my third list of climbers, as it is neither a Wichuraiana nor an autumn flowering climber. I am interested to see that the form of the flowers reminds Mr. Molyneux of the oleander, for in describing this variety in my article on summer flowering roses, written before his notes appeared, I have noted this resemblance.

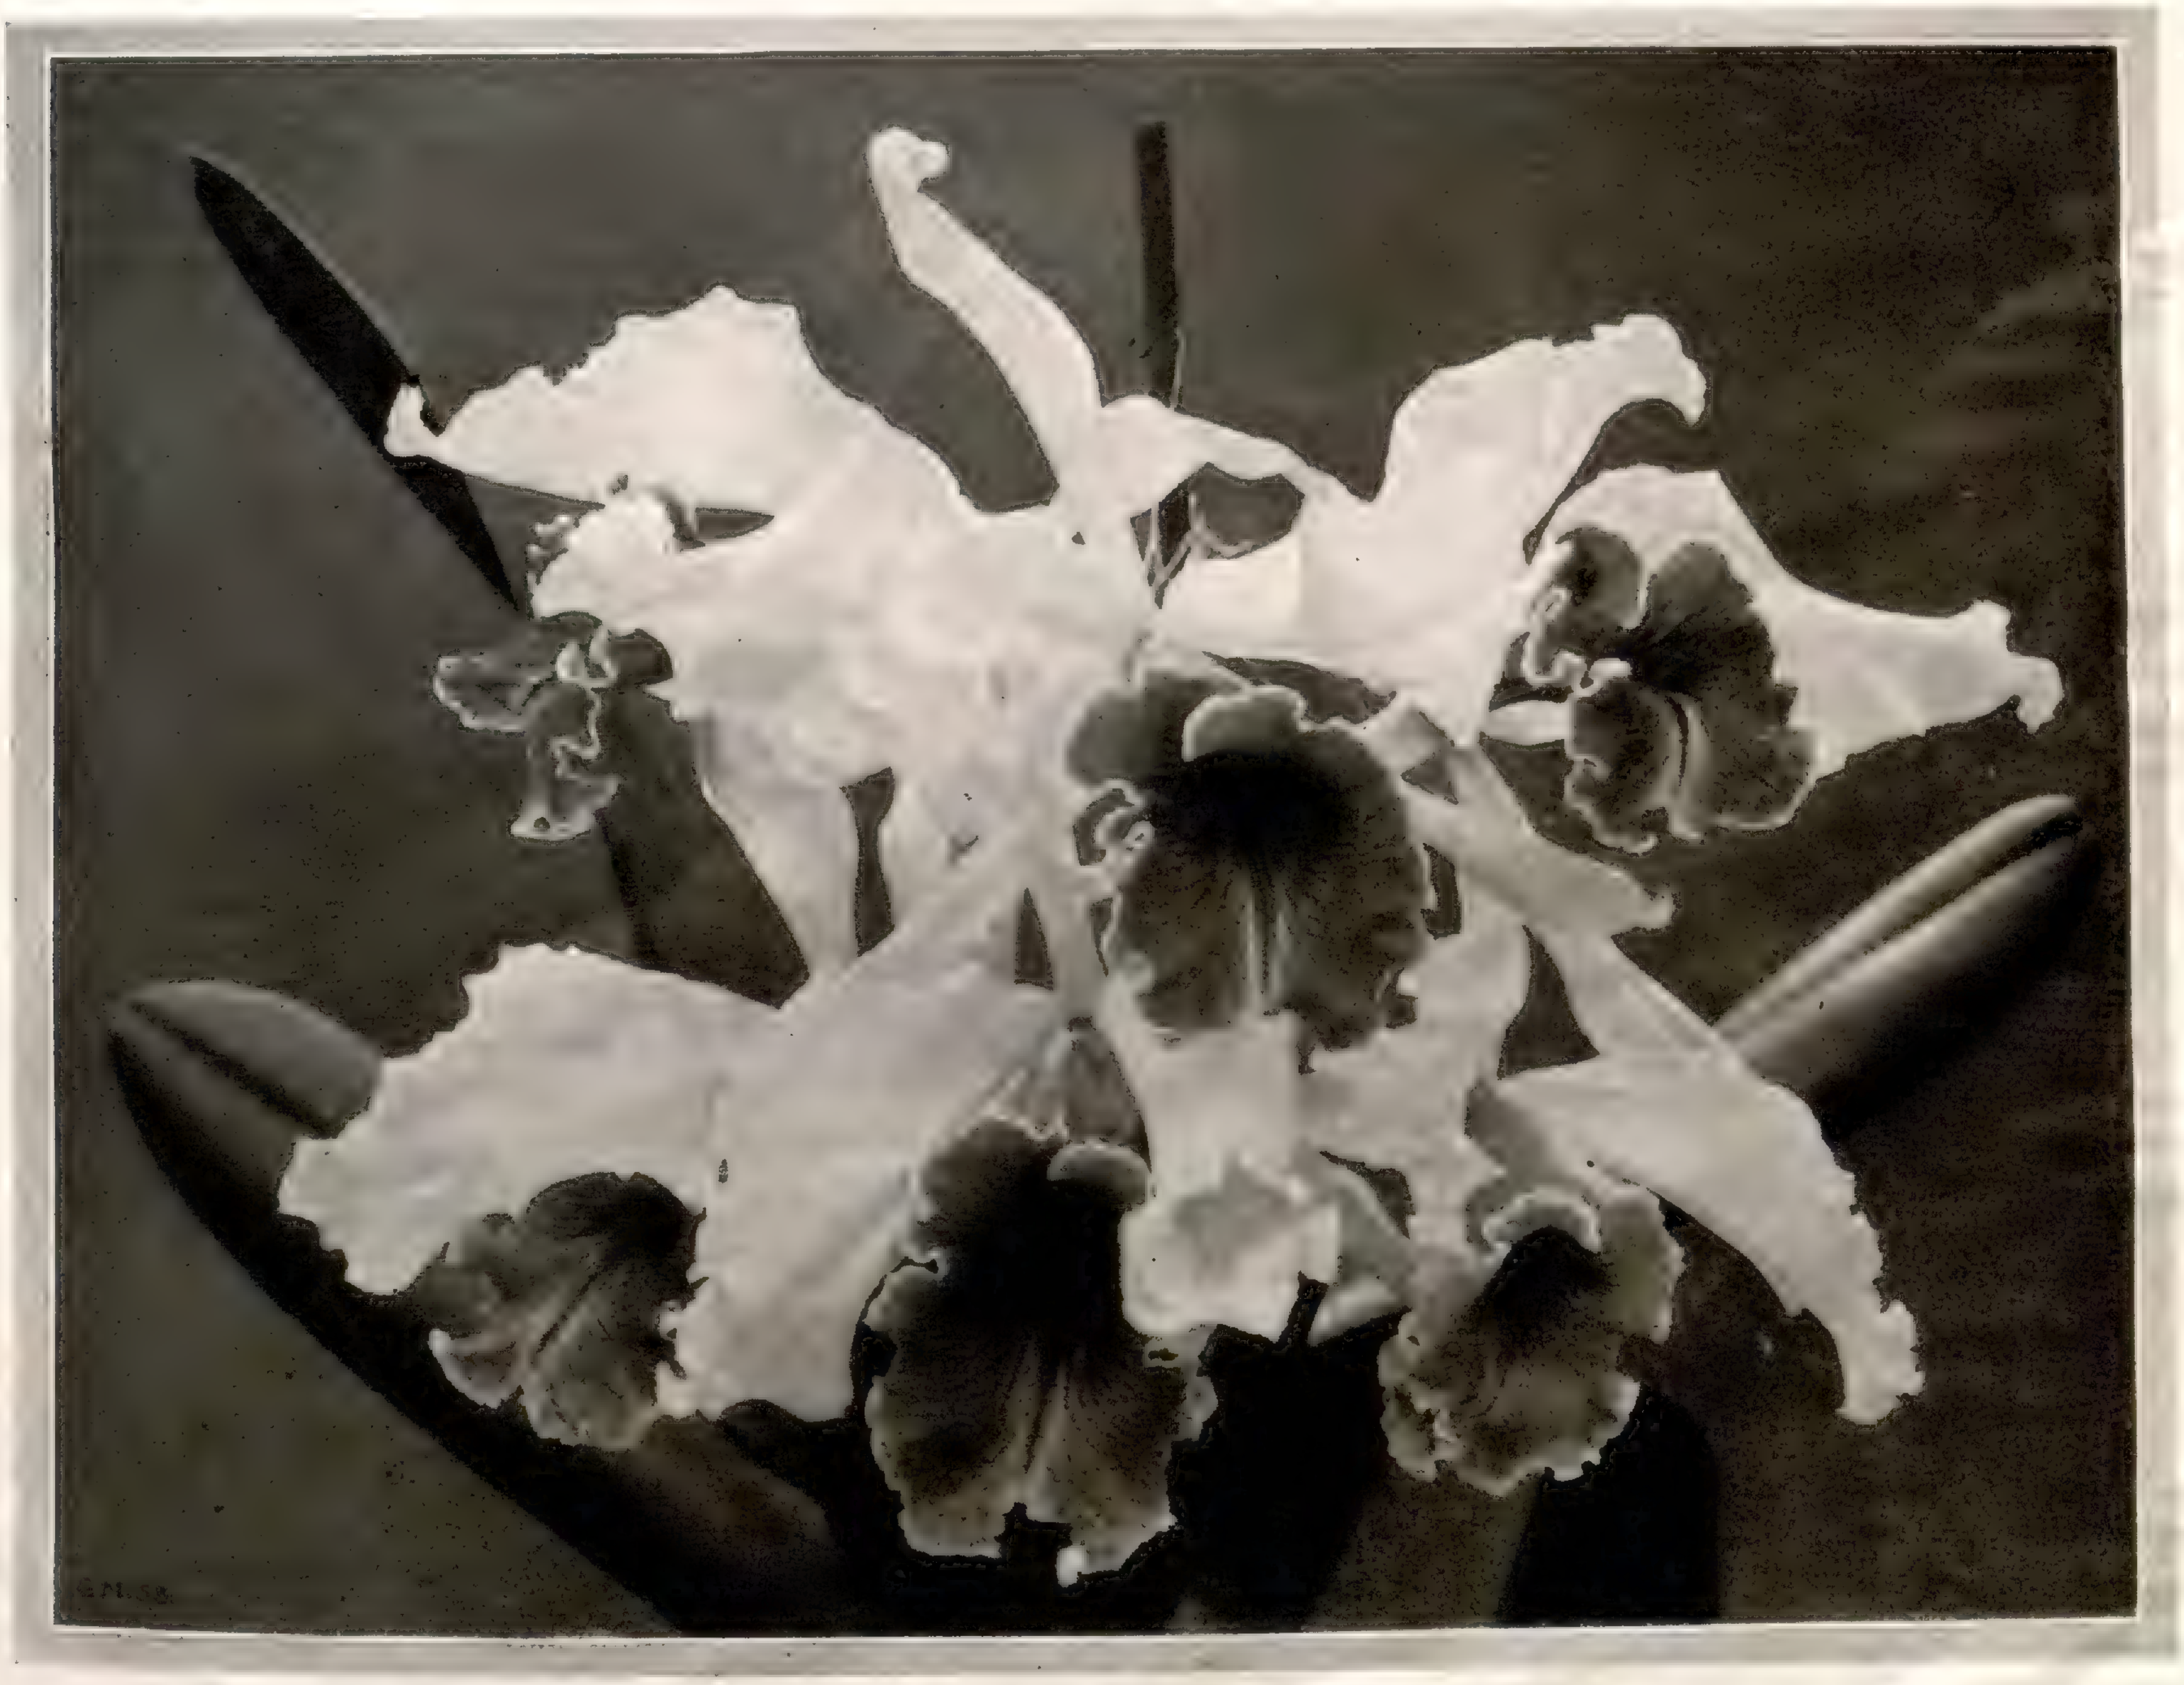
"White Lady."

**Hotbeds.**—These are essential where early vegetables, salads, etc., are required, and so easy to construct, that no garden, however small, should be without even one. It is now known that far better returns are obtained from gentle hotbeds than even heated houses, besides the outlay being much less, and the advantage of having a good mulching material from the spent beds for the later summer vegetables of various kinds. In preparing the materials, choose two parts long fresh stable litter and three parts leaves. Well mix by turning several times to sweeten before forming the bed. This should not be less than four feet high, and should exceed in width the frames by two feet. Place the frames in position immediately the bed is made. In a few days place nice prepared soil in the frame to a depth required for the intended crop. When aired or warmed through, gently press the bed evenly over, and sow a good type of short horn carrot, Inimitable for preference, forcing turnip, radishes, cauliflowers, and lettuce. If a shortage of lettuce is feared, plants from the autumn sowing should be planted in such frames, taking care to well air on all favourable occasions. Subsequent beds should be made according to requirements. It will be necessary to line the frames with additional litter from time to time to maintain a lasting heat.—G. Ellwood.

## NEW PLANTS, ETC.

### LÆLIO-CATTLEYA BELLA ALBA, DELL VARIETY.

This is a superb orchid, and it was exhibited in fine style, the plant carrying six large and beautiful flowers on one spike. The sepals and petals are pure white, the large lip being dark, rich crimson-purple, with some lighter lines in the throat. F.C.C., R.H.S., Jan. 9. Baron Bruno Schroder (grower, Mr. J. E. Shill), The Dell, Egham.



LÆLIO-CATTLEYA BELLA ALBA, DELL VAR.

A very beautiful variety, with pure white sepals and petals and crimson-purple lip. F.C.C., R.H.S., Jan. 9. Baron Bruno Schroder (grower, Mr. J. Shill), The Dell, Egham.

### LÆLIO-CATTLEYA MRS. W. HOPKINS.

A very beautiful hybrid, derived from L.-c. Haroldiana and Lælia Iona nigricans. It has a shapely flower, and is very effective, the sepals being deep yellow, and the broader petals a lighter, brighter, and glistening yellow, with some purple mottling on the upper half. The lip is very bright crimson-purple. A.M., R.H.S., Jan. 9. F. Wellesley, Esq. (gardener, Mr. W. Hopkins), Westfield, Woking.

### CYPRIPEDIUM SAN-ACTÆUS WESTFIELD VAR.

This effective variety of a well-known orchid is a charming one; the dorsal sepal is white with a green base and purplish spots, while the sepals and lip are light greenish-yellow. A.M., R.H.S., Jan. 9. F. Wellesley, Esq. (gardener, Mr. W. Hopkins), Westfield, Woking.

### ODONTOGLOSSUM CRISPUM QUEEN OF THE MORN.

A finely formed and very pretty variety, the broad and rounded flowers being almost wholly of a soft and pleasing shade of light rose. A.M., R.H.S., Jan. 9. Walter Cobb, Esq. (gardener, Mr. C. Salter), Normanhurst, Rusper.

### CYPRIPEDIUM JUCUNDUM.

A most distinct hybrid, the parents being C. alcidiades and C. veronica. The large flower has a white dorsal sepal of considerable size, with a small green area at the base and some delicate lines of rosy-purple dots. The petals are also white, with delicate purple markings, but the lip is of a creamy shade, tinged with purple. A.M., R.H.S., Jan. 9. Messrs. Sander and Sons, St. Albans.

### CATTLEYA MAGGIE RAPHAEL ORCHIDHURST VAR.

The parents of this variety of a popular and beautiful hybrid were evidently well selected, fine forms of C. Trianæ alba and C. Dowiana being used. The result is a fine batch of seedlings remarkably true in form and colour, the sepals and petals being white and the lip purple with gold veins. A.M., R.H.S., Jan. 9. Messrs. Armstrong and Brown, Tunbridge Wells.

### CYMBIDIUM ROSEFIELDIENSE.

An excellent addition to the hybrid cymbidiums, the parents in this instance being C. grandiflorum (Hookeri) and C. Traceyanum. The flowers are of large size, and the broad bright green sepals and petals are regularly spotted with light red, while the large lip is cream-coloured, with red-brown spotting. A.M., R.H.S., Jan. 9. De Barri Crawshay, Esq. (gardener, Mr. W. Stables), Rosefield, Sevenoaks.

### CYPRIPEDIUM CATILINE.

A large and showy cypripedium obtained by crossing C. Mrs. W. Mostyn with C. Leonidas superbum. The influence of the first-named parent is very marked, the bright rose-purple markings, the sheen, and the white apex to the dorsal sepal all being confirmative evidence. The lip and petals are greenish-yellow, with purplish shading. A.M., R.H.S., Jan. 9. The Duke of Marlborough (gardener, Mr. Hunter), Blenheim Palace, Woodstock.

### CARNATIONS WIVELSFIELD WONDER.

A handsome fancy perpetual carnation, long-stemmed and with an excellent calyx. The flowers are of large size, white freely and delicately marked with red. We figured this variety in a recent issue. A.M., R.H.S., Jan. 9. Messrs. Allwood Brothers, Wivelsfield, Hayward's Heath.

### CYPRIPEDIUM NITENS-BEEKENSIS.

One of the largest of cypripediums, its parents being C. nitens and C. Beekmanni. It has a big, rounded dorsal sepal, white, with a green base, and heavy spots of bright purple. The lip and petals are yellowish-green, shaded with purplish-brown. A.M., R.H.S., Jan. 9. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

### PEAR MRS. SEDEN.

A handsome, rounded pear, of ample size for dessert purposes, and of special value because of its excellent quality at a late date. This newcomer is the result of crossing Seckle with Bergamotte Esperen, and it has the shape of the latter with the finer flavour of the Seckle. The skin is dull greenish-yellow, with crimson streaks or shading on the sunny side, and the whole is covered with a fine bloom. The flesh is melting, not gritty, and of pleasant and good flavour. A.M., R.H.S., Jan. 9. Messrs. James Veitch and Sons, Chelsea.

## PROBLEMS IN FRUIT CULTURE.

Hardly a year goes by but what some fresh problems crop up in fruit culture, or some fresh difficulty arises which brings disappointment to those who grow fruit as a hobby and loss to those who depend upon it for a living.

Last year when apples, which in a general way were a good crop, were advancing towards the stage of ripening, and Nature was painting colours on their cheeks, the like of which they had never seen before, growers were confident in their anticipations that the fruit was maturing as it should, and that after it was picked it would keep in perfect condition. It is true the fruit ripened earlier than usual, but we put that down to the extraordinary summer, and never feared but what everything would be well.

So much for anticipations, but what about the realisation? The general complaint since last autumn has been that apples were keeping badly, and badly they have kept without a doubt. Tons of fruit that was apparently sound when picked have had to be thrown away, and because they were afraid of what might happen many growers rushed their apples into a glutted market, and sold them for what they would fetch in preference to running the risk of keeping them and having none to sell later on.

PEAR MRS. SEDEN.
A useful, rounded, finely-flavoured pear, late, and of good quality.
A.M., R.H.S., Jan. 9. Messrs. James Veitch and Sons, Chelsea.

What is the actual cause of all this disappointment? This is just where the problem part comes in, but whether it can be so easily solved is another matter. We may venture, I think, to give that peculiar disease known as "bitter-pit" the credit for a large proportion of the apples failing to keep, but what was the cause of the "bitter-pit"? One correspondent, writing of the apple crop in his particular district and speaking of the spots with which the fruits were marked, said that they were bruises caused by hailstones, but he did not explain how the hailstones had managed to hit the undersides of the fruits. I need hardly describe the symptoms of bitter-pit because most people unfortunately are too well acquainted with them, and they take the form of brown spots in the flesh which have no apparent connection with any surface injury.

We naturally look to the Scientific Committee of the Royal Horticultural Society for help in troubles of this kind, and the views of that body were given in the GARDENERS' MAGAZINE for November 11 last in the following words: "No fungi or bacteria have been found connected with bitter-pit, and it *appears to be a* disease of physiological origin rather than due to any parasite. The dead brown cells contain starch, whereas in the rest of the flesh the starch has been converted into sugar. It would therefore appear that the death of the cells *probably* took place before the ripening process had proceeded so far as the conversion of the starch into sugar, and may *possibly* be due to an accumulation of a poisonous substance in the cells through interference with the water supply." The italics are mine, and they go to show that there is a strong element of doubt about it all. And even if the solution is the correct one it does not help the grower much who has lost his apples, and all that he can do is to leave out the scientific explanation and say that the dry season is the cause of the trouble. The position appears to be one in which scientists may surmise and suggest, but they cannot prove, and the grower must apparently follow the advice of a noted statesman, and "wait and see." Shall we have a repetition of the "bitter-pit" trouble in the coming season? We do not know, but we should not if the Scientific Committee is right in its conclusions, and we are favoured with a normal summer in point of rainfall. In short, we must wait and see.

In the meantime another problem has been added to fruit culture, the fear of another loss has been placed on the already burdened shoulders of the fruit grower, and his only hope is that the trouble may be due, as suggested, to physiological reasons, and he may get no more of it. Be that as it may, the fact remains that bitter-pit has upset the calculations of growers, and brought about loss and disappointment in a season when everybody thought the natural conditions were favourable for apples keeping in a perfectly sound state.

Speaking of another fruit problem, take the homely gooseberry. A few years ago the American mildew was "discovered" on it, and a great sensation was the result. It is a matter of history now how the affair was brought before Parliament, the mildew was scheduled as a notifiable disease, inspectors were appointed, and plantations and gardens were searched, with the result that there turned out to be a good deal more American mildew in the country than was at first imagined. It is needless to say that with it all growers have been put to a good deal of trouble and expense, and now how do they stand? This is the problem, and like Rosa Warble, I only ask the questions, How far have we gone in the eradication of gooseberry mildew? Is there more or less of it now than there was four or five years ago? Is it such a dreaded disease as growers were first led to believe? Has any grower failed to obtain a crop of berries from established bushes, as the direct result of mildew? The American mildew certainly presented a problem, but the time has arrived when some kind of solution ought to be forthcoming, and there should be something to show for all the money that has been spent.
H.

## ACANTHUS MONTANUS.

Three years ago a First Class Certificate was given to Acanthus montanus, a tender member of the Bear's Breech family, nearly all of which are quite hardy. This comes from the West Coast of Africa, and requires a warm house for its successful culture. Apart from this feature in which it differs from its hardy relatives, it forms an erect stem of a half-woody character. This stem is regularly furnished with long deeply-cut leaves, disposed in an almost horizontal manner. These leaves have the course of the midrib and principal veins marked with a pale tint, almost white, while the remaining portion is of a deeper hue, the effect being to give a singularly mottled appearance to the surface of the leaf.

This acanthus flowers, as a rule, in the depth of winter, and, like the common kinds, the blossoms are produced in an erect spike. Each flower is sub-tended by a large rosy bract, and a succession is kept up from one spike for a considerable time. The flowers themselves are white, their principal feature being the large widely-expanded lip. This species has been grown for over forty years in this country, yet on the occasion of the certificate being granted it was practically unknown. Of easy propagation by means of cuttings, it will thrive in ordinary potting compost, providing it be grown in the stove, or at all events in the temperature of an intermediate house.
W. T.

**Chrysanthemum Mrs. Roots.**—This variety is unsurpassed as a good all-round one; it is equally as good grown in pots as in the open border. The habit is dwarf and compact. Cuttings rooted in March flower in October and early in November. Tops, taken off and struck in June, flower two weeks later, and only grow about 10in. high. Sucker cuttings result in plants bearing flowers two weeks later still, so that blooms of the purest white are available for a long period. There is nothing stunted about the plants, and they are so very useful for placing on front stages in greenhouses and conservatories.—GEO. GARNER.

## NEW RAMBLER ROSE ROWENA.

Rambling roses continue to increase in popularity and numbers, and considering the trend of the taste of those who are specially interested in roses and the activities of raisers of new varieties, it may be assumed that the day is far distant when some decline may be anticipated in the favour with which these elegant roses are regarded, or in the number of novelties introduced. The list of rambling roses is somewhat lengthy, but, owing to the raisers beyond the boundaries of the United Kingdom not so fully appreciating the importance of a high standard in selecting from the seed bed as growers at home, the number of really first-class varieties is as yet considerably short of requirements. Hence it is that novelties which possess the attributes essential to a variety of the first-class not only merit the attention of the rose-loving public, but are likely to receive the warmest welcome when their high qualities become known.

The beautiful variety Rowena, which we have the pleasure of illustrating herewith, is one of the most notable roses of its class that have been introduced within a recent period, and should, when distributed in the coming spring, have the instant attention of those who are interested in rambling roses. It belongs to the Wichuraiana section, is really vigorous, and the flowers are profusely produced in large and elegant trusses. The colour is best described as transparent rose-pink, with a slight shading of mauve, and in this respect the variety is quite distinct. Rowena was raised from seed in the nurseries of Messrs William Paul and Son, Waltham Cross, and is a valuable addition to the list of rambler roses.

## CONTROLLING THE ROOT SYSTEM OF FRUIT TREES.

(Concluded from page 27.)

### Apricot Trees.

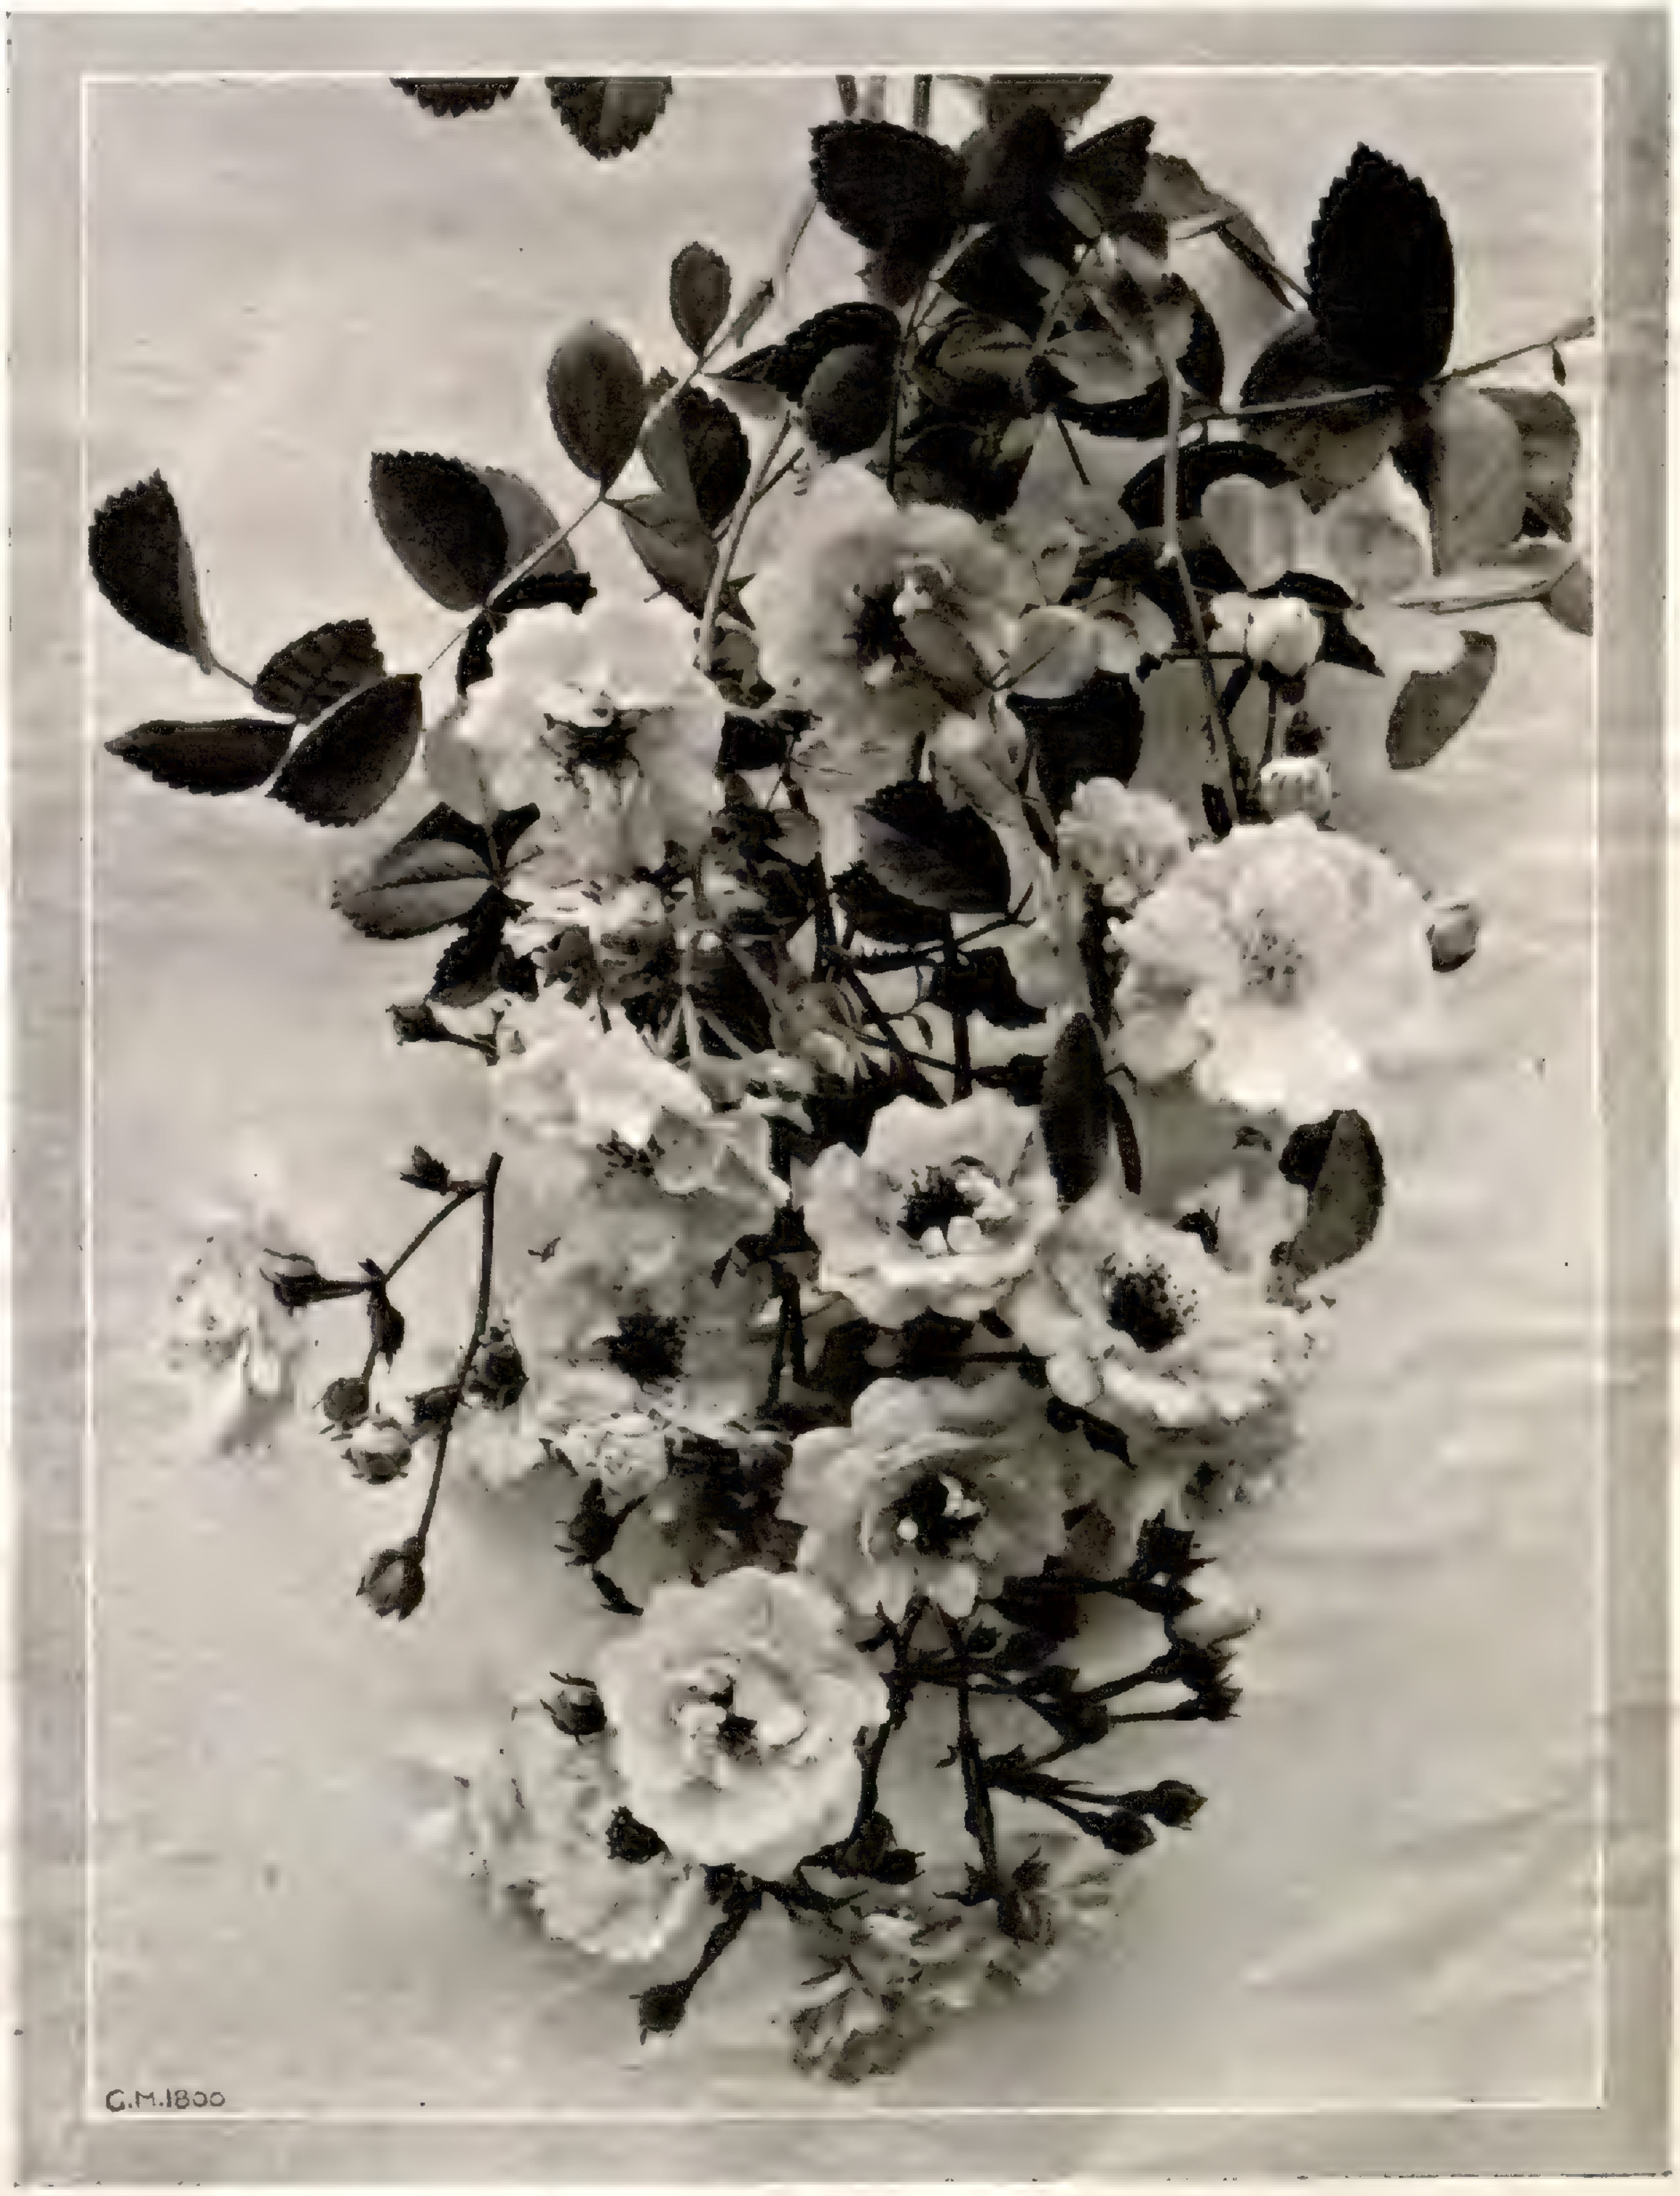
Apples will succeed in nearly all classes of soils, provided that, where necessary, a little special preparation is given, but such cannot, however, be said of apricots. In its native country the apricot is found to flourish on poor sandy soils, which may account for the fact that nowhere in this country do we find the apricot making a luxuriant growth in soil naturally heavy and damp, but only at the higher elevations where drier soil conditions prevail. Also, if such soils have a fair percentage of lime and sand in their composition, so much the better.

The difficulty which many experienced cultivators encounter is that of being unable to procure really strong healthy young trees; too often it is found that, through being cut back, snags have formed, which indicate that constitutional trouble has already commenced. The necessity for this practice of hard cutting back is because the trees have made an abundance of rank growth. Where these difficulties exist, it is wise to purchase maidens, not only of apricots, but of all other stone fruits, and plant them where they are to remain, giving the trees such soil and root area as will conduce to a steady and well-balanced growth of wood.

As to soil requirements, I doubt if there is anything better than good fibrous loam, with which is incorporated a liberal supply of brick and mortar rubble; in fact, the healthiest apricots I have ever seen were growing in material which was excavated to lay bare the foundation of an old castle, that had been buried by débris for quite a century. Further, it may be remarked that, given an ideal soil, it matters little how firm and hard these soils become. Where apricots are found growing under these ideal conditions of soil, elevation, and climate, the roots call for little, if any, special attention, while if, on the other hand, the trees are placed in unsuitable soils, not sufficiently compressed, or where heavy tenaceous soils receive too much ramming, root troubles must be expected. Where young trees exhibit signs of canker, and the limbs commence to die back, the sooner they are lifted and examined the better. Lifting must be performed carefully, all suckers and diseased growths removed, after which the tree should be replanted in a compost as above advised. Soil stagnation is often the cause of unhealthy root action, which is speedily followed by decay.

The greatest difficulty is often experienced with large trees, in which case it is advisable to excavate carefully under the roots, and note if any have their existence in cold, damp, or unwholesome subsoil. If so, sever these roots carefully, afterwards ramming a thick layer of lime rubble into the space between the ball of the tree and the subsoil. It would appear that the cause of barrenness in the majority of cases is traceable to trees having been planted in deep, rich, or cold, damp soils.

Mulching is often attended with excellent results where soils are naturally shallow and light, and equally good effects are to be found where mulching is practised for the purpose of preventing roots from penetrating into an undesirable stratum of soil below, as, for instance, a blue clay, which I have known prove fatal to many specimen trees when once the roots have penetrated into it. In some establishments that I have visited, I have been impressed by the many large trees cankered and diseased, which ought to have been grubbed out long ago. Sentiment, doubtless, is the reason for the existence of many such trees, and if the gardener had his own way, probably the ground would long ago have been planted with young and healthy specimens. When once these aged subjects have gone beyond renovation the sooner they are destroyed the better, but before replanting, very careful attention must be paid to making good and replenishing the necessary soil constituents and destroying injurious germ life which is undoubtedly active for some considerable time.



ROSE ROWENA.

A distinct and beautiful Wichuraiana variety raised by Messrs. William Paul and Son, Waltham Cross, and bearing a profusion of rose-pink flowers.

### Peach Trees.

Of late years fewer peaches are to be seen growing in the open throughout the southern counties of England than was once the case. Nevertheless, many still remain and succeed admirably where good walls with a south aspect can be afforded them. Many object to peaches being classed as hardy fruits, but if those who hold this opinion were to see the perfection to which some trees attain in the open, they would hold less strictly to their classification. To ensure healthy growth the soil conditions must receive special attention, otherwise the roots, however healthy when planted, will go wrong, and I know no soil that will sooner bring disaster to peaches than one that is close and damp, and more especially if overcharged with manurial ingredients of a highly concentrated character.

If the natural soil is a loam it can be perfected by the application of lime on brick rubble, together with a sprinkling of well-decomposed farmyard manure—in preference, that which has come out of a covered yard. Soot and wood ashes are also beneficial in the proportion of half a bushel to a cart load of the mixture. The whole secret of success is to provide a compost that will retain its sweetness over a long period, and restrict the production of gross, watery shoots, thereby giving place to firm and fruitful wood.

Another source of barrenness in peaches is often caused by allowing the roots to grow in loose open soils devoid of sun-heat through being shaded by other crops, planted, maybe, on the borders. Peaches will endure less tampering at the roots than any other fruits, and while it is necessary to lift and examine them occasionally, such operations must be conducted with the greatest possible care; and in replacing the soil, avoid giving rich mixtures containing an excess of farmyard manure. On no account should any nitrogenous fertilisers, such as nitrate of soda, sulphate of ammonia, or the more recently-introduced nitrogenous manures, nitrate of lime, or nitrolim, be added. Bone-meal will contain all the nitrogen necessary, and in addition, will provide the roots with phosphates in the best possible form for their future benefit. If wood ashes cannot be procured, give a few ounces or so of sulphate of potash; say five ounces to every square yard of the compost. I would here repeat that if a too rich nitrogenous soil is provided, it will be necessary to again lift the trees owing to their unfruitful condition, due to the roots having again established themselves in this rich layer of soil.

By systematic stopping of gross shoots the branches can be easily regulated, and so the use of a knife may be dispensed with, except perhaps as regards the cutting back of a few gross shoots after the season's growth has been completed, care being taken not to leave "snaggs," the presence of which indicates mismanagement or lack of good training on the part of the operator. If removed close to the main branch all cut surfaces will heal over.

With large gross-growing trees every attempt must be made to control root action and to encourage the formation of fibres in preference to slashing away at the branches indiscriminately with a knife. Abundance of sunshine is absolutely essential for the ripening of the wood, and it is owing to this lack of sunshine that several years ago peaches as hardy fruits proved such failures throughout the South of England. Last year extreme conditions were experienced and there can be no doubt as to the wood being ripened and sound, if only the foliage was retained in a healthy condition. Spring frosts contribute to the uncertainty of peaches becoming popular as hardy fruits, even in the southern counties. There are, however, still many kitchen gardens which can boast of productive trees that will repay the labour and expense incurred in their cultivation. Excessive cutting of the roots of peaches is a common source of bark disease.

### Cherry Trees.

Although it is advised to plant cherries in deep mellow, or rather sandy, soil, I have seen some of the finest specimens growing in little more than stones and rubble. Some of our best varieties of cherries are very subject to gumming, even where a knife has never touched the tree, but this disease, as most assuredly it is, can be averted to a great extent by retaining the roots close to the surface, thereby inducing a short growth and the establishment of firm natural spurs. In rich, loamy soils, some varieties grow too luxuriantly, with the result that the trees do not go early to rest, and that shortness and firmness of growth so essential to fruit production is not secured.

Morellos as bushes grow very luxuriantly, but unless the roots are induced to make abundance of fibres by keeping well to the surface, and well away from an unhealthy subsoil, they often die off very rapidly. One often comes across old specimen cherry trees which have not received treatment of any kind since the day of planting; trees of this class I have even seen growing in what would appear little more than gravel, and into which, on examination, the roots were found to have penetrated with considerable zeal. The branches, by the way, were thickly and regularly studded with clusters of fruiting spurs. Healthy cherry trees are also commonly met with in limestone districts, or where refuse from limestone quarries is incorporated with an open and well-drained loam. Gumming in cherries, as in plums, often takes place after periods of drought; the bark and sap vessels become so contracted that when rain softens the ground the roots take up a superabundance of nourishment which the half-dried stem cannot adequately deal with, and so gumming results.

### Currants and Gooseberries.

It is rarely that any special attention is paid to the roots of currants and gooseberries, the usual practice being to regulate growth from above rather than from below. Too often, hard cutting back is adopted in nurseries where the one object is to keep trees that are unsold from making too much head growth. In gardens we come across large bushes that would benefit very considerably if the roots were given a little attention, and, if need be, lifted and replanted in new ground.

In cottage gardens and allotments, one is continually coming into contact with old bushes that have been practically starved for want of nourishment and feeding, and where such specimens are diseased and dirty, the best remedy may be to make a bonfire of them, but if constitutional weakness is the only defect, and the surrounding ground is not choked with weeds, much good can be done by drawing away the surface soil, and placing a liberal mulching of manure around the roots, again covering with the soil that was removed. To still further rejuvenate the plants, remove a reasonable number of old branches, particularly those from the centre, so as to admit as much sun and air as possible. By retaining the roots of all trees near to the surface, many forms of disease, particularly canker, are warded off. While the wanton mutilation of roots is to be discouraged, there can be little doubt that the careful management and pruning of roots with the object of producing an abundance of fibres is a step in the proper direction, provided that such fibrous roots are carefully fed. J. C. N.

## A NUT WALK.

The planting of nuts so as to form a nut-walk affords an opportunity of combining fruit-growing with a charming piece of wild gardening. The prime necessity is space, for, if the bushes or trees are planted at such distances that the walk is well grown together in two or three years, its future will be disappointing, both as regards the amount of fruit produced and the opportunities for wild gardening. It should be planned on a liberal scale in this respect, or else left alone.

The question of soil preparation need not be entered into here, except so far as to say that, as it will not be properly dug again for many years, it should be well broken up to start with, and a good dressing of quarter-inch bones applied at the same time, say, at the rate of twenty pounds to forty square yards, and, in addition, for the sake of the plants, farmyard manure and refuse of all sorts. Twelve feet between the bushes in the rows is a fair distance apart, or, with a view to early effect, they may be planted at six feet apart, with the unswerving purpose of taking out alternate trees after a couple of years, or three at the most. The distance between the two rows, which will, of course, include the path, must depend, to some extent, upon the way in which the trees are to be allowed to grow. If they are to meet together at a fair distance above the heads of those walking through, a greater distance is necessary than would be the case if they are going to be limited to a height of six or eight feet, and the walk kept open by cutting in the trees at the sides. A fair average space to allow would be a foot-path of three to four feet, with a similar distance from the edge of the path to the centres of the bushes. This will seem a great deal at first, but if twelve feet are to be allowed between the bushes in the rows, ten to twelve feet is not at all too much between the rows, and, in fact, the border on each side of the path might well be increased by a foot each side, if due regard is paid to the future. All the above distances are based on the assumption that the kind of tree to be planted will be the naturally-grown bush, and not the semi-standard with a clean stem. If there is any choice about the position of the walk it should be laid out from north to south, that direction ensuring the maximum amount of sunshine alike for the nut trees and the borders between.

The system of pruning adopted will depend upon the character one wishes the walk to take. If fruit is the main object, which it will hardly be when the trees are grown in this way, then a good deal of cutting out of old wood will be practised, and the trees kept open, a system which is, of course, fatal to the beauty of the trees. If they are to be allowed to grow naturally within certain limits, then all that will be necessary will be a careful thinning out of the branches that will admit sun and air into the trees without disfiguring them, this method of thinning out giving the opportunity of regulating the height as well as the spread of the branches. In practice, all cutting back of the branches lessens the beauty of the trees, especially when the leaves are off, and as the early spring is the time when a nut-walk is in its fullest beauty, this aspect of the matter should receive careful consideration. In pruning nuts it should always be borne in mind that the female blossom is almost entirely pollinated by the action of the wind carrying the pollen to it, and, in order that there may be as much pollen blown about as possible, the pruning should not take place until the catkins are beginning to dry up, say, the latter part of February, the trees being almost at rest for a month or more after that time.

The use to which the borders along the walk are put may be quite different the first year or two from that to which they will be put later on when they become a good deal shaded. The ground having been well prepared to start with, it may be used, within certain limits, as ordinary flower borders at first, though no general digging should be practised, for, as the space between the bushes and the path is so small, it will be occupied throughout by the roots of the bushes by the end of the first year. After it begins to get shady, and the soil more fully permeated with roots, so that little cultivation can be practised, few summer-flowering plants will do much good, and the borders must be given up almost entirely to spring subjects of all sorts, including, of course, bulbs, all growing in a semi-wild state, the main attention given after it has become well filled with plants, being weeding, the clearing out of masses of seedlings of primroses, foxgloves, violets, and the like, and the occasional taking up of big clumps of bulbs and dividing them. Many bulbs do better among the roots of trees than anywhere, and many kinds of narcissus and tulips may be left for several years undisturbed, tulips especially never looking better than when growing in clumps with ten or a dozen blooms springing from a mass of luxuriant foliage. When it is advisable to take up the bulbs for division, or certain clumps of them, it is better to do this in October, when the disturbance to the roots of the trees will not harm the latter so much as it would when the foliage of the bulbs is dying down in June, though at the former season lifting gives a check to the bulbs, as their roots for the following season are then well developed.

These borders offer a fine position for primroses, especially that beautiful class which have come to be named Munstead, bunch, or polyanthus primroses. Though division is necessary for perpetuating the finest strains, it is better in a place of this kind, where practically no proper preparation of the soil can be made, to rely upon self-sown plants, selecting plants of the finest varieties for propagation for other parts of the garden. All the scilla family will thrive here, and clumps of hyacinths turned out of the pots after flowering will do well in such a position for years, increasing until they become fine naturally-grown clumps, which is the only way in which hyacinths in the open give real satisfaction in the opinion of some. It is as nearly a natural position for many spring bulbs as can be found, for while shady in the summer, when the bulbs are at rest, and fairly dry in the winter relatively to the general condition of the soil, when the bulbs are in flower, they get almost full sunshine owing to the leafless state of the bushes. Foxgloves luxuriate in such a place, but they must be kept under control, so that they do not damage the lower branches of the nut stubs. Plants of the best gloxinia-flowered strains should be planted to start with, and then left to seed themselves, always pulling up, or cutting for the house, any plants which are not good enough to be allowed to seed themselves. Doronicums will be in their element, as well as Jacob's ladder, and the old European pæony, if there is room for it. The delightful old-fashioned hepaticas will often succeed in a shady place kept open by the roots of trees, if not too dry, when they dwindle in other parts of the garden. Among other suitable subjects for a nut-walk, there might be mentioned columbines of the short-spurred type, Lenten and Christmas roses, wood lilies, tradescantias, honesty, wallflowers, evening primroses, Dielytra spectabilis, astrantias, lily of the valley, Solomon's seal, Hypericums calycinum, evening primroses, etc., etc.

Alger Petts.

## ACACIAS IN OPEN BORDERS.

The specimen of Acacia verticillata in full blossom, herewith illustrated, is growing in the gardens of Gnaton Hall, near Plymouth, the residence of Charles Bewis, Esq. The border in which it is planted is sheltered from the north and east winds by a belt of hardy evergreen shrubs, otherwise no other protection is given. The soil is an open, friable loam, and apparently is highly conducive to the healthy and rapid growth. The height of the specimen is fifteen feet, and, as will be seen, is well furnished to the base, and in the spring its growths are thickly hung with tail-like yellow flowers, making a highly attractive object. A few yards distant in the same border is a specimen of A. armata in excellent condition, and growing well. This species is not quite so hardy as the first-mentioned, and consequently a little protection is given during severe weather. A framework (similar to those used by nurserymen for packing) is placed over it, and in frosty weather, mats are placed over the frame at night. The small dark-green foliage acts as an admirable setting to the small balls of blossom with which the shoots are studded late in spring.

Several of these beautiful flowering shrubs adapt themselves to outside cultivation in the genial climate of South Devon and Cornwall, and deserve to be largely planted, where suitable spots can be found for them. Of course, even in these favoured districts, some require protection, when the weather is very severe, and they well repay any extra labour that has to be expended on them. A. longifolia is very handsome, with long, smooth foliage, and pale yellow blossom. A. Riceana is of rather rambling growth and pale yellow flowers. A. cultriformis has pretty glaucous foliage. A. dealbata, commonly called Mimosa, should have the shelter of a warm wall in a favoured spot. Large quantities of flowers of the latter are imported from the South of France for the London markets in the early part of the year.

E. C. Pooley.

A PROFUSELY-FLOWERED SPECIMEN OF ACACIA VERTICILLATA.
About fifteen feet high, growing in the gardens of Gnaton Hall, Plymouth, the residence of Charles Bewis, Esq.

An edition of "SWEET PEAS AND THEIR CULTIVATION," by C. H. Curtis, has just been issued for 1912, and consequently this is the most up-to-date work on the subject. The price, by post, is 1s. 2d. (cloth, 1s. 9d.) from the Publishers, 148-9, Aldersgate Street, London, E.C.

Mo. Bot. Garden

## GOURDS FOR PERGOLAS.

The abnormal summer of 1911, although not suiting many subjects in the garden, certainly favoured the growth of ornamental and other gourds, and all the varieties that I grew fruited splendidly. The colours also were certainly more remarkable than I have ever had them, although I have cultivated these very interesting plants somewhat largely for the past twelve or thirteen years.

In the early part of the season they certainly did not grow quite as fast as I liked to see them, there not being quite sufficient moisture to suit them in the early stages, but once I realised this there was no further need to worry, either about the growth they made, or the manner in which they set their fruit. Many of the smaller growing varieties, such as the orange, gooseberry, yellow pear, white, striped, and bicolor pear, the portmanteau, and bell-shaped gourds carried fruit from four to six inches apart, on growths from ten to twenty feet in length. Such plants as these, covering a pergola some sixty yards in length, with practically every upright supporting a different variety, made a quite pleasing feature in the kitchen garden, and certainly elicited more attention from visitors than many other subjects upon which more time and money had been expended.

The small varieties in themselves make a most pleasing display, but to produce a really telling effect some of the larger-growing varieties, such as the Giant Spanish, Red Etampes, Grey and Green Boulogne, Whale, Giant Turks Cap, Naples, Corfu, Embroidered, Climbing Crook-neck, Olive, and Hubbard gourds, must be employed, especially where the pergolas or arches are of large dimensions. These large gourds not only produce contrasts in the matter of size, but it is in these that one obtains the best colours, none of the small ones being really brilliant; I might add that practically all the large forms mentioned are edible, and where well ripened can be kept and used from right through the winter. The most popular one probably from an economic point of view is the Red Etampes, this being much in demand for various purposes on the continent, the chief use being for soup-making.

The Lagenaria family forms a quite distinct group of gourds, the growth and foliage being quite silky to the touch, whilst those in the Cucurbit group are all more or less prickly, and some of them are apt to cause small eruptions or spots on the arms of those working among them during very hot weather. Another distinctive feature of the lagenaria group is found in the flowers, which are white, and usually borne on a longer stem than that of the curcubit section. This family includes all the different types of bottle gourds, some of these being quite small, whilst others are so large that, if hollowed out, they would hold a couple of gallons of water. Some are of the shape of clubs, bottles, syphons, powder flasks, and snakes, and as the fruits of these remain a beautiful shade of green till quite late in the season, they are also desirable subjects for using on pergolas, in conjunction with the others But it cannot be too distinctly understood that their fruits must not be eaten, being described as bitter and probably poisonous. The species and varieties forming the lagenaria group are natives of tropical countries, and it is doubtful if they would fruit as well every season as they did during the past year, but from the fact that they add variety and interest to a collection a few at least should be tried, as, even if they did not fruit, the foliage and flowers are quite decorative.

The cultivation of gourds is simplicity itself. The young plants are raised as you would raise vegetable marrows, giving a little protection from cold winds at planting-out time. This should be done fairly early, so as to give the plants a good season's growth. The ground naturally should be well prepared for them, trenching it at least three feet deep, previously giving a fair dressing of manure. During hot dry weather plenty of water will be needed to keep them growing freely, and as the roots are apt to keep fairly near the surface, a mulching of suitable material will be of much assistance to them.

Considerable attention is needed in training to keep the growths tied in, and during July and August the growth is so rapid that they must not be left to themselves many days, or they may be seriously damaged by the wind. I have found them grow from eight to twelve inches to a foot each day during this period. As the fruits begin to swell, some support must be given to them, or they will soon break the growths down. Strong yarn is sufficient for the medium-sized fruits, running it over them in the same way that one often sees melons slung; but the larger fruits will need something much stronger. The best material I have used is 1½in. webbing, using it in the same way as the string, and allowing plenty of room for swelling. Even this must be of great strength, as some of the larger varieties will carry fruit ranging from 50lb. to 100lb. If carefully looked after, and care taken to so arrange the varieties that several plants of any one variety are not in close association, they cannot fail to be of interest.

Thomas Stevenson.

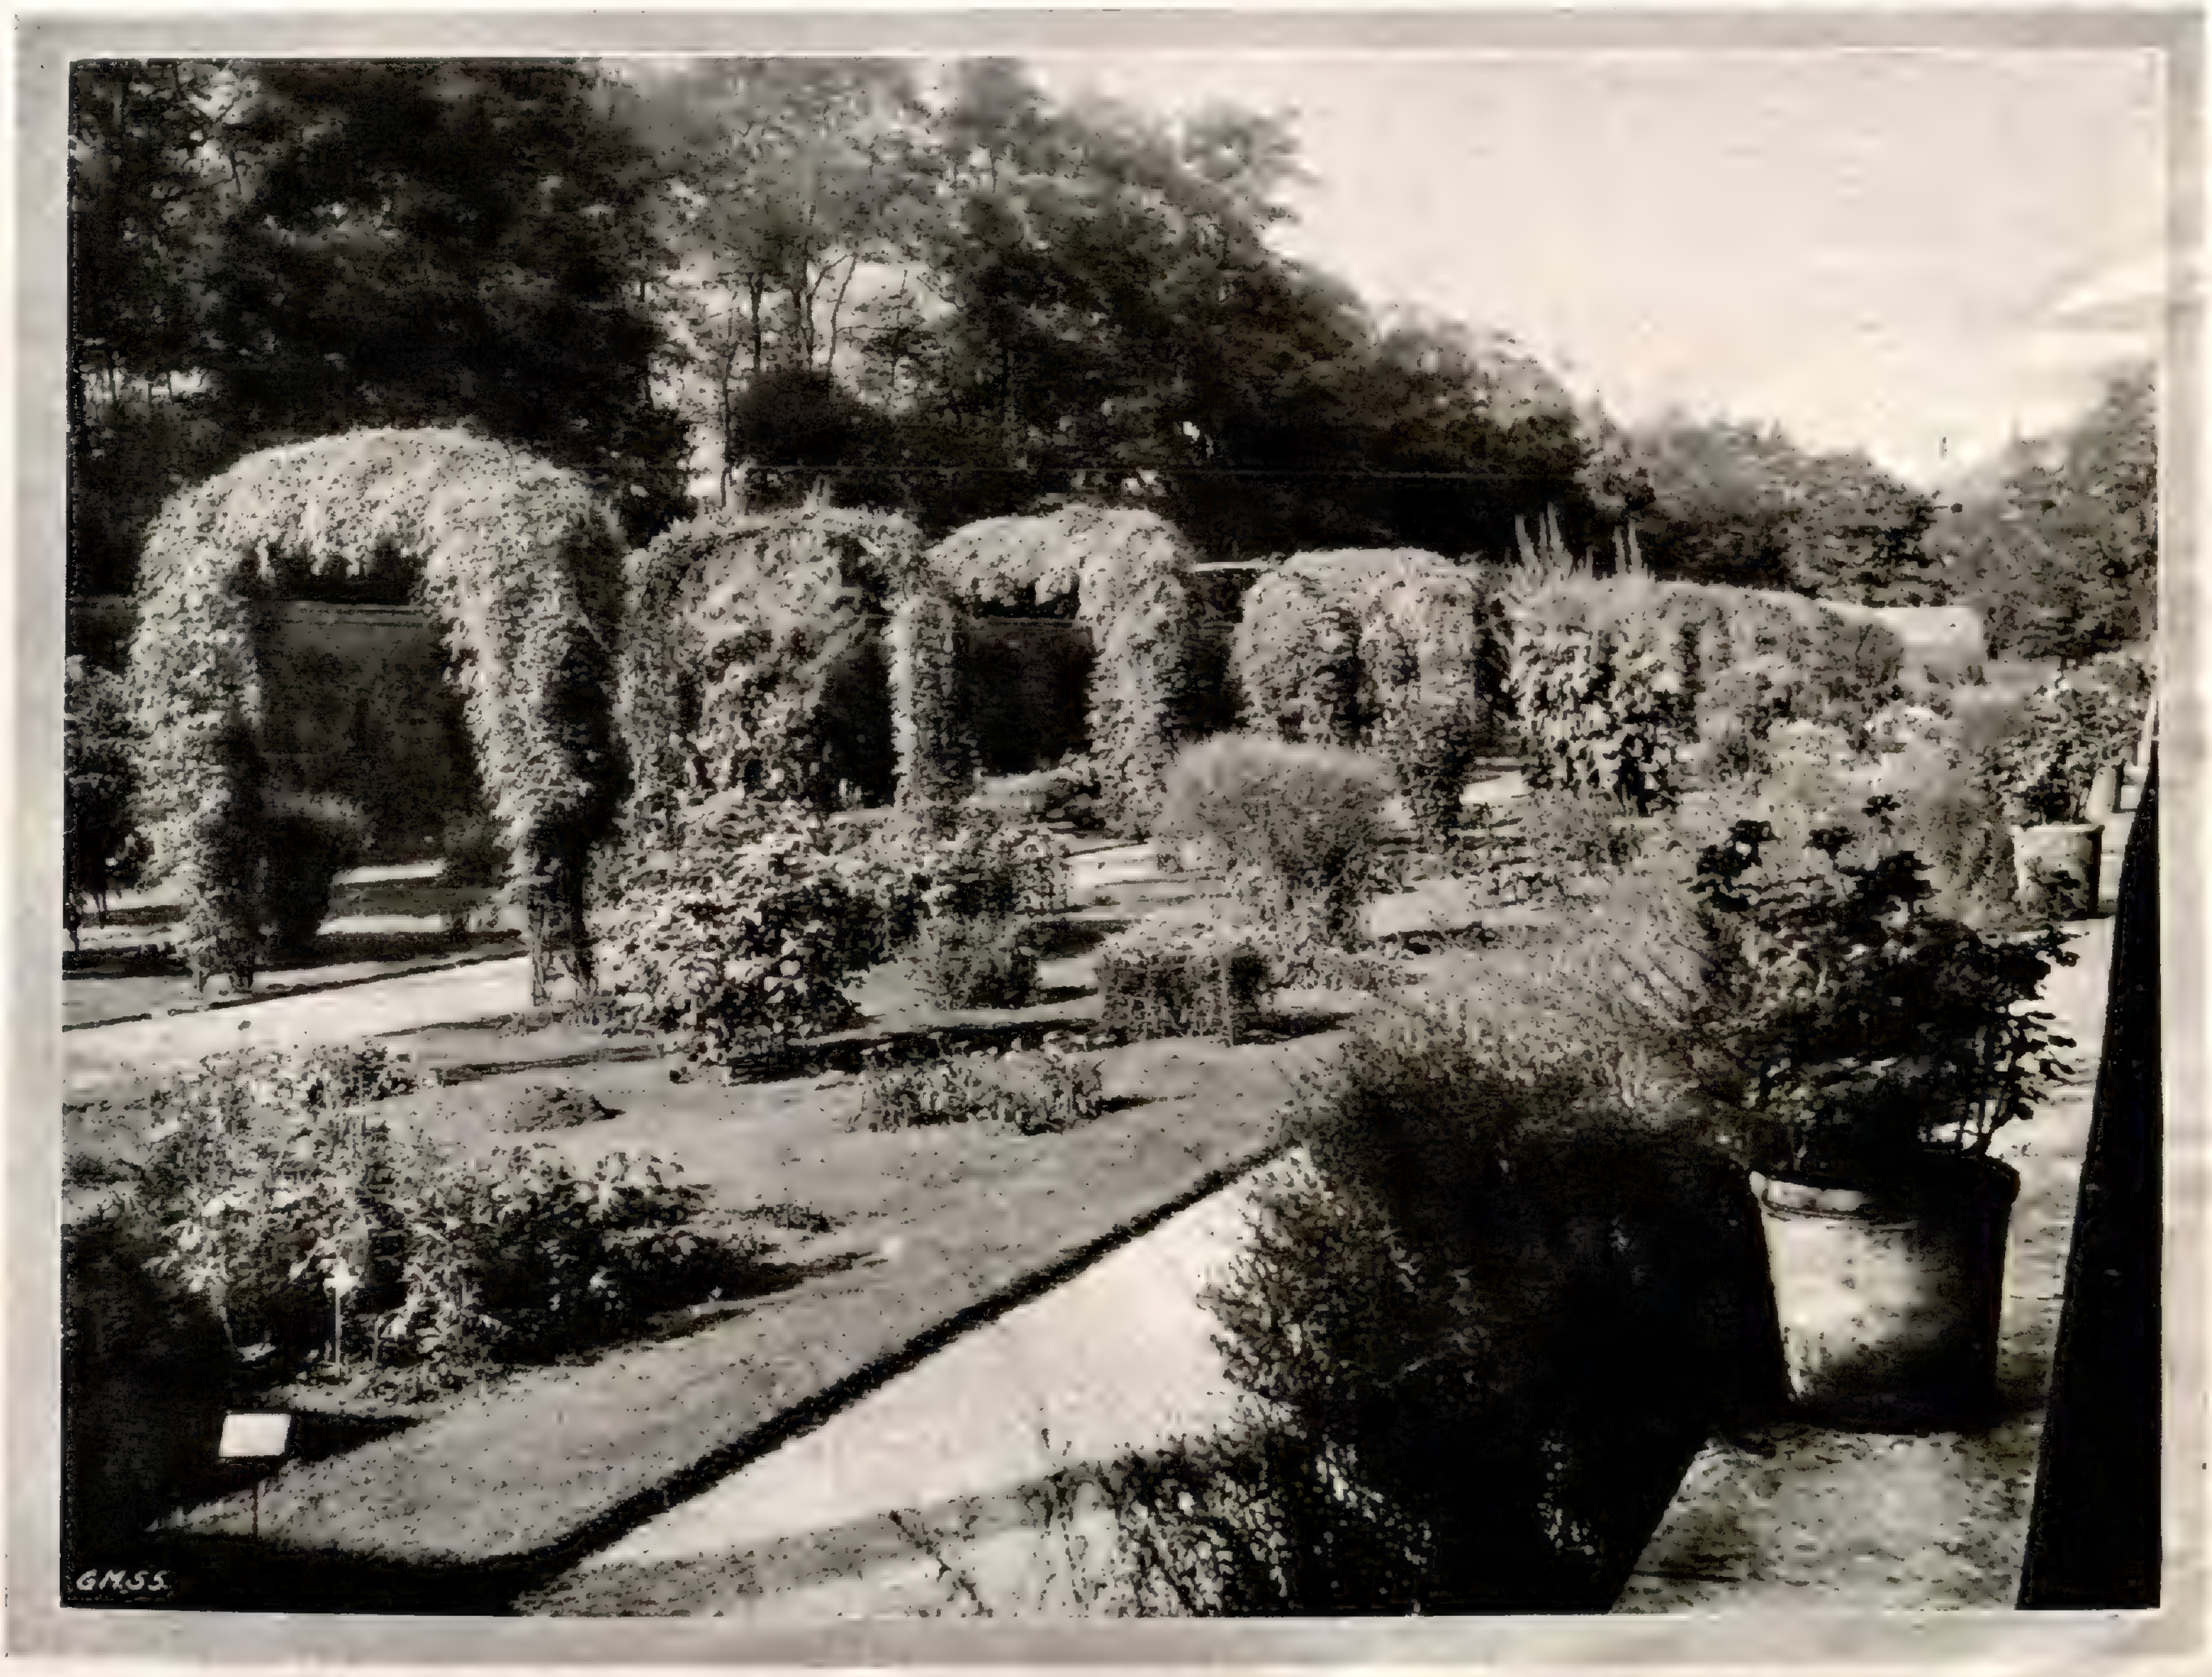
PORTION OF MR. T. STEVENSON'S GOLD MEDAL COLLECTION OF GOURDS.

Exhibited at the meeting held by the Royal Horticultural Society, September 26, 1911, the aggregate weight of the fruits being two tons.

## CLIMBING PLANTS IN THE BAGATELLE GARDENS.

So numerous are the hardy climbers that have been introduced from Western China and other parts of the world within recent years that the question of displaying their distinctive charms to the best advantage has become of considerable importance, especially in gardens where they are rather fully represented. In some gardens many of the kinds can, with advantage, be utilised in clothing the walls of the dwelling-house and other buildings within view of the gardens, for not only is it desirable to cover wall surfaces that are bare, but to use some of the vitis for the purpose of obtaining a greater diversity of foliage than when the ivies alone are planted. Some are specially adapted for training to strong trelliswork to form screens where it is desired to separate one part of the garden form the other, or to shut out some unsightly object. Again, several are well suited for climbing stout poles, and where these are judiciously placed they present a most attractive appearance, and render substantial assistance in removing any flatness that may be evident in the part of the garden in which they have been arranged.

With few exceptions, they may all be successfully employed in covering pergolas and arches which usually now have such prominent positions assigned them in the garden. With reference to the use of hardy climbers in the embellishment of pergolas and arches we do not purpose doing more than direct attention to the facilities which the latter afford for growing a select number of species and varieties separately. By spanning a broad walk of some considerable length with arches, as in the grounds of Bagatelle, Paris, of which an illustration is given herewith, a number of the finest of the vitis, clematis, etc., may be grown separately, and the owner of the garden given an opportunity of enjoying to the full their varied charms. When several members of the same group of climbers are arranged in close association when a pergola is being furnished, they lose much of their individuality; but by constructing a number of arches and allotting one to each of the climbers, they have full opportunity for the display of their distinctive habit and affording much pleasure to those who derive interest from the study of individuality in plant life. The arches may be of iron, and of the same shape as those in the Bagatelle Gardens, or they may be of wood, and with flat tops, if preferred; but in all cases they should be of sufficient width and height to avoid inconvenience to persons passing along the walk, and be of sufficient strength to withstand strong winds when fully clothed.



CREEPER CLAD ARCHES IN THE GARDENS OF BAGATELLE, PARIS.

---

**Sarracenias in Flower.**—The curious pitcher-like leaves of the sarracenias are usually regarded as their principal claim to recognition, but the blossoms from their strange shape and showy character must not be altogether passed over. In this respect Sarracenia rubra stands first, as apart from the noble appearance of the deep red blossoms they have also a pleasing violet-like perfume. Though the flowers of S. flava are of a pretty primrose tint, they have a disagreeable cat-like odour. The purplish-coloured flowers of S. Drummondi have but little or no scent. These sarracenias seem now to have almost dropped out of cultivation; at all events they are not as much grown as they were 25 years ago.—W. T.

## HARDY SHRUBS FOR FORCING.

Many kinds of these are well adapted for decorative purposes, especially in a small state, as they make delightful pot plants, and as many of them can be raised from cuttings or seed, plants may be obtained in quantity, provided there is convenience at command for their production. Where this is not possible suitable plants may be purchased from a nursery at a cheap rate. Some species are produced by grafting, and these are best left to those who make a special business of that branch of horticulture.

The light graceful sprays of the various forms of deutzias, spiræas, prunus, cerasus, viburnums, syringas, philadelphus, pyrus, and some others form a list that could not well fail to satisfy the most fastidious, but those who wish for a still greater variety may include the various forms of azaleas, Clethra alnifolia, and hydrangeas. If we take the different kinds separately we shall find that they will not all do treated alike, as some require a peaty soil, others a light rich loam. The kinds that are the most easily excited by a gentle heat are those that naturally flower early when grown in the open ground, such as some of the spiræas and deutzias. Spiræa Thunbergi and S. confusa are most desirable, the last-named species producing its flowers in small clusters like the hawthorn, and is often called the French May. When forced gently it is charming for decorative purposes, its small pale-green foliage forming a neat background to the delicate little trusses of flowers. There are many of the deutzias that are useful for forcing, but the most common is D. gracilis. Prunus are all grafted plants, and those of the sinensis type form neat little bushes when their clusters of snow-white flowers are produced all along the slender growths. There are several species, such as P. Mumé, double white; there is also a pink form of this, which is very pretty; P. sinensis flore alba pleno, and rosea pleno; also the double-flowering sloe. As the flowers of these expand with the aid of a low temperature, it is essential they should be grown in a light airy structure, and not be subjected to an excess of warmth. Some of the pyrus also make grand subjects for forcing, and where large conservatories have to be furnished, these early-flowering shrubs form special features when well grown. Such forms as P. coronaria fl.-pl. and P. floribunda atro-sanguinea, when grown as standards, make delightful subjects for conservatory decoration; their long sprays of highly-coloured sweet-scented flowers remind us of the profuse display of flowers produced late in the spring in the open. Then we have the various forms of Cydonia japonica and C. Maulei, their richly-coloured flowers, which are freely produced, being most attractive.

Who is there that does not admire the cherry blossom early in the spring. The various double-flowered forms of these are most interesting. They all force well, and the double-flowering kinds, whether white or pink, are very attractive. They may be had either as dwarfs or standards, but for them to show to best advantage the plants should be of fair size. They are all grafted and when grown in pots will need liberal treatment. Syringas or lilacs are always much admired, particularly the white varieties. Plants of these may be purchased of almost any size, but those most useful are such as can be grown in moderately-sized pots. It is a great mistake to force these into bloom too rapidly, as, by so doing, the flowers are rendered soft, and therefore do not stand so well, either on the plants or when cut.

The old snowball tree (Viburnum opulus sterile), which is found in such abundance all over the country, needs no description, but there are several others that are not, as a rule, well known to the generality of gardeners. V. plicatum, V. macrocephalum, and V. tomentosum are alike useful for forcing, and those who have not grown them thus can have but little idea of their beauty. The large trusses of pure white flowers, which are borne in such abundance, produce a most attractive display.

All are more or less acquainted with the hardy deciduous azaleas, but there are now so many hybrids from the various sections that it is not easy to say to which section they belong. The long-tubed forms are very pretty, reminding one of the honeysuckle. Then there are the mollis, mollis hybrids, and the Ghent hybrids. These hardy azaleas would of themselves form a glorious feature in the conservatory during the early spring months, and as they are so easily grown and forced, should be had in quantities. A peat soil suits them best, though they will thrive in a loam that is free from lime. Clethra alnifolia is sometimes seen in gardens in a most miserable condition on account of its being planted in the common garden soil, whereas it is a peat-loving subject. When growing in the open it does not bloom until the latter part of the summer, but no shrub that I am acquainted with forces so well, or is an object of greater beauty when in bloom. It produces upright terminal spikes, and has a light graceful habit. The flowers are pure white when forced.

H. C. PRINSEP.

## SNOWDROPS.

> "Soon shall kind spring her flowery gifts bestow
> On sunny banks, where silver snowdrops grow."
> —J. SCOTT.

Snowdrops are better known as garden blossoms than as real wild flowers. Like the primrose, the lily of the valley, and the foxglove, their beauty and grace have lead to their wholesale introduction into the garden. They are nevertheless true wild flowers, as truly wild as any buttercup. It has been contended by some writers that the snowdrop is probably not indigenous, but it has in any case got so thoroughly naturalised amongst us that, whatever may have been the state of affairs five hundred years ago, it is now as much a wild flower in our midst as any of the other plants mentioned in the British flora, and as such is always included without question among them. The snowdrop is a perennial galanthus, its graceful little drooping flowers must be sought for in gardens, orchards, shady pastures, woods, and hedgerows during the months of January, February, and March.

"In our own orchard," writes Edward Hulme, "and nestling deep down in our hedges, we have them springing up by thousands at the opening of each year. The third week in January is generally the time when we may look for them." Gilbert White, the famous Selborne naturalist, gives the dates of flowering 12th to the 24th. I can give you some dates from my own observation, namely: 1906, January 25; 1907, January 20; 1909, January 12; 1910, January 16, only one bulb flowering; 1911, January 18, three or four blooms flowering. How often have we noticed it showing its drooping head immediately after the melting of the snow. Dr. Alfred Smee tells us that one year, and only one he new of, his snowdrops appearing between Christmas and the New Year, and I remember some being brought from Stanway Hall, Essex, at the end of December.

Snowdrops are naturally single, but cultivation has given us a variety with double flowers, but I think my readers will agree with me that the former have the greater charm. It is only necessary to plant the bulbs, and then to leave them, when they will multiply year by year. Quantities of snowdrops should be grown in every garden and in shrubberies, and under trees whenever the space can be found, as they light up the bare ground in the garden among ferns, etc. A larger species of snowdrop known as Galanthus plicatus, was introduced from the Crimea in 1872. The flower is somewhat larger, and the leaves are much broader and coarser. It is less plentiful than the common species, and differs so little from it that it is hardly to be recognised without careful and close examination. Except as a mere curiosity, it is not a very desirable addition to the garden. The old snowdrop is now known to be only one member of a large family, most of which have some merits for garden culture. The snowdrop never looks better than when naturalised amid the tender grass of an old orchard or paddock, the margin of lawns, or beside the pathways of woods. Almost any soil suits them, but rich gravelly-bottomed soils drained are best, though we are met by the rather startling fact that in Leicestershire and Nottinghamshire this flower grows well on the clay soil of hedge banks and old orchards. As cut flowers, snowdrops are most attractive and useful, and a delightful addition to bouquets, etc.. To cut the flowers in bud is, however, essential to ensuring perfect beauty, as they can be carried better and open fresher in water, than if cut when fully expanded.

The present very interesting and growing state of our knowledge of snowdrops may best be gleaned from a paper read by the late Mr. James Allen before the Royal Horticultural Society, of which the following is an extract: "Less than twenty years ago there was practically but one kind of snowdrop grown in England—Galanthus nivalis—in its single and double forms. Galanthus plicatus was introduced soon after the Crimean War, but it was not often seen unless in botanic gardens. Early in the 70's Galanthus Elwesi was introduced, and in 1875 Mr. Barr offered, under the name of Galanthus Imperati, a very fine form, which the late Mr. James Atkins, of Painswick, procured 'from somewhere in the kingdom of Naples. This is much finer than the Galanthus Imperati offered some two or three years later, and now generally grown under that name. I propose that the earlier form be called Galanthus Atkinsi. Then Galanthus latifolius (first offered as Galanthus Redoutei), a snowdrop with the leaves of a scilla, was followed later on by Galanthus caucasicus, and finally by Galanthus Fosteri." We have also discovered that a few forms of Galanthus nivalis, from the mountains of Greece, hurry into flower in September or October, instead of January, and some of their little cousins in Corfu try to do the same, but cannot get their wardrobes ready until a few weeks later. In speaking of snowdrops, we must not forget that, besides the division into species and subspecies, we have the arrangements into classes according to colours, and other peculiarities. Consequently, we hear of white snowdrops and yellow snowdrops, and also green snowdrops. Galanthus Elwesi is a native of the Levant, with large flowers, the three inner segments of which have a much larger and more conspicuous green blotch than the common kind which is a native of Great Britain, and largely cultivated in Lincolnshire for the supply of flowers to the London and other markets, and also for the production of bulbs for sale.

Many of my readers will understand that nivalis is a Latin adjective that signifies relating to or resembling snow. The generic name is Greek in its origin, and signifies milk flower. And now for the description of the flower itself. The leaves are two in number, bluish-green in colour, hence no other green (not even ivy leaves) associate so well with snowdrops when used for decorative purposes, the leaves being long and narrow, and at the time of flowering they are often six inches in length, but after the blossoms have died away, continue to elongate for some time, and may often be found a foot long, and the vigorous upward growth of their younger days exchanged for a somewhat drooping and feeble appearance. The flowering stem that rises from the midst of these little leaves, bears a single flower. The flowers of the snowdrop are somewhat bell-shaped and composed of six segments; of these three are pure white, while the other three that alternate with these, and are placed within them are considerably smaller and are tipped or blotched at their outer extremity with a spot of bright green. The three outer and larger segments spread outwards considerably more than do the others. It does not call for forcing, and it is very disappointing to try it, for the leaves grow long before the flower reveals its beauty. If you want them early for a bowl in the room (the bulbs, I mean, of course), lift a clump just as it shows above ground, and you will have it true to nature. A quaint old book gives this: "The snowdrop is a special favourite of all who are acquainted with the English language, and who have heard of its appearance amid the snows of winter. Still more is it to be prized by those whose eyes are cheered by the first arrival in gardens, groves, and shrubberies when yet partially covered with a white mantle of Nature's own weaving. The snowdrop is the earnest of spring, it is the forerunner of that glorious train of flowers in which follow on in rapid succession the various beauties which Flora itself brings before our enchanted gaze month by month. Who can look upon the snowdrop without feeling a thrill of renewed pleasure and joy? Who can see its drooping pearly head without his own heart rising in grateful joy at its assurance of returning spring? Hence we have a sympathy with the snowdrop apart from all other flowers which claim our love and care later on in the year."

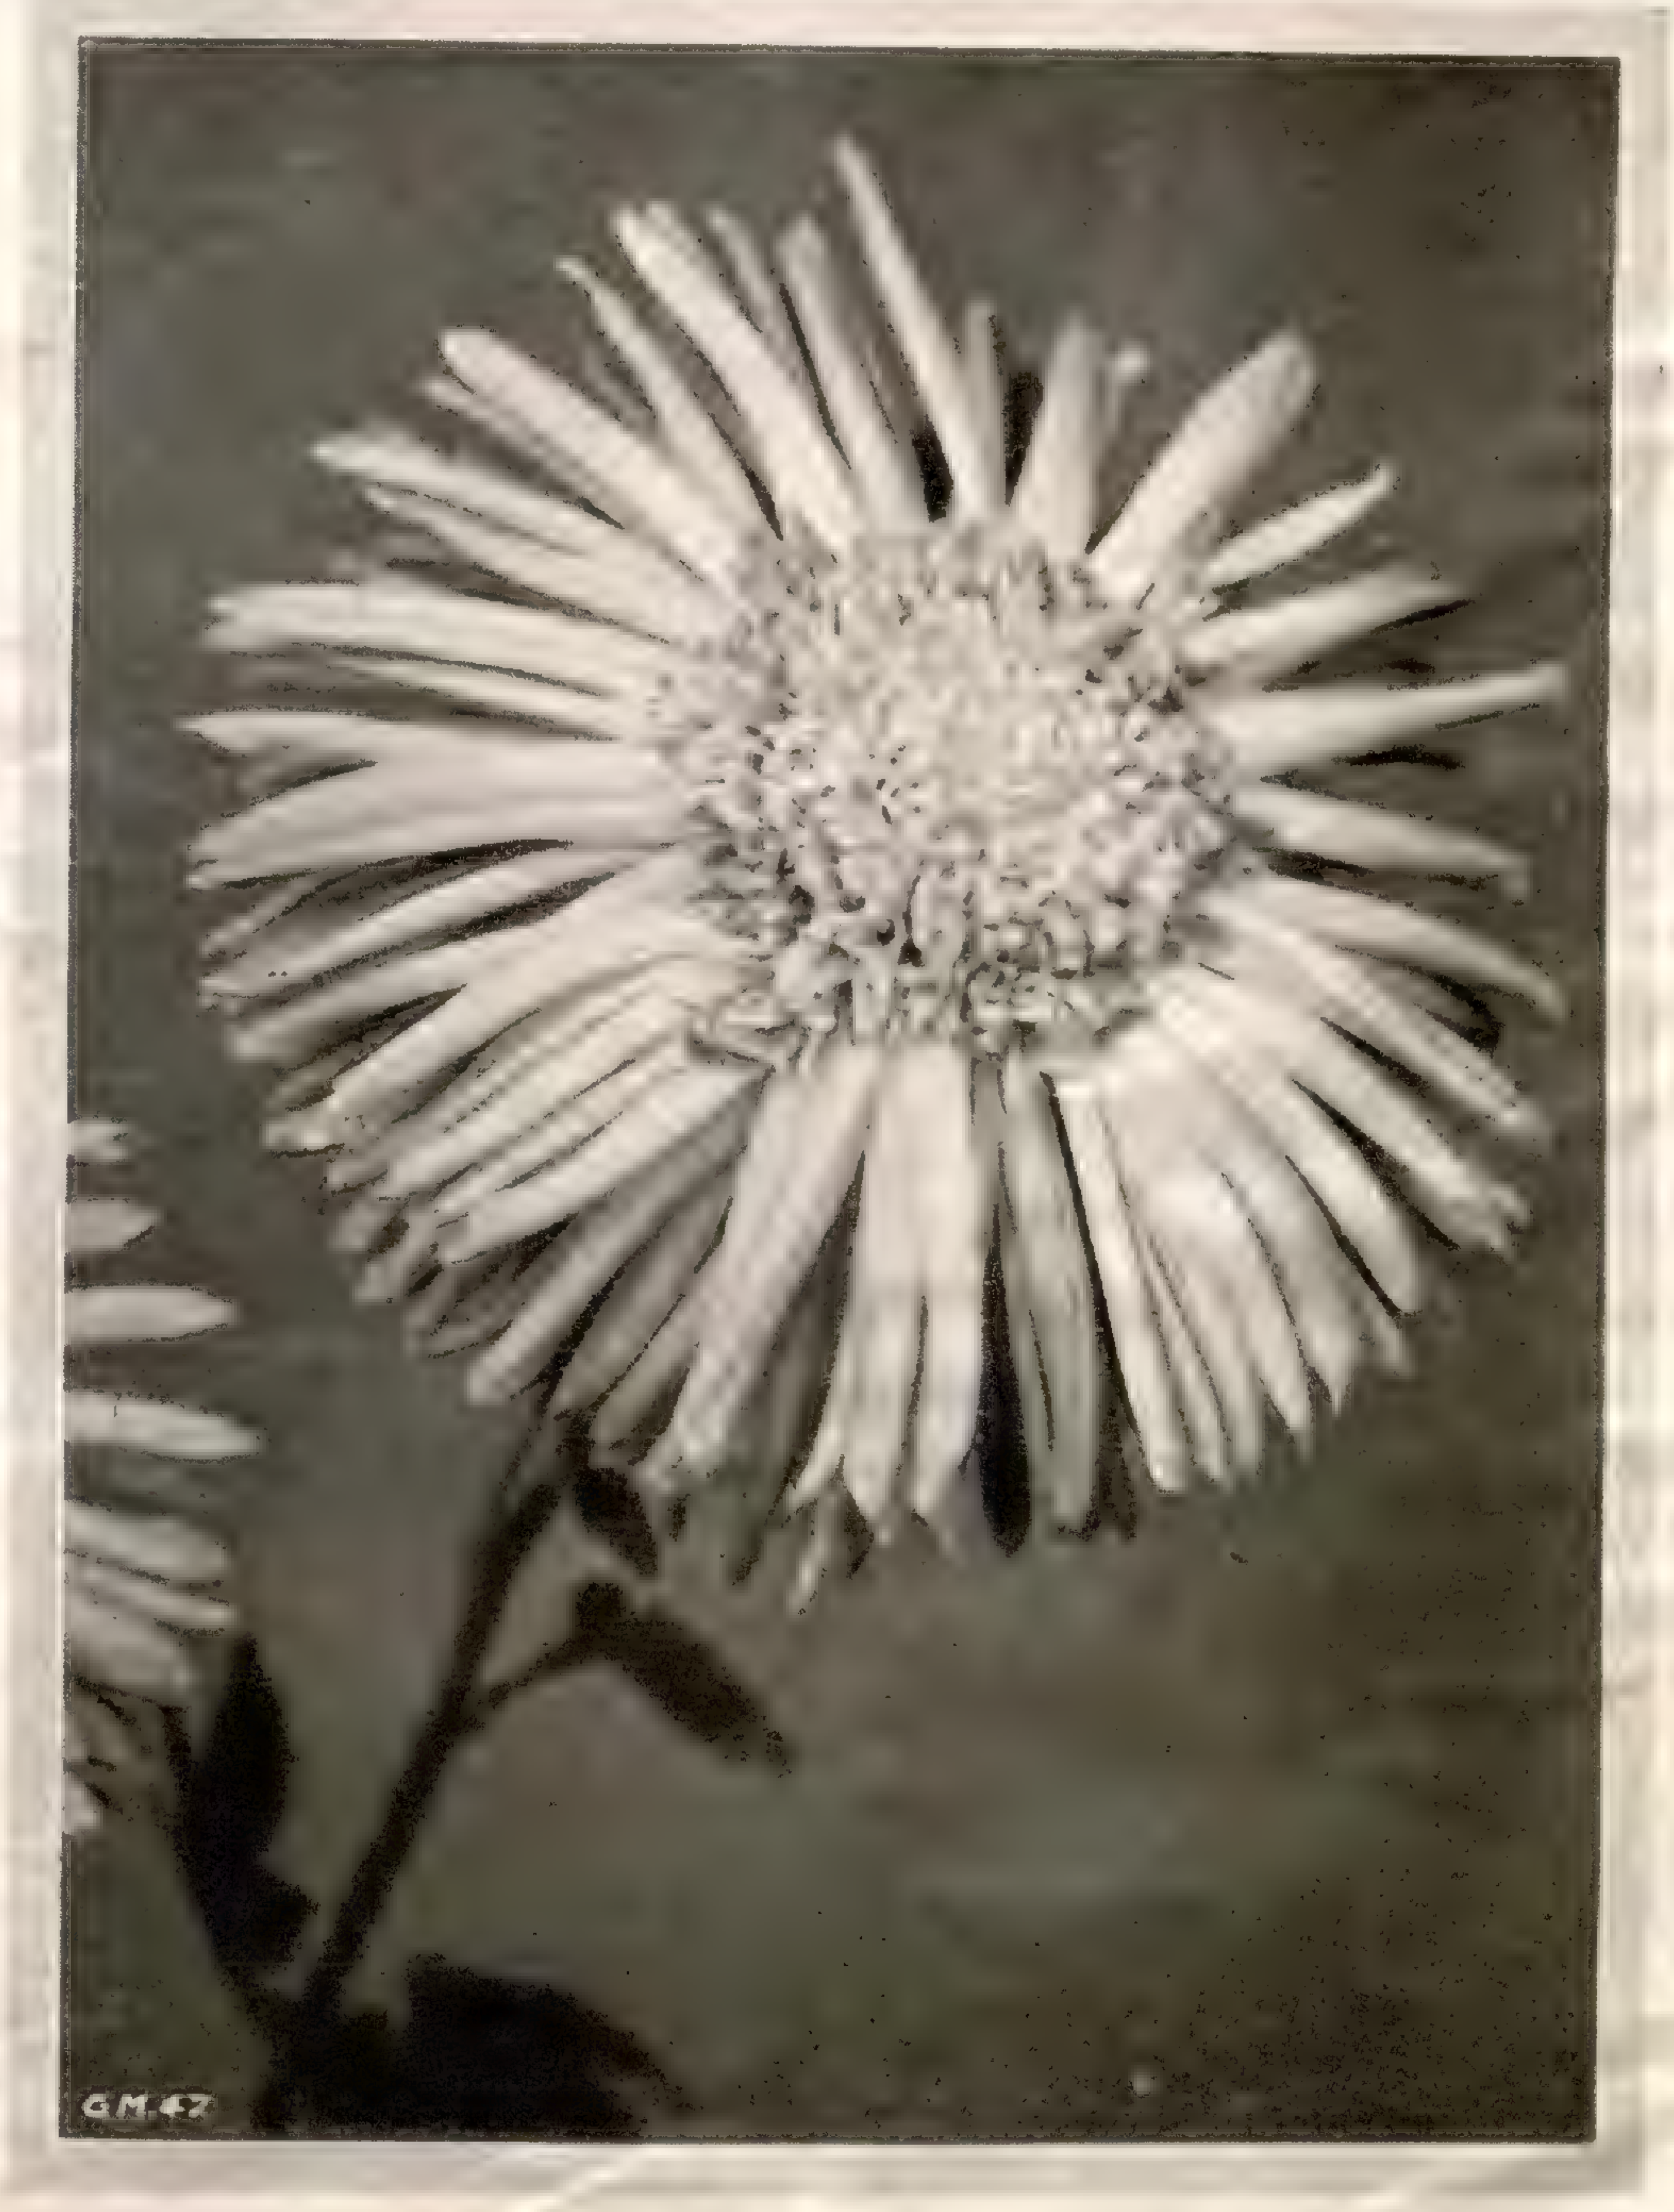
And now for its other names, for Galanthus nivalis, the common snowdrop, has been called the early bulbous violet, and Fair Maids of February (natural order, Amaryllidacæ), one of the most charming members of the British Flora, a native of our fields, woods, and orchards, so beautiful to be beyond description, and fortunately so common as to need none. It belongs to a noble order of bulbous plants, the genera of which are numerous, as are the species, too, in perhaps an increased proportion, comparatively few are hardy in our climate, and very few indeed are natives of this country, so that in this respect the snowdrop, if not a rare flower, is a rare representative in our Flora of the order Amaryllidacæ. It may be useful to give a few of the better known genera to which galanthus is so nearly related, amaryllis, crinum, vallota, pancratium, alströmeria, and narcissus. The last-named is more nearly allied than any of the other genera mentioned. Not only does the narcissus resemble the snowdrop in style, early period of bloom, and habit of becoming double, but also in the general hardiness of its species, a feature not usual to their order. The literal meaning of the generic name is "milk flower." The title, with a pleasing reference, was given by Linnæus. The specific name, meaning white, may for two reasons seem unnecessary; first, because milk is white (or should be), and because no other than white-flowered species are known. All the three common names are happy ones; snowdrop and Fair Maids of February are appropriate both to the season, and a pretty flower, bulbous violet, pleasantly alludes to its sweetness, and they have a very delicate and exquisite perfume which ever tells of coming spring—all are poetical as if this lovely flower had the same effect on different kinds of verse (including Linnæus) who first gave them. A dropped name for the snowdrop was that of "Gillo-flower." Theophrastus, the father of natural history, gave it the name of violet (Viola alba or Viola bulbosa), that would be about two thousand one hundred years ago.

The bulbs should be planted by thousands where it can be managed, and as I said before anywhere and in almost any kind of soil, the demand for their blossoms is growing, and increasing, and snowdorps are, as we all know, ever welcome, and in place in the grass, border, or window sill, or as decorations for the table, they are pure, and attractive without showiness, and may be used as emblems, both of joy and sorrow. This is the flower, and the only flower, I think, that "trembles to the kisses of the bee."

H. C. Philbrick.

## CHRYSANTHEMUM MRS. BULLIVANT.

We were much interested in the handsome single-flowered chrysanthemum that Mr. Cresswell, of the Holmwood Gardens, Eden Park, Beckenham, contributed to the second of the two meetings held by the Royal Horticultural Society in December last. The distinctive merits of the variety fully justify it receiving a full share of attention, but it was of special interest to us as representing a type of flower that we believe has a promising future. All the single varieties that have blooms of good form are more or less attractive, but in many cases the beauty of the blooms is discounted by a somewhat prominent disk of a green-yellow hue. In this case the ordinary yellow disk has disappeared, and is replaced by a central cluster of florets that, like those forming the outer fringe, are of a bright lilac-rose hue, and, in combination with them, produce a pleasing effect. To those who appreciate the elegance of the single chrysanthemums, but have an objection to the yellow disks, this variety, which is known as Mrs. Bullivant, will be especially welcome, and in their interest, and indeed of chrysanthemum-lovers generally, we hope to have the opportunity of recording the introduction of other varieties of a similar character.



CHRYSANTHEMUM MRS. BULLIVANT.
A distinct single variety, raised by Mr. Cresswell, with anemone centre, and of a pleasing lilac-rose hue.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of Chrysanthemums for Garden and Greenhouse, by D. B. Crane, price 2s. 6d. net; or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## THOUGHTS FOR THE NEW YEAR.

With the opening of the New Year the work of the garden enters upon a phase of activity, which will increase as rapidly as the days lengthen. Mental as well as manual activity is the requirement of the moment. Much has to be arranged for the coming spring and summer, and any delay or hesitation now will be felt tenfold later on. There is no time for procrastination in garden work, and happy is he who is alert to the requirements of the times.

At the moment of writing the mildness of the season lulls one into a feeling of security. One can hardly realise in these mild days that we are in January; it rather seems like early autumn, so un-wintry are the conditions. The rock garden reveals the rapidity of movement and the need for pushing work forward. A mass of Lithospermum prostratum is in full flower, giving its exquisite touch of blue at a very early date. Potentilla alba is also fully out, the tiny cups of white being very acceptable. Geums, especially montanum and giganteum, are lifting their golden flowers above the green leafage, and Aubrietia Dr. Mules is beginning to cover itself with beauty.

Rock garden subjects are all very much on the move, and point to a fine spring display. This coming spring will undoubtedly see a further extension of the cultivation of rock plants. Such a widespread interest is now taken in these gems of the mountain and the wild, that we are in danger of being overwhelmed by an over-sufficiency of varieties. Like the sweet peas and other florist's flowers, amateurs and professionals are taking up with avidity the cult of special rock plants, and I am afraid we shall soon want a "Saxifrage Committee," a "Primula Committee," and a host of other committees to look after the interests of these plants at the meetings of the R.H.S.

New varieties are very welcome when they are improvements, but they are bewildering and time-wasting if they do not surpass standard varieties. What we want is more definite selection instead of indiscriminate seedling raising. Might I suggest that raisers should work with a definite object in view. Saxifrages that will keep their colour in the sunlight. Aubrietias with the perpetual habit of Dr. Mules; primulas of greater hardiness and in some cases of improved colouring; violas that will for ever banish Papilio and it confrères from the rock garden, are just a few ideas of many which might be brought into play.

The meetings of the R.H.S. will probably reveal many new things in rock plants, as well as among other plant groups. We shall await these with great interest. There are new saxifrages we want to compare, new aubrietias which we hear more of than see, which must have a testing with the standard varieties.

It would be a good thing if the new Hardy Plant Society could occasionally convene meetings in suitable centres, so that the growers and raisers of special subjects could bring their varieties and novelties together, and finally settle the merits of the differing forms to the complete satisfaction of the floral world. A day devoted to mossy saxifrages would be of material service to all who cherish rock garden subjects, a day to dianthus, a day for heucheras, a day to pentstemons, and so on, covering in turn a vast range of subjects, would assuredly settle in a large degree the comparative values of the many varieties. It would materially assist intending purchasers, both in private and trade capacities, to a knowledge of the better forms in each plant group, without necessitating a previous trial, which is enforced upon many cultivators at the present time. The propagation of stock for spring and early summer planting must commence forthwith.

Schemes must be thought out for the summer, to ensure pleasing effects. The points of different varieties must be considered in order to obtain the best out of them when planted. Care should be taken to ensure diversity from previous season's arrangements. The eye tires of sameness. What is wanted is originality in our designs and plantings, and in this it is necessary to arrange for this as early as possible, in order to have the material forward for the planting season.

Mistakes of past seasons should be considered, to avoid a repetition of them. No garden is perfect, and a wide margin is usually to be found to exist between the "actual" and the "ideal." To aim high is as necessary in the garden as in other walks of life. To use an Americanism, one should "hitch their waggon to a star," for the upward striving after the ideal brings improvement, if not perfection, and he who fails is one who courts failure by sitting still while his fellows are making the running.

Thus we welcome the New Year, with its abundance of work and its hearty promise, thankful that the opportunity is given us to march in the ranks of progress.

P. S. HAYWARD.

**PROFITABLE FRUIT GROWING** for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, writen for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## ROSES IN UNHEATED HOUSES.

Few climbers are more suited for unheated houses than a good selection of roses, growing so well in a sheltered wall it is evident they would much appreciate the little further help of an unheated structure, where we can keep any excessively cold or uncongenial winds at bay. But we find the chief fault lies in giving too much protection in the majority of cases; and more ventilation, so as to keep the plants as backward as possible during the chilly days of January and February should be given. Any semblance of hurrying the growth will assuredly mean checks later on. It is not to force roses that these houses are most useful, but rather as a most efficient protection from the cold days and nights early in the spring, which so frequently spoil the first crops in sheltered places.

We can battle against insect foes and mildew much better, being able to fumigate when necessary. Perhaps the most difficult point to contend against is the damp atmosphere so often experienced where one has no means of drying by artificial heat. A little thought and care will avoid this. Ample ventilation upon all suitable occasions, also to keep the borders and soil on the dry, rather than moist side, and never syringing or using water in any form, except early upon clear days.

Later on as the days become warmer more moisture may be given, but to have deckles of water hanging from young foliage is, perhaps, the most frequent cause of its dropping. That it conduces to decayed tips and flower buds cannot well be denied, although such conditions are very grateful to the growth in the summer months; acting in the same refreshing way as dews at that season.

Other occupants of the house should be confined to those thriving under similar conditions, for it would not be wise to attempt any that could not stand a few degrees of frost, should extra severe weather set in. We should not forget that if we encourage early growth we have no means of effectually contending against the severe frosts often met with at the end of February and early in March. Once the days get warmer growth will come on with surprising freedom, because of the shelter from chilly winds and morning frosts, and it is this protection which makes the house so valuable.

Too often young growth is allowed to touch the glass because the older wood was not secured sufficiently far away. Twelve to eighteen inches is not too much, and we can scarcely expect the young growth to be safe when in contact with glass that is frozen over.

Most of the pruning is done late in January, except in the case of the strongest climbers, which should have most of the wood cut away soon after they have flowered. This will induce some longer rods than would otherwise be the case, and it is such wood that proves most valuable upon the climbers. A few, notably William Allen Richardson and Climbing Niphetos, may be spurred back instead of cutting away so freely. These varieties have a tendency to bloom over an extended period, but I would not allow them to become crowded.

Before new growth commences, it is well to thoroughly cleanse the old wood, more especially because we can now use much stronger measures than would be safe later on. Syringing with very strong insecticides does not find favour here, it often being injurious to the roots from running down the stem of the plant.

Ventilation is rather difficult, because we so frequently have a bright sun, which, so far as the outdoor roses are concerned, is tempered by quite a keen wind, and so does not hurry the growth on so rapidly. But under glass the temperature is speedily raised, and we cannot give enough ventilation to counteract this unless able to put it upon the sheltered side, so that it is essential to have these in as many aspects as possible. All endeavours should be made to avoid any extremes of temperature, as there can be little doubt such are the chief causes of mildew. A moister atmosphere can be given as the plants make progress and the season allows of drying this off more frequently. Roses do not need much shade, but, as the sun gains power, the strongest of its glare may be broken. A weak wash of whiting and milk keeps on well, and is not so dark as many other washes. The slightest break of glare and burning is all that is needed.

Plenty of weak liquid manure may be used when growth is active, but do not use it strong for the sake of applying a less number of times. Strong manures, more particularly when the soil is on the dry side, check the points of growing roots, and do much harm. As the wood gets a fair length all the light and air possible is needed, also a little less water. This will encourage an earlier and more efficient ripening, which is essential to future blooms.

ROSARIAN.

## HIDDEN TREASURES IN FLOWERS.

There are more unappreciated things of value laying around us than things that are treasured and held in high repute. It was only recently that a great orator told us of his sorrow that so many books should lay upon the shelves of our libraries unread. But to the horticulturist the saddest thought of all must be that millions of plants of great rarity, beauty, and value grow in far-off nooks unknown, whilst others grow in greenhouses unappreciated by some, and perchance despised by others. Nothing in the world was given to the few, but everything was made for the many. The diamond which flashes in the tiara of the duchess can be admired and enjoyed by the gods in the gallery, and its brilliancy is seen by them more than by the wearer, but the choice seedling carnation which flowers in the greenhouse of a selfish person is hidden from the outer world and lives, and perhaps dies, without its full worth being known.

It seems to me that all who have uncommon plants, or seedlings, which appear better than present existing kinds, should communicate with the Editor of the GARDENERS' MAGAZINE, or some specialist in that particular kind of plant, so that it may be appraised, and then disseminated, if of true merit. Personally, it is one of the joys of my life to receive specimen flowers of other people's carnation seedlings, partly, I suppose, because I delight in criticising the work of others, and partly because I love to see good carnations. Few raisers are capable of judging the worth of their own seedlings, and they should invite criticism.

In the case of perpetual flowering carnation seedlings, the present is perhaps the best season to deliver judgment upon them, because a variety which is not good now will never be of very great value. But it must also be remembered that a perpetual carnation seedling is not properly fixed until it is four years old, and good cultivation during that time can have a great influence upon it, while bad cultivation would naturally have the opposite effect.

Nothing that I know of is so interesting as the raising of cross-bred seedlings for new varieties. It may be a petty form of gambling, but then we Britishers all love the sporting chance.

MONTAGUE C. ALLWOOD.

## APPLE NEWTON WONDER.

Introduced to cultivation by Messrs. J. R. Pearson and Sons a quarter of a century ago, this valuable late apple was for a time slow in obtaining full recognition from cultivators of hardy fruits, and was in consequence not planted so largely as should have been the case. When, however, fruit-growers became acquainted with its great merits it at once leapt into favour and has enjoyed an ever-increasing popularity until the present time. As so well known, it belongs to the culinary section, and whatever the season of its availability for use, it would merit high praise; but, seeing that its season extends from November to May, it is somewhat difficult to place too high an estimate upon its value for general cultivation. The accompanying illustration of a well-grown specimen will be sufficient to indicate that the fruit is of large size and shapely, and when it is stated that the skin is yellow and crimson, the latter colour extending over the greater part of the fruit when fully exposed to the light and air, it will be readily understood that it is one of the most handsome of culinary apples. The flesh is firm, greenish white, and subacid, and when late in the season the fruits are ripe, they are sufficiently pleasant in flavour to be eaten. The growth is vigorous with handsome foliage, and the variety is equally suitable for orchard trees on the crab and bushes on the paradise stock, and on the last-named stock it makes excellent espaliers. Grown in either of the three forms, the trees bear excellent crops, and with reference to the productiveness of the variety it is important to mention that it is one of the most sure croppers in the northern counties of England, and is being largely planted both in private gardens and market plantations. An apple possessing so many good qualities should have a place in every garden.

APPLE NEWTON WONDER.
A well-grown typical fruit of this valuable late culinary variety.

---

## DECIDUOUS HEDGES.

For extensive lines of hedgerow, such as park and estate boundaries in general, as well as for the division of large tracts of land into large or small areas best suited to the purposes of agriculture, deciduous trees and shrubs have always been much in favour. This is accounted for by their free growth, greater strength of stem and branch, which enables them the better to resist the efforts of deer and cattle to break through, as well as to their freedom from any poisonous substance injurious to animals. It may seem paradoxical, but the statement is none the less true, that a higher, stronger, and altogether better fence is at the present day required to effectually fulfil its purpose, than was the case a few years ago. This is due, in a large extent, to the unrest (not in the labour world) among quadrupeds. Formerly cattle were bred, and spent their existence, in one particular district, and possessed, or acquired, a quieter disposition than is the case at present, when, to replenish and maintain the vastly-increased herds, the animals, when young, are introduced from far-distant places, and for a long time afterwards do not settle down with any degree of contentment; hence it is that fences as nearly perfect as possible must be maintained to adequately meet the exigencies of the case.

This subject of hedges, their upkeep and improvement, was discussed by the members of the North Northumberland Hunt at their annual meeting in the early days of the present month—November—and the decision arrived at was that of the appointment of an expert hedger for the district, to whom both owners and occupiers could apply, and obtain advice and instruction upon the best courses to pursue in respect to existing fences, as well as in the preparation of the soil and planting of new ones.

### The Beech.

In the immediate neighbourhood of the mansion, for avenues, for surrounding orchards or other small enclosures, where a pleasing tone of colouring and shelter from piercing winds are required, the beech is, in many respects, unsurpassed among deciduous shrubs. As a hedge plant, subject to annual clipping, the young shoots following upon this retain the dead foliage throughout the greater part of the winter, thus presenting a warm and cheerful appearance when most other hedges are bare. Though less particular as to soil than the thorn, it well repays the labour and expense involved in preparing the site. Frequent transplanting in the nursery, and ample room provided each time, is the principal item in the management of the plants to fit them for their future use.

### Hornbeam.

This very closely resembles the foregoing, but has rather more diversified foliage, which also remains upon the branches long after the summer lustre has departed therefrom. This plant is considered more hardy, and better able to withstand storms and greater vicissitudes of temperature than the beech, but in practice I have never discovered any material difference in this respect, though it will thrive satisfactorily in poor, thin soils, which makes its valuable for exposed uplands, where the fitful gleams of winter sunshine, resting upon the russet foliage, vastly improves the landscape scenery.

Plants of the two last-named subjects naturally assume a bushy habit of growth, consequently frequent transplantation and sufficient room to encourage this should be given in the nursery lines to fit them for a permanent position. A single line of plants, so arranged that one about meets the other, which may be from twelve to eighteen inches apart at the roots, will, in well-prepared soil, speedily form a handsome hedge.

### Mixed Hedges.

Thorn and beech, two plants of the former to one of the latter, make a good mixture, or, if so desired, the holly may be introduced at intervals, and the appearance of such, in the winter season especially, when all around is bare, is very pleasing.

### Myrobalan Plum.

Hedges are sometimes required of subjects than can be allowed to grow with little or no attention to keeping them within limits by close trimming. For the purpose this plant is one of the best, as, allowed to grow naturally, a fine display of blossoms are produced in April, which, apart from their beauty as growing, are very useful for cut flower decoration. To achieve this, however, the shoots must not be close cropped annually, though the plant is as much amenable to this treatment as the whitethorn, and bears severance near to the root when it becomes much overgrown, equally well.

James Day.

Galloway House, Garlieston.

(To be continued.)

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

WATERING ORCHIDS.—In the cultivation of all plants under artificial conditions, the application of water to their roots and foliage is one of the chief agents that leads either to success or failure. Successful plant culture depends in a large measure upon the administration to each individual the proper quantity of water at the proper time, accordingly to its requirements, whether it is in full growth or at rest. In the first place, we must study the plants both at rest and in full growth. Orchids are so many and so varied that in one short article one cannot deal with them all at the same time, but I hope to deal with the different families from time to time; so that watering may be readily understood. Owing to the wet, sunless weather we have experienced now for some time, the atmosphere outside has been heavily charged with moisture, which has prevented the evaporation in our houses being what it would have been had the weather been clear and bright. Consequently, the plants have not required so much water as they otherwise would have done. The greatest mistake possible, in my opinion, is giving water at the roots with a view to forcing the pseudo-bulbs to become plump and hard. Such treatment is likely to end in the loss of the roots. The best thing to do at this season is to keep the plants on the dry side, making sure they require water, before it is applied to them. The atmosphere also at this season should be kept drier than it is during the growing season.

VANDAS of the V. tricolor and V. suavis sections, occupying the cooler end of the cattleya house and rooting freely, should be given sufficient water to induce the sphagnum moss to grow luxuriantly. The terete leaved vandas, such as V. teres, V. Hookeriana, and others, in fact, any terete leaved orchids at this season should only have sufficient water to prevent shrivelling. Shrivelling in any orchid, at any time of the year, is detrimental to its well-being.

COMPOSTS.—A good supply of the different fibres, such as peat, polypodium, and osmunda, which are used for the preparation of the different composts should now be obtained, so that it may be in proper condition for use, and readily available when the potting season commences. During open weather a good supply of sphagnum moss should also be obtained.

REPOTTING.—The practice is not a good one that is often adopted of overhauling a house, whether it be of cattleyas, odontoglossums, or other kinds, and repotting everything therein that may appear to require it, quite regardless of whether they are in a proper stage of growth to be repotted. For instance, one plant may have just commenced growth, another may have half completed it, whilst a third may be at rest. The best course is to repot each plant at the proper season only. The plants will not only be the better for it, but the work distributed over a longer period, and undue pressure at any particular time prevented. Should, however, any plant be in an unsatisfactory condition, do not hesitate to give it new compost, even in the depth of winter. It will be much better than allowing it to dwindle in sour materials.—J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

PROPAGATING.—Although one can generally find a place in the ordinary stove for a temporary propagating case, yet a properly constructed pit or house for propagation is most desirable in the garden. In some gardens where much propagation has to be done it is carried out early in the year on a hot-bed formed in one of the houses set apart for early cucumbers or melons, and if hand-lights, or a frame is placed thereon, this answers well for the raising of seeds and cuttings. Whatever means are adopted, now is the time for preparation, so that the propagation of the various plants may proceed as opportunities offer. Insert good batches of cuttings of the various plants used for edgings to the stages, as Panicum variegatum, fittonias, and lycopodium. These root readily if dibbled several in a small 60 filled with rich sandy soil. When rooted they should be placed on a shelf near the glass, and have the points pinched out to promote the production of side growths. When well established they may be placed in position.

RAISING SEEDLINGS. — Some stove plants are annually raised from seed, and many of the seeds are a long time in germinating. Therefore sow early in the year to ensure a long season of growth. The plants usually raised from seed which require to be sown early are asparagus, Myssiphyllum, Clerodendron fallax, Asclepias carassavica, Exacum macranthum, and gloxinias. Pans or pots may be used according to the quantity of seed to be sown. They should be quite clean and efficiently drained, covering the crocks with a layer of clean moss, then nearly fill with light sandy soil. Equal parts of good loam and leaf-soil, with half a part of peat and of sharp sand form an excellent mixture. Water through a fine rose, with tepid water and sow the seeds thinly and evenly an hour or so afterwards. Cover lightly with sandy soil passed through a fine mesh. For some of the very small seeds but a dusting of sand will suffice. Place a sheet of glass over the pot or pan, and plunge to one half the depth in the propagating bed. Sprinkle the surface with water occasionally to assist germination, then remove the glass and keep near the light, but avoid draughts.

PLANTS IN ROOMS.—As many of the plants used at this time of the year for the adornment of indoor apartments are taken from warm houses it is most desirable that they are not exposed to draughts. A careful man who is fond of his work should be in charge of the house decorating, and it should be impressed upon him the necessity of close watchfulness to watering and frequent changing of the various plants used. A covered barrow should invariably be requisitioned at this time, and the plants moved in and out with dispatch.

CLIMBERS. — Allamandas, dipladenias, stephanotis, Clerodendron Balfouri, and other climbers should now be pruned and cleansed, it being important to do this when at rest. It is a mistake to spare the knife with these subjects, though I am aware that pruning may be carried to excess. Cut back each growth to well-matured wood; then if the other conditions be favourable a wealth of blossom will result. In gardens where these are grown for exhibition as specimens they should be treated in like manner as those permanently planted for the rafters and pillars, except they should be so tied to the wires placed near the roof-glass that they may be easily taken down when well advanced, and trained to the balloon-shaped trellis.

WATERING.—Great care is necessary in watering at this dull season; rather err on the side of dryness for the majority of the subjects.—H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

EARLY VINES.—The shoots will be sufficiently advanced in growth to handle, and will need to be carefully disbudded. Commence by rubbing off the weakest growths, and finally in a few days reduce them to the required number, leaving the strongest and best placed shoots that show the best bunches. Examine the borders, and if at all dry, give sufficient tepid water to soak the whole thoroughly, increase the night temperature to 60 deg., with a day temperature of from 65 deg. to 70 deg., allowing a rise of 10 deg. with sun heat. Maintain a moist atmosphere in the house, and give air on all favourable occasions, close the house early, and during bright weather lightly syringe the rods and foliage with water of the same temperature as that of the atmosphere in the house. Where it is possible to obtain liquid manure from the farmyard, the paths and walls should be damped down late in the afternoon with a weak solution of this liquid.

LATE VINES.—The work of pruning, cleaning the rods, and washing the houses should be finished without delay, allow the ventilators of the house to stand wide open during open weather to give the vines a complete rest. Care must be exercised not to allow the water in the pipe to become frozen; this can usually be obviated by reducing the ventilators or closing them altogether during severe weather.

PEACHES AND NECTARINES. Permanent trees that were started some weeks ago will be in flower; therefore increase the temperature to between 50 deg. to 55 deg. at night, allowing a day temperature of from 60 to 65 deg. During the flowering period the air should be kept rather dry, and the flowers be pollinated every day with the aid of a camel-hair brush or a rabbit's tail to ensure a good set of fruit. Admit plenty of air when possible, but at the same time avoid cold draughts. If the borders require water, this should be applied early in the day to allow a fairly dry atmosphere to be maintained at night during the flowering period. Disbud sparingly as the young shoots develop, removing only the strongest from the upper and lower part of the branches. Keep a sharp look out for green-fly, and fumigate on its first appearance.

POT FIGS.—Pay particular attention to figs grown in pots. The soil must not be allowed to become dry, or the fruit will turn yellow and drop off. On the other hand, the pots must be thoroughly well drained, or the trees will suffer in precisely the same way from stagnant moisture. A temperature of 50 deg. at night and 60 deg. by day with sun heat is sufficient to commence with, gradually increasing the night temperature to 60 deg. and 65 deg. in the day. Lightly syringe the plants in genial weather, admitting air on all favourable occasions to maintain a sweet growing atmosphere.

STRAWBERRIES.—If the fruits are set, thin them immediately to the required number, and give those remaining some support, attend carefully to the watering, and supply occasionally with liquid manure water, to accelerate the swelling of the fruit. Continue to syringe the plants on fine days until the fruit commences to colour, when springing must be discontinued. Maintain a night temperature of 55 deg, with a day temperature of 60 deg. Introduce batches of plants into a cool house to maintain a succession.—Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

HERBACEOUS BORDERS.—Where these have to be rearranged, push on with the work during mild weather, in order to complete it as soon as possible, and in replanting always retain the more vigorous outside portions of the roots. In dealing with a border of large dimensions it is desirable to place each variety in bold masses, as a finer effect is obtained in this way, but in the case of a smaller border it is preferable to arrange the plants in small groups. The arrangement of the herbaceous border is a matter that requires close attention; and an intimate knowledge of the various plants is necessary to enable the cultivator to group them with due regard to their height and colour. The more bold kinds, like delphiniums, phloxes, pæonies, the campanulas, helianthuses, artemisias, and rudbeckias, will form the outstanding features of the border, while such kinds as aquilegias, potentillas, trollius, gaillardias, pyrethrums, veronicas, are suitable for the intermediate spaces. Herbaceous borders may be carefully forked over now, and, where well-rotted manure is available, a dressing of this can be worked in with advantage.

THE WILD GARDEN.—This portion of the pleasure grounds, when judiciously planted and well cared for, forms a pleasing feature. At the same time such a garden need not be a wilderness, but rather an arrangement on natural lines of some of the more ornamental hardy plants and shrubs not largely employed in other parts of the grounds. A wild garden is capable of being made extremely beautiful, for the number of plants and bulbs suitable for its embellishment is sufficient to make it more or less attractive at all seasons of the year. An undulating area is the best for such a garden, and if it contains a few specimen trees a foundation exists for a picturesque and beautiful feature. Should there be water within or near the wild garden that will admit of an irregular stream being made to wind through it, the general effect will be greatly enhanced. Moreover, if the stream can be widened here and there to form pools, it would provide suitable positions for a considerable number of aquatic and bog plants. Among suitable subjects for a wild garden are Japanese maples, roses in variety, rhododendrons, ericas, rubus, cystisus, vitis, hardy bamboos, yuccas, and other ornamental, deciduous, and evergreen shrubs; plants like gunneras, Japanese irises, spiræas, foxgloves, senecios, campanulas, funkias, prim. roses, apennine anemones, narcissi snowdrops, and numerous others are desirable.

BEDDING PLANTS.—Cuttings taken of tender bedding plants last autumn can now be potted off and put separately into 3in. pots, and it is well to attend to this before the roots become much entangled. Heliotropes, fuchsias, swainsonias, streptosolens and pelargoniums should be treated in this way. Soft-wooded plants, as, for example, mesembryanthemums iresines, alternantheras, verbenas, and ageratum can now be propagated by means of cuttings taken from plants potted up for the purpose. They may be inserted in well-drained pots or boxes filled with a light sandy compost, and rooted in a warm temperature.—J. GARDNER, Batsford Park Gardens.

## MAGNOLIA GLAUCA.

The sunny summer of 1911 was most favourable to this species, for it bloomed more freely than usual, and the flowers were produced over a considerable period. Even when we had reached the middle of October, flowers were to be found, while many unopened buds failed to develop. As a rule, flowering takes place during the earlier summer months, the white or cream-coloured flowers terminating the short shoots. They are two to three inches across when fully expanded, and very fragrant. The flowers are succeeded, when conditions are favourable, by reddish-brown fruits, from which scarlet-coated seeds are ejected in autumn. For a short period after ejection the seeds are suspended from the fruits by means of slender threads, which gives the whole head a somewhat quaint appearance. The leaves on different plants may be evergreen or deciduous. They are oval, from three to five inches long, green above and glaucous beneath.

M. glauca is a native of the United States, where it forms a bush from six to fifteen feet or so in height. Owing to the laurel-like leaves it is sometimes called the laurel magnolia, while its preference for damp or swampy ground has gained for it the name of swamp bay. Though in its natural habitat it is often met with in wet ground, it thrives under cultivation in ordinary garden soil, with a preference for that which contains a little peat, and is never liable to become very dry.

## THE VALUE OF BIRDS TO MAN.

At a recent meeting of the British Empire Naturalists' Association, Mr. James Buckland read an exhaustive and interesting paper on "The Value of Birds to Man," and, in view of the importance of the subject, we purpose publishing the sections of special interest to horticulturists.

### The Use of the Birds in Nature.

Man has become the dominant power on the earth. He has delegated to himself the right to adopt a utilitarian standard by which he measures the usefulness or destructiveness of all other forms of life. All animals which injure his person or his property he classes as injurious. All animals that contribute to the increase in value of his property, or to his comfort, he considers beneficial. Beauty he disregards, devastating the wild places of the earth in mere wontonness of strength. But let that pass for the present. To take him from his own standpoint, is he not sometimes in error? In his grasp for the useful, has he not overlooked the beneficent power of the bird?

To answer this question we must first determine what particular functions it is in the economy of Nature that birds alone are fitted to perform.

Vegetation is the prime requisite for the perpetuity of all other forms of life upon the earth. It is the only form in organic nature that does not war upon other forms. The greatest known enemy to vegetation is insect life, while bird life, by virtue of its predominating insect diet, wields a most important balance of power against the ravages of this the chief pest of vegetation.

This is the principal mission of the bird in preserving the balance of Nature's forces; and when we remember that birds are distinguished from all other animals by organs of perfect flight, when we remember that the sense of sight in birds is developd to a degree unparalleled in the animal world, when we remember the surpassing breathing power possessed by birds, their wonderful muscular strength and activity, the high temperature and rapid circulation of their blood, and, as necessary fuel for all these fires, their extraordinary capacity for assimilating food, we must admit that these marvellous creatures are admirably fitted to pursue and capture their natural prey, or, by making earth-wide sweeps from zone to zone, to follow the seasonable ebb and flow of the tide of insect life. We must also admit that no other class of animals could fill their peculiar place.

### Number and Reproductiveness of Insects.

That it may be seen how essential the bird is as a part of Nature's great plan, I propose making brief mention of the enormous number of insect species, of their stupendous powers of reproduction, and of their insatiable voracity.

The number of insect species is greater by far than that of the species of all other living creatures combined. Over 300,000 have been described, and it is considered not improbable that twice that number remain to be described. Practically all living animals, as well as most plants, furnish food for these incomputable hordes. More than this, Kirkby, in the "Introduction to Entomology," devotes no less than five entire epistles to the injuries we sustain from insects, whilst two only are sufficient to describe the benefits they yield.

The fecundity of certain insect forms is astounding, the numbers bred reaching such prodigious proportions as to be almost beyond belief. Riley once computed that the hop aphis, developing thirteen generations in a single year, would, if unchecked to the end of the twelfth generation, have multiplied to the inconceivable number of ten sextillions of individuals. Noting the preceding, Forbush says, if this brood were marshalled in line, ten to the inch, it would extend to a point so sunk in the profundity of space that light from the head of the procession travelling at the rate of 184,000 miles per second, would require 2,500 years in which to reach the earth.

Kirkland has computed that one pair of gipsy moths, if unchecked, would produce enough progeny in eight years to destroy all the foliage in the United States.

A Canadian entomologist has determined that a single pair of Colorado beetles, without check, would multiply in one season to 60,000,000 units.

The filibusters of old, who carried on their nefarious business chiefly within tropical areas, declared that of all dangers, and of all pains, they dreaded most the wounds of insects. No surgical instrument ever invented by man could inspire more terror than the impliments insects possess for piercing, cutting, dissecting, and rending. These appliances, which are used to do battle with animal and vegetable life, are equalled in horror only by the furious ravenousness of the insects.

Indeed, the voracity of insect life is as astonishing as its power of reproduction. Many caterpillars consume twice their weight in leaves per day, which corresponds to a horse eating daily a ton of hay. Forbush says that a certain flesh-feeding larva will consume in twenty-four fours 200 times its original weight, a parallel to which, in the human race, would be an infant consuming, in the first day of its existence, 1,500 pounds of beef. Trouvelot, who made a special study of the subject, affirms that the food taken by a single silkworm in fifty-six days equals in weight 86,000 times its original weight at hatching. What a destruction this single species of insect could make, if only a one-hundredth part of the eggs laid came to maturity!

### Man at War with Nature's Laws.

The development of young birds is so rapid, and the demand upon the vitality of older ones so great, that an enormous amount of food is necessary to sustain the vital processes. Digestion is exceedingly rapid in birds, and they feed for the most part throughout the day, especially when rearing young. The number of insects daily passed into the insatiable maws of the nestlings during this period almost exceeds belief.

But the most valuable services of the adult bird are rendered when it is feeding in winter or early spring, for then it destroys countless numbers of insects in the embryo state, and thus presents myriads of depredators from coming forth.

Grave and far-reaching results invariably follow the suppression of this perennial regulative influence which is exerted by birds individually everywhere as a check on insect life.

Some years ago the agriculturists of Hungary, moved to the insane step by ignorance and prejudice, succeeded in getting the sparrow doomed to destruction. Within five years these same men were crying frantically for the bird to be given back to them, lest they should perish; and it cost the Government 230,000 rix-dollars to reinstate the outlaw. So the sparrow was brought back, and, driving out the hordes of devastating insects, proved the salvation of the country.

In the Island of Bourbon once, because of the same ignorance and prejudice, a price was set on each martin's head. The birds all but disappeared, and grasshoppers took possession of the island. Then the edict of banishment was hurriedly revoked and the exile recalled. And fortunate indeed was it for the Island of Bourbon that the bird was not beyond recall.

During the years 1861 the harvests of France gave an unusually poor return, and a commission was appointed at the instance of the Minister of Agriculture to investigate the cause of the deficiency. By this commission the deficiency was attributed to the ravages of insects which it was the function of certain birds to check. These birds, it appeared, had been shot, snared, and trapped throughout the country in such numbers that but little repressive influence had been exerted upon the insects. In one department of the east of France the value of the wheat destroyed in a single year was estimated at 5,000,000 francs.

For some years prior to 1877 vast numbers of red-winged blackbirds were poisoned in the spring and autumn round the cornfields of Nebraska. This was done in the belief that the blackbirds were damaging the crops, especially the wheat. Great numbers of prairie chicken, quail, plover, and various other insect-eating species were destroyed at the same time by eating the poisoned grain. Then came 1877, and with it Nemesis. The locusts appeared in countless numbers, and Nebraska mourned. Hardly a field of grain escaped.

An astounding number of bird-skins are collected annually for hat decorations in Russian Siberia. In 1895 the ravages of two species of cut-worms and some ten species of locusts produced a famine in the region of Ekaterinburg, which is in Russian Siberia. The local Society of Natural Sciences inquired into the cause which had permitted such a numerous propagation of insect pests, and reported that it was due to the almost complete destruction of birds, most of which had been killed and sent abroad by wagon-loads for millinery purposes.

Though I could give a hundred cases similar to the foregoing, I must rely on the few I have cited to show that the wholesale destruction of birds is surely followed by disaster to man.

(To be continued.)

## EXHIBITING HARDY FLOWERS.

A keen supporter of the National Hardy Plant Society, I feel I must make a brief reference to it. There is not the slightest doubt that this society will become one of the most useful yet formed. My idea is that this society should have the full confidence of all horticultural committees, and I suggest to the latter that they would do well to seek the society's aid in the framing of classes for hardy plants. Most lovers of Nature will agree with the chairman's suggestion that in the staging of hardy flowers an endeavour should be made to represent the herbaceous border in as natural a manner as possible. I suggest that a schedule should distinctly state in the conditions governing a class of this description, that bamboo stands shall not be used, and also that their use will lead to disqualification. At York, Norwich, and the Great Yorkshire Show at Rotherham, there were bamboo stands from five to six feet high filled with heuchera, double gypsophila, Chrysanthemum maximum, gaillardias, etc. Can anyone imagine anything more ridiculous than in using such stands in an arrangement intended to represent a herbaceous border? No vases or stands for raising the flowers should be allowed, but sand or other material should be supplied by the societies to form a sloping bank on which to arrange the flowers; or a platform could be provided, but it ought not to exceed two feet high at the back, sloping to the level of the ground in the front. Any other kind of elevation should disqualify.

With reference to the rock and water gardens, which are such a great feature at the exhibitions at York and Wolverhampton, and this year for the first time will, it is anticipated, be a great feature at Shrewsbury, there is not the slightest doubt but what these arrangements attract as much, if not more, attention than any other exhibits in the show. I ask, are rock and water gardens shown in a natural manner? My answer is in the negative. The class for rock and water gardens was first introduced at York several years ago as a class for hardy herbaceous plants. The prize was not a large one, but it has been increased since. I have staged in this class from the first year it was introduced for the firm by whom I am employed, and therefore know something about the matter. The first year at York a well-known firm introduced huge stones built up in a most artistic manner. To compete with any chance of success against such arrangements made it a very expensive matter for a firm from a considerable distance. I have done it myself continually, not because I am an advocate of a natural style. I have used stone freely, because if you go to Rome you have to do what Rome does. Owing to the large quantity of stone used in these groups the effect is far too massive for the space occupied. The same quantity used in double the space would present a much more natural appearance as a rock garden for which the class is intended. Bamboos or others decorative plants can be used as a background. What's the meaning of this? Where is Nature represented when a group of bamboos, rambler roses, etc., are planted on the top of a massive bank of stone from four to six feet high? We all know bamboos are more or less bog plants, growing in damp positions. If I suggest pine trees, or such that do grow naturally on the top of rocks, I feel sure I shall meet with support, and thousands of these can be seen growing naturally on the top of rocks in different parts of the country. Most of them self-sown and growing between stons where one would hardly realise there was any soil.

I feel sure the National Hardy Plant Society could suggest more natural methods and help to state the conditions of competition more clearly in the schedules, and especially is clearness of expression necessary where the competition in the hardy plant classes form an important feature.

In conclusion, I wish to state that my object in pointing out some defects in exhibiting hardy flowers (knowing, of course, that my remarks will meet with some opposition) is toshow how the National Hardy Plant Society could do much good, if only the committees of the various local societies would act upon the advice the National Society is so well able to give. J. L. EDGINTON.

## LADY HUTT GRAPE.

Without entering into a discussion upon the relative value of "close pruning," and the extension system, I may say, at "G. B.'s" request, that close pruning, viz., cutting back the previous season's growth to two eyes—with the exception of the leading shoot, which was left two to four feet, according to the strength of the vine until the available space was filled—has been the method adopted here with the vines of Lady Hutt grape referred to on page 935 of the GARDENERS' MAGAZINE for 1911. Had I "G. B.'s" plant of Lady Hutt under my care I should not hesitate to cut it down to within two eyes of the ground level, providing the eyes were not damaged, which may possibly be the case with "G. B.'s" vine, and even then a young growth would almost certainly spring from the base, which would doubtless give a stronger and better result than if the previous year's growth were left, say, two or three feet long.

Lady Hutt is not a difficult grape to cultivate, given the conditions mentioned on page 935, and is worthy of more extended cultivation for winter use.

Somerleyton Gardens. F. HANSON.

**A Useful Blotting Pad.**—Messrs. Evans, Sons, Lescher, and Webb, Lim., 56, Hanover Square, Liverpool, have issued a useful "Agents' and Factors' Blotting Pad and Diary for 1912." Tables of weights and measures and a list of the chief agricultural societies are given, with various statistics of interest to agriculturists. The blotter is flat, and the diary, and when not in use the pages of useful information fold down like two desk lids over the pad. The pad is of substantial make, and will be found a useful adjunct to the writing-table of an agent or farmer.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

## EXHIBITIONS AND MEETINGS.

◆

### Royal Caledonian Horticultural Society.

The annual general meeting of the above society was held in Dowell's Rooms, 18, George Street, Edinburgh, on the 10th inst. Mr. McHattie, senior vice-president, presided, and there were about thirty present.

The Secretary submitted the report by the Council on the year's work of the society. The members had reason, it stated, to congratulate themselves on the shows, but the financial result was disappointing on account of want of support by the public, especially in the case of the autumn show. It was hoped the heating of the Waverley Market would have a beneficial effect, especially in the case of the spring show, on the attendance in future. The accounts showed an increase of £23 in the funds.

Mr. J. Stewart Clark, of Dundas, was re-elected president, and Mr. D. W. Thomson was elected as a vice-president in room of Mr. McHattie, who retires by rotation. Messrs. W. Galloway, Gosford; J. Phillips, Granton Road Nursery, Edinburgh; and R. Craig Cowan, Eskhill, Inveresk, were elected to the vacancies in the council.

The question of increase of allotments in Edinburgh was raised by a member, who pointed out that certain land, at present nursery ground, belonging to the Heriot Trust, was about to be used for other purposes, and suggested that the Council should bring the matter to the notice of the Town Council. The Chairman stated that he favoured increase of these allotments in Edinburgh, and that the council would keep the matter in view. This was all the business, and a vote of thanks to the chairman closed the meeting.

### National Chrysanthemum Society.

There was a well-attended meeting of the Executive Committee of this society at Carr's Restaurant, Strand, W.C., on Monday, January 15, under the chairmanship of Mr. Thomas Bevan.

The draft annual report was submitted and passed for presentation to the annual meeting, and it is in every way satisfactory, as also is the financial statement, which shows a balance of £47 5s. 10d., in addition to £50 on deposit, while the total surplus of assets over liabilities is £101 12s. 7d. It was arranged that three further medals, gold, silver-gilt, and silver, respectively, be offered to the International Horticultural Exhibition authorities, to be awarded for the best non-competitive exhibits of chrysanthemums at the great show in May.

In connection with schedule matters, an interesting recommendation was that prizes of two guineas each be offered in 1913 for the best seedling plant of an anemone, anemone pompon, and pompon chrysanthemum, while the usual class for affiliated societies will be altered, and will be for three vases each of Japanese, incurved, and single chrysanthemums. An exhibition is to be held at Essex Hall on November 20, and the Holmes Memorial Cup for incurved blooms will be offered for competition on that occasion. All the prizes offered on November 20 are being presented by members of the society.

The committee has in view the issue of various publications, and the beginning of a new era in this direction will probably commence with a modest volume of "Transactions," the schedule to contain only matter immediately relative to the society's exhibitions. Several nominations for Honorary Fellowships and corresponding members were made, and unanimously put forward for the confirmation of the annual meeting that will take place at Carr's Restaurant on Monday, February 5, at seven p.m. The Floral Committee members propose to dine together on February 19 at six p.m. One new member at a guinea, and three new ordinary members were elected, and a donation of one guinea to the prize fund of 1912, from an anonymous donor, was handed in by Mr. Frogbrook, and thankfully acknowledged.

## Chester Paxton Society.

Under the chairmanship of Mr. A. W. Armstrong, the annual general meeting was recently held in the Grosvenor Museum.

In presenting the annual report, Mr. G. P. Miln, the hon. secretary, reported an increase in the number of members, and stated that the course of winter lectures was probably the most successful in the society's history. He also reported that the exhibition of fruits, chrysanthemums, etc., held last November was admitted by all to be one of the best on record, the quality of both fruit and flowers being of a very high standard. The decorative effect was also better than at any previous exhibition. He regretted to have to report that the exhibition was a financial loss, which was mainly accounted for by reduced takings at the doors and the loss of several subscriptions, which, he hoped, however, would be remedied another year. The officers and committee were thanked for their services. a special tribute being paid to the hon. secretary for his valued services and continued interest in the work of the society.

The following officers and members of committee were elected for the ensuing year: President, Mr. T. Gibbons Frost, C.C., vice-presidents; Major McGillycuddy, J.P., Mr. James G. Frost, J.P., Rev. Canon L. Garnett, M.A., and Mr. E. Peter Jones, J.P.; chairman of committee, Mr. A. W. Armstrong. Executive Committee: Messrs. N. F. Barnes, J. Clack, O. Edwards, W. Evans, J. Fleet, T. Gilbert, W. H. Little, S. May, E. Palin, G. H. Plant, W. Pringle, J. Ryder, W. Seddon, E. Stubbs, R. Wakefield, A. Walker, J. Weaver, and J. Wynne; Districts Committee: Messrs. J. Breen, J. Clarke, F. England, C. Flack, A. Grimsditch, E. Jones, J. Saunderson, W. S. Sharp, J. Shaw, J. H. Taylor, and J. Thompson; Consulting naturalist: Professor R. Newstead, M.Sc., etc.; hon. secretary and treasurer, G. P. Miln.

## Reading Gardeners' Association.

The members of the Reading and District Gardeners' Association reviewed another successful year at the annual meeting held on Monday in the Abbey Hall. The President, Mr. F. B. Parfitt, was in the chair.

The Hon. Secretary introduced the report he had prepared, and which had been passed by the committee, reviewing the doings of the Association during the year 1911. The report revealed the excellent work done by the society, fourteen lectures being given during the spring and autumn months and three instructive excursions taking place during the summer. Unfortunately, the association had lost several prominent members and supporters by death during the year, notably Sir Wm. Farrer, Mr. Chas. Foster, and Mr. W. G. Pigg.

The financial statement revealed the substantial balance in hand of £50 11s. The receipts amounted to £92 16s. 11d., included in which were balance brought forward £43 7s. 2d., members' subscriptions £35 15s., and honorary members' subscriptions £13 0s. 6d., and the expenditure totalled £42 5s. 11d.

The President congratulated the society on its sound financial position, and added that the report so carefully compiled by the secretary and committee would compare very favourably with that of any previous year. He wished to re-echo the statement that the continued success of the society depended not so much upon the officers as upon the individual efforts of every member. In this connection he wished the younger members would overcome their bashfulness and join in the discussion at the meetings, so as to profit by the experience of their older brethren.

The report and balance-sheet were adopted on the proposition of the President, seconded by Mr. F. Townsend.

The election of officers followed and in every case was unanimous, the feeling being one of satisfaction at the excellent choice made. Mr. Parfitt was re-elected president, and Mr. Leonard Sutton vice-president, while Messrs. A. C. Bartholomew and M. J. Sutton were reappointed trustees. The new chairman is Mr. F. G. Drew, and the new vice-chairman Mr. E. Blackwell, who succeed Mr. F. Townsend and Mr. H. Goodger respectively. Mr. E. J. Dore continues in office as librarian, being assisted by Mr. Durrant. while the auditors are Messrs. A. H. Leaver and W. J. Taylor, the latter in place of Mr. A. Smith. Messrs. L. Castle (hon. secretary) and F. W. Macdonald (hon. treasurer) were again chosen.

Balloting for the committee resulted in the election of Messrs. A. F. Bailey, F. Barnes, G. Carter, H. G. Cox, D. Dore, F. Goodger, H. Goodger, R. A. Hatton, G. Hinton, W. Hulbert, T. Judd, H. C. Loader, W. C. Moles, T. Neve, T. J. Powell, G. Stanton, F. Townsend, W. J. Townsend, T. Tunbridge, and H. Wilson.

The meeting voted the following subscriptions: Royal Horticultural Society £2 2s. (delegates, chairman and vice-chairman), Gardeners' Orphan Fund £3 3s. (Mr. Neve), Gardeners' Royal Benevolent Institution £2 2s. (the hon. secretary), Royal Berkshire Hospital £1 1s. (Mr. Dore), and University College, Reading, £3 (the hon. secretary).

A hearty vote of thanks to the President concluded the meeting.

## Kew Gardeners' Social Meeting.

The gardeners employed at Kew held their 15th social gathering at the Boat House, Kew, on January 12. The hall of this building was tastefully decorated with evergreens, plants, and flowers, and the usual greetings "Welcome" and "Floreat Kew" were prominent on either side of the hall. The attendance was large, and among those present were many past Kewites, including several from the Colonies.

## East Anglian Horticultural Club.

This club held its 23rd annual dinner on Wednesday, January 10, at the Criterion Restaurant, Norwich. Mr. W. Rush, gardener to F. P. Hinde, Esq., Thorpe, presided, and the company included the prominent amateur and professional gardeners of the district. After the loyal and patriotic toasts had been duly honoured, Mr. A. W. Preston, in some well-chosen and encouraging words, gave "Success to the East Anglian Horticultural Club." This was responded to by the President, the vice-president (Mr. F. Williams), and the secretary, Mr. W. L. Wallis, each of whom gave some interesting facts of the growth and useful work the club had achieved since its formation.

Mr. H. Perry gave "The Norfolk and Norwich Horticultural Society," and remarked that this was one of the oldest societies in the kingdom, and could trace back its existence to the time when the weavers grew their flaked and biazzare tulips, laced pinks, and other well-known florists' flowers of the early part of the nineteenth century. He was glad that the falling off of income had been checked and that the society was able to again report progress.

Mr. C. E. Pilling, hon. secretary, replied most suitably. Mr. J. Forder gave "The Royal Horticultural Society," to which Mr. Charles Daniels responded, and in so doing detailed a visit he made during the past summer to the Wisley Gardens. "Success to the Royal International Horticultural Exhibition," was ably proposed by Mr. J. Clayton, who spoke of the magnitude of the proposed exhibition, and urged everyone to make a point of going. Mr. L. Smith responded, and as the representative of the club upon the local county committee, was able to give some useful information as to admission, etc. Mr. J. F. Betts gave "The Norwich Museum Association," to which Mr. E. Peake responded; other toasts being "The Prize Donors" and "The Press." A capital musical programme had also been provided.

## Edinburgh Market Gardeners' Association.

The Edinburgh Market Gardeners' held their annual dinner in the Imperial Hotel, Market Street, Edinburgh, on the 12th inst., under the presidency of Mr. David King, president of the association.

Mr. Thomas Russell, Glasgow, took occasion, in proposing the toast of "The Fruit Growers," to point out that the fruit which came to the Glasgow Market from East Lothian was of extra fine quality, but that some of the land on which such fruit was produced in the East of Scotland was rented as high as £10 an acre, while land in Ayrshire, which was used for this purpose, and was quite as satisfactory as regards the quantity of fruit produced, was rented at £2 10s. to £3 an acre. With such high-priced land and dear labour growers could not compete with those who rented land at the lower figure. Mr. George Sinclair, East Linton, who replied, thought that the opportunity should be taken under the Scottish Smallholders' Act to increase the fruit-growing area, and he would prefer to see some of the best land in the Lothians used for this purpose instead of sending growers to the Highlands.

## CATALOGUES RECEIVED.

DICKSONS, CHESTER.—Garden seeds in great variety are offered by the Chester house, and the leading kinds and varieties are illustrated. Collections of seeds for various purposes and for gardens of various sizes are a feature of the catalogue.

W. DRUMMOND AND SONS, LIM., DAWSON STREET, DUBLIN.—This old-established Irish firm issues a capitally illustrated catalogue of selected varieties of flower and vegetable seeds, and also gives an unusually good list of tools and horticultural sundries.

BARR AND SONS, COVENT GARDEN.—The very business-like size and arrangement of Barr's Seed Guide cannot fail to appeal to those who love order and method. Everything is arranged in alphabetical order, brief cultural notes are given for each subject, and in every case the botanical name and order of the plant is appended.

ALEXANDER AND BROWN, PERTH.—An excellent catalogue of flower and vegetable seeds and roses. It is freely illustrated with charming views in a large number of Scottish gardens, many of the pictures showing the firm's specialities under cultivation.

THOMAS S. WARE, LIM., FELTHAM.—From the Feltham firm we have received two catalogues, one dealing with seeds of flowers and vegetables in great variety, and the other devoted to the splendid tuberous begonias for which the firm is famous.

DANIELS BROS., LIM., NORWICH. — Though chiefly devoted to seeds and containing illustrations of several of the firm's specialities in flowers and vegetables, a considerable space is devoted to hardy climbers, fruit trees, ornamental trees, dahlias, and herbaceous plants.

VILMORIN-ANDRIEUX AND CO., QUAI DE LA MEJISSERIE, PARIS.—This freely-illustrated and closely-printed seed catalogue is on the usual comprehensive lines followed by the Paris firm; it is difficult to think of any subject usually raised from seeds and fail to find it listed.

H. CANNELL AND SONS, SWANLEY.—Once more there comes from Swanley the "Herald of Spring," which is a very practical and interesting list of "Golden Seeds."

HENRY ECKFORD, WEM, SALOP.—As becomes a house famous for the "making" and development of sweet peas, the new seed list has a cover upon which new and beautiful sweet peas are portrayed in colour. As already notified, the firm is offering £1,000 in prizes for sweet peas in 1912, but it should not be forgotten that culinary peas are also a speciality of the Wem seedsman.

BLACKMORE AND LANGDON, TWERTON HILL, BATH.—Tuberous begonias take pride of place in this firm's catalogue, and our readers are well aware of the high position the Twerton strains and varieties now occupy. Other subjects specialised in are carnations, delphiniums, violets, primroses, and polyanthuses.

W. ATLEE, BURPEE, AND CO., PHILADELPHIA, U.S.A.—There is plenty of evidence of American "go-aheadiveness" in the handy seed catalogue issued by the Philadelphian firm. The list is crowded with illustrations, the descriptions are unique, and novelties and specialities are very much in evidence, notably in sweet peas and vegetables.

WILLIAM BULL AND SONS, CHELSEA.—The familiar red-covered seed catalogue from the nursery rendered famous by its many introductions of new plants, contains a very carefully selected list of varieties of the best kinds of flower and vegetable seeds.

H. W. CHURCHMAN, SAWSTON.—A handy and descriptive little list of sweet peas.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

---

ROSE EDU MEYER.—W. P., Stamford Hill: It seems fairly evident from the letters decipherable on the label that the rose you have is a comparatively new one named Edu Meyer, a hybrid tea variety raised in Germany by Lambert, of Trier, and sent out in 1904. It is a vigorous bedding variety, with flesh-pink flowers heavily shaded with copper and tinted with fawn. It is a pretty rose, its striking colour and semi-double flowers making it at once attractive and elegant.

FERTILISERS FOR TOMATOES.—A. R., Notts: Sterilise the soil for the seed bed by heating it to 180 degrees; when cool add sand and proceed to sow the seeds thinly. The seedlings will not grow away so freely at first as those raised in unsterilised soil, but they will soon make up for apparently lost time, and will eventually become sturdier and more fruitful if cultural conditions are suitable. If only a very poor loam is available for tomatoes, the very best results can scarcely be expected, but the soil may be materially improved by the addition of old potting soil from chrysanthemums and decayed vegetable material from the refuse heap. Only under exceptional circumstances should organic manures be added to the potting soil, but when such addition is deemed necessary one part of old spent mushroom-bed manure to six parts of loam will suffice. Potash, especially muriate of potash, may be added to the soil with advantage, at the rate of about 2oz. to the bushel. When the tomatoes have set two trusses of fruits they should be fed with superphosphate, given at the rate of one ounce to three gallons of water once a week. An occasional feeding with clear soot water and also of liquid cow manure will prove of great service, while top-dressings of rich soil should be given whenever the roots show through the soil surface. Make the soil very firm, especially in the fruiting pots.

GUANO.—C. B. M., Chelsfield.—If you are not satisfied you should have the guano analysed as per the instructions given. We must say we do not fully understand your position or what it is you wish us to do for you. There are various tests for high-class guano, besides those of chemical analysis, and they are fairly good ones. Your sample blazes up quickly when put on the fire, and leaves a charcoal residue; it has a strong salty taste, and it is neither grey enough to contain an excess of earthy matter, or brown enough to suggest an excess of moisture; when damped it smells strongly of ammonia, as also it does when mixed with quicklime, and all these tests suggest that the sample is a good one. We shall be glad to help you further if you will tell us exactly what your difficulty is.

GARDENING IN VICTORIA (AUSTRALIA).—T. H. P., Surrey, writes: "Having been a constant reader of the GARDENERS' MAGAZINE for some considerable time, I would like, through its pages, to ask for opinions from gardeners as to the suitability or otherwise of Victoria, Australia, for gardeners. I have had twenty years' experience in very good private gardens, and am thinking of going to Victoria, and therefore should be glad of some expressions of opinion regarding private gardening there. I am especially anxious to have opinions from those not directly interested in emigration." If any of our readers are able to help T. H. P., we shall be glad if they will send us an expression of opinion on the matter.

PRIVATE GARDENS OPEN TO THE PUBLIC.—G. W., Harrogate: In most cases the well-known private gardens may be inspected free of charge if a request is made in proper form to the owner. Some owners throw open their gardens upon certain days in the week or at certain periods of the year, such as when rhododendrons or daffodils are in bloom; if a charge is made for admission on these occasions the amount received is generally devoted to a charity or charities. Among the gardens mentioned in your letter we know that those at Belvoir Castle are regularly opened to the public, but whether there are specified times for the admission of visitors to the others we do not know. You could readily obtain the desired information by writing to the head gardener in each instance, and enclosing a stamped addressed envelope for reply. At the same time the matter is of general interest, and so we should be extremely obliged to our readers if they will send us, on a postcard, the days and hours during which private gardens in their neighbourhood are thrown open to the public. Such information regarding Rufford Abbey, Melbourne Hall, Tissington Hall, Beaulieu Palace, Brockenhurst, Eridge Castle, Farnham Castle, Groombridge House, Longford Castle, Paulton Park, Knole Park, Penshurst Place, The Palace, Salisbury, Tring Park, Wilton House, Taplow Court, Pentillie Castle, Cotebele, Waverley Abbey, Castle Malwood, Chequer's Court, Hedsor

£1000 for Sweet Peas!

OPEN TO ALL CLASSES. OVER 200 CASH PRIZES.

**1912 will be a great "SWEET PEA YEAR," for interest in the Queen of Annuals is still increasing. In view of the tremendous number of growers of Eckford's Sweet Peas, the famous Wem firm of Sweet Pea Specialists have decided to give £1,000 in Cash Prizes to cultivators this year. Provision has been made so that every grower, large or small, may have a chance of a prize. There is no entry fee, and full particulars of prizes, classes and conditions, may be obtained free by sending a postcard for same to HENRY ECKFORD, DEPT. 221, SWEET PEA SPECIALIST, WEM.**

SPECIAL NOVELTY OFFER FOR 1912.

**CLARA CURTIS (WAVED).**—A fine waved primrose of splendid substance; very free flowering; strong in growth and stem; fine for exhibition. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1/-**.

**W. T. HUTCHINGS (WAVED).**—A very fascinating flower of soft cream overlaid with a delicate pink; exceedingly warm when bunched; a strong grower, frequently producing four flowers on long stems; of fine size and splendid for exhibition. In sealed packets, 7 seeds, **3d.**; 15, **6d.**; 30, **1/-**.

**OTHELLO (WAVED).**—A beautiful self-coloured giant chocolate, of splendid substance and robust habit. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1/-**.

**APPLE BLOSSOMI 1908 (WAVED).**—This, as its name implies, is a beautiful flower of apple blossom colour, of giant size, and, like most of the waved varieties, is a very strong grower, giving long, strong stems, frequently four-flowered. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1/-**.

**APRICOT (WAVED).**—A beautiful light apricot overlaid with rich cream pink; delightful for table decoration; one of the most superb; frequently giving fours on its splendid long stems. In sealed packets, 5 seeds, **6d.**; 10, **1/-**.

**MRS. HENRY BELL (WAVED).**—A beautiful rich apricot ground overlaid with a soft pink, which deepens towards the edges of both standards and wings. Exceedingly dainty for table or other decoration; finely waved and frequently four flowered; on long strong stems; a strong grower. In sealed packets, 10 seeds. **3d.** 20, **6d.**; 40, **1/-**.

**TERRA COTTA.**—A bright cerise standard overlaid with terra-cotta; wings soft rose; a very showy and free flowering garden variety, and exquisite for table; most effective under artificial light. In sealed packets, 5 seeds, **6d.**: 10, **1/-**.

Eckford's Giant Sweet Peas

**MISS GUEST (WAVED).**—A pure, bright, almost self rose, robust and of giant size; beautifully waved; a bold flower; exquisite for cutting and fine for exhibition. In sealed packets, 5 seeds, **6d.**; 10, **1/-**.

**ASTA OHN (WAVED).**—A pretty waved lavender overlaid with rose; a very charming flower of good size and substance; a strong grower. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1/-**.

**CERISE (WAVED).**—A fine bold, beautifully waved, true cerise; a very strong grower, giving generally four flowers on long, strong stems; a fine exhibition variety and exquisite for cutting. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1/-**.

**SAINT GEORGE (IMPROVED WAVED).**—This is a very charming flower; as accurately as one can describe, it is a deep, exquisite coral of giant size and splendid substance; is a fine exhibition variety and frequently produces four flowers on long strong stems. In sealed packets, 5 seeds, **6d.**; 10, **1/-**.

**DODWELL F. BROWNE (WAVED).**—This is a very beautiful intense bright crimson, three and four flowered, almost a self: a true Giant Waved variety of intense King Edward VII. colour, it is in great demand for exhibition and all other purposes. In sealed packets, 10 seeds, **3d.**; 20, **6d**; 40, **1/-**.

**EVELYN HEMUS (WAVED).**—A warm cream shading to yellow with a picotee edge of terra-cotta pink; of great size and refinement; standard and wings beautifully waved, and nearly always four-flowered. In sealed packets, 10 seeds. **3d.**; 20, **6d.**; 40, **1/-**.

**PICOTEE, (WAVED).**—A giant waved flower, pure white with a beautiful picotee edge of carmine; in most cases the flowers are borne in fours on a long, strong stem; and they are well placed and of splendid substance; a really beautiful flower and fine for exhibition. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1/-**.

**SPECIAL OFFER.** One full-sized packet of each of the foregoing 14 charming and novel Sweet Peas, **11/6** post free for cash with order. One half-sized packet of each of the foregoing 14 charming and novel Sweet Peas, **6/-** post free for cash with order.

SPECIAL COLLECTIONS FOR 1912.

**VILLA (A) COLLECTION.** 50 very choice varieties, suitable for Villa garden, excellent giant flowered sorts, most suitable for cutting and exhibition, 25 seeds of each, **10/-**, post free, cash with order.

**VILLA (B) COLLECTION.** 24 splendid varieties, suitable for exhibition, 50 seeds of each, **5/6**, post free, cash with order.

**EXHIBITORS' (D) COLLECTION.** 12 Giant Waved varieties, new and up-to-date; fine for exhibition, 10 seeds of each, **2/9**, post free, cash with order.

**FREE.** A specially written booklet on Sweet Pea Growing given with every order. Send to WEM to ensure satisfaction. Send a postcard to-day for large illustrated and coloured Catalogue. It gives full particulars of all novelties in Sweet Peas for 1912, also complete particulars of the £1,000 offered in Prizes for growers of Eckford's Sweet Peas, and contains full list of all flower and Vegetable Seeds.

*Address* ..........................................................

Castle, Hardwick Hall, and Belvoir Castle would be much appreciated.

PROPAGATION OF BEGONIA GLOIRE DE LORRAINE.—D. W., Orpington: This useful begonia may be propagated by means of cuttings of the young growths that push up if the old plants are rested a while after flowering, and then placed in genial warmth. Such cuttings should be about an inch and a-half long and be inserted in sandy soil in a propagating case, taking care to avoid excess of moisture. Another method is to use leaves, inserting these in sandy soil, in an erect position, and sufficiently low to cover the junction of the leaf-stalk with the leaf blade.

ROCK GARDENS AND ALPINE PLANTS.—E. K., Halifax: The book you refer to is "Rock Gardens and Alpine Plants," by Mr. E. H. Jenkins. This can be obtained from the office of the GARDENERS' MAGAZINE, 148, 149, Aldersgate Street, E.C., past free, price 2s. 9d.

## NAMES OF PLANTS.

Under this heading we can only undertake to name species and well-marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

G. W., Reigate.—1, Maranta zebrina; 2, Acacia dealbata; 3, Cypripedium Tityus.

R. G., Dorking. 1, Thyrsacanthus rutilans; 2, Erica mediterranea; 3, Chimonanthus fragrans.

F. E. S., Newbury.—1, Epidendrum variegatum; 2, Primula floribunda; 3, Coleus thyrsoideus; 4, not sufficient for identification.

A. O., Bedford.—1, Cymbidium grandiflorum; 2, Cypripedium Memoria-Mœnsi; 3, C.- Cardoscanum; 4, Odontoglossum Lambeauianum; 5, O. crispum, a very pretty form; 6, also a variety of O. crispum.

## OBITUARY.

### MR. JOHN DEACON.

It is with deep regret we learn of the death of Mr. John Deacon, head gardener to the Right Hon. Joseph Chamberlain, M.P., at Highbury, Birmingham. Mr. Deacon was found dead in one of the lakes at Highbury. Mr. Deacon was a capable gardener, and had been at Highbury about twenty years; he had a special knowledge of chrysanthemums, hardy spring flowers, alpines, and amaryllis, but he was a skilful cultivator of all subjects he took in hand, as those who have visited the Highbury Gardens can testify. Mr. Deacon was an old Kewite, having left the Royal Gardens in 1881. His death is deeply deplored, and the sympathy of all who knew him will be extended to his family.

## GARDENING ENGAGEMENT.

**Mr. J. Bratley,** late head gardener at Hopwood Hall, has been appointed head gardener to Robert Armitage, Esq., M P., Farnley Hall, near Leeds, and entered on his duties January 13.

**The only resemblance** between a Pine Spray Syringe and others is in the shape of the barrel. The metal is more substantial. For the rest, the combination spraying head renders Spray, Rose, and Bend instantly obtainable without the addition or removal of a single fitment, while the adjustable leather bucket plunger gives perfect suction, never allows water to escape past it and up your sleeve, and wears interminably.

A written request from your ironmonger or seedsman, and a Syringe will be sent in 24 hours for your approval. Price 10/6. Sole proprietors and manufacturers, **Robinson Bros., Ltd., West Bromwich.**

**PINE SPRAY SYRINGE** (patent).

## MARKETS.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Cult of the Sweet Pea.

With a full appreciation of the wondrous beauty and the high degree of usefulness possessed by the sweet pea in its great diversity of colouring, it is impossible to regard otherwise than with a strong sense of satisfaction the prospects of the Queen of Annual Flowers in the year on which we have recently entered. Certainly, in no year since the introduction of the flower into this country, upwards of two centuries ago, has there been so great a promise of a magnificent demonstration of its capabilities, both for beautifying the garden and supplying an abundance of cut flowers for the adornment of the home and for obtaining honours at the exhibitions. Twelve months ago there was ample justification for anticipating a successful sweet pea year, but the exceptional heat and the long-continued drought effectually prevented the realisation of the anticipations that were indulged in, excepting it may have been in the few districts that were especially favoured by the rainfall. We do not pretend to forecast the weather of the coming summer, but we do not believe that the sweet peas will suffer to the same extent this year as in 1911, even if the climatic conditions should be much the same. As the result of the heavy rainfall during the past three months, the soil is now liberally charged with moisture, and it is not probable that the general body of cultivators will forget the remarkable object-lesson they had last summer on the value of deep cultivation in mitigating the effects of a severe drought. Whatever may have been the effect of the drought upon the sweet peas, it did not in any way check the interest that is being taken in them by the flower-loving community. It might, indeed, be inferred by those who are of a speculative turn of mind that the failures stimulated the interest in the flower. We offer no opinion upon that point, but we are in a position to state that in no year has the demand for seed of both old and new varieties been so keen as that which is being met this season. We have evidence also that there will be a considerable addition to the number of those who grow sweet peas in a manner commensurate with their beauty and usefulness. It is not surprising there should be considerable accessions to the ranks of sweet pea growers, for, as our contributors show in this issue, there are sufficient new varieties to satisfy those who attach much importance to novelty, and also an abundance of varieties of high quality among those now in general cultivation. The sweet pea possesses one trait that is not common to all classes of plants that are distinguished by the beauty of their flowers, and this trait is their adaptability to the gardens of all classes. That they are highly desirable in the ducal garden all will be prepared to admit, while for the cottage garden, however limited may be its dimensions, they are most appropriate, more especially as the seed of a selection of the finest of those in general cultivation can be obtained at a very small cost. Some of the cultivators who have not at their command a very large area available for these flowers are complaining of the number of new varieties being too large. We do not share in that opinion, and, with reference thereto would point out that, while it may not be possible for any one grower to include any considerable number of novelties among the varieties for which he has room, it is most desirable that all which are distinct in colour and of high quality should be placed at the disposal of the general body of cultivators. It should be remembered that new sweet peas, as in the case of other novelties, do not always fulfil their promise, and also that some which are not particularly promising possess qualities that render them in some respects superior to those of which a high opinion was held when they first made their appearance. It is certainly not desirable there should be an excessive multiplication of new varieties, and certainly not of those which differ but little in colour from others already in cultivation. As regards colour distinctions, there are too many varieties wanting in distinctness, as shown by the list of too-much-alike varieties prepared by the National Sweet Pea Society. But with the greater facilities that now exist for instituting comparisons, we may anticipate that there will be a material reduction in the numbers distributed that present too strong a family likeness to those already in commerce. Cultivators have good reason to be grateful to the society mentioned for the valuable service that has been rendered in this particular, but it is doubtful whether this work has been fully appreciated. In the interest of the cult it is satisfactory to know that the society has found it possible to arrange for two distinct trials of varieties under wholly different climatic and soil conditions. We are gratified by this extension of the society's work, because of the importance of not only eliminating such as are inferior, but of avoiding the possibility of a first-class flower failing to obtain recognition owing to the local conditions being unfavourable to its full development. With reference to the exhibition side of the cult, there is full justification for the belief that the competition for the cups, medals, and cash prizes offered by the various societies will be even more keen than in past years. No society specially identified with the sweet pea has of late been established in England, but a considerable proportion of the local rose societies have included sweet peas in their programme, and thereby materially enhanced the attractions of their exhibitions and improved their financial position. Horticultural societies have given additional encouragement to sweet peas, and these now form so important a feature as to suggest the possibility that in a few years hence they will be the means of excluding some classes of flowers that should be adequately represented at exhibitions of general societies. In Scotland sweet peas are, to use a common phrase, "going strong," for several special societies have been formed quite recently, and the exhibition season was highly successful last year. Although the drought was severe in Scotland it was not so injurious in its effects as in England, and from the beginning of July until September was well advanced, there was an abundance of flowers of exhibition quality. The great object-lesson that was afforded cultivators in the summer of 1911 on the importance of deep cultivation as a means of averting the effects of a severe drought received a full share of attention from the general body of cultivators. Some, we know, are increasing the depth to which the soil is usually cultivated, and it may be assumed that many others will do so. All the successful cultivators are careful to cultivate deeply, and those who have hitherto failed to obtain a high place on the prize list would improve their positions as prize winners were they to follow their example. Deep cultivation is, of course, equally necessary where the flowers are grown simply for beautifying the garden and yielding supplies of cut flowers. Liberal manuring is not less essential to success, but the excessive applications of manure that are frequently made are not only unnecessary, but undesirable, because of their promoting an undue luxuriance of growth and the development of coarseness, both in the flowers and flower stems. The use of large quantities of nitrogenous manures should be avoided, for they not only promote coarseness, but represent waste as the nitrifying organisms that locate themselves in the nodules on the roots will provide the plants with the greater part of the nitrogen they require. On the other hand, potassic fertilisers might be used more freely in preparation of light soils than is usually considered necessary.

---

**Sugar in Plant Leaves.**—In studying the relationship between cane sugar, dextrose, and lævulose under different conditions in the leaf of the snowdrop for the purpose of testing Messrs. Brown and Morris's view that cane sugar is the first product of carbon assimilation in plants, Mr. John Parkin obtained some interesting results. It was found that maltose is always absent from the snowdrop leaf, so that it appears probable that maltose, when present in leaves, is a hydrolysis product of starch. The total quantity of sugar in the snowdrop leaf is considerable, being from 20 to 30 per cent. of the dry weight in leaves, actively assimilating. The amount of sugar increases from above downwards in a single leaf, and at the same time the ratio of cane sugar to dextrose and lævulose diminishes. In the early part of the season there is more cane sugar in proportion to reducing sugar than later, the comparison being made between leaves gathered about the same period of the day. During any single day the percentage of dextrose and lævulose in the leaf remains fairly constant, but that of cane sugar fluctuates considerably, increasing during the day and decreasing during the night. As the result of his investigations, Mr. Parkin is inclined to the opinion that cane sugar is, as suggested by Messrs. Brown and Morris, the first sugar formed in the leaf. Mr. Parkin also considers that it is within the bounds of probability that cane sugar itself may take a direct part in the formation of cell walls.

**Honour to Mr. Harman Payne.**—Among the French New Year's honours our old friend and correspondent, Mr. Harman Payne, has been awarded the "Palmes Académiques" by the French Government in recognition of his many years' writing in the French gardening press. This is the first time the decoration has been bestowed upon an English horticultural writer, and it carries with it the title of "Officier de l'Instruction Publique."

**Daphne odora.**—At the recent meeting of the R.H.S. Scientific Committee Dr. Otto Stapf drew attention to the fact that most of the figures in botanical works under this name represented Daphne sinensis, the true D. odora being very rarely figured, and apparently only of comparatively recent introduction into this country. In times past, at any rate, it would appear that D. sinensis was the more common plant. It differed from D. odora, a Japanese species, in having the calyx tube externally hairy. Messrs. J. Veitch exhibited the true D. odora at the show on this day. Dr. Stapf showed a figure from the "Garden," which was named D. odora, but which differed markedly from that species in the arrangement of its flowers.

**R.H.S. Colonial Fruit Show.**—We are informed by the Royal Horticultural Society that, owing to unforeseen circumstances, the Colonial Government have been compelled to abandon the exhibition of South African fruits, which had been arranged for March 14 and two following days.

**Primula obconica from Roehampton.**—From Mr. R. Bradford, gardener at Highwood, Roehampton, we have received a gathering of finely developed trusses of Primula obconica, which represent a strain of much merit. The trusses we have received have, we are informed, been cut from plants that were raised from offsets that were taken off and potted in April of last year. Mr. Bradford commenced the cultivation of his present strain of Primula obconica six years ago by purchasing from one or two firms the best seed obtainable. From the progeny thus obtained he has year by year made careful selections, and, as the result of his method of procedure, he has obtained finer flowers, bolder trusses, brighter colours, and larger flower stems. Mr. Bradford states that the flowers are used freely in a cut state for indoor decorations, and that they retain their freshness in gas-lighted rooms for fully a week. Last year he was able to maintain a supply of flowers over a period of six months.

**Big Bud of Black Currants.**—A small but useful experiment was carried out by an officer of the Board of Agriculture at Harvington, Worcestershire, in 1911, to test the efficacy of various sprays for combating big bud on black currants. The sprays used were lime and sulphur in the dry form at the rate of one part of lime to four of sulphur; quassia and soft soap at the rate of 2lb. of quassia chips, 1lb. of soft soap, and ten gallons of water, and soft soap alone at the rate of 1lb. soft soap to ten gallons of water. The quassia chips were boiled for two hours previous to the soft soap being added. At the first spraying, April 20, the sprays were used as above. At the second, May 4, the lime and sulphur were used in the proportion of 1 to 8, and at the third, May 25, sulphur alone was used. The soft soap spray did not produce any effect upon the mites, but the lime and sulphur treatment reduced the amount of disease to two-thirds of the untreated bushes, and the quassia and soft soap to four-fifths.

**Royal Horticultural Society of Ireland.**—At the recent monthly meeting of the Council of this society Alderman Bewley and Mr. B. d'Olier were elected chairman and vice-chairman respectively for the current year. Messrs. H. Nicholls, Farmleigh Gardens, Castlerock; J. Shekleton, Seafield Gardens, Donagate, and D. M'Intosh, Danum Gardens, Rathgar, were elected practical members of the society. The society will hold three exhibitions during the year. The spring show will be held April 17 and 18 at Ballsbridge in connection with the Royal Dublin Society's exhibition; the summer show will be held July 11, and the autumn show August 27, both in the grounds of Lord Iveagh's St. Stephen's Green residence, Dublin.

**Mr. William Ward,** who for many years represented Messrs. Osman and Co., London, and more recently occupied the position of general manager for Messrs. J. Backhouse and Son, Lim., York, has been in indifferent health for upwards of twelve months. Upon the advice of his doctor, he has, for the present, retired from active business life, and has gone to Lincolnshire for a complete change and rest. We are quite sure that Mr. Ward's many friends will join with us in the hope that he may be speedily restored to health.

**Fungicidal Action of Bordeaux Mixture.**—The problem of the manner in which Bordeaux Mixture exerts a fungicidal action has been investigated by Messrs. B. T. Barker and C. T. Gimingham, and reported upon in the "Journal of Agricultural Science." The question of the existence of a solvent action of the fungus itself upon Bordeaux precipitates has hitherto not been settled. In this investigation hanging drop cultures of spores were made with Bordeaux mixture and with the filtrate from it. In the filtrate germination and subsequent growth were fairly vigorous, while in the drops of the Bordeaux mixture germination was rare. Diffusion tubes were then used to separate Bordeaux precipitate from its filtrate, when the spores germinated both in the filtrate outside the diffusion tubes and in the diffusion tubes containing the precipitate, but in the latter case only at a little distance from the precipitate itself. In the final experiments films of Bordeaux precipitate were allowed to dry on cover-slips, and films of Nectria conidia were superimposed on these films, overlapping them. After twenty-four hours in a moist atmosphere there was a sharp limit between dead and living conida which coincided practically exactly with the edge of the copper film. Beyond the copper zone nearly all the conidia were living, and had germinated in many cases, especially in the region farthest removed from the copper. With regard to the practical outcome the results obtained support the views of the fruit-growers, with reference to the necessity for thorough spraying, so as to coat as completely as possible the surfaces liable to infection, the importance of the finely divided form of the copper precipitate, and of the adhesive properties of the spray.

**Trees in Paris.**—According to some recent statistics given in "Le Jardin," the number of trees in the Parisian boulevards is 86,154, representing some 21 species. The planes are the most strongly represented, and of these there are 26,254 trees; the horse chestnut ranks next with 16,662 trees, followed by 14,173 elms, 8,920 Ailanthus glandulosa, 5,960 maples, 4,788 sycamores, 3,903 acacias (robinias), 3,197 limes, 942 paulownias, 539 cedars, 344 American walnuts, 238 sophoras, 123 poplars, 34 negundos, 27 service trees, 26 planeras, 18 pterocarpus, two ash, and one mulberry and catalpa.

**Extraordinary Mushrooms.**—Mr. R. H. Legg writes as follows, from the Gardens at Melksham House: Some three or four years ago I put some mushroom spawn in a melon pit at the time I planted out some melons. In the autumn of that year quite a good crop of mushrooms was gathered, and in subsequent years several nice lots have been obtained in the same pit, although the manure and soil have been cleared out several times. At the present time, January 18, 1912, several fine mushrooms have grown out from the brick wall of the pit, a foot from the ground level. Evidently, the brickwork contains a lot of mycelium. I should say it is rather unusual to see mushrooms growing on a brick wall, although one often hears of them doing most extraordinary things; I am enclosing a mushroom from the wall for you to see." This is a remarkable case of persistence of mushroom mycelium; the mushroom sent was a very good specimen.

**Navel Orange.**—Mr. H. S. Rivers sent to a recent meeting of the Scientific Committee of the Royal Horticultural Society a large "St. Michael" orange, produced on a plant which three years before had been cut down. It had the "navel" form seen usually in some varieties of orange, but very unusual in this. Apparently, the extra vigour of the growth had induced its formation.

**Edinburgh Scholars and the Botanic Gardens.**—There was a brisk discussion at the meeting of the Edinburgh School Board on the question whether the school children should visit the Royal Botanic Gardens during or after school hours. The Committee on Day Schools recommended that, as the visits are made for educational purposes, the children should be taken to the gardens in school hours. Some members regarded the visits as recreative and opposed the recommendation, and moved an amendment to the committee's report. In the result it was decided by a majority of one that the children shall visit the gardens outside the school hours.

# MR. ROBERT SYDENHAM,

***President of the National Sweet Pea Society.***

Mr. Robert Sydenham occupies a prominent, and we had almost written unique, position in the world of horticulture. Few men are more widely known, and his genial personality has secured him large numbers of friends. By way of recreation he took up gardening very many years ago, and found it a pleasant change from the conduct of a wholesale jeweller's business. But his keen business instincts led him to look further than the recreative side of gardening, and before long he commenced to sell bulbs, and very soon developed a large business in them.

From bulbs to seeds was an easy step. The business has grown to be a very large one, and the premises at Tenby Street, Birmingham, are taxed to their utmost at this season of the year, when orders for seeds come pouring in. Though one of the keenest of business men, Mr. Robert Sydenham is also one of the most generous, while his jollity is infectious. He has travelled considerably in North America, Europe, the Mediterranean region, and in South Africa, and is contemplating a visit to California. An early riser and a hard worker himself, Mr. Sydenham sets the pace in any society with which he is connected, never shirking the duties that fall to his share. He has been from the time it was established the life and soul of the Midland Daffodil Society, which has done so much to promote the cultivation and improvement of the narcissi, spending time and money freely to maintain its high position. He is a member of the Royal Horticultural Society's Narcissus and Tulip Committee, and his knowledge of varieties is a wide one. Mr. Sydenham is a great believer in "taking notes," and he is mostly found with a note book in his hand.

For many years Mr. Sydenham grew carnations and picotees for exhibition purposes with wonderful success, and was difficult to beat at the Midland shows, a fact of interest as showing that he has the florists' instincts as well as a strong love for these two classes of flowers. Latterly he has, as a cultivator, taken special interest in the cultivation of bulbous plants in fibre, in undrained pots; indeed, he may be regarded as the pioneer of this useful form of cultivation. As so well known to all who are in any way concerned with sweet peas, these charming flowers occupy a large share of his attention, and in his private garden he grows them freely and well, while he travels far and wide to see new varieties and inspect seed stocks. It is of interest to recall the fact that Mr. Sydenham was a member of the committee that carried through the celebration of the bi-centenary of the introduction of the Sweet Pea, at the Crystal Palace, in 1900, which had such an enormous influence on the extension of the cultivation of sweet peas and on the development of new forms. Since the formation of the National Sweet Pea Society he has always been a prominent and official member, and so, in recognition of services rendered, the members of this society unanimously elected him, at the recent annual meeting, president for 1912, a position of which Mr. Sydenham is justly proud, and one which he will fill admirably.

## EARLY VEGETABLES.

### Peas.

There was a time when green peas were considered a great luxury in June; now they are to be had in abundance by the latter part of April and early in May. But, as a rule, private establishments are not provided with the requisite means for their production, so it is to the great market growers that we look for these most delicious and dainty dishes. Still it is possible in most private places to get a few early dishes before outside crops are ready. Those who are provided with brick pits ought not to have any difficulty in gathering peas by the end of April or early in May, as peas do not require any artificial heat, and they resent forcing. If some of the early varieties are sown at once in brick pits, the seeds will soon germinate, and the plants be then brought on gradually.

The varieties grown must in a measure be determined by the depth of the pits, but as a rule there is plenty of space for the dwarf kinds, or such as do not exceed a height of eighteen inches. A mistake often made when growing such things under glass is overcrowding the plants, and so preventing the air from circulating freely amongst them. Peas are fairly hardy, therefore only need to be protected from frost and cold winds to ensure success. When grown in pits, if the seed is sown any time during the first half of January, with due attention, and if an ordinary season, pods should be ready to gather early in May, but if required before that time they may be grown in a cool house. We have often had a good crop in pots in the late peach-house until the foliage of the peach trees began to shade the plants when they were transferred to a temporary pit. I have grown many varieties under glass, but have never grown the round-seeded kinds, as they are of poor quality. The best of the more recent introduction is Hundredfold; this is a good cropper, and produces fair-sized pods and peas of a deep green colour, and of excellent quality. It grows under glass to the height of about eighteen inches. Some like a dwarfer variety, but we do not obtain the same results from extraordinary dwarf kinds.

### Cauliflowers.

Cauliflowers in early summer are always in request, and as there are now so many dwarf kinds that are well adapted for growing under glass, there is no need to sow seeds in the autumn where a frame can be provided in spring. Seeds may be sown in a box or pan, and introduced into a gentle heat. Here they will soon germinate, and when large enough to handle should be pricked off to prevent damping. When the plants have made three or four rough leaves they should be planted on a slight hot-bed and have a frame placed over them. Air must be admitted on all favourable occasions to keep the plants sturdy. Such varieties as Early Forcing do not require much room; if planted about a foot apart each way, and kept fairly close to the glass, this will be found ample space for them to develop. When the weather is mild the lights may be removed entirely in the daytime, but should be put on early in the evening, and should there be any signs of frost, cover the glass with mats to ward this off, but air should be admitted as early in the day as possible to keep the plants sturdy.

### French Beans.

Of French beans there are now so many good varieties to grow under glass that it is difficult to say which is best. At this time of the year, if a hot-bed can be provided in a pit, an abundance of fleshy pods may be had a couple of weeks or so earlier than from cold frames. The main thing is to keep up a succession, and where the houses in early spring are crowded with other things, it is often difficult to find sufficient space for all; therefore if brick pits are available good crops may be had from these with far less trouble than growing the plants in pots. But it must be borne in mind that French beans, unlike peas, require heat to bring them forward, and unless this can be provided failure is sure to be the result. Where a three-inch pipe runs round the pit there should be no difficulty in keeping up the requisite degree of heat, especially if fermenting material can be given, but this should on no account be excessive, as bean roots are very sensitive, and often more harm than good is done by trying to bring the plants on too rapidly, especially before the pods have begun to form. When grown in pits it is essential that air be admitted both at the top and bottom of the lights on all favourable occasions, as there is not such a free circulation in these situations as in light, airy houses.

### Lettuces.

Lettuces are always in demand early in spring, and as there are now so many dwarf compact quick-growing kinds there is no need to winter so many plants in frames as of old. Seeds sown early in the year in gentle heat will give nice hearts by April and May. As soon as the plants are large enough to handle they should be pricked out about four inches apart each way on a gentle hot-bed, and as near the glass as possible. One light will be sufficient at a time for an ordinary establishment, but if more are required preparations should be made accordingly. The tender crisp hearts of such varieties as Golden Queen are much appreciated as salads.

### Potatoes.

No place should be without a continuous supply of potatoes from the early spring until they are ready to lift from the open ground, but there are very few gardens provided with sufficient accommodation to grow all that are required, hence the reason so many contrivances are made in order to bring forward and protect the numerous crops that are desired. Young potatoes are a dainty dish in the early months of the year, and unless a gardener is able to provide them he is not considered to be a first-class and capable man; but it is not at all times the man that is at fault, but the means at his command. Where heated pits are provided there should be no difficulty in keeping up a supply, as sets may be brought forward in the houses to take the place of those that have been cleared out, thus accelerating the growth of the crop by two or three weeks, which is a great consideration where space is limited.

H. C. Prinsep.

---

**Cauliflowers.**—No pains should be spared to obtain these as early as possible, as they are greatly appreciated in most establishments. First Crop, Early Forcing, or any of the Early London types are the best for this sowing. Sow in light soil in boxes, place in gentle heat, and prick off immediately the seed leaves are fully developed, two inches apart. Later on some may be potted in 60-sized pots, and others planted out on declining hotbeds, the rest being gradually hardened off and planted on a south border and well protected. Magnum Bonum and White Queen, sown in the same manner, make a good succession to the above varieties.—G. Ellwood.

## MICHAELMAS DAISIES IN THE NORTH IN 1911.

I had almost begun to expect that Michaelmas daisies were going to be a failure in my garden during 1911. They did not like the extreme heat and dryness of the summer. Mine never received any artificial watering for the excellent reason that I was climbing amongst the Italian Alps when I should have been attending to their mute appeals for moisture.

But about mid-October they largely recovered. The aster which I personally "as at present advised," as lawyers say, admire most, is Climax. I wondered when it would condescend to open its flowers; it did so on October 18, and they were charming, though not so large as I have sometimes seen them. Beauty of Colwall, from whom, owing to the F.C.C. from the R.H.S., one is perhaps given to expect too much, was moderately good here. All the flowers were, I think, double. The Hon. Edith Gibbs was hardly as good as usual, but this year one small-flowered variety gave me great pleasure, to wit, Chastity. I took some trouble in planting it in a position where it would be able to show its beauty, and it did not disappoint me. The plant—not a large one—was a charming thicket of white blossoms, enhanced by their golden centres.

Of the pink or red varieties St. Egwin was as delicately pretty, though hardly so profuse in blossoms, as ever; while Ryecroft Pink, Lil Fardell, and Mrs. Rayner were all good. I used to place Mrs. Rayner first, but the sight of a breadth of Lil Fardell in the York Nurseries caused me to put Lil Fardell in front of my former favourite. Some of the pale pink varieties in my own border have been distinctly disappointing this season, e.g., Mrs. Twinam, Miss Gainsford, and Thirza. The new variety Lustre, which is of a deep pink or rose colour, pleased me much.

Of the blue, pale blue, and purplish-blue varieties, Feltham Blue—much paler in colour than last year—was very attractive. Miss Southall was good—much darker in colour than Feltham Blue. A variety which I have under the name of Splendens, was praiseworthy; so also was A. puniceus, which is very near it in colour.

One of my favourites, Brightness, was very late in opening, but, on the other hand, gave us flowers when other varieties had ceased to bloom. As to whites, I am not yet satisfied. Mrs. Peters does not do well in my garden. A variety at the York Nurseries, under the name of Mrs. F. Thorpe, was last year certainly better than Daisy Peters. Silver Queen, also a white. with a suspicion of a flush of pale blue, was pretty. I noticed one or two varieties in blossom about October 18 which were certainly pleasing—Ethel Perry, a good pink, not much more than two feet high, and A. japonicus, a semi-dwarf blue of a tint very difficult to describe.

It will be observed that I have said nothing of many well-known and praiseworthy varieties, either because they do not appeal to me personally, or because they did not seem to be particularly good this season. One plant which I do not generally admire extorted from me a word of praise, viz., William Bowman, whose purple flowers, in the sunshine, were decidedly effective.

The two chief points as to the culture of Michaelmas daisies ceem to me to be, first, do not let the clumps get too big, or, in other words, divide them every year, and, secondly, stake early.

G. Yeld.

York.

# SWEET PEAS IN 1912.

## NEW SWEET PEAS.

New sweet peas are as numerous as new roses and new cypripediums. Probably they are not so numerous as is the last-named family of orchids, but they are so abundant that hardly any enthusiast has seen all of them in any one year, and fewer have had opportunities of comparing the newer varieties one with the other. Doubtless some varieties that are at present by way of being "dark horses" may eventually become winners, and also it seems quite likely that some new sweet peas of which a good deal has been said and written, will soon fall in estimation. Therefore, one must needs write with care of new varieties lest overpraise or overblame be given.

SWEET PEA R. F. FELTON.

Lilac with blue-grey wings, flowers considerably reduced in size. Introduced by Mr. R. Bolton.

Mr. Robert Bolton occupies a foremost position with new varieties, especially with those belonging to the fancy section. He gave us a hint at further delightful colour combinations when he sent out Charles Foster, and probably his newest varieties will supersede that variety. It is doubtful whether any new sweet pea was more talked about at the N.S.P.S. show in July last than Afterglow, a beautiful and indescribable variety with blue, purple, and mauve colouring. Prince George is another fancy sort which Mr. Bolton thinks will quickly take the lead in this division: it is a combination of rose, violet, and bronze. R. F. Felton, lilac, with blue-grey wings, is another fine variety from Carnforth.

Messrs. Dobbie and Co. have some capital varieties to offer, and their May Campbell, cream, with rosy flaming and veining, is right at the top of the "marbled" section. Mauve Queen will not please everyone, but it is a first-class flower, and its shade of colour is very pleasing. Lady Knox, of ivory shade, gives a fine spike of flowers, while Melba, a light salmon-pink, is a beauty that can scarcely fail to secure popularity. Red Star, raised by Mr. Malcolm, and distributed by Messrs. Dobbie and Co., is fine in the rich deep scarlet section.

Mr. Robert Sydenham, Lim., presents several new sweet peas, chiefly raised by Mr. R. Holmes, of Norwich. Thomas Stevenson has been with us one season now, and is a fine orange-scarlet; Barbara is a fine deep salmon; Millie Maslin Spencer is a big waved magenta; Scarlet Empress is a waved counterpart of Queen Alexandra; Edith Taylor, deep rich rose; and Lady Evelyn Eyre, pink, flushed with soft salmon, are other sorts offered from Tenby Street, Birmingham, and all have been seen in fine form.

Mr. W. J. Unwin, Histon, offers four novelties, and of these Winifred Unwin, a charming light blue shade, should find favour; Leslie Imber gives a medium shade of blue; Cyril Unwin is a fine grower, and has maroon, violet-shaded flowers; while Walter P. Wright is light lavender-blue, a pretty shade of colour, and the variety has strong growth.

Miss Hemus, Upton-on-Severn, offers dwarf forms of Marjory Hemus, Maroon Paradise, and Purple Paradise; these are said to grow about sixteen inches high, forming little bushes; these I have not seen, but their descriptions suggest beauty and novelty. Of Lucy Hemus, Paradise Regained, and Evelyn Hemus, double forms, are now offered, and should prove interesting and useful. Paradise Moonstone, pink, with blue tinting; Holdfast Picotee, pink, with red edge; Marjory Hemus, white, with soft violet edge; Paradise Celestial, pale blue; and Paradise Opal Pierce, white with opal veining, are all new and striking novelties, and in some cases there is more than one shade of the variety offered, thus Marjory Hemus is offered in three heights—dwarf, intermediate, and tall—and in three shades of colour—pale, medium, and deep.

Messrs. W. Atlee Burpee and Co., Philadelphia, U.S.A., are offering the splendid Vermilion Brilliant in conjunction with Messrs. Alex. Dickson and Sons. Newtownards; it is vermilion, and it is brilliant. These two firms are also sending out Irish Belle, a lovely lilac flower, shaded with pink. The Burpee Company has several "duplex," or double, varieties, that is, those with two standards, and in Margaret Madison it would seem to have secured a good bright blue Spencer form.

Mr. Henry Eckford, Wem, has a short list of new sweet peas, and the varieties offered are Miss Guest, a bright reddish-rose self of great beauty; Apricot, a charming combination of soft apricot and pink; Terra Cotta, difficult to describe, but combining cerise and rose shades in pleasing fashion; and an improved waved form of the brilliant St. George.

Mr. C. W. Breadmore is distributing Iris, a lovely salmon sweet pea, promised some time past; Jack Tar, deep blue, with bronze-tinted standard, is a good thing; and so is Alpha, a fine pink, shown well at the Temple Show of 1911.

Messrs. Aldersey and Marsden Jones, Tilston, have some very choice varieties of refined form, and these include Amber, deep pink, shading to scarlet; Dragonfly, lavender and cream; George Curzon, deep blue flake; Mulberry, deep reddish-maroon; and True Blue, an indigo self that I do not remember having seen.

Messrs. Stark and Son, Great Ryburgh, have Hercules, which did so well last year, and White Queen, a white counterpart of the former. I am waiting for the Messrs. Stark to give us a waved form of the solid and pure White Florence Wright—it would be fine. Majestic is offered as a new cream form, and King Manoel must be classed as chocolate-red; and Ashantee as dark maroon; while Bluejacket is very promising in the deep blue section.

Messrs. Lumley and Co., Hayling, have a good chocolate self in Enid Damerum, and another dark variety in their Guy Langton, while Ruth Earl is a dark wine-red sweet pea that has been exhibited well on several occasions. Mr. William Deal, Kelvedon, offers Bouquet, a pink Helen Pierce; Minnie Orst, a pale waved Helen Pierce; and Juliet, a very pretty variety, cream, flushed with salmon. Mr. James Box, Lindfield, is distributing Orange Perfection, a rich variety he showed largely and well at many exhibitions in 1911. Messrs. Isaac House and Son, Westbury, Bristol, have a mauve and purple variety named Messrs. James C. House. Chastity, a fine blush form, from Messrs. R. H. Bath, Wisbech, promises well. Earl of Chester, orange-scarlet, offered by Mr. Ward, of Vicar's Cross, Chester, and Messrs. Faulkner and Aitkens, Tarvin, Chester, has been highly spoken of by many growers, but I do not think I have seen it myself. Mr. Mackereth, Ulverston, is sending out Mr. F. H. Chapman's Iolanthe, a good white garden variety. Messrs. Gilbert and Son, Dyke, Bourne, have a good cream-pink in Lady Florence Willoughby, and a charming blue flaked variety in Mrs. B. Gilbert, and Mr. A. E. Alsen, of Waterlooville, has a distinct novelty in Minnie Furnell, pink, with cream centre. Messrs. E. W. King and Co., Coggeshall, have a new ivory variety named Princess Mary. Mr. W. O. Cantley, Bury St. Edmunds, is offering a new pale blue named Seamew, and a lilac-blush variety named Agnita; the first-named is very pretty, while Agnita is unusually fragrant.

There are other new varieties, some of them offered by the raisers mentioned above, and some by other firms, but those named are all worthy of trial. Probably not fewer than a hundred and fifty new sweet peas were exhibited in 1911, but some of them appeared to be new only to the exhibitor, and so had received a new name for the time being. It grows more difficult each year to keep pace with the novelties. C.

## THE SCIENTIFIC INTEREST IN SWEET PEAS.

We all know the story of the Cambridge undergraduate whose one strong point was a simple problem in mechanics, and who, when sitting for the "Little-Go" began an answer to a question on Xenophon's Anabasis: "That the Retreat of the Ten Thousand may be clearly understood, I must first explain the principle of the Common Pump." I mention this because I fear your feelings will be mixed when I say that, in order to make clear the scientific interest in sweet peas, I must first explain Mendel's principles of heredity.

The main principle underlying Mendel's law is very simple, and really very interesting, as all up-to-date sweet pea raisers know, but the average man whose delight is in his prize blossoms, when he sees pages covered with symbols that look like algebra sums gone mad, is apt to shy at it and turn over to the next article with its accompaniment of pictures. I shall not go far into the mysteries of Mendelism, but just give the main principle. Mendel experimented with culinary peas, and came to the conclusion that the characteristics of a plant (height, colour, and so on) are due to pairs of alternative factors, respectively dominant and recessive, the recessive characteristic being latent except when the dominant factor is absent. He also found that when a pair of factors were brought together by crossing, the seedlings in the first generation showed dominant characteristics only, but that in the second, if self-fertilised, the plants had issue in the proportion of three dominants to one recessive. Of these the recessive and one dominant bred true, while the other two dominants always broke up again in the same three to one ratio. That is, as you may say, the bedrock of Mendel.

The chief workers on sweet peas from a purely scientific point of view are Mr. W. Bateson, late Professor of Biology at Cambridge and his successor, Professor R. C. Punnett. In one of their early experiments they found to their surprise, on crossing two white sweet peas, that the offspring was coloured. This was due to the fact that colour in a flower is not due to one, but to two factors, called C. and R., and if either of these is absent, the flower is white. In this case each flower carried one of the complementary factors, so their union produced a coloured seedling in the first generation, while in the second, of course, some of the seedlings were again white. Consequently, when crossing a coloured sweet pea with a white, we must not imagine that colours can come in from one parent only. This will be so if the whiteness is due to the absence of the factor R., but if C. is absent, all sorts of tints may be suppressed in the apparently pure white.

It was thus, I think, that Audrey Crier got its beautiful salmon shade. Audrey Crier, in stud book parlance, was by Countess Spencer out of Dorothy Eckford. Dorothy Eckford is the albino form of Miss Willmott, the factor C. having apparently dropped out, leaving the orange tint latent, to reappear in the offspring of the cross. Of course, the colour question is not so simple as this; in the composition of any tint it is probable that more than one, in fact, several, factors are concerned.

Another very interesting phenomenon with regard to sweet peas is what is known as "coupling" and "repulsion." Where two apparently quite independent factors are concerned, we sometimes find them occurring in a different ratio from the usual three to one series, certain combinations being far more frequent than others. A further discovery was made last year which may be of great practical value to raisers.

It is well known that old type sweet peas seed much more freely than the waved varieties. This would lead us to think that there is some connection between shade and fertility, that, for instance, a system exists in which the factors for plain standards and fertility are coupled, while the factor for waviness repels the fertility factor. If this were so, wavy sweet peas, with a fertility equal to plain ones, would occur with very great rarity, likewise sterile peas with plain standards. Last year it was discovered that if you cross these exceptional members of a coupling system, you reverse the system in their progeny, so that if in your seedlings of the second generation you find an extra sterile plain standard and an extra fertile wavy pea and cross these two, you will obtain a race in which the great majority of the waved peas will be extra fertile and the plain standards sterile.

Another interesting problem which remains to be solved is the cause of scalding and burning. Why should Sunproof Crimson, for example, come unscathed through the brightest sunshine, while King Edward Spencer, in the same circumstances, turns a kind of dingy purple? In this connection I made some interesting observations last year, which lead me to think that burning is not the result of sunshine only. Everyone remembers, with more or less gratitude, according to his occupation, that last July was exceptionally hot, dry, and sunny. From the 6th to the 13th we had cloudless days here, with a considerable breeze from the N.E. and temperatures from 75 to 85 degrees. On the 16th the wind went round to S.W., there was a good deal of cloud, and temperature ranged from 74 to 91 degrees, with a very close, thundery atmosphere, and kept so till the end of the month. Very light showers fell on four days in the latter period, the former was rainless. During the former period King Edward Spencer, growing unshaded in the open field with a S.E. aspect, showed absolutely no signs of burning, but no sooner had the wind gone into a southerly quarter and the air become close and humid, than it burnt badly, although there was more cloud, and at first a rather lower temperature. By the second morning, even the unopened buds were a dingy purple. Does this justify one in supposing that the phenomenon we call "burning" is not really as much the effect of sunburn as of the humidity in the air?

We often hear that a variety is quite fixed in one garden, and hopelessly sportive in another. Is there any connection between soils and fixity? Two things I have noticed with regard to wild flowers make me inclined to answer "Yes." In the first place, in this neighbourhood, cases of albinism seem to occur with comparative frequency in some districts, while in others they are very scarce. In the second place, I noticed in the Lincolnshire fens, on the border of the limestone district, that several normally blue chalk-flowers which had become naturalised by the side of the fenland dykes, bore pink blossoms in that situation. If there is anything in this analogy, we might find a clue here to the unexpected appearance of rogues in an apparently fixed variety and by following it up might arrive at an explanation of the origin of that source of worry and joy to raisers, namely, Sweet Pea Countess Spencer. T. H. DIPNALL.

Shelley, Hadleigh.

# A FIRST-CLASS 24 SWEET PEAS.

In giving a list of twenty-four varieties of sweet peas for exhibition, exclusive of the actual novelties, one is able to speak quite definitely as to the merits of all varieties, although I very much doubt whether any two growers would quite agree on the whole twenty-four, although they may probably agree on eighteen of that number. This really means that after a certain number of varieties have been included (of really outstanding merit), the inclusion of the others more or less depends on the taste of the individual making the selection, and so he naturally includes those varieties that do well in his particular neighbourhood, or which appeals to him most by their colour or form.

In staging twenty-four varieties of sweet peas the aim should be to include as many distinct colours as possible, and in preparing the following selection the importance of this has been constantly kept in mind.

Elsie Herbert, when in good form, is, I believe, as near perfection as we can hope to have in the sweet pea, and it is easily first in the picotee edge white ground section. Dainty Spencer is its only rival, but after growing both side by side I find that the first-named is the best.

Maud Holmes is another pea of unique proportions, a giant in every way, and is, if anything, just a little the best of the Sunproof Crimson section, but there is not much difference in point of merit between the first named and Dobbie's.

John Ingman, the first break from Countess Spencer in its true colour, rose, is the best in that section, and although we have Marie Corelli and one or two others similar, they are not to be compared to the first-named for exhibition purposes.

Clara Curtis.—This stands alone in the cream class for colour, a good bunch of it being very effective. Paradise Ivory and Isabel Malcolm are its nearest rivals, and, although good in every other way, they just lack the deep colour of Clara Curtis.

Mrs. C. W. Breadmore.—This is the exact counterpart of Evelyn Hemus, except that it is a trifle the stronger grower, and must be included in any collection, whether large or small, it being, in addition to a good exhibition variety, one of the best in the decorative section.

Thomas Stevenson.—Although of rather more recent introduction than the other varieties, it certainly deserves its place at the head of the orange-scarlet class. It is a good grower, and the flowers stand the sun well. They should be exhibited when well developed.

Elfrida Pearson should, I think, be included in the best twenty-four, not as a pink, but a blush variety, it being rather larger than Princess Victoria, with just a trifle more colour.

Mrs. Routzhan.—Now there is a true stock of this variety I think it stands quite at the head of the cream-pink section, a bunch of this being exquisitely beautiful and highly effective.

Queen of Norway. This variety belongs to the mauve section, and is of great merit. The flowers stand the sun well even in a summer such as that of last year. Tennant Spencer, Winvoe Castle, and Helio Paradise are also highly meritorious.

Anglian Blue. This is a sweet pea that I have grown and shown well for three seasons, and in comparison with other blue varieties, I consider it the best both in size of flower and colour.

Earl Spencer was undoubtedly the best in the salmon section till last year, and even now it is good enough to have a prominent position among the new varieties of last season belonging to the same shade of colour.

Florence Nightingale.—As a lavender variety a fixed stock of this sweet pea would be difficult to surpass. As grown in 1910 it was decidedly the best lavender I ever saw, but it did not quite keep up its reputation last year.

Nora Unwin.—Although not so free in producing four blooms on a stem as Etta Dyke, it makes a rather better bunch, the flowers having a longer stem, and show themselves off to better advantage. Etta Dyke is, of course, a very fine variety, and well deserves the popularity it enjoys.

Nubian.—This was my best dark variety last year, probably because it was on rather better ground. It is quite fixed, and is well worth commending, although Tom Bolton and Black Knight Spencer both so meritorious as to deserve the heartiest commendation.

SWEET PEA MRS. W. J. UNWIN.
A handsome red-flaked variety.

Scarlet Monarch.—This is probably the best variety raised by Mr. William Deal. It is a first-rate scarlet, although the plant is not so robust as some of the other colours; the flowers are very fine, and stand the sun well.

Helen Grosvenor.—This is about the best in the orange-pink section, not quite so large as Edrom Beauty, but it is brighter in colour and less liable to burn. In the north the latter might possibly prove the best.

Menie Christie.—This is a distinct sweet pea, the colour of which is described as magenta, but I think it more closely approaches violet. The flowers are large, and when well shown will make a good addition to a collection.

Charles Foster.—This is termed a fancy, and is a very fine pea, and will, I think, be seen in much better condition during a cooler season than that of last year.

Countess Spencer, in good form, is still one of the best of the pink varieties, but it has some strong competitors among the newest varieties.

Doris Usher belongs to the deep cream-pink class, and is very fine, and in a collection of twenty-four varieties there is room for it in addition to the other pinks named.

Winsome.—The colour of this variety might be described as lilac, and is a very pretty sweet pea of full exhibition size, and if given a suitable position in a collection is very telling.

Mrs. W. J. Unwin.—This very fine striped variety in good condition is very telling in the front row of a stand, and although not very long in the stem, the size and colour of the oflwer is all that can be desired.

W. R. Beaver.—The colour of this chocolate striped variety is not beloved by everyone. Nevertheless, it is a very telling variety, and certainly one of the best in size and form in its class, and, like nearly all the striped varieties, it is a very strong grower.

Arthur Unwin is a strong-growing bicolor, and the flowers are very effective in the bunch. It is not so distinct in the two colours as is Colleen and Mrs. Andrew

Ireland. The variety is of much merit for exhibition.

Although in this list of twenty-four varieties I have not been able to include one from each of the various colour classes, yet I believe I have included those of most moment, and certainly those that I have proved to be useful for various purposes. If they should be taken en bloc as a collection, it will be found that not one variety is included that, with good cultivation, will fail to do the raiser, grower, and myself justice. THOMAS STEVENSON.

SWEET PEA ETTA DYKE.
A pure white waved variety.

---

**French Beans.**—Where a regular supply of these are required, fortnightly sowings must be made. A good plan at this season is to sow six seeds in 4in. pots, transferring them when large enough to 8in. pots, and potting them low enough to allow two top-dressings. It is remarkable the progress and ultimate benefit the plants receive from top-dressings as advised. Use a compost of loam, dried horse-droppings, grit, and wood-ashes, and maintain a temperature of not less than 60 degrees. Syringe during favourable weather to keep down red spider. Support the plants with hazel or other suitable branches, and pinch the tops of the shoots when high enough. When cropping give the plants occasional manurial waterings; using all liquids at the same temperature as the house. Plentiful and Ne Plus Ultra are two sure croppers at this season, and Canadian Wonder is perhaps the best variety for later batches. Sow broad beans in a cool house.—G. ELLWOOD.

## MARKET INTEREST IN SWEET PEAS.

There is no gainsaying the fact that the modern Sweet Pea has aroused a considerable interest in market-growing communities. The interest may be a commercial one, yet at the same time the market men may be said to take quite as much interest in the cultivation of this flower as any other section of the community, though, perhaps, from their own particular point of view.

No doubt the popularity of the flower has done much to stimulate its cultivation, for one can always walk round Covent Garden Market in the season and see the most up-to-date varieties grown to such a state of perfection that they would not disgrace even the National Sweet Pea Show. But for market use all and sundry varieties are not available, and the would-be cultivator has to make a careful selection of his colours, for plenty of our best peas, from an exhibitor's point of view, would be worthless for market purposes.

Although a wide range of varieties is grown, the colours must be decided, bright, and clear; washy pinks, thin blues, magentas, and most of the fancy sorts are absolutely barred, for nobody would buy them. The flowers of the varieties selected must have substance, or they will not pack well, and, above all, they must have long stems. These qualities are somewhat difficult to obtain, but they are to be found, first by proper selection of varieties, and afterwards by special cultivation.

Sweet pea growing for market is rather an expensive matter, for the land must be well cultivated and heavily manured, while the seed is a considerable item, especially in the past few years; then the stakes dip pretty heavily into the profits, while the labour is another somewhat heavy item.

### The Cropping Season.

The season cannot be described as a long one, for the indoor crop starts in April and goes through May and June, and by the time we reach the middle of July the market is tired of peas, and as soon as the stems shorten up they barely pay for gathering. I remember that in May last fine bunches could be bought from 2s. 6d. to 4s. per dozen bunches, while a few years back these would have realised at least 9s. to 10s. per dozen bunches; but I fear the day of high prices has departed, never to return. There are numbers of growers who will tell us that sweet pea culture for market does not pay, and I am inclined to this opinion myself, unless the very best sorts are grown with the best of cultivation and packing, then, no doubt, they will give a return; but there must be thousands of bunches sold in the summer that never return a penny profit to the grower, and now that the "streak" disease has become so prevalent the crop will have to be regarded as a problematical one, for last season there were crops that did not give a profitable picking for more than three weeks owing to this disease, and from a commercial point of view the cure or preventive seems as far off as ever.

### Culture.

In some favoured districts the seeds are sown in the autumn in the open ground, and where the plants survive the winter this crop work out well, for they come in on the first flush of the market, but there are so many enemies to contend with, that the bulk of growers sow early under glass, and plant out early in April, for seed of the newer kinds is too expensive to risk in the open air all winter, especially where birds and mice are troublesome.

Quite a large trade has sprung up in recent times for seedling plants in pots. These are sent to market by the thousand. I fear it would astonish our exhibitors if they only saw these little pots crowded with young plants. I should guess there are often twenty to thirty in a three-inch pot, but unless they are packed full, the buyers will not look at them.

### Varieties.

It is unnecessary to give the colours of the different varieties, as they are so well known, but the following are largely grown, with many others. Mont Blanc, Dorothy Eckford, Emily Henderson, Etta Dyke, Enchantress, Gladys Unwin, Countess Spencer, Miss Willmott, Mrs. Hardcastle Sykes, Nora Unwin, Helen Lewis, Queen Alexandra, Lady Grisel Hamilton, King Edward, Frank Dolby, Clara Curtis, Evelyn Hemus, and Asta Ohn.

Mixed bunches are also to be obtained in the cheaper grades, but I should think they hardly pay for packing.

### Packing.

This subject has been lately dealt with in these columns, but I may mention that scores of boxes of flowers find their way to the street carts solely because of bad packing, or packing them while the flowers are wet. Bruised or damaged flowers are useless for market or any other purpose.

J. B. RIDING.

# SOIL PREPARATION FOR SWEET PEAS.

No one will doubt that the proper preparation of the soil is the foundation of success in the cultivation of sweet peas. Last season provided many object-lessons as to the suitability or otherwise of certain soils for the successful growth of this favourite flower, and of the importance of deep cultivation. Excepting a deep friable loam, a heavy retentive soil is the best medium for the roots we could wish, provided it is properly prepared. The flowers colour well when the plants are growing in such a soil, and they possess much substance in both stem and petal, both of which are important, especially when the winning of prizes is the chief aim of the cultivator. Sweet peas, when growing in stiff soil, make stout haulm, which is most desirable, it being difficult to have the growth too sturdy. Large, thick, leathery leaves of a dense green colour are a sure indication of what the flower crop will be, provided, of course, all necessary details are carried out.

## Soils and Sites.

Sweet peas are impatient of a lack of moisture at the roots, and in a heavy soil when properly prepared, this is not nearly so likely to be a source of trouble as when the soil is light in texture. It must be remembered that the better the preparation of the soil the more effectually is the moisture conserved, and also that there is as much art in conserving moisture in soil as there is in applying it, and the conserved moisture is distinctly of greater benefit to the plants. Last season there were many excellent crops of flowers upon plants with but a minimum of labour expended in the supply of water by artificial means. I allude to stiff soils in low-lying districts where capillary attraction was indeed a boon last year.

Sandy soil, or that which is light, with a gravel subsoil, is the least desirable for sweet peas, at least where the best possible results are aimed at. In such soil we rarely find that luxuriance of haulm that is so pleasing, neither do we obtain a continuous supply of flowers extending over a long period. For ordinary garden decoration full crops of blossom can be obtained, but I have in my mind in writing these notes, a higher standard of quality.

A change of site, or I should say soil, is a distinct gain, for sweet peas resent being grown in the same soil in two consecutive years. The growth is not so vigorous when they occupy the same site year after year without changing the soil, which in the ordinary way is too much trouble. As far back as 1895 I had distinct experience of this. Then, and some years previous, I grew sweet peas in clumps beside paths in the kitchen garden for convenience in attending them, and for effect, and soon found that the growth became shorter each year. The ordinary grower for exhibition nowadays has none of this trouble to contend with; he does not arrange his plants for effect in groups, but he usually grows them in rows across the quarters in the kitchen garden. In this manner no trouble need be experienced, as the site can be changed at will. Not so the person who is expected to produce an effect in the same part of the garden year after year. In this case, a complete change of soil annually is the only remedy, and this is quite practicable. (I practise this method annually now in a small way, and with very good results.

## Deep Cultivation.

What is needed to ensure success is a deep, well-prepared, rich rooting medium, and as the roots of sweet peas go to a great depth when the medium will allow them to do so, deeply stirred soil is necessary. This is a brief summary of the requirements; how it shall be prepared is, of course, a matter of opinion, each cultivator has his own method, and, as I have always said, there is no one road only to success.

While trenching is such a boon in heavy soil, it is not such an essential detail in that which is sandy. Why are heavy soils trenched is a question that might well be asked, and it is one deserving an answer, as this, when properly given, should be of assistance to the inexperienced. Apart from the facility of root penetration, the deep stirring of the soil well down into the hard subsoil admits of a quick passage of water after heavy rains, and thus avoids stagnant water about the roots. This is important, as it ensures the free, uninterrupted growth which is so desirable for all plant life. Especially is checking injurious to plants that have to make so much progress in a limited period as in the case of the sweet pea. In deeply-stirred soil a much greater quantity of liquid stimulant can be given to the plants without fear of injury to the roots or growth, because the surplus liquid will quickly pass away.

## Manuring and Trenching.

In applying the manure as the trenching proceeds, put at the bottom of the trench, 3ft. deep after the bottom is broken up, a quanity of half-decayed stable manure. Cover this with a few inches of lighter soil and a good dressing of superphosphate of lime. In using this artificial manure it is well to employ a high grade as less in quantity is required. A good sample should contain 30 per cent. of soluble phosphate. The superphosphate should be mixed with the soil at the rate of 1oz. to every square foot superficial. Mix the manure with the soil as the trenching goes on, adding the superphospate regularly, but do not place thick layers of manure by itself, rather thoroughly mix with the soil, adding occasionally a handful of bone-meal. The farmyard manure should not be nearer than nine inches of the surface, but continue the superphosphate.

Whether the sweet peas are to be grown in lines or clumps the method of trenching is the same. In carrying out this operation the soil should be broken up to the desired depth, have the requisite quantity of manure incorporated with it, without any of the clay or other unsuitable material being brought to the surface. Where the soil is heavy near the surface, more nearly approaching clay than loam, and not more than twelve or eighteen in thickness, it appears to me to be folly to trench in the ordinary way to a depth of about three feet, and thereby bury the upper layer about two feet below the surface by means of the clay subsoil. What has to be done is to open out the trench in the usual way, but instead of turning the top spit of the second trench into the bottom of the

SWEET PEA COUNTESS SPENCER.

A fine pink sweet pea, the original of the waved section.

first, put it on one side. Then, having done this, dig over the soil in the bottom of the trench to the desired depth, and turn it over into the first trench, well incorporating the manure in the process. This having been done place the top spit from the third trench on the top of the soil in the bottom of the first trench and mix with it such manure as may be considered advisable.

Leave the surface as rough as possible for the action of frost to pulverise the lumps and render it friable. It is an advantage to trench the ground early in the autumn to allow the soil to settle down quite firmly by the time the plants are put out. But if the ground is at once trenched in accordance with the directions here given, the soil will become sufficiently consolidated by the time for planting to enable the plants to grow freely and to make stout and short-jointed haulm.

SWEET PEA CHARLES FOSTER.
A beautiful mauve and pink variety.

### Surface Treatment and Light Soils.

Over the surface spread a compost three inches thick of old potting soil, decayed vegetable refuse and wood ashes as a means of lightening the surface and rendering the soil favourable to root development. A surface dressing of quicklime applied during dry weather, and lightly forked in will make the surface still more friable, and more favourable to growth. In the case of light soil cow or pig dung is an excellent stimulant tending also to retain the moisture in the soil. Light soils are usually deficient in potash, and as the growth of leguminous plants is much promoted by a free supply of this fertiliser, an application should be made when the ground is being prepared. Kainit or sulphate of potash may be used at the rate of 2oz. of the former or 1oz. of the latter to the square foot, superficial, of the soil. The value of potash as a dressing to light soils in which sweet peas are grown is made very evident in dry seasons by the prolonged vigour of the plant and the abundant production of flowers.

Such soils need liberal quantities of manure, but it should be evenly mixed with them. Some persons will dig out a trench one foot wide, two feet deep, filling it nearly with manure, and covering it with soil sufficient to receive the seeds or plants. This is quite a wrong idea, the plants plants grow vigorously for a time, but the roots quickly run through the light manure to the sides of the trench, and if a spell of dry weather sets in, the plants suffer for want of moisture, mildew follows, and we all know the result of an attack of that fungus. E. Molyneux.

---

**Pruning Raspberries.**—In established plantations the cutting out of old wood, and tying in of bearing canes calls for early attention. If not already done, the unripened tips should be removed. If the canes are left too long the lower buds usually fail to break, and the base will be bare. Clear away mulching material, and where pointing of the land between the rows is resorted to apply a dressing of well-rotted manure, as to the advisability of digging or lightly pointing the land between the rows the condition of the roots will prove the best guide. Where the roots have formed a dense mass near the surface the less they are interfered with the better. The necessary food can be given in the form of liquid manure, suitable artificials, and a mulching of horse or cow manure later in the season. — W. Messenger.

## WINTER HEATHS FOR THE ROCK GARDEN.

The lover of gardening is never satisfied unless he has in his garden something in flower. In this climate of ours, save in the more favoured parts of the three kingdoms, it is almost impossible to secure this in the open, and thus many, to satisfy their longing for the pleasures of flowers, seek to compass their desire by growing plants under glass. This is not possible for everyone, and the lover of hardy flowers is anxious to make his garden itself a place where he can enjoy some bloom at every season.

In compassing this he has no greater boon than some of the few Heaths, or Ericas, which, despite the hard weather, bloom on cheerily, and give an acceptable brightness to the garden.

The gem among the few we own is Erica carnea, a perfect gem indeed and a true jewel of the first water. It is a lovely thing when employed as an edging to other shrubs or heaths, but it is, I think, still more fascinating when it is in masses or groups among the rockwork, or massed in beds by itself on the grass. Then its pretty pink flowers, coming when we have few other plants in bloom, afford us a special pleasure, and agree well with the Snowdrop and the Winter Aconite, and the few other subjects which dare the inclemency of the season. A plant which we may have in bloom before Christmas in the milder parts of the kingdom, and early in the New Year in other places is a veritable boon to the outdoor garden.

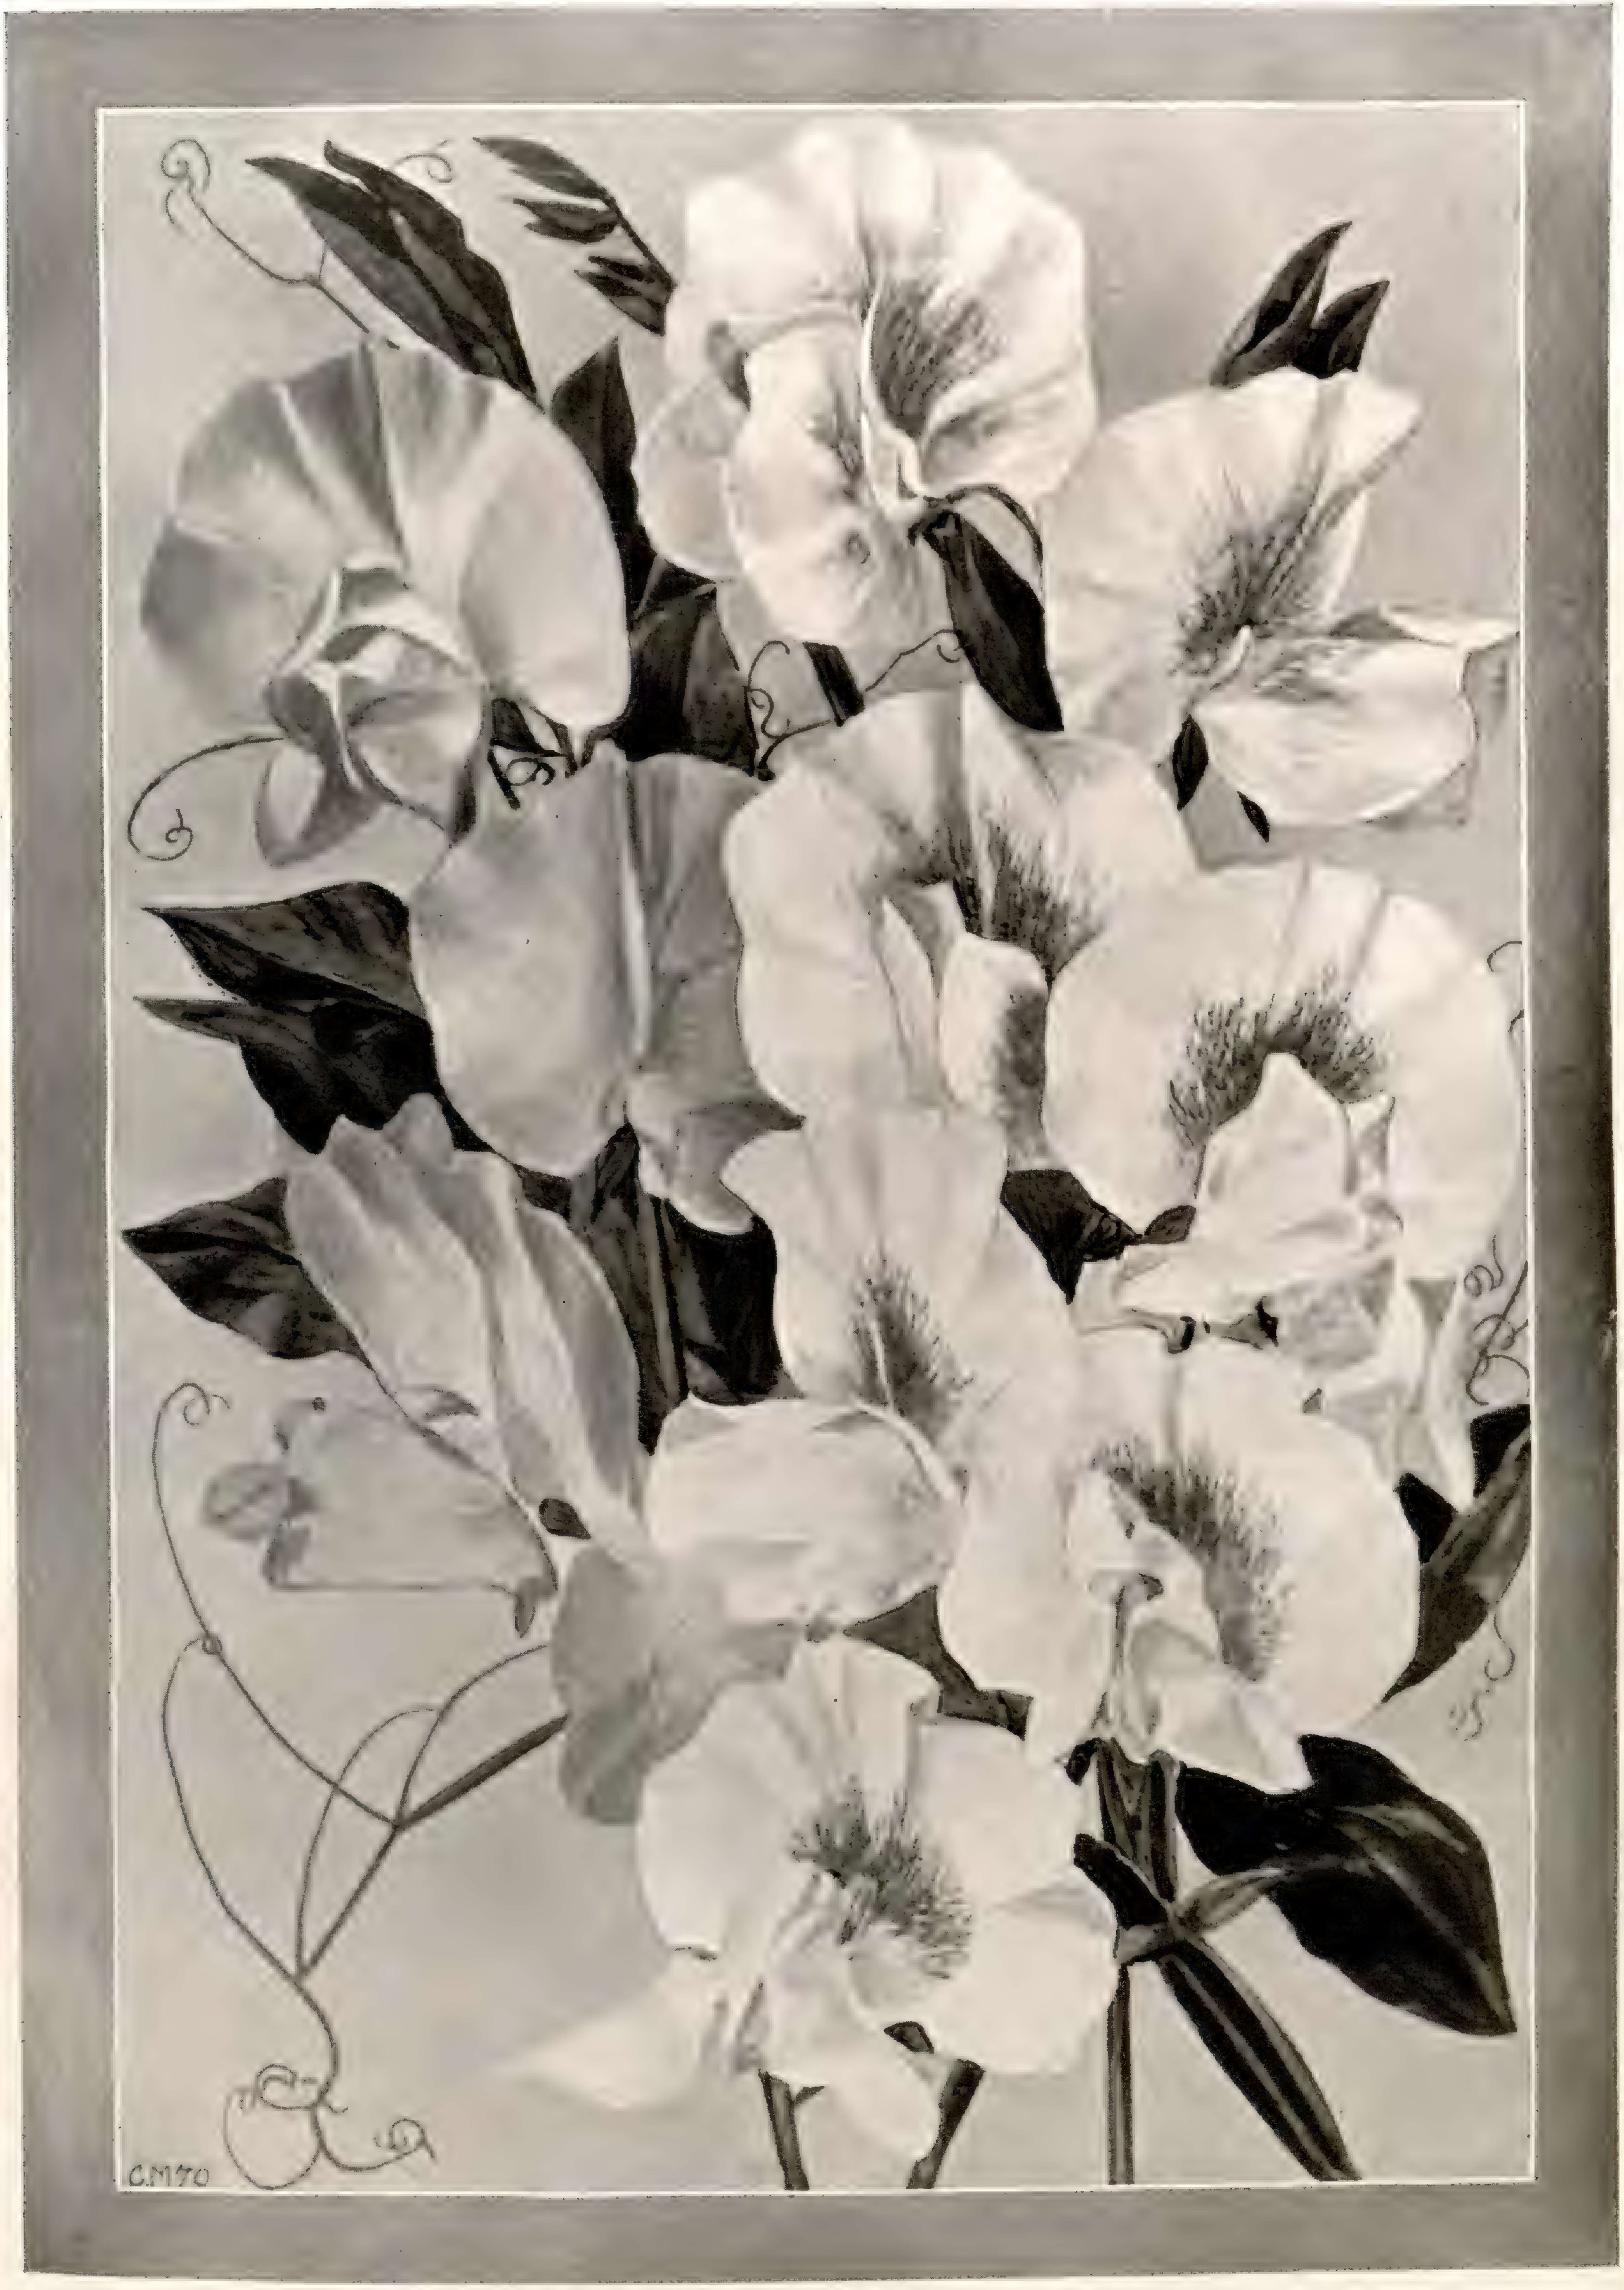
The flesh-coloured flowers of what is known as the typical Erica carnea are very beautiful indeed, and the deeper-hued one, called rubra, gives an additional warmth to the garden. No less beautiful is the white variety, E. carnea alba, which looks at a distance as if its spiny green branches had been powdered with small flakes of snow. It comes a little earlier, and is a real beauty. The writer has long been desirous of securing other varieties of Erica carnea, said to exist in its native habitats, and it is whispered that such are likely to be offered by-and-by. If so, they will be coveted by all who love these heaths, and who appreciate their worth for the winter garden.

In Erica hybrida, which, we are told, has a share of the blood of both E. carnea and E. mediterranea within it, we have another and a truly indispensable heath. It is, perhaps, not so perfect in its habit of growth, and not so neat in its way, but it generally comes into bloom before E. carnea, and lasts in flower for a very long time. The writer has had it in bloom from early November until April, and very delightful it is with its pretty red flowers. It is more erect and taller than E. carnea, and is a plant which should be in every garden in which winter flowers are enjoyed. It and E. carnea are perfectly hardy, and it is but rarely that the writer has seen even the blooms injured by the most severe frosts of several decades.

These heaths are not difficult to cultivate in almost any soil, although lime should, if possible, be avoided. Peat is not essential, and in a good loam, with exposure to the sun, these lovely shrubs will give the highest satisfaction as the seasons come round for their blossoming. S. Arnott.

---

"Rock Gardens and Alpine Plants" bids fair to be one of our most popular Horticultural Manuals. It is beautifully printed and illustrated, and we strongly recommend the book. If your bookseller has not a copy in stock, send 2s. 10d. to our Publisher; it will be posted by return.



THREE GOOD SWEET PEAS.
Mrs. B. Gilbert (variety at top), blue-flaked, introduced by Messrs. Gilbert and Son. May Campbell (right-hand lower variety), cream flamed rose, introduced by Messrs. Dobbie and Co. Hercules (left-hand variety), pink, introduced by Messrs. Stark and Son.

## SOWING SWEET PEAS.

The best way to raise sweet peas is a matter of the greatest importance to sweet pea enthusiasts. If the seeds are plump and sound there is no reason why less than 96 per cent. should germinate. The grower must remember that the method he adopts in raising his seeds will most probably make all the difference between success and failure. What must be aimed at is a natural germination which will ultimately produce a sturdy, healthy plant. Seeds sown in excessive heat will be drawn and spindly, and one can never expect first-class results from them. There may be different times for sowing the seeds to keep up a succession of bloom, but whatever the time the method of sowing should be the same.

SWEET PEAS RAISED IN BOXES AND READY FOR POTTING OFF.

Everyone who is an enthusiast will naturally obtain the newest and most up-to-date varieties, and should adopt the most up-to-date methods of raising the seedlings. I shall therefore confine these notes to what I consider the most popular and economical way of working. Anyone who has a cold frame at disposal will find it excellent for the purpose. Fill it to within nine inches of the glass with cinder ashes to prevent worms working up from the soil below.

If the varieties to be sown are represented by only a few seeds of each, 4in. pots are best for our purpose. But should there be several packets of each variety, small trays, about 18in. long, 9in. wide, and 4in. deep, are the best receptacles. If pots are used they must be clean, otherwise when turning out the plants great damage will be done to the roots. One piece of crock only should be placed at the bottom, and the pot should then be filled with the compost to within one inch of the top. If boxes are used place a layer of leaves over the bottom, and fill to within one inch of the top and make level and firm.

It is necessary to have good loam, with plenty of coarse silver sand, well mixed with it, and the compost should be moist, but not sticky. Many specialists advocate leaf-mould, and, although it is a splendid material for sweet pea plants, I do not advocate it for sowing the seeds in, for I have found that if there happens to be a decaying seed a fungoid growth will appear on it in a few days if leaf-soil is used. Rosellina hecatrix or white root rot, thrives on the organic matter provided by leaf-mould, quickly spreads over the whole surface of the pot or box, and in some cases kills the plants outright. If the leafmould were sterilised it would be then free from fungus, and be excellent material.

The seeds should be sown evenly over the surface, placing five or six seeds in each pot, and covered with half an inch of the compost. Place in a cold frame after sowing, and water them. They should not require any more water until the plants are up, which should be in about twelve to fourteen days. If the seeds do not germinate regularly they should be examined, and it may be found that the outer skin of the seed has become very hard; if that is the case cut away a bit of the covering or file it through, and the seed will then develop all right. So soon as the seedlings appear through the soil they must have plenty of air, and whenever it is fine pull the lights off by day and give air at night. Frost will not kill the young plants, but it is not advisable to allow the soil to become frozen, so protect with a mat if frost threatens.

SWEET PEAS PUT SINGLY IN PAPER POTS.

When the young plants are about 4in. high they should be turned out of the pots or boxes, and potted off singly into 3in. pots. The cost of so many pots may be a consideration where a large number of plants have to be dealt with, but there are now several kinds of "paper pots" offered from 1s. 6d. per 100, which are very suitable. The potting compost should consist of two parts loam, one part leaf-mould, and one part coarse sand, with a dash of soot. When potted replace in the cold frame, and keep fairly close for a few days, then gradually give more air, and eventually pull the lights off and harden preparatory to planting out.

LEWIS SMITH.

Shotesham Park Gardens.

## SOLANUM JASMINOIDES.

This summer-flowering climber is rarely seen in a luxuriant state of growth in the open air. I shall never forget one specimen which I once saw trained nearly all over the gable end of a large dwelling-house, near the sea, on the Hampshire coast. Both the lower and bed-room windows were embowered in a rich mass of foliage and clustering flowers, and the general effect was charming indeed. Although there were other choice climbers on this house, none attracted as the solanum did.

The ordinary soil was a stiff loam on gravel, and, with the addition of some leaf-soil and old mortar rubble to form a rooting medium, there was no difficulty experienced in growing this solanum to perfection. As regards hardiness, the plant survived several rather severe winters without any protection.

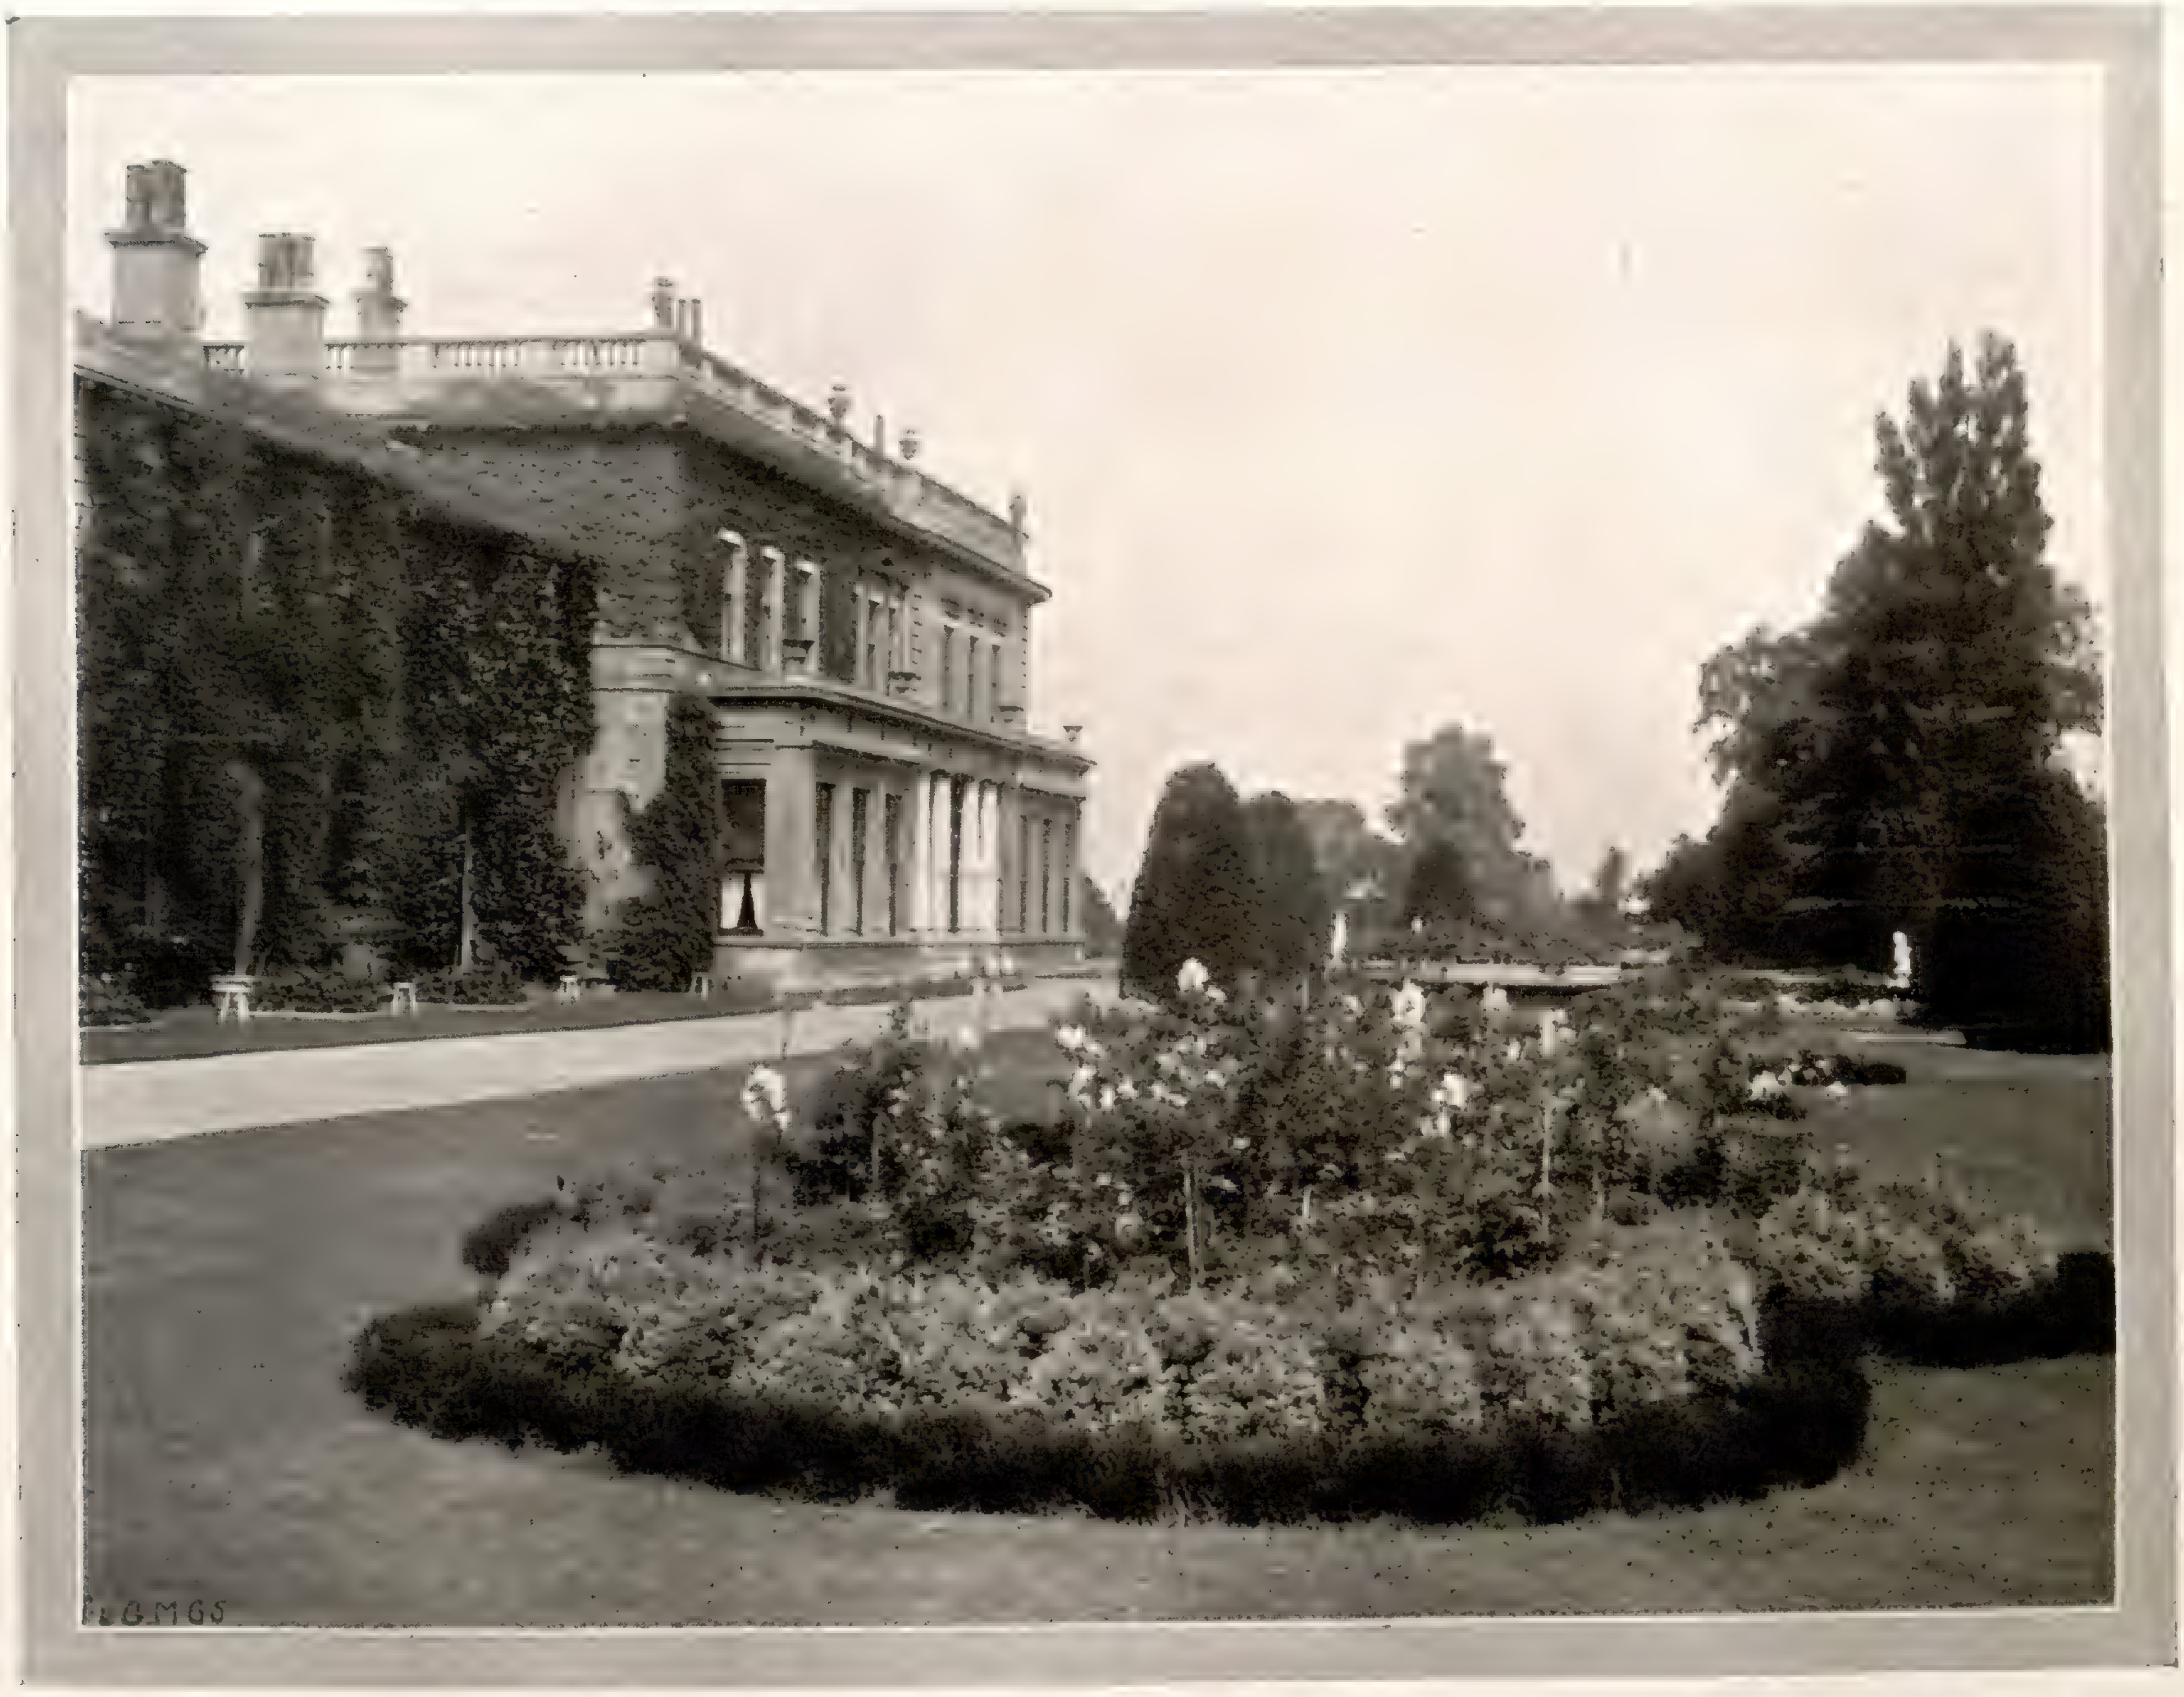
For the benefit of intending cultivators who have not had any experience with S. jasminoides, I may say that it is easily propagated in spring by inserting cuttings in small pots filled with sandy soil, and placed under a frame on a gentle hot-bed. They are very effective as pillar plants in a greenhouse or conservatory, and also when grown in large pots and placed on the lawn in summer, with the branches loosely supported by neat, tall stakes. G. B.

**Cæsalpinia pulcherrima.**—It is surprising how widespread the idea is that Certificates or Awards of Merit are given by the Royal Horticultural Society only to new or comparatively new, plants. It is questionable if such an opinion has even been wider of the mark than in the case of this cæsalpinia, which was given an Award of Merit on November 21. It is a native of the West Indies, and, according to the "Dictionary of Gardening," was introduced as long ago as 1690, that is to say, over two centuries have elapsed since it was first brought to this country. From its beauty as a flowering shrub it is now widely distributed throughout the tropics, but more generally under the name of Poinciana pulcherrima than that at the head of this note. The large bipinnate rich green leaves are very ornamental, while the flowers are particularly showy. They are borne in rather loosely disposed terminal clusters, and are a couple of inches or thereabout in diameter, the petals being orange-scarlet, with a yellow border.—W. T.

# HARDY HEATHS IN THE FLOWER GARDEN.

The beautiful gardens of Hillingdon Court, the Middlesex seat of Lord Hillingdon, are remarkable for the success that has been achieved in the creation of distinct features, and the great interest they have as a consequent result. While the most delightful harmony pervades the whole of the area of the ornamental grounds there are hardly two parts exactly alike, and as the attractions of the gardens are maintained at a high level throughout the year, the visitor finds much that is of exceptional interest, whatever may be the time of the visit. Immensely attractive throughout the summer months is the geometric flower garden, with its bold flower beds, edged with white marble, which forms so fine a feature adjacent to the mansion. Hardly less attractive and of much interest are the bold borders wholly devoted to blue and red flowers respectively; the big beds and bold groups of roses that in their season of flowering produce the most delightful colour effects, and so we might continue until a somewhat lengthy list has been made. Our object at the present time is not to deal with the general features of the Hillingdon Court gardens, but briefly to refer to the good use that has been made of the hardy heaths in furnishing the flower beds of a more or less formal character. We have within recent years devoted a considerable share of attention to these attractive denizens of the moorland, and thereby contributed materially to the popularity they now enjoy as ornaments of the garden. We have brought before our readers many different methods of utilising the hardy heaths, and we have been careful to point out that while they are of great interest and beauty when grown in such manner as to suggest a portion of some wild moorland, they are highly attractive when arranged in formal beds.

At Hillingdon Court they have been used with much success as marginal bands to beds of roses, mixed shrubs, and other suitable subjects. Two bands are formed in each bed, and, as each band consists of species or their varieties, flowering at different seasons, a display of flowers extending over a considerable period is obtained in each bed. Thus, by forming a broad margin of one of the several varieties of Erica carnea, and an inner band of one of the forms of E. mediterreana, a profusion of flowers may be had from quite early in the year until May. Again, by combining E. ciliaris with E. cinerea in a similar manner flowers can be had from early in June until September. The flower bed that occupies a prominent position in our illustration, as will be seen, was filled with Japanese maples, having richly-coloured leaves, and lilies which of themselves formed a charming combination, but the effect was appreciably enhanced by the bright rose-pink flowers of the heath. This bed, in its simplicity and quiet beauty, is the best possible proof of the success that may be achieved in the use of the hardy heaths for edging purposes, and affords an excellent object-lesson on what may be accomplished in beautifying the flower garden with their aid.



A SUCCESSFUL EXAMPLE OF THE USE OF HARDY HEATHS IN THE FLOWER GARDEN, HILLINGDON COURT.

# THE WITCH HAZELS.

Although but a few kinds of witch hazels or Hamamelis, as they are correctly named, are known, they form a very distinct and showy group of shrubs, which is of peculiar interest to the gardener, inasmuch as the various members blossom during autumn and mid-winter, thus giving bright touches of colour to the otherwise rather sombre appearance of the garden. Neither is their bright colour their only attraction, for the weird and spidery look of the curiously twisted petals is also of interest, whilst the flowers of one or two kinds are very fragrant. The witch hazels give the most satisfactory results when planted in light, warm, loamy soil of good quality, and are partial to a little peat about the roots.

Several methods of propagation suggest themselves, for they may be increased from seeds, layers, or by grafting. The method usually adopted is to raise stocks of the American H. virginica from seeds, and graft the other kinds on to it. Grafting may be done in spring, and the young plants either be kept in pots and wintered in a cold frame for the first winter, previous to planting in nursery quarters the following spring, or they may be planted out the first summer. By paying attention to pruning in the case of the stronger growing sorts, it is possible to get them to form a distinct leading shoot and assume the habit of small trees, otherwise they grow into bush form. Seeds are not produced every year, but in the event of the weather being favourable during the time of flowering, it often happens that a certain number of seeds are matured. These should be looked for about August, for if not gathered as soon as ripe, the fruits burst, and the black seeds disappear. The following species, one from North America and the others from China and Japan, may be obtained.

H. arborea is a Japanese species, which was introduced by Messrs. J. Veitch and Sons many years ago. In Japan it is said to sometimes attain a height of 30 or 40 feet. Here it is doubtful whether those dimensions will be attained, though it will grow 20 feet high under favourable conditions. The leaves are more or less ovate in shape, and up to 3½ inches in length. The flowers are borne in January from short growths of the previous year's wood, and each one has four narrow golden twisted petals, and an equal number of sepals which are brown on the outer side and red inside.

H. japonica is so like the last-named in most respects that the former is often made a variety of it. It is usually less tree-like in habit, has weaker growth, and the sepals and petals are less highly coloured. Sargent, in the "Forest Flora of Japan," p. 42, speaks of it as a common forest shrub and says that its leaves turn yellow in autumn, whilst those of another kind (H. arborea) turn deep vinous red. The variety Zuccariniana is distinguished by its lemon-coloured petals.

H. mollis is the best of all the species, so far as decorative value goes, and it is still the rarest. Curiously enough, it had been in cultivation in this country for 20 years before its true value became known. It was discovered by Charles Maries in the Kiu-kiang district of China, and was sent by him to Messrs. J. Veitch and Sons about 1879. The first description of the shrub, however, was prepared from one of Dr. Henry's specimens collected in Hupeh. This appeared in Hooker's "Icones Plantarum," No. 17,42, in the volume for the years 1887-1888. It grows naturally into a large bush or small tree, sometimes 30 feet high. The rounded or ovate leaves are 4 to 5 inches long and 3 inches or more wide, and they are covered on the under surface by a dense mass of stellate hairs. The golden, primrose-scented flowers are very showy, and differ from those of other species by their flat petals, with hooked ends. They appear during December and January. It grows freely, and flowers well even when quite small.

H. virginica is the common Witch Hazel of Eastern North America. In its native country it is usually met with as a bush 8 to 15 feet in height, but where specially well placed, it may attain a height of 25 feet. In our gardens we are familiar with it as a wide-spreading bush 6 to 8 feet high. The oval leaves are 3 to 5 inches long, with undulated margins. The flowers often appear in September about the time the leaves begin to assume their golden colour previous to falling. In America the flowering time is said to be a couple of months later. A great deal depends, however, on the place where the plant is growing. The bark of the Witch Hazel is collected in America, and used in the preparation of ointments, lotions, etc., for applying to wounds and for other purposes. The name of Witch Hazel is said to have been given partly on account of its resemblance to the hazel and partly by reason of forked branches being used as divining rods, with the belief that they were endowed with the power of indicating the position of hidden treasure, water, etc. An account of the American Witch Hazel and its uses is to be found in "American Medicinal Barks," by Alice Henkel. So far as flowers are concerned, it is less ornamental than the Asiatic kinds.

Kew. W. DALLIMORE.

## SOME WINTER-FLOWERING IRISES.

The fragrant blossoms of the beautiful winter-flowering Iris stylosa are highly appreciated, opening as they do in mid-winter when outside flowers are so scarce. The plant is perfectly hardy, but the flowers are very delicate in texture, so that it is advisable to afford some protection to prevent the frosts or rains from spoiling them. If planted by themselves in a narrow sheltered border, where a frame can be placed over the plants, an abundance of lovely blossoms can be obtained. In the event of the necessary protection being inconvenient or impossible, the flowers should be cut in the bud state, when they will freely open in water, if placed in a greenhouse. The colour is a lovely shade of blue, with yellow blotches. A warm sheltered position should be afforded the plants, and any well-drained, fairly light soil is suitable for their cultivation. There are several forms, having varying shades of blue, and one white variety.

Iris reticulata is an early-flowering bulbous species, with dark violet flowers, which are marked with bright yellow. These usually open in February. The stems reach the height of about six or eight inches, and are produced before the foliage has much advanced. It is a beautiful little flower for decorative purposes, especially when used in small glasses. A warm sheltered sunny position will be found suitable if a lighty sandy soil is provided. If planted in wet spots the bulbs will frequently decay during the summer, the light soil being more conducive to thorough ripening which is quite essential for the production of blossom the following season. I. reticulata Krelagei is not so handsome, being rather dull in colour, and not quite so large, yet at the same time it has one advantage over I. reticulata, that is, in flowering a little earlier. These two are very effective when planted in colonies in sunny sheltered spots in the rock garden, with dwarf mossy saxafrages for a carpet.

I. tuberosa—the Snake's Head—although an interesting species, cannot be called beautiful, yet where a corner can be found for a clump it is worth growing. It has grass-like foliage, and flower stems about twelve or fifteen inches high, which bear brownish-green blossoms with dark purple blotches.

The flowers of I. alata are a delicate blue, blotched with yellow, and are produced in mid-winter. It is a species comparatively easy of cultivation, and if given sandy soil and a warm sheltered nook in the rock garden, it will be found to thrive exceedingly well. To keep the flowers in good condition an overhead covering should be afforded the clump, to prevent the rains from bruising them. Owing to the fact that they are so delicate in colour and texture, rain and wind soon spoil them if they are unprotected.

I. Vartaini, a beautiful species from Palestine, resembles I. reticulata, but has flowers of a pale blue colour, which open in February. The plants should be treated in the same manner as I. alata. I. sina-pers is a hybrid between I. sinajarensis and I persica; it has lovely blue flowers, slightly fringed, and marked with black and yellow. This also flowers in February.

I. histrioides is apparently a form of I. reticulata, with a little white in the blotches and an orange crest. This usually flowers before I. reticulata, which makes it very acceptable, as the blossoms frequently open in January.

I. fimbriata is one of the most beautiful of all the irises, but unfortunately it is not sufficiently hardy to allow it to be successfully cultivated outdoors. It might thrive in some favoured spot in the south-west, but it is undoubtedly seen at its best when treated as a pot plant for a cold greenhouse. Numerous spikes are produced from a well-established plant, which carry an abundance of flowers, usually opening singly, but as one fades another opens. It is a plant which when once established should not be disturbed for some time, for apparently the more pot-bound it is, the better it flowers. A small quantity of peat should be given occasionally as a top-dressing when the growth is being made. When a plant is so tightly fixed in a pot that the rhizomes creep over the sides, flower spikes are produced in abundance. I. fimbriata usually commences to flower about January, and, as the buds are so numerous and open slowly, the beautiful blossoms are to be seen for some considerable period. Cultivation is by no means difficult. A fair amount of water is required when the plant is making its growth and during the summer months it is quite happy if stood outdoors. Regarding soil, peat suits it very well. It has graceful shining foliage, and the flowers rival those of many orchids in beauty; they are pale blue, veined with white, and delicately fringed.

Gnaton Gardens.

## THE BALSAM POPLAR.

Although the poplars have been extensively employed throughout the country for landscape effects, screens, and, commercially, the production of timber, yet we rarely meet with Populus balsamifera, which is undoubtedly the most ornamental of the genus. Is this because it is not known, or through a lack of knowledge of its requirements? Some of the varieties of poplar like their roots in well-drained soil, and others theirs in water. The balsam poplar is among the latter, and if planted in rather heavy loam on the banks of a brook, river, or lake, or in boggy ground, its growth will be clean and rapid. The black Italian is also admirably suited for positions of this kind, and, if the object is simply to secure a screen, nothing is better, but if the aim is to have something more interesting and more beautiful then balsamifera is the species to plant.

It is one of the earliest of the trees coming into leaf in spring; its buds are covered with a resinous substance, which is strongly scented, and agreeable to the olfactory organs, and the leaves are of a yellowish-green hue. Even although the leaves take on a darker green colour as the year advances, still they retain their striking effect, in contrast with other foliage, all through the summer. Populus balsamifera would be a good companion to willows, alders, and other moisture-loving trees, and its conical habit of growth, foliage decidedly its own, early leafage, and fragrant buds, would enhance the landscape in early spring, gratify the sense of smell, and contribute to the diversity of tree growth in its neighbourhood. Possessing so many good points as it does, a few trees should find a home in the vicinity of every mansion when the essential moisture for its roots is available.

PEDESTRIAN.

# SWEET PEA ENTHUSIASM IN SCOTLAND.

The passing of another year shows an unabated enthusiasm in Scotland in the culture of the loveliest of all decorative flowers, the sweet pea. Notwithstanding the adverse season, a great many have joined the ranks of the sweet pea enthusiasts, and the number of sweet pea societies are on the increase. The Perthshire S.P.S. had a brilliant success on August 4 and 5 last, and, with regard to it, one of our judges has stated that at our show he "saw the largest show outside the National, and the flowers of the year." The entries numbered 229, an increase of about 30 over 1910, and the number of vases staged were considerably over 1,000. The feature of the show was undoubtedly the glorious flowers shown by Mr. John S. Grigor, Seapark, Forres, in the open classes, and Mr. G. Milne, Duninald, Montrose, in the small growers' section. Mr. Grigor, who won the cup and a whole string of firsts, showed perfect models of flowers and, just what all growers should aim at, large and substantial, and placed evenly and closely on strong stems, and every vase remarkable for refinement. He staged in his cup collection the following varieties: Mrs. Hugh Dickson, Sunproof Crimson (Dobbie's), Nubian, Elsie Herbert, Masterpiece, Mrs. W. J. Unwin, Etta Dyke, Countess Spencer, Isobel Malcolm, Edrom Beauty, John Ingman, and Earl Spencer. Mr. G. Milne's best collection was in the class for six vases, where he staged Sunproof Crimson (Dobbie's), Etta Dyke, Evelyn Hemus, Mrs. H. Dickson, Tennant Spencer, and Edrom Beauty. He also showed a glorious vase of Hercules, a giant rose of Messrs. Stark's, and it is a question whether the raisers ever saw it shown in as fine condition.

There was a great gathering of enthusiasts from east, west, north, and south at the Conference, at which Mr. W. P. Wright gave a short address on "Staging and Judging," in which he deprecated overfeeding, which was resulting in a coarseness of flower and a gappiness in the placing of the bloom on the stem. Mr. W. Cuthbertson, F.R.H.S., gave a paper on "New Sweet Peas," in which he indicated the probable position of certain varieties would take in the various colour sections next year.

Regarding the coming year, there are great changes in the schedule of the Perthshire Society, which a keen enthusiast (who has seen the advance proof) describes as "A1; the best you have yet sent out." The society have the honour of first offering for competition to Scottish growers the Scottish challenge cup presented by the National Sweet Pea Society (open to Scotland only), also they have the Dewar Challenge Cup offered by Sir John Dewar, Bart., M.P., Dupplin Castle (open to all); the society's challenge cup (open to all); also medals and other valuable prizes gifted by prominent city and county ladies and gentlemen. Messrs. Dobbie and Co., R. Sydenham, Lim., R. Bolton, W. G. Unwin, Thyne and Son, Young and Son, and the Boundary Chemical Company, all offer valuable prizes in the open section. The schedule comprises 33 classes, divided into six sections: Sec. I., open to trade only; Sec. II., open to all; Sec. III., open to growers of 15 to 50 yards or clumps; Sec. IV., open to growers of not more than 15 yards or clumps; Sec. V., decorative; Sec. VI., special open classes; and it is completed with a splendid paper by Mr. John S. Grigor on his mode of culture down on the borders of Scotland, made famous by Mrs. Fraser, Sproughton Manse, Kelso, winning the £1,000 "Daily Mail" prize last year.

The Lockerbie and District Sweet Pea Society was formed last year. This show is confined to the district, which considerably limits the competition; fully 20 members competed, and 235 vases were staged, and were, on the whole, the finest lot of flowers for quality seen on the Borders. Notwithstanding the drought, the peas did extremely well in that district, the growers adopting the deep mode of cultivation, and no disease of any kind appeared. The society is looking forward to drawing a grand year under the care and guidance of Mr. G. L. Moffatt, the energetic secretary. Ayrshire has a band of enthusiasts in the village of Catrine, who have formed a society, with Mr. M. Duncan as secretary, and are to hold their third annual show on July 27 next. The first year the schedule consisted of three classes, with a membership of 18; last year the membership increased to 30, and this season they expect a corresponding increase over last year. The schedule for 1912 consists of eight classes, and a special for the best vase in the show. Sweet peas in that district, with few exceptions, did well right up to September.

There are an enthusiastic lot of growers in the West of Scotland, and there are probably few counties in Scotland where the sweet pea is more extensively grown than in Dumbartonshire. Although the various county shows give liberal encouragement for sweet peas; they are held too late in the season to do justice to the sweet pea exhibits. A public meeting was held at Dunbarton on October 27 last, and it was agreed that the time was ripe to form a sweet pea society for the shire, and it was resolved to proceed with its formation. A strong committee was appointed, and it augured well for their success when Lord Inverclyde consented to become hon. president, W. Henderson, Esq., J.P., president, Captain Alex. Cameron vice-president, all keenly interested in the flower. The show will be held on July 27 next, and a most attractive schedule has been drawn up of twenty-seven classes, covering the trade, gardeners, amateurs, allotment holders, and school children. Prizes to the value of £21 is offered, also a silver cup and medals. The secretary is Mr. W. C. Hyndman, Willowbank, Dumbarton.

In Fifeshire, Dunfermline, the home of the Carnegie Trust, had a very fine show last year, and the quality was much better and competition keener than in 1910. In entries there were an increase of thirteen over last year's, which were eighty-three, and, considering the season, speaks well for the success of the coming year. In the East of Scotland the Broughty Ferry Society has held a nice little show and conference in the past two years, and is in the excellent hands of Mr. James Croll. Aberdeenshire, although not possessing a society, held a very successful show in Aberdeen last year (entirely owing to the energy of Mr. M. H. Sinclair, the secretary), where Mr. J. S. Grigor, of Forres, won the principal prizes. The quality of flower was great, and the competition very keen. The honour of being the "furtherest North" Sweet Pea Society belongs, we think, to Strathpeffer, where Mr. T. O. Fraser, of the Spa, the hon. secretary, organised a most successful two days' show on August 11 and 12 last. The schedule was a good one, ten classes in all, silver bowls, vases, and valuable cash prizes being offered.

Last year was peculiar for weather, for while some districts had a few good showers, others had none for weeks, and the results in the various districts were rather striking. In Stirlingshire, at Kippen, Mr. C. Shaw had about a four-yards row of Stirling Stent, a perfect blaze of colour, nearly ten feet high, at the beginning of August. The flowers were very fine, with no shade. Elsewhere in the district this variety did not do at all, and was most disappointing. Charles Foster did well, but needs shading. Earl Spencer all over was very fine, and will take a lot of beating. Mrs. Hugh Dickson, Edrom Beauty, Isobel Malcolm, Sunproof of Crimson, Nubian, Elsie Herbert, John Ingman, Mrs. H. Sykes, Elfrida Pearson, Hercules, and Thomas Stevenson have been the standard varieties for Scottish exhibitors, and did well last year at Cultoquhey. Mr. Thomas Fender was unfortunate owing to disease and drought, while lower down on the same estate Mr. T. M. Kirkwood was in grand form, and did well at Perth and Crieff, and Edinburgh. The following varieties did well with him: Mrs. Sykes, Mrs. Breadmore, Etta Dyke (Dobbies'), Charles Foster, Norah Unwin, Constance Oliver, Edrom Beauty (best of all), John Ingman, Helen Lewis, The King, Tom Bolton, Menie Christie was grand up to the Perth Show, but failed after, Mrs. Hugh Dickson (a perfect gem). In Comrie disease showed very badly with the Rev. H. Mayall ,and in Newburgh, Fife, Mr. W. A. Morrison failed entirely owing to the effects of drought and disease. Elsie Herbert completely changed its character, and showed a distinct feathering or pencilling in place of the usual edging. Should the coming season be a good sweet pea year secretaries of shows will have trouble in obtaining room for the shoals of entries that will be forthcoming. H. S. HALLEY.

# RUBUS BAMBUSARUM.

The rubi which have been introduced during the last ten or twelve years contain many distinct and ornamental species, some of which are already becoming popular in our gardens. R. bambusarum is, perhaps, one of the best known of these kinds, for it has been available to the public for the last five years, Messrs. J. Veitch and Sons offering it in their new plant list of 1906. It was first brought to notice by Dr. A. Henry, who found it growing at an elevation of from 4,000 to 6,000 feet in the Province of Hupeh, but it was Mr. E. H. Wilson who succeeded in sending good seeds home in 1903.

The long, slender branches grow from 12 to 15 feet in length, and they are clothed with trifoliate leaves, the narrow segments of which are deep green above and covered with a pale, buff-coloured felt beneath. Nothing can be urged in favour of the decorative qualities of the flowers, for, though borne in fair-sized terminal racemes, they are small and not showy. The black fruits are sweet, but not very large. It is a good plant for placing against the post of a pergola or for planting against a rough fence. In such positions its elegant habit and decorative foliage are seen to advantage, but left without a support and the branches allowed to trail along the ground much of its attractiveness is lost. There does not appear to be any doubt as to its general hardiness, and it grows well in any ordinary garden soil. W. D.

Have you had the "Gardening Year Book and Diary for 1912"? It contains 300 pages of sound, practical information, embellished with illustrations in colour and half-tone, 1s. 3d. post free from our Publisher.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

CYPRIPEDIUMS of the cooler growing section are amongst the most beautiful and effective of winter-flowering orchids. C. insigne and its many varieties, such as Harefield Hall, Sanderæ, Sanderianum, Thompsoni, etc., are always appreciated. These and the less distinguished varieties are not only very beautiful, but last in a fresh condition for a considerable time. Therefore, where flowers are required in mid-winter, they are indispensable, and should be grown in quantity. The plants possess vigorous constitutions, and are easily cultivated. They are also capable of withstanding fogs better than the majority of plants which flower at this season, therefore, to those who reside near large cities or towns, they are most desirable. C. Charlesworthi, C. Fairrieanum, and C. villosum should also be grown, as should the numerous varieties of C. Leeanum, C. Euryades, C. Actæus, C. aureum, C. Alcibiades, C. Thalia, C. Minos, C. Priam, C. Froilus, C. Germain Opoix, C. Gaston Bulteel, and many others.

POTTING.—All of the foregoing should be potted as soon as possible after their flowers have faded, if this operation is necessary. I do not favour the practice of topdressing the plants, as I believe we add to the difficulty of watering by so doing. When repotting afford liberal root room, with a fair amount of clean crocks for drainage. The compost these cypripediums succeed in is made up of: two parts best fibrous peat, one part polypodium fibre, and one part fibrous loam, with a liberal addition of sphagnum moss. All the earthy particles should be shaken from the peat, polypodium, and loam. Pot each plant with moderate firmness, and keep its base just below the rim of the pot, and the compost filled up to the same level, so as to leave sufficient space for holding water. The compost should be used in a moist condition, but care must be taken that it is not too wet.

HEAT AND MOISTURE.—These plants delight in a moist position, and must have water administered to them, according to their requirements. Repotting offers a favourable opportunity for dividing any it is desirable to increase the stock of. I am not in favour of dividing plants simply to increase the numbers, as small plants do not produce flowers as fine as plants that are larger. Many recommend these plants be grown in a cool house, but, to my mind, it is folly to attempt their culture in a house of that description; they will exist there, but their proper place is in a moist atmosphere in the intermediate house, and during the growing season they need shade from strong sunlight.

GENERAL REMARKS.—During the wet, dull weather that we are now experiencing it is desirable to pay great attention to the airing and heating of the various houses: such weather as we have had lately is about the worst possible for successful orchid cultivation.—T. Barker, West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

CYCLAMEN.—These handsome greenhouse plants make a grand display in the conservatory all through the winter and spring months, and if they are brought on in batches there is no difficulty in maintaining a constant supply of flowers. A well-grown plant, carrying 15 to 30 fine flowers, set off with finely mottled foliage, is not easily surpassed. Cyclamens are best raised from seed annually. The older system of growing the bulbs or corms for several years has now pretty well died out, although in some gardens it is still practised with good results. The former system is generally acknowledged to be the best, as the plants produce finer flowers on stronger stems. I would advise sowing the seeds in two batches, the first about the third week in February and the second in August. The early batch is best raised in heat. The compost best suited for sowing the seeds in is two parts loam, one part leaf-soil or peat, and one part coarse silver sand, all passed through a half-inch sieve. Crock the pan well, and cover the crocks with oak leaves; fill to within one inch of the rim with the compost, make firm and level, and sow the seeds singly and evenly all over the surface, covering them lightly with the compost; afterwards cover the pan with a piece of glass, and this with a piece of paper until germination ensues. Place in a temperature of 60 degrees. When the plants are well up, and have formed two leaves, they should be potted off singly.

NERINES.—The nerines are among our most gorgeous autumn-flowering bulbs, and are at present finishing up their growth. Some people imagine it is necessary to crowd the bulbs in a mass to induce them to bloom well, and often they are left in the same pots for five or six years. It certainly is necessary to confine the roots, but at the same time liberal treatment and a thorough rest is the best inducement to a harvest of flower and spikes. Take, for instance, Nerine Fothergilli major, perhaps the most gorgeous of all. Large bulbs, the size of the biggest hyacinth bulbs, require a 48-size pot, and they should be repotted at least every three years. The best time for this is directly after flowering. The bulbs then commence to root freely, and soon get established. The best compost to grow them in is loam, some well-decayed manure, old mortar rubble, and coarse sand, all passed through an inch sieve.

LILIES.—Order bulbs of Lilium speciosum and L. s. rubrum, L. s. Melpomene, and L. auratum. Pot them directly they arrive, and place two bulbs in large 16-sized pots, using loam, rotten manure, peat, and coarse sand, leaving room for top-dressing. Place the pots in cold frame but protect from frost.

SEED SOWING, ETC.—Many stove and greenhouse subjects which are raised annually from seed require to be sown at once, such as gloxinias, begonias, Clerodendron fallax, etc. General remark: Place lilies, azaleas, deutzias, spiræas in heat, and if they have been grown in pots they will force readily. Constant supplies of tulips, hyacinths, lily of the valley, should be brought forward.—Lewis Smith, Shotesham Park Gardens.

## HARDY FRUITS.

RASPBERRIES.—If fresh plantations are to be formed the land should be heavily manured and trenched at the earliest opportunity to allow the necessary settlement of the soil before planting takes place. On well-prepared ground the raspberry will thrive and yield crops of fine fruits for many years. The most satisfactory method of training the growths is on wires strained at the ends to iron or stout wood posts. A space of four feet should be allowed between the rows, and the plants placed eighteen inches apart in the row; when established, five growths should be tied out at an equal distance apart. When planting spread out with due care the fibrous roots, working in amongst them the finer portions of soil, and make firm. I have noted very little difference eventually between such plants as were cut down to within a foot of the ground, or those from which the tips were removed, either practise can be carried out with satisfactory results. Many prefer to grow their plants on the old method, a stake to each plant. To do so the plants should be spaced out three feet apart in the row, and allowed four feet between the rows; when placing the stakes in position a cord stretched at the required height will ensure uniformity in the row.

LOGANBERRY. — This useful fruit requires more space between the rows, at least six feet and five feet apart in the row. The top wire should be six feet from the ground. Being a strong grower and gross feeder, it should be treated liberally, or the plants quickly lose strength, and the fruits deteriorate both in size and quality.

THE WINEBERRY.—This fruit is worthy of more extended culture. Its highly attractive fruits are of much value for mixing with red currants when the raspberry crop is over, or for preserving. The growths should be trained to wires similar to the loganberry, height of wire, five feet, three feet apart in the row, and five feet between the rows. The fruits are very much relished by the birds, and therefore have to be protected.

STANDARD AND BUSH PLUMS. — The birds have commenced stripping out the buds, and spraying will have to be resorted to, to prevent their depredations. Where growth is thick on standard trees, badly placed growths and dead shoots should be cut away. Bush trees, if properly attended to during the summer months, will require very little pruning. The young breast shoots and others for forming fruit spurs need less severe cutting back than is the case with apples and pears. To obtain crops of high-class fruits the branches should be so disposed that light and air has free admission to all parts of the tree. Young trees making too vigorous growth should be lifted, root-pruned, and replaced in original position. As a preventive of injury by birds taking the buds, spray the trees with a mixture of lime, soot, and nicotine compound. By adding half a pound of Russian tallow to each peck of unslaked lime, the mixture will adhere much better and longer. — W. Messenger, Wolverstone Gardens, Ipswich.

## THE KITCHEN GARDEN.

LEEKS.—A small quantity of leek seeds should be immediately sown where early or August leeks are required, deferring the sowing of the autumn ones till the second week in February. Sow the seed in 6in. pots, using a nice light sandy compost; an excellent place for germination is a vinery just started; in fact, this will suit the young plants for some time. Prick off the seedlings into boxes of similar soil when large enough, and place in a position near the glass.

ONIONS.—Where large, early bulbs are required, seeds must be sown in soil as advised for leeks, but using boxes instead of pots. Excellent onions are obtained for later use by sowing the middle of February. The boxes should be very carefully crocked to ensure perfect drainage; just cover the seeds with the fine soil, water well in, and afterwards go carefully with the water-pot. When the seedlings are large enough to handle, prick them off into other boxes at two inches apart in a well-prepared compost of two parts loam and one part each of leaf soil and spent mushroom-bed manure, adding enough sand to keep the whole open.

PEAS.—A few boxes should be sown for an early supply, choosing a dwarf-growing variety which can be planted out later in a frame; treated this way it will be observed that a freer growth will result than from sowing direct in the cold frame.

POTATOES.—Providing these have been sprouted in boxes, no time must be lost in placing some in pots and boxes as the case may be. Use a rough, light compost, and cover the sets with two inches of soil, top-dressing with similar soil as the shoots appear. A peach house just closed will be an ideal place for potatoes. Here we place three sets in a 9in. pot.

TOMATOES.—Make a sowing of seed in 6in. pots for a succession to the autumn-sown ones. Use a light soil, consisting of loam, leaf-soil, and sand in equal parts. Water well in, and place the seed pot on a shelf near the glass in a temperature of 55 to 60 degrees. As soon as the seedlings show their first true leaf, pot off singly into thumb pots, adding rather more loam to the compost this time. Place near the glass, and avoid excess of water, both at the roots and overhead.

CUCUMBERS.—Seeds of these should be sown singly in small 60-sized pots, and plunged in a hotbed to germinate; failing this, fill a water trough on the hot-water pipes with cocoanut-fibre or leaf-soil, and plunge the pots therein. Quiet germination must be encouraged, or the seeds will rot.—George Ellwood, Swanmore Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

Notwithstanding the woefully wet and dismally dark weather, there was a capital exhibition of fruits and flowers at the Royal Horticultural Hall on Tuesday, January 23, and there was a good attendance. In the early part of the day the darkness rendered artificial light necessary; but during the early part of the afternoon the natural light improved considerably. The Orchid Committee had plenty to do, but the Floral and Fruit Committees had practically nothing but groups to consider

### FLORAL COMMITTEE.

A fine lot of primulas and cyclamens from Messrs. Sutton and Sons, Reading, suffered a good deal in effectiveness because of the lack of light to bring the colours out properly. The salmon and red cyclamens, and the crimson primulas were very showy, and during the early part of the afternoon they lit up the surroundings. Reading Blue, Duchess, and Czar primulas stood out prominently, and the fine strain of P. obconica was a great attraction.

A large group of the yellow-flowered Jasminum primulianum, grown as standards, and represented by specimens 4ft. to 8ft. high, smothered with pretty flowers. The plants would have looked far better had not the fog of the previous two or three days reduced the numbers of blooms. This exhibit was from Mr. G. Reynolds, gardener to Leopold de Rothschild, Esq., Gunnersbury Park, Acton.

Another attractive group was staged by Mr. H. Prime, gardener to the Marquis of Salisbury, Hatfield House; this consisted of two mounds of Euphorbia fulgens (jacquinæflora), the plants carrying long sprays of brilliant orange-scarlet flowers; and a central bank of the beautiful blue-flowered Saintpaulia ionantha, very finely grown.

Messrs. R. Gill and Sons, Falmouth, showed some beautiful trusses of varieties of Rhododendron arboreum, splendid bunches of Iris stylosa, and bushes of Erica lusitanica, all from the open ground. The same firm contributed a very interesting set of paintings of native fungi representing a large number of species. Two plants of the new Primula Winteri were an attraction to lovers of hardy plants.

The cyclamens from Messrs. Stuart Low and Co., Enfield, made a brave show, and especially fine were the salmon-coloured varieties. The same firm showed a collection of perpetual carnations.

An interesting group of greenhouse plants from Messrs. Jas. Veitch and Sons, Chelsea, included a selection of Indian azaleas, tall plants of Acacia dealbata, the golden Senecio grandiflora, Primula Kewensis, the blue Coleus thyrsoideus, camellias, and the fragrant Daphne indica rubra.

A small group of Chinese primulas from Messrs. J. Carter and Co., Raynes Park, included a large number of new seedlings of the large-flowered section, and an interesting lot of a double rosy-flowered variety with deeply incised oak-leaf foliage.

The beautiful perpetual carnations from Mr. H. Burnett, Guernsey, suggested that the Channel Islands have enjoyed better light than London has of late; the group contained splendid bunches of Marmion, R. F. Felton, Mandarin, Mrs. H. Burnett, White Chief, Scarlet Glow, Sultan, and Carola.

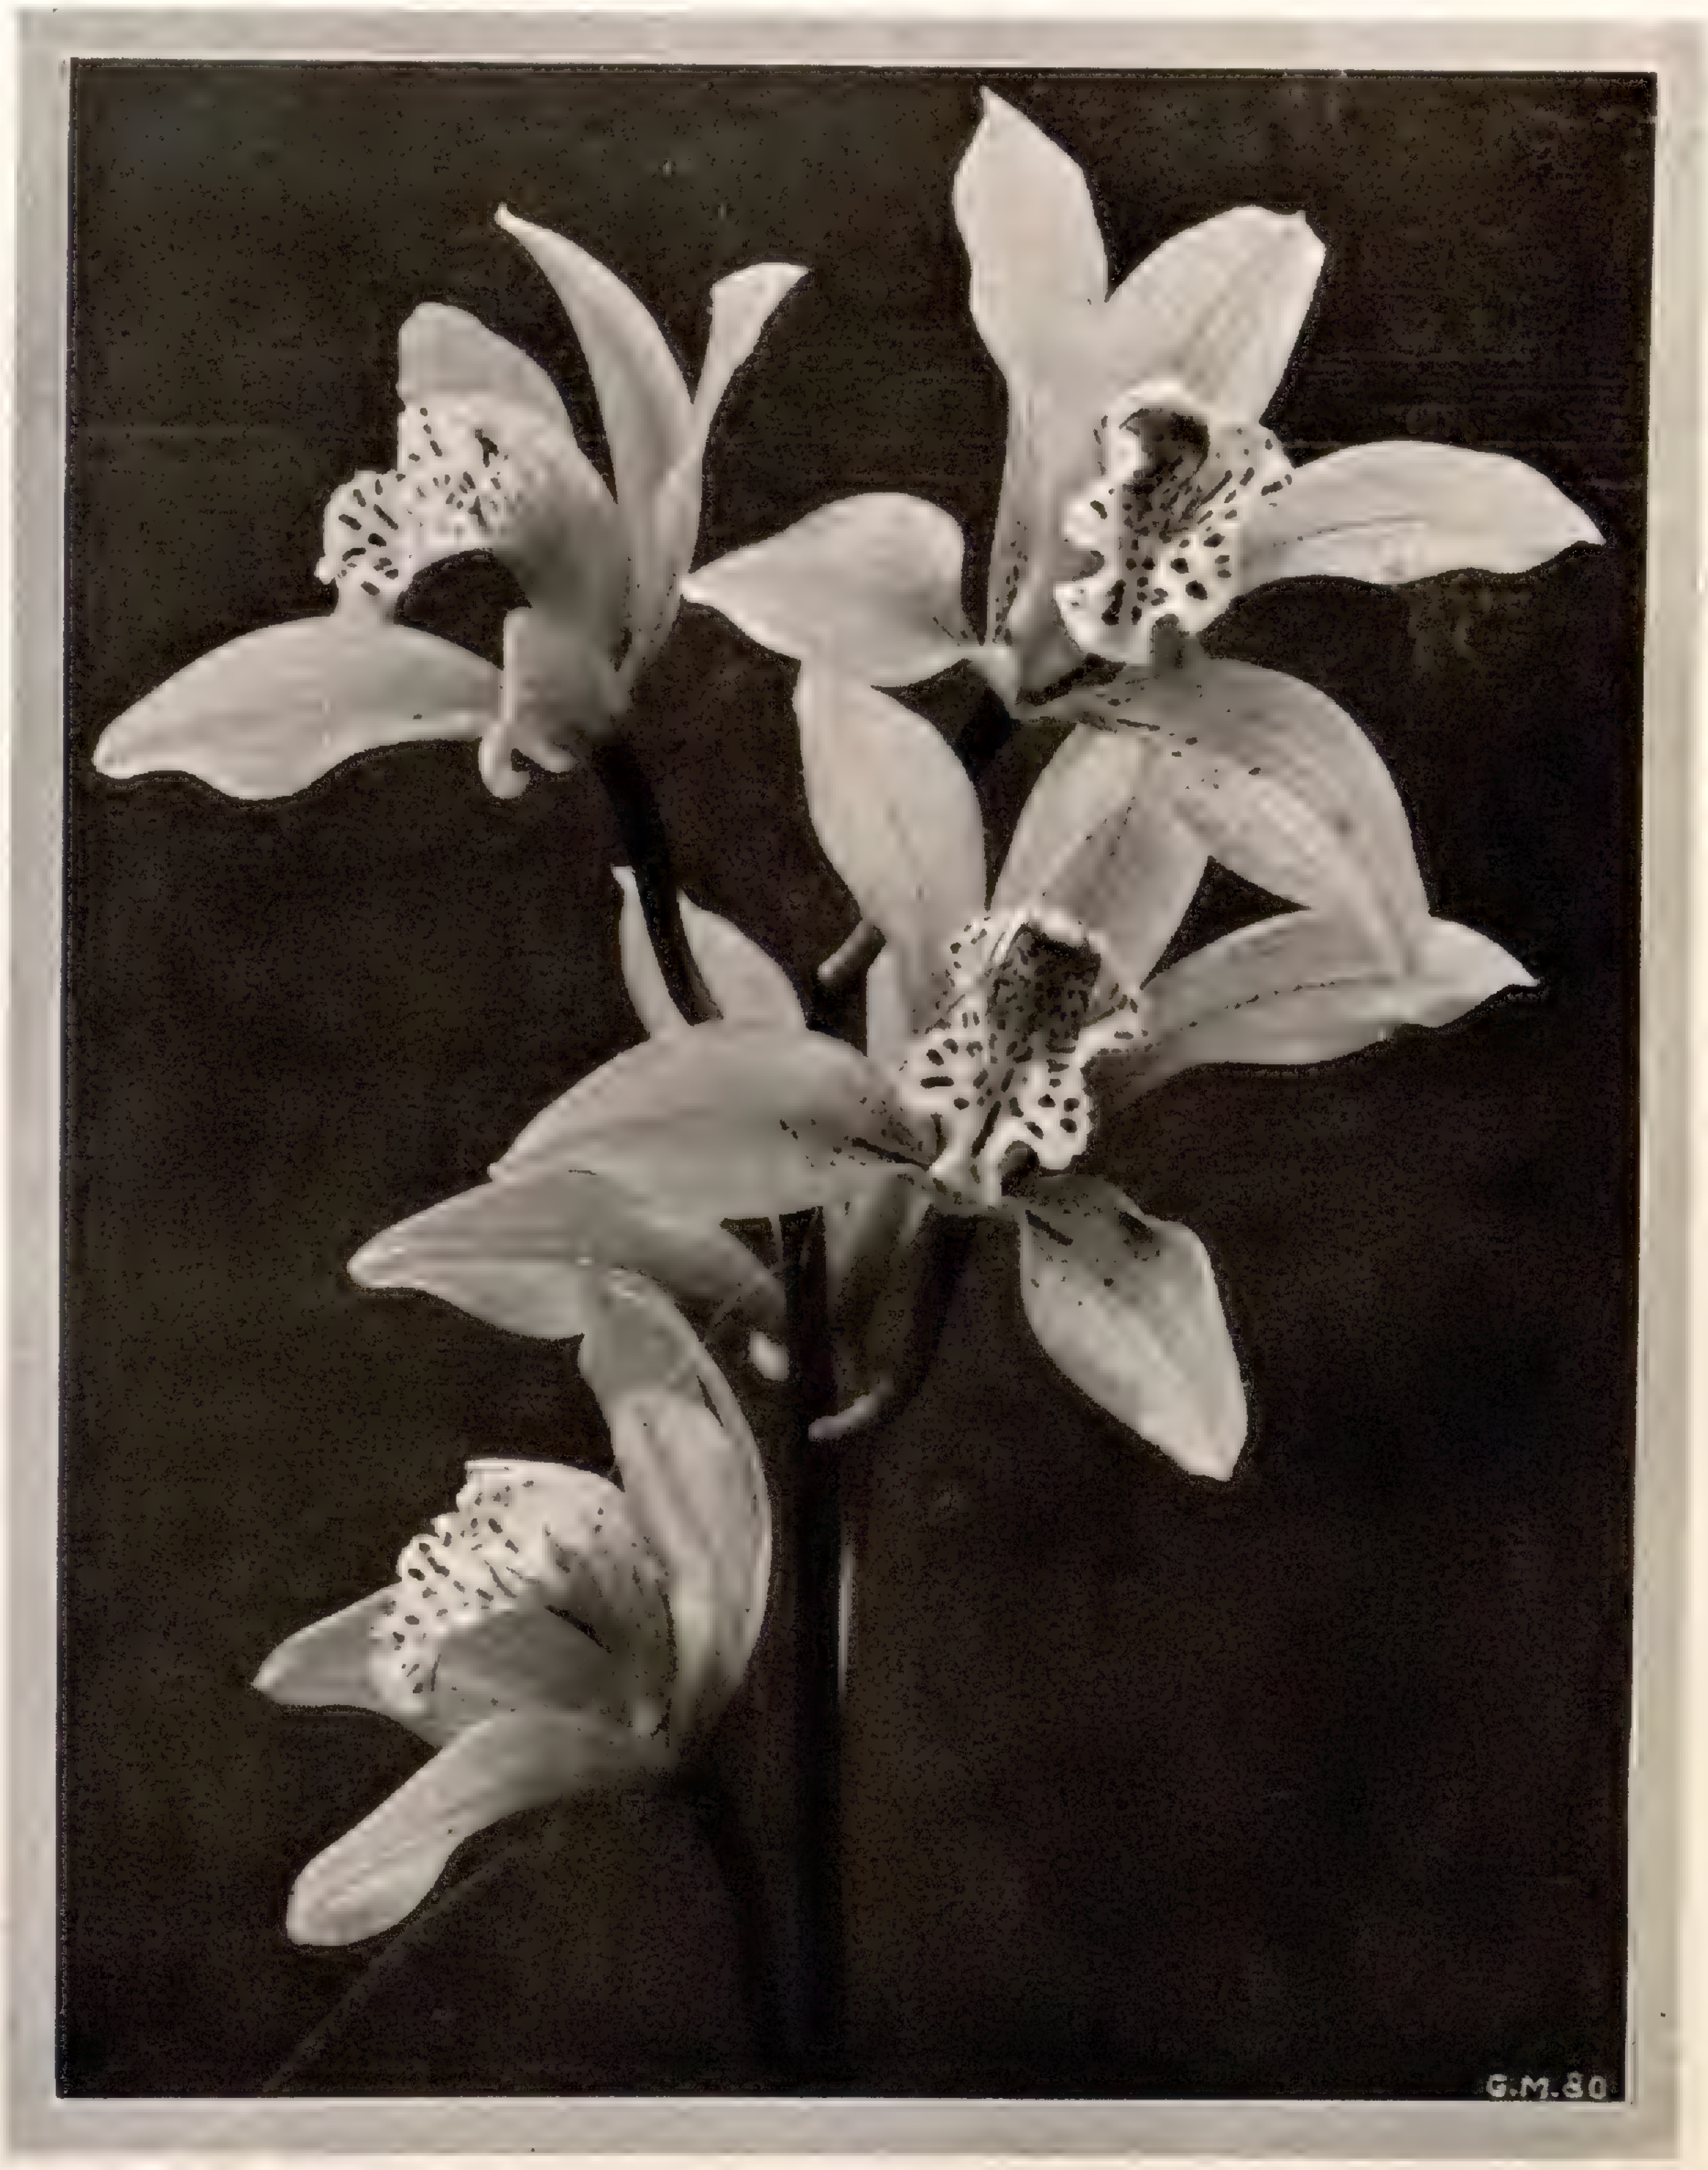
A little rock garden from Messrs. J. Cheal and Sons, Crawley, was furnished with hardy primulas and small-flowering specimens of Cydonia Maulei, Rhododendron Early Gem, Spiræa Thunbergi, Forsythia suspensa, Erica lusitanica, and berberis, etc.

A collection of begonias was submitted by Messrs. H. Cannell and Sons, Swanley, and proved very interesting; in the group those kinds that most appealed to us were B. fuchsiodes, B. foliosa, B. semperflorens gigantea rosea, B. Duchartrei, B. Vesuve, B. hybrida floribunda, and B. nitida alba odorata.

Messrs. Allwood Brothers, Wivelsfield, Haywards Heath, contributed a few good carnations, including Wivelsfield Wonder, White Wonder, Geisha, and the large-flowered yellow French variety, La Rayonnante.

Messrs. H. B. May and Sons, Upper Edmonton, brought up choice ferns, golden variegated oleanders, begonias, ardisias, etc.

Mr. L. R. Russell, Richmond, staged Jasminum primulinum and Buddleia asiatica, two useful shrubs for conservatory decoration, and the lovely Prunus triloba; with these were Primula malacoides and Japanese oranges.



CYMBIDIUM SCHLEGELI.

Flowers cream colour, with small purplish spots on petals and sepals, and large red-purple spots on the lip. A.M., R.H.S., January 23. Messrs. J. and A. McBean, Cooksbridge.

A large and bright exhibit from Messrs. W. Cutbush and Son, Highgate, was composed of perpetual carnations in variety, including lovely flowers of May Day, White Perfection, and Scarlet Glow; early flowers, such as Iris Danfordiæ, I. histrioides major, I. Tauri, Eranthes cicilicus and Narcissus Bulbocodum, are gems arranged in little rockwork groups; and flowering shrubs, such as magnolias, Prunus triloba, hamamelis, and lilacs.

Mr. C. Engelmann, Saffron Walden, had some new carnations on view, notably Salome, Lady Northcliffe, Rex, Washington, and La Mode.

Fringed cyclamens were capitally staged by Mr. Shambrook, gardener to the Rev. H. Buckston, Sutton Hall, Derby, and the salmon form named Mrs. Buckston was particularly good.

Messrs. T. S. Ware, Feltham; Mr. G. Reuthe, Keston; and Messrs. J. Peed and Sons, Norwood, showed collections of alpines, a few being in flower.

Among the carnations shown by Messrs. W. Wells and Co., Merstham, there were good blooms of Merstham Beauty, cerise-pink; White Wonder, White House, and Dorothy Gordon.

Messrs. Barr and Sons, Covent Garden, exhibited the popular Narcissus Soleil d'Or in quantity, and a collection of early hardy flowers, such as crocuses, hamamelis, Galanthus Whittalli, Iris stylosa, I. Danfordæ, and Narcissus bulbocodium.

Mr. Bertie Bell, Castel Nursery, Guernsey, brought over grand flowers of Coronation, a beautiful bright pink perpetual carnation, and showed the variety in quantity.

### ORCHID COMMITTEE.

The choice and elegant white varieties of Lælia anceps were well shown by Mr. J. Collier, gardener to Sir Jeremiah Colman, Esq., Gatton Park, Reigate, over fifty spikes being staged, the varieties being L. a. Williamsi, L. a. Gatton Park var., L. a. Schroderiana, L. a. Sandersi, L. a. Hilliana, and L. Dawsoni. Phaio-calanthe Colmani was also shown from the Gatton Park collection.

Messrs. Armstrong and Brown, Tunbridge Wells, contributed a group of orchids wherein cypripediums were abundant, together with Cattleya Maggie Raphael alba, various odontiodes, and odontoglossums, and the quaint unpleasant smelling Bulbophyllum neilgherense.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, made a brave show of orchids, and had Calanthe Veitchi, C. Williamsi, Lælio-cattleya Cappei, and various cypripediums and cattleyas.

From St. Albans, Messrs. Sander and Sons, came some choice hybrid odontoglossums, the lovely Odontioda Diana flammea, the white Saccolabium Harrisonianum, Odontioda Chelseaensis, and a number of cypripediums.

A Lindley medal, an uncommon and high award, was granted to Mr. Alexander, orchid grower to Lieut.-Col. Sir G. Holford, Westonbirt, Gloucester, for splendidly grown examples of Lælia anceps Amesiana with ten spikes; L. a. G. D. Owen, with nine spikes; Lælio-cattleya Cappei Westonbirt var., with a huge spike of thirteen gorgeous flowers; Vanda Watsoni, with seven spikes of pure white flowers; and Lælia autumnalis, with four spikes; and the new Cypripedium Norah (F.C.C.).

Mr. Hunt, gardener to Paulia Ralli, Esq., Ashstead Park, Leatherhead, showed two beautiful white forms of Cattleya Trianæ, and the handsome Lycaste Balliæ.

From Mr. E. V. Low, Haywards Heath, came Cypripedium aureum Surprise, C. The Nizam, C. Waterloo, C. Portia, etc.

Mr. Hunter, gardener to the Duke of Marlborough, Blenheim Palace, sent up Cypripedium Duke of Marlborough (A.M.) with fine white dorsal sepal.

De Barri Crawshay, Esq. (gardener, Mr. Stables, exhibited Odontoglossum Harvengtense Crawshayanum, a beautiful rounded yellowish flower; and Zygopetalum brachypetalum.

From Messrs. Hassall and Co., Southgate, came the chaste Cattleya Blacki, C. Octave Doin, and a beautiful form of Odontoglossum Lambeauranum.

Mr. W. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, sent up some cypripediums, including C. Thalia The Baron.

Messrs. J. and A. McBean, Cookbridge, showed some grandly-grown odontoglossums and white forms of Lælia anceps, but their leading plant was Cymbidium Schlegeli (A.M.), a cream-coloured hybrid between C. insigne and C. Wiganeanum, with purplish spotting at the base of the segments, and prominent red-purple spots on the white, yellow-throated lip.

A bank of cypripediums from Messrs. J. Cypher and Sons, Cheltenham, contained very fine blooms of C. villosum splendens, C. Vandyke, C. aureum Hyeanum, C. Mrs. F. Godman, C. Thompsoni, C. Actaeus Sybil, and C. Minos Youngi.

Messrs. Charlesworth and Co., Haywards Heath, submitted a beautiful form of Cattleya Octave Doin, the rare Calanthe violacea, Lælio-cattleya amabile (A.M.), Odontioda Bradshawiæ, Odontoglossum hibernicum, a richly-hued form of O. crispum; and a white form of the old Zygopetalum Mackayi named Charlesworthi (A.M.).

Zygocolax Charlesworthi Cobb's variety (A.M.) was sent by Walter Cobb, Esq., Normanhurst, Rusper, and some remarkably fine and beautiful spikes of Calanthe Wm. Murray were staged by Mr. E. S. Branson, gardener to G. Hanbury, Esq., Blythewood, Burnham, and gained a cultural commendation.

Odontoglossum Doris (O. crispum Victoria Regina x O. Ossultoni), prettily spotted with red, came from Messrs. Jas. Veitch and Sons, Chelsea. Mr. H. S. Goodson, Fairlawn, Putney (gardener, Mr. G. Day), brought up a fine form of Odontioda Cooksonæ named Royal Scarlet.

FRUIT AND VEGETABLE COMMITTEE.

A splendid collection of apples from Messrs. G. Bunyard and Co., Maidstone, was a striking feature of the meeting. It filled a whole length of double staging. Along the centre were piled up baskets of fruit, with smaller lots in dishes on either side, and a few ferns and palms to relieve the flatness of the exhibit. All the varieties were in splendid condition, but especially noteworthy were Wagener, Kentish Fillbasket, Clark's Seedling, Twenty-ounce, Newton Wonder, Belle de Pontoise, Foster's Seedling, King of the Pippins, Lane's Prince Albert, Hambling's Seedling, Mere de Menage, Chelmsford Wonder, Lord Derby, Red Ribbed Greening, Adam's Pearmain, Sanspariel, Blue Pearmain, Edward VII., Blenheim Pippin, and Cox's Orange Pippin. In all there were 180 varieties in this fine exhibit.

A collection of rhubarb from the Society's gardens merited attention, and showed the value of Early Red, Danver's Early Red, Laxton's No. 1, Crimson Perfection, Hawke's Champagne, and Collis' Ruby for forcing.

A group of vegetables stored in late autumn, and kept for winter use, was put up by Messrs. Sutton and Sons, Reading. Onions figured prominently, and potatoes were well to the fore. Carrots, both long and stump-rooted, beet, artichokes, and a grand lot of Tender and True parsnips, were included, and all showed evidence of careful handling and storing.

The well-kept apples displayed by Messrs. W. Seabrook and Sons, Chelmsford, provided a rare display of colour, and the dishes of Gascoigne's Scarlet, Bismarck, Blenheim Pippin, Cox's Orange Pippin, King of the Pippins, Barnack Beauty, Newton Wonder, Beauty of Kent, and The Queen, were of first-class size and colour.

Mr. W. E. Sands, Hillsborough, Co. Down, contributed a collection of potatoes, and a few notable varieties on view were Erin's Best, Langholm Model, Emerald Queen, Scottish Triumph, Fourball, Duchess of Cornwall, and Irish Hero.

CERTIFICATES AND AWARDS.

First-class Certificates.—To Cypripedium Norah, from Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

Award of Merit.—To Zygocolax Charlesworthi, Cobb's var., from W. Cobb, Esq., Normanhurst, Rusper; to Cypripedium Duke of Marlborough, from the Duke of Marlborough (gardener, Mr. Hunter), Blenheim; to Zygopetalum Mackayi Charlesworthi, from Messrs. Charlesworth and Co., Haywards Heath; to Lælio-cattleya amabilis, from Messrs. Charlesworth and Co.; and to Cymbidium Schlegeli, from Messrs. J. and A. McBean, Cooksbridge, Sussex.

MEDALS.

Gold.—To Messrs. G. Bunyard and Co., Maidstone, for apples.

Lindley.—To Mr. Alexander, orchid grower to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester.

Silver-gilt Banksian.—To Messrs. W. Cutbush and Son, Highgate, for carnations and flowering shrubs.

Silver Knightian.—To Messrs. Sutton and Sons, Reading, for vegetables; to Messrs. W. Seabrook and Sons, Chelmsford, for apples.

Silver Flora.—To Mr. H. Burnett, Guernsey, for carnations; to Mr. Reynolds, gardener to Leopold de Rothschild, Esq., Gunnersbury Park, Acton, for Jasminum primulinum; to Mr. H. Prime, gardener to the Marquis of Salisbury, Hatfield, for euphorbias and saintpaulias; to Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Mr. J. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver Banksian.—To Messrs. J. and A. McBean, Cooksbridge, for orchids; to Mr. W. Sands, Hillsborough, Ireland, for potatoes; to the Rev. H. Buckston, Derby, for cyclamens; to Messrs. R. Gill and Son, Falmouth, for rhododendrons and paintings of fungi; to Messrs. H. B. May and Sons, Edmonton, for ferns, etc.; to Mr. L. R. Russell, Richmond, for various flowering plants; to Messrs. Sutton and Sons, Reading, for primulas; to Messrs. Jas. Veitch and Sons, Chelsea, for greenhouse flowering plants; and to Messrs. S. Low and Co., Enfield, for carnations and cyclamens.

Bronze Flora.—To Messrs. Barr and Sons, Covent Garden, for early flowers; and to Mr. Bertie Bell, Guernsey, for carnations.

Bronze Banksian.—To Messrs. H. Cannell and Sons, Swanley, for begonias; to Mr. C. Engelmann, Saffron Walden, for carnations, and to Messrs. T. S. Ware, Lim., Feltham, for alpines.

## Dundee Horticultural Association.

The ordinary monthly meeting was held in the Technical College on the evening of the 11th inst. Mr. Wm. Christeson presided.

The essayist, Mr. J. G. Beisant, late of Castle Huntly Gardens, was unavoidably absent owing to his acceptance of an appointment in Ireland. The Hon. President, Bailie Melville, kindly consented to read the paper, which was a concise and practical treatise on "Malmaison Carnations." At the outset the essay set forth the necessity of obtaining a clean, healthy stock to start with, and clearly showed how to keep up this clean, healthy condition by careful and intelligent cultivation. In fact, everything worth enquiring after, from the various methods and times suggested for layering, until the plants had flowered a second season, and were again operated upon for a renewal of stock, was amply dealt with in a way which showed the essayist to be conversant with every detail of successful cultivation. In the discussion which followed the reading of the paper, some members spoke highly of the success Mr. Beisant had achieved as a grower of Malmaisons. On the motion of Mr. James Bethel, Bailie Melville was thanked for his kindness in taking Mr. Beisant's place at the meeting, while he also moved that a letter of thanks be forwarded to Mr. Beisant.

The Chairman acknowledged a donation of £2 from the Right Hon. the Earl of Moray, while the secretary reported arrangements for a social meeting and dance on February 9, and an excursion to Pittencrieff Park on July 6.

## Scottish Horticultural Association.

The annual business meeting of this association was held in the hall of the Young Men's Christian Association, 14, South St. Andrew Street, Edinburgh, on the 16th inst. Mr. Massie, the president, occupied the chair, and there was an attendance of 155 members.

The report by the council for 1911 stated, inter alia, that the proposals laid before the members by the President in his inaugural address on February 7, which were remitted to the council for consideration and report, had received their earnest consideration, and that, as a result of their deliberations, they had now to present to the members for their acceptance a revision of the constitution of the association, embodying these proposals, and in other ways providing for the expansion of its work in the near future. The principal recommendations were: (1) a thorough revision of the finances of the asso-

**The only resemblance** between a Pine Spray Syringe and others is in the shape of the barrel. The metal is more substantial. For the rest, the combination spraying head renders Spray, Rose, and Bend instantly obtainable without the addition or removal of a single fitment, while the adjustable leather bucket plunger gives perfect suction, never allows water to escape past it and up your sleeve, and wears interminably.

A written request from your ironmonger or seedsman, and a Syringe will be sent in 24 hours for your approval. Price 10/6. Sole proprietors and manufacturers, **Robinson Bros., Ltd., West Bromwich.**

**PINE SPRAY SYRINGE** (patent).

ciation; (2) that immediate steps be taken to start a fund for the foundation of a horticultural institution and library; (3) that more facilities be afforded the young men to take part in the work of the association; and (4) that a Benevolent Fund be started to temporarily assist gardeners who had met with misfortune. Provision was also made for the holding of examinations in horticulture, granting bursaries to students of horticulture, etc.

As regards the members' subscriptions, it was proposed to adopt, in place of the uniform annual subscription of 2s. 6d. at present in force, a scale of subscriptions commencing at 2s. 6d. as at present, running up to £2 2s.; and, as regards the foundation of a horticultural institution and benevolent fund, it was stated that the council were now in possession of the nucleus of a fund for the former in the shape of a donation of £80 from the surplus of the Scottish National Exhibition (1908), and that about £200 more had been subscribed by the office-bearers of the association, and that an anonymous donor had offered £25 to start the latter.

The work of the association, the report went on to say, had been well maintained in the past session, and that the average attendance at the ordinary meetings had been 100. The admissions to membership had been satisfactory, but the loss by deaths, resignations, and lapses had been in excess of the accessions, so that there was a small decrease in the total membership. The chrysanthemum show had been a decided success, and had yielded a profit of £31 5s. 9d. The adoption of the revised constitution and bylaws was moved from the Chair, and after same amendments of a minor kind had been made the motion was agreed to.

The following office-bearers were elected in place of those who retired by rotation: Honorary president, Captain Stirling, of Keir; president, Mr. W. H. Massie (reelected); vice-presidents, Messrs. James Dobdie and D. W. Thomson; councillors, Messrs. D. Kidd, Carberry Tower; Jas. Whytock, Dalkeith; A. Chalmers, Edinburgh; T. Highgate, Hopetoun; T. Fortune, Edinburgh; E. P. Laird, Edinburgh; W. J. Thomson, Edinburgh. Mr. A. D. Richardson was reelected secretary and treasurer.

It was intimated that Captain Stirling, the honorary president, had invited the members to Keir, and that July 27 had been fixed as the date of the excursion. Fifteen new members were elected.

On February 6 the president will take as the subject of his opening address, "Garden City Problems."

### North of England Horticultural Society.

The annual meeting was held in the Queen's Hotel, Leeds, on Thursday, January 18, Major Dent presiding.

The annual report presented reviewed the year's work, and stated that there should always be a majority of Council members from outside Yorkshire. The Council desired to express their thanks to those lecturers who have throughout the year given to the members the results of their labours in the garden or the laboratory. To the trade especially the Council desired to extend their appreciation of whole-hearted assistance and support. Needless to say, without the goodwill of those who are in the front line of horticulture, the society could neither have held the shows nor given its Fellows and members a continuous succession of floral feasts. At the same time it had been most encouraging to note the steady increase of amateur exhibits, and it cannot be too strongly stated how necessary it is that amateurs should also bring of their best to the shows. Although no money prizes can be given, yet all amateurs are entitled to awards. Amateurs are not placed in competition with the trade, each exhibit at all shows being judged apart by a recognised standard.

In 1912 and future years the policy of the society with regard to local shows will be the formation of local district committees, composed of Fellows and members of the society, who will be responsible for the accommodation, staging, and advertising of the local shows. The society was started with 52 members, and now there are 224 Fellows and 189 associate members.

The balance-sheet showed an adverse balance of £262 15s. 10d.

The Chairman moved the adoption of the report and balance-sheet, and explained the fact that the society was for the North of England and not merely for Yorkshire; he also referred to the great help received from the Royal Horticultural Society. Mr. Reginald Farrar seconded the motion, which was unanimously adopted.

It was subsequently agreed that the Council consist of 30 members instead of 15, and that bona fide gardeners be admitted as Fellows at 10s. 6d. per annum. To the existing Council were added Professor Seeton, Mr. W. Cuthbertson, and Mr. T. H. Gowan. The Rev. J. B. Hall was re-elected secretary, and the Hon. R. Beckett as treasurer. The standing committees were then appointed.

### Broughty Ferry Horticultural Association.

The opening meeting of the session was held on the 16th inst. Mr. William Grant presided, and the President, Mr. James Bethel, gave the opening address, as well as a paper entitled, "Orchard House Gleanings." The paper was thoroughly practical in every detail, and showed that the president was well up in every problem which presents itself to the cultivation of fruit trees in pots and tubs, from the grafting upwards. He gave a lucid survey of the best methods of cultivation to secure the best results. Apples, pears, plums, cherries, peaches, nectarines, apricots, and figs were the kinds dealt with, and the best varieties of each were given as a guide. Top-dressing, potting, housing, feeding, spraying, watering, setting the fruit, thinning, disbudding, pinching, and pruning were points emphasised.

The members showed their appreciation of the lecture in the usual way. There was a good display of cyclamens from Messrs. D. and W. Croll, Dalhousie Nurseries, and Mr. James Slater, Passmore Villa Gardens; vases of Christmas roses and chrysanthemums, and some forced rhubarb from Mr. Wm. Grant, Fern Hall Gardens. Three new members were enrolled.

### Beckenham Horticultural Society.

At the meeting of this society, held on Friday, 19th inst., Mr. C. F. Watts, B.Sc., in the chair, Mr. J. Gregory (of Croydon) gave a lantern lecture on "Ferns and their Allies." The beautiful pictures of mosses, lycopodiums, and ferns, both as specimens and groups, were much admired, while the remarks by the lecturer proved very instructive, especialy those relating to the evolution of the Nephrolepis, and the fertilisation of ferns. A large number of dried specimens was brought by Mr. Gregory, and these afforded much pleasure to the members. The meeting concluded with a hearty vote of thanks to Mr. Gregory.

## GARDENING ENGAGEMENTS.

Mr. W. Bailey, for upwards of twelve years fruit and plant foreman in the gardens of Woburn Abbey, Beds, has been appointed gardener to the Countess of Carysfort, Glenart Castle, Arklow, Co. Wicklow, Ireland.

Mr. Fred Low, late of Edinburgh, City Gardens, has been appointed gardener to J. D. Fletcher, Esq., Rosehaugh, Ross-shire.

Mr. C. J. Pople, for three years general foreman in the gardens of Breckenbrough Hall, Thirsk, Yorkshire, has been appointed gardener to G. B. Jackson, Esq., The White House, Saltburn-by-the-Sea.

Mr. W. Stevens, late gardener at Audley House, New Barnet, has been appointed gardener to Colonel Barham, Hole Park, Rolvenden, Kent.

## OBITUARY.

◆

### M. THEOPHILE DURAND.

With much regret we record the death of M. Théophile Durand, the Director of the Belgium State Botanical Garden, Brussels. Born in 1855, he was in the prime of life, and his many friends looked forward to his still further rendering good service in the cause of botanical science. After a successful university career, and taking his degree in medicine, M. Durand was in 1881 appointed an assistant in the State Botanical Garden, and in the discharge of his duties he showed such marked ability that he was appointed Conservateur in 1895, and Director in 1902. Throughout the whole period of his association with the State Botanic Garden he was a strenuous worker, and his contributions to the literature of botanical science were numerous and of a high order of merit, his most important work being "The Flora of the Congo." In the course of his active life M. Durand filled many important positions in learned societies of Belgium, other than those associated with botany, and was the recipient of many honours, both from home and foreign Universities, in addition to the Orders conferred upon him by the King of the Belgians.

There was a large gathering of scientists at the funeral, and in the course of the addresses that were given in the church the leaders in science and art testified in warm terms to the commanding abilities of M. Durand and the high estimation in which he was held.

## CATALOGUES RECEIVED.

FREDERICK ROEMER, QUEDLINBURG, GERMANY.—In this list of choice German flowers and garden seeds there are a number of novelties, especially in stocks and asters.

W. LAING, SUTTON, SURREY.—A plain, useful, descriptive and altogether useful list of seeds, bulbs, and flower roots.

Eckford's Giant Sweet Peas

**HENRY ECKFORD, F.R.H.S.,**
**(Dept. 221) WEM, SHROPSHIRE.**

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

DAMPING OF FERN PROTHALLI.—J. B., Sheffield: The rapid damping off of large numbers of fern prothalli is due to the presence of a fungus named Pythium intermedium, but the presence of the fungus is due to certain conditions, just in the same way as mildew. Excess of moisture when the crowded prothalli are just developing provides conditions favourable to fungus attack, therefore overhead watering should never be resorted to when ferns are being raised from spores. The needful moisture can be provided by standing the pots in saucers of water, or by dipping each pot gently into a bucket or tank of water until the moisture rises through the drainage and soil, and just moistens the surface. It will be obvious that unless dipping is carefully performed it will be no advantage over overhead watering.

DAMAGED PLANTS IN GREENHOUSE.—F. B., Camberley: The damp surroundings, low temperature, and insufficient ventilation, probably all combine to produce the unpleasant results noted. A little more heat, combined with increased ventilation, would secure better atmospheric conditions in the house. The other matter we are endeavouring to elucidate, and hope to reply further at an early date.

EXAMINATION IN HORTICULTURE.—S., Barnsley: We congratulate you and your friends upon your work and success. The Royal Horticultural Society hold four examinations in horticulture; a general examination for those eighteen years old and upwards; a general examination for juniors, under eighteen years of age; a school teachers' examination and a public parks examination. We imagine you will prefer the school teachers' examination, which confines attention to cottage and allotment gardening. This examination is only open to elementary and technical school teachers, and has been undertaken in view of the increased demand in country districts that the school teachers shall be conpetent to teach the elements of cottage and allotment gardening, and of the absence of any test whatever of such capacity. You can obtain full particulars regarding this examination on application to the Secretary of the Royal Horticultural Society, Vincent Square, Westminster, enclosing a stamped addressed envelope for reply.

HEMP FOR SUB-TROPICAL GARDENING.—F. E. F., Staines: The hemp used in sub-tropical gardening is Cannabis sativa, an Indian species, easily raised from seeds sown under glass in March or April, and grown freely in rich soil until planting time.

OUTLINE SYLLABUS OF R.H.S. TEACHERS' EXAMINATION.—S., Barnsley: The folowing outline syllabus will give you a good idea of the nature of the examination: (1) Some knowledge of elementary chemistry and biology, as affecting garden practice. (2) Such a knowledge of the formation and nature of soils as is essential to cultivators. (3) Information as to the best average sizes of cottage gardens and allotments such as men engaged in diverse vocations can cultivate in spare time. (4) Preparation of soils for the reception of crops of all descriptions to ensure successful results. (5) Renovating neglected gardens. (6) Manuring soils for diverse crops with some knowledge in practical form of the nature of manures and their constituents. (7) Spring vegetable crops, varieties and method of cropping, times for manuring, planting, etc. (8) Summer crops—successional. (9) Autumn or winter crops for successional purposes. (10) General treatment to secure best results for all seasons. (11) Suitable fruits for cottage gardens. Varieties, methods of culture, pruning and training. General treatment. (12) Fruits suitable for allotment culture. (13) Flowers for cottage gardens, seasons of flowering, methods of propagation, etc. (14) Flowers suited for allotments, varieties and general culture. (15) Window gardening, inside and out.

GIANT FRENCH CARNATIONS.—S. W., Chingford: In all probability the strain of carnations you refer to is the one known as Geant de Nice, and is largely grown in the South of France for the early flower markets. The plants resemble a tree carnation in style of growth, and they grow freely and flower abundantly. You can purchase seeds from most of the seedsmen who advertise in our columns. The flowers are large and of varied and rich colours. Sow seeds in gentle heat in February, pot the seedlings as soon as they need more root room, and plant out on a warm border at the end of May. These plants will flower in September, and if they are protected with frame-lights they will continue to bloom for a long time. Now that the perpetual carnations are so well understood and so largely grown for winter-flowering, we doubt whether it would pay to grow any quantity of the Geant de Nice strain for flowering during the winter under glass; if you have room to spare, grow a dozen or two in pots, plunge them out in May, and lift them and bring them into a warm, airy greenhouse in October. The experiment would not be a costly one, but would prove the value of the strain for the purpose you have in view.

SWEET PEAS FOR EXHIBITION.—S. S. H., Retford: An excellent work on this subject is "Sweet Peas and Their Cultivation," by C. H. Curtis, Hon. Secretary, National Sweet Pea Society. This can be obtained at 1s. 2d., or 1s. 8d. (cloth) post free, from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.

ROLLING LAWN.—B. E. S., Dartford: As long as the grass is not frozen, or the lawn so wet as to be sticky and very soft, rolling should be done twice a week. Use a moderately heavy roller, and do not roll the lawn twice consecutively in the same direction; work lengthways one time, and crossways the next. When the surface is fairly dry give the lawn a good sweeping, using a new birch broom for the work.

### NAMES OF PLANTS.

B. T. L., Lichfield.—1, Plumbago rosea; 2, Callicarpa purpurea.

T. I., Byfleet.—Probably Oncidium incurvum; very poor specimens.

C. W., Bangor.—1, Odontoglossum crispum; 2, Lasiandra macrantha.

L. M. A., Abergavenny.—1, Rrododendron arboreum; 2, Pelargonium denticulatum.

N. R., Saltash.—1, Gmnogramma calomelanus; 2, G. Matthewsi; 3, Lastrea hispida.

A. A., Plymouth.—1, Abutilon Thompsoni; 2, Euphorbia fulgens; 3, Pinus Pinsapo; 4, Francisea calycina; 5, Amaryllis aulica.

E. G. K., Winchester.—1, Hamamelis mollis; 2, Exacum affine; 3, Monstera deliciosa; 4, Camellia Donckelaari; 5, Erica carnea.

W. L., Whitby.—1, Adiantum cuneatum; 2, probably A. c. mundulum; 3, A. c. Legrandi; 4, A. c. gracillimum; 5, A. c. grandiceps; 6, A. c. Pacotti.

## FORTHCOMING ENGAGEMENTS.

THURSDAY, February 1.—Linnean Society Meeting.

SATURDAY, February 3.—French Horticultural Society of London.

MONDAY, February 5.—National Chrysanthemum Society's Annual Meeting, Carr's Restaurant, Strand, W.C., at 7 p.m.

TUESDAY, February 6.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m. on "Plants of Fiji and other South Sea Islands," by Sir Everard im Thurn; Scientific Committee at 4 o'clock.

THURSDAY, February 8.—Manchester and North of England Orchid Society.

FRIDAY, February 9.—Royal Gardeners' Orphan Fund Annual Meeting and Election at Simpson's Restaurant, Strand, at 3 p.m.

Enchantress, Harlowarden, Winona, T. W. Lawson, Winsor, Britannia, etc., 1s. 6d. per doz.
ALLSOP BROS., Gainsboro.

**SWEET PEAS.**—All best varieties recommended by the Nat. Sweet Pea Society. Collections, 1s. to 30s.—ELLISON, 57, West Bromwich.

MINEHEAD URBAN DISTRICT COUNCIL.

TO LANDSCAPE GARDENERS.

THE MINEHEAD URBAN DISTRICT COUNCIL invite COMPETITIVE DESIGNS for LAYING OUT the BLENHEIM MEADOWS at MINEHEAD as a PUBLIC PARK and PLEASURE GROUND.

Plan of the site and conditions may be obtained from the undersigned on deposit of five shillings, which sum will be returned on receipt of bona-fide designs in accordance with the conditions.

A Premium of £10 10s. (subject as stated in the conditions) is offered by the Council for the best design, and the design in respect of which such premium may be awarded shall become the property of the Council.

Design, etc., enclosed in a sealed package, as directed in the conditions, and endorsed "Blenheim Meadows," are to be sent to the undersigned on or before the 26th day of February, 1912.

Dated, this 17th day of January, 1912.

By order,
L. C. WEBBER-INCLEDON, Clerk.
16, Park Street, Minehead.

**WM. DUNCAN TUCKER and SONS,** Lim., 27, Cannon Street, London, E.C.; Works, Tottenham. Conservatories, Winter Gardens, Vineries, Peach-houses, portable buildings, etc. Catalogue gratis.

SOW NOW UNDER GLASS.

**SUTTON'S WINTER BEAUTY TOMATO.**
per packet, 1s. 6d. and 2s. 6d., post free.
Mr. G. F. Pearce, Gardener to F. B. Rendle, Esq., writes: "I have had a grand show of Sutton's Winter Beauty Tomato this year, some of the fruit weighing nearly ¾lb., and the flavour is all that can be desired. My employer says that they are the best Tomatoes he has ever had."

**SUTTON AND SONS, THE KING'S SEEDSMEN, READING.**

**THE MODERN HERBACEOUS BORDER.**

Full particulars and prices of Kelway Borders, packed, arranged for planting, to flower in tasteful schemes of colour, from
KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

"———, Palace, W.
"28th December, 1911 (the year of great drought).
"The new herbaceous border has done *extremely well*; much better than Her Royal Highness anticipated."

**KELWAY'S MANUAL OF HORTICULTURE** is the best of all Garden Books. 2s., post free, from KELWAY and SON, LANGPORT, SOMERSET.

From an article in "The Field," August 12th, 1911, on The Best Gardening Books:
"I do not know of anything dealing with herbaceous borders more comprehensive than Kelway's Manual."

**NOW is the time to plant KELWAY'S DELPHINIUMS**—fine, bold, upstanding plants, with a wealth of bloom in all shades of blue and purple. They are from strong country-grown stocks, and flourish under almost all conditions.

———, Esq., ——— Greenock.
"All the Delphiniums received from you last spring did very well indeed. I have now about three dozen of your delphiniums. They are the admiration of all the flower lovers in this district."

Choice named collections, 15s., 24s., 34s., 56s. a dozen.
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

**FIDLER'S NEW ILLUSTRATED CATALOGUE OF CHOICE GARDEN SEEDS** will be sent, post free, to any address, on receipt of postcard. Write at once for a copy. It may help you to save 50 per cent. on your seed bill this season. FIDLER and Sons, Royal Berks Seed Stores, Reading.

**CHRYSANTHEMUM CUTTINGS.**—My collection contains nearly 600 up-to-date vars. Purchaser's selection, from 1d. each. Catalogue free. H. WOOLMAN, Shirley, Birmingham.

**POULTRY and KENNEL APPLIANCES** of every description. Write for latest Catalogue free on application.—BOULTON and PAUL, Lim., Norwich.

**OSMUNDA FOR ORCHIDS.**
CONSIGNMENTS ARRIVE FORTNIGHTLY.
2s. 6d. per bushel; per bag, 8s. 6d.
SANDER AND SONS, ST. ALBANS.

**THE POPULARITY OF XL ALL SPECIALITIES** increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardener's favourite Fumigant, both Liquid and Cake.

XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown, both poisonous and non-poisonous, are XL ALL WEED KILLER, XL ALL FERTILISER, XL ALL WINTER WASH for Fruit Trees, RICHARDS' BANDING GREASE, etc. Don't forget to ask your N. S. or Florist for Richards' small pink list.

VOL LV.—No. 3,040. SATURDAY, FEBRUARY 3, 1912.

THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Frost.

The advent at last of a period of truly winter weather is a matter of general congratulation to all who are in a position to defend themselves against the effects of biting cold and searching wind. Both the farmer and the gardener, though prevented by the ironbound condition of the soil from doing much on the land, is fully aware that an immensity of good is being done by its internal disintegration and mellowing, by the probable consequent reduction of vermin, and last, but not least, by checking betimes unseasonable growth, which, sooner or later, would be bound to suffer. The young and the healthy of all ages, find themselves invigorated, and are enabled to revel in the outdoor sports of skating, sliding, snowballing, tobogganing, curling, etc., etc., which Jack Frost alone is capable of facilitating, and the whole country assumes a new and refreshing aspect under the brilliant coating of snow or hoarfrost which winter proper brings in its train. Reflecting upon all this, and the immense difference such conditions present when compared with the decidedly miserable, muddy, misty, and moist ones which have prevailed for so long, it is curious to think that a change of a few degrees only, as indicated by the thermometer is sufficient to do so much. On one occasion recently, with the thermometer in the London suburbs at 31 degrees, the warmth of the soil was sufficient to check the frost, and the mixture of rain, sleet, and snow which accompanied this temperature, simply aggravated matters. Out in the country, however, a difference of only two or three degrees sufficed to produce heavy snowfalls, deep enough to impede traffic seriously, and, in many places, that somewhat rare phenomenon of rain freezing as it fell clothed everything with ice, and did much damage to trees and shrubs by its accumulated weight. The turning point of such phenomena is 32 degrees of Fahrenheit, hence termed the freezing point, or point of congelation of water. At that point, and this constitutes, undoubtedly, one of the most providential laws of Nature, the molecules of still water arrange themselves into a crystalline form in such a manner as to occupy more space than before, instead of less, as is the case with nearly all other bodies, so that a piece of ice of a given size, is larger than its constituent bulk of water. This, at first sight, seems an unimportant fact, but, nevertheless, were it not for this our world would be a very different one to what it is, and its habitable area would be immensely reduced. Thanks to this property, ice, bulk for bulk, weighs less than water, since the same contents occupy more space.

MR. W. HOPKINS.

Did water contract continuously by cooling, as it does until, as it were, the last moment when ice is formed, ice no sooner than formed would sink to the bottom, and go on accumulating there. Being thus withdrawn from the thawing and evaporating influence of open air and sunlight, it would eventually reach the surface, and every stream, pond, and lake would very speedily be frozen solid, instead of being covered, and thus protected by a superficial sheet. In all probability, also, owing to the consequent more persistent lowering of temperature due to accumulation, the great polar icecaps would again, as they have before, for a different reason, invade enormous areas to the south and north of their present limits, while, of course, both seas and oceans within the range of winter frosts would become solidified, as well as the terrestrial water areas aforesaid. Hence it would only be in tropical or sub-tropical regions, where frost is rarely experienced, that humanity could flourish or vegetation thrive. This represents, however, but one effect of this apparently unimportant expansion; there is another. Water, with its penetrative power, pervades all our rock systems, whether in their solid stratified state, or in their decomposed superficial forms, which constitutes the bulk of our soils. This water, no matter how finely diffused, fills the cracks, crevices and interstices, and when, by exposure, it falls to 32 degrees F., its molecules irresistibly demand greater space, and consequently force the containing walls farther apart. After a frost we see peculiarly clear evidence of this in every gravel walk, where, not merely is it rendered soft, but every pebble will be seen to have been clearly lifted, and now lies loose in a cavity. It is this property which mellows the land for the gardener's benefit by disintegrating the most obdurate soil to the very utmost, and thus giving entry eventually to the roots of his crops more effectively than any implements could do. When, too, we view a wide prospect of hill and dale, shaped mainly by the denuding action of the streams which intersect it, here, too, it is frost which does an immensity of disintegrating work, disrupting bit by bit every rock which water can permeate, by the irresistible expansion in question. To this we owe the great bulk of our fertile alluvial soil, which forms the major part of our cultivable land.

---

**Mr. W. Hopkins,** who is head gardener to Francis Wellesley, Esq., J.P., at Westfield, Woking, has been prominently before the public during recent years as a successful cultivator of carnations, of sweet peas, and of orchids. At the beginning of his career he spent six years with Messrs. Sander and Sons, St. Albans, chiefly in the hybridising department. Two years among Mr. C. Winn's orchids at Selly Hill, Birmingham, followed, and then came two other years spent in the fruit and plant department at Kingsweston House, near Bristol. After this large experience under glass Mr. Hopkins spent three years in the kitchen garden and hardy fruit department in Mrs. Leveson Gower's gardens at Bill Hill, Wokingham, and left there to become foreman at Leighton House, Westbury, where he stayed two years, and then entered service with Mr. Wellesley. Some of his successes include the Champion Cup at Guildford for chrysanthemums, which he won three times in succession, and fifty first prizes for carnations. He has held the Eckford Cup for sweet peas, and was runner-up for the National Sweet Pea Society's Provincial Cup at Saltaire; the Reigate Cup and the Gamage Shield for sweet peas have also fallen to his share, while for orchids numerous First Class Certificates and Awards of Merit have been obtained from the Royal Horticultural Society, the majority being granted to hybrids raised at Westfield.

**Proposed Exhibition of South African Fruits.**—The Rev. W. Wilks writes: "The following cablegram was received on January 22 by the High Commissioner in London for the Union of South Africa from the Department of Agriculture, Pretoria: 'Owing to unforseen circumstances regret Government compelled to abandon exhibition.' No further explanation has yet come to hand, but it is necessary to abandon the exhibition accordingly. All notices of it appearing in the Royal Horticultural Society's Book of Arrangements, on Fellows' tickets, and elsewhere, are cancelled.

**Revival of the Hull Chrysanthemum Show.**—For some time past a strong desire has been felt by chrysanthemum lovers in the district of which Hull is the centre, that the chrysanthemum shows, which were allowed to fall into abeyance some eight years since, should be revived. As the result of this feeling a public meeting was held in the Town Hall, Hull, for the purpose of considering the question. The chairman was the Right Hon. T. R. Ferens, M.P., and he was supported by the Mayor and Sheriff of Hull and an influential body of citizens and the leading chrysanthemum growers. After some discussion it was unanimously resolved to revive the chrysanthemum show. The title of the Hull and East Riding Chrysanthemum Society has been revived, and a strong executive formed, with Mr. James Dixon, who for many years took an active part in the management of the old society as honorary secretary. The exhibition will open on Wednesday, November 20, and, presumably, be continued on the following day, but we have no definite information upon this point. It will be held in the new City Hall, which is in the centre of the city, and in every way suitable for an autumn flower show.

**British Gardeners' Association.**—As notified in our issue of January 20, Mr. J. Weathers has resigned the position of general secretary, which he has occupied during the past seven years, and on the 25th ult., a special general meeting was held at Carr's Restaurant, Strand, for the purpose of receiving his resignation and other business. The latter comprised the alteration of rules, and confirming the subcommittee's report upon the future management of the association, as adopted by the Executive Council. Mr. Frogbrook, the chairman of the Council, presided, and there was a large attendance of members, including a considerable number of representatives of the branches in the provinces. At the commencement of the meeting the Chairman directed attention to the fact that, as it was a special general one, the proceedings should be regarded as private; therefore the Council had decided not to allow the members of the Press, as such, to be present, unless the members wished it otherwise. On the question being submitted, it was decided by a large majority that the Press should not be admitted. While we respect the decision of the meeting, we protest against the refusal to allow the Press to give a report of the proceedings in the usual manner. The exceptional course taken on this occasion is all the more remarkable, for to us there did not appear anything in the course of the proceedings, which extended over about three and a-half hours, to whirh publicity might not have been given with advantage. For instance, there could surely be no objection to the publication of the fact that at this meeting Mr. John Weathers was heartily thanked for his splendid services, and was unanimously awarded the gold medal of the association, which is to be accompanied by an illuminated address! Since writing the foregoing we have received from the association, through Mr. Hawes, the Council's report of the proceedings at the meeting, but as our representative was not allowed to carry out his duties and thus provide our readers with an independent report, we do not propose to publish it.

**Rose Show at Belfast.**—The National Rose Society's visit to Belfast on July 19 should be a most interesting one, for the exhibition will be held in the beautiful Botanic Gardens Park, kindly lent for the occasion by the City Council. The local society that will receive the parent body on this occasion is the newly-formed Irish Rose and Floral Society, which has Colonel Sharman-Crawford as president, and includes Messrs. S. McGredy, Alex Dickson (Newtownards), Alex. Dickson (Belmont), and Hugh Dickson (Newtownards) among its official members. Belfast, needless to say, is the centre of a great rose growing and rose raising industry.

**American Roses at the International Show.**—The Massachusetts Horticultural Society has offered a gold medal, to be awarded at the International Horticultural Exhibition in May, for the best display of roses of American origin in pots. Mr. J. K. Farquhar has been appointed delegate from the Massachusetts Society to the great show.

**Sale of Herbals and Old Gardening Works.**—The library of the late Dr. J. F. Payne, librarian to the Royal College of Physicians, was sold by auction by Messrs. Sotheby, Wilkinson, and Hodge on Tuesday, January 30. There were 235 lots, and these realised £1,089. The Herbals and similar works were arranged in 116 lots, and an effort was made to sell these in one block, but, as the reserve price was not reached, the lots were put up separately. The principal works in this series, the prices realised, and the purchasers were as follows: Dr. L. Fuchs's "New Kreutzerbuch," etc., Basel, 1543, the first edition of this fine herbal in German—£27 5s. (Royal Gardens, Kew); P. A. Matthiolus, "De Plantis, Epitome Utilissima," etc., Franckfort-a-Main, 1586—£7 (Royal Gardens, Kew); Apuleius Platonicus, "Herbarium," Rome, circa 1488, extremely rare, the earliest printed book with figures of plants—£96 (Ellis); L. Fuchsius, "De Historia Stirpium Commentarii Insignes," Basel, 1542—£25 10s. (Tregaskis); Herbarius Patavie," Passu, 1485, a fine and perfect copy of this very rare herbal — £69 (Maggs); "Herbarius Teutsch," printed by Schoeffer, 1485—£22 (Leighton); "Herbarius zu Teutsch und Allerhandt Kreuteren," Augsburg, 1496—£26 (Llewellyn); three editions of the "Hortus Sanitatis," by Joannem de Cuba, one printed at "Moguntiae," by J. Meydenbach, 1491—£46; another at Cologne, circa 1496—£31; and the third from the Paris Press of Philippe Le Noir, no date, but about 1539—£35 (all purchased by Messrs. Wesley); Ortolff von Beylandt, "Ein Artzneibuch," the very rare original edition printed at Augsburg by G. Zainer, circa 1471—£24 (Maggs).

**Fijian Plants.**—The lecture to be delivered before the Royal Horticultural Society on Tuesday, February 6, at 3 p.m., at Westminster, should be of unusual interest. The lecturer is Sir Everard im Thurn, K.C.M.G., and his subject "Plants of the Fiji and other South Sea Islands."

**Anemone and Pompon Chrysanthemums.**—We are much gratified to learn from the report which will be presented to the members of the National Chrysanthemum Society, at the annual meeting on Monday evening, that the committee have decided to offer special prizes for seedlings of pompon, anemone pompon, and large anemone varieties at the autumn exhibition, to be held in 1913. Our gratification is derived from the fact that while distinct in character, and of great beauty, these sections have of late years been much neglected by chrysanthemum societies generally. We trust that the new departure on the part of the National Chrysanthemum Society will be successful in directing the attention of chrysanthemum lovers to the merits of these sections.

**National Chrysanthemum Society.**—The annual general meeting of this society will take place at Carr's Restaurant, 264, Strand, W.C., on Monday next, February 5, at 7 p.m., with Sir Albert Rollit, LL.D., D.C.L., president, in the chair.

**Partial Sterilisation of Soil for Glasshouses.**—During the past few years Dr. E. J. Russell, of the Rothamsted Experimental Station, has devoted considerable attention to the investigation of the effects of sterilisation on soil used for cultural purposes, and in the course of his experiments has obtained some remarkable results. To the current issue of the "Journal" of the Board of Agriculture, Dr. Russell contributes, conjointly with Mr. F. R. Petherington, B.A., a report on "The Partial Sterilisation of Soil for Glasshouse Work," which is not less deserving the attention of the practical cultivator than of the scientist. One of the great difficulties with which cultivators of cucumbers, tomatoes, and some other crops under glass have to contend is keeping the soil free from organisms more or less injurious to plants. As the investigators point out, "before very long the soil may be so infected with the germs of undesirables that it is little better than a death-trap for the plants, and has, therefore, to be thrown out." Recent experiments have shown that, by means of certain poisons, or by heat, these germs and the injurious bacteria can, practically speaking, be destroyed, and the beneficent food-making bacteria be thereby enabled to multiply freely, and make much more food than before. Such heated soils are, therefore, well suited for crops grown under glass, because they are free from harmful organisms. This differential treatment whereby some organisms are killed and others are spared, is known as partial sterilisation. The plants that were utilised in considerable detail, and the text is freely chrysanthemums, tomatoes, carnations, cinerarias, cucumbers, and melons, verbenas, and lettuce. The results are given in considerable detail ,and the text is freely illustrated, so that there is no difficulty in following the authors. Their conclusions, briefly summarised, are: Partial sterilisation of the soil increases the supply of food for the plant, somewhat alters its growth, and kills insect pests. It may cause a temporary retardation of growth. It was not proved advantageous for pot work, where abundant supplies of clean virgin soil and manure are available. It is very useful for work with borders, cold frames, and plants that are run for some time without fruiting. It is particularly useful for commercial glasshouses, where soil pests are a source of trouble, and soil sickness sets in. The most effective method of partial sterilisation is to heat the soil to a temperature above 140 deg., but not exceeding 212 deg., very satisfactory results being obtained between 180 deg. and 200 deg., and ½cwt. or less fuel is required per ton of soil.

**National Amateur Gardeners' Association.**—The syllabus of this strong and ably-managed association for 1912 is before us, and, as usual, it contains particulars of a large number of competitions to be held at the monthly and other meetings held during the year. The classes range from lowly and useful vegetables, through plants and flowers of many kinds, to the aristocratic orchids, and they are so arranged that they offer inducements to a very large number of the members, and are a direct encouragement to careful and skilful cultivation. The summer show is to be held at Winchester House, on July 13. A series of lectures has also been arranged, to be delivered at Winchester House, Old Broad Street, as follows: "Zonal Pelargoniums," by Mr. H. J. Jones, on March 5; "Ferns," by Mr. H. B. May, V.M.H., on April 2; "Orchids for Amateurs," by Mr. C. Alwyn Harrison (with lantern slides), on May 7; "Kew Gardens: Their History and Attractions," by Mr. Charles H. Curtis (with lantern slides), on June 4; "Hardy Plants for Sun and Shade," by Mr. A. J. Macself, on September 5; "Vegetables for Exhibition," by Mr. Edwin Beckett, V.M.H. (with lantern slides), on October 1; and "Gardens of Roses," by Mr. George Gordon, V.M.H. (with lantern slides), on November 5.

**Yucca with Curious Outgrowths.**—Mr. G. A. Bowles contributed to the recent meeting of the R.H.S. Scientific Committee leaves of Yucca filamentosa flaccida from his garden, with curious, short, hollow, horn-like lateral growths near the top of the leaves. He had seen the same thing in the same variety in the gardens of Trinity College, Dublin, and all the plants of this variety, but of this variety only, showed the peculiarity in his garden every season.

**Mushroom Culture in France.**—The commercial cultivation of mushrooms is carried out on a large scale in the suburbs of some of the larger towns in France, especially in the vicinity of Paris and Bordeaux. The production of mushrooms in the neighbourhood of Paris is very large, the supplies obtained being nearly equal to the whole of the demand of the city, often large quantities have been exported to England. The abandoned quarries of building stone, chalk, etc., are utilised for the purposes of the mushroom crop, and about 1,500 employees are engaged in the management of the beds and gathering the mushrooms, and packing them for market. It is estimated that about 500 cwt. of mushrooms are gathered daily during the summer months from the beds around Paris. In Garonne and Gironde 113 quarries are devoted to the production of mushrooms, and about 16,800 cwt. of mushrooms are gathered annually, the average price being £2 per cwt. There has been a decrease in mushroom culture in Garonne and Gironde within recent years, but in France, as a whole, there has been some increase, as the result, chiefly, of the rise in the price of mushrooms. The syndicates of mushroom growers estimates the total annual production at 128,000 cwt., and valued at £320,000. The shortage in suitable manure, due to the development of motor traffic, is being felt in France, as in this country, and the cost has materially increased. It is, indeed, thought by some that a limit has been placed upon mushroom culture round Paris by the decrease in the supplies of suitable manure.

**Royal Gardeners' Orphan Fund.**—Following the annual election of gardeners' orphans to the benefits of this fund, which will take place on Friday afternoon next, at Simpson's, 100, Strand, W.C., the committee and friends will dine together at 6.30 p.m., under the chairmanship of Mr. Henry B. May, V.M.H.

**Amateur Gardeners' Bohemian Concert.**—As a wind-up to its 1911-12 season the National Amateur Gardeners' Association have arranged a Bohemian Concert, to take place in the Council Chamber, at the Holborn Restaurant, on Wednesday, February 7, at 7.30 p.m. The prizes won at the various competitions and exhibitions during the last year will be presented on this occasion.

**Dry Cultivation,** which has been greatly extended within recent years, both in America and on the Continent, with evident advantage, was dealt with in a paper of much value by one of the delegates from Hungary at the International Institute of Agriculture at Rome. The great value of this method of culture had prominent attention given to it by the reader of the paper, and many proofs of the advantages derived from it were given. Dry cultivation is practically the maintenance of a loose surface by frequent use of the horse or hand hoe. The practice is, of course, of greater importance in dry climates than in this country, but there has been abundant proof of late years of the beneficial results following its adoption both in gardens and on farms in the United Kingdom. Those who visited the Woburn Experiment Station in July last had the opportunity of seeing a field of swedes looking healthy and prosperous, when in Bedfordshire generally the crop was almost a total failure. Dr. Voelcker attributed the comparative luxuriance of the Woburn crop to efficient surface cultivation. The hand and horse hoeing had probably not been so systematic as would be prescribed under the principles of dry farming, but it had been constant enough to minimise the effects of the drought. A prominent farmer in Bucks was also able to detect the influences of a fine surface mould upon the condition of his swedes and turnips. He continued to hoe the surface throughout the drought with the object of checking capillarity and conserving whatever moisture was in the soil, and, although the plants made little progress at the time, they responded quickly when the rain came late in September.

**Croydon Gardeners' Annual Dinner.**—The Croydon Horticultural Mutual Improvement Society held its twelfth annual dinner at the Greyhound Hotel, Croydon, on Thursday evening, February 15, at 7.30 precisely. A large attendance of members and friends is anticipated.

## COLOUR ARRANGEMENT IN FRONT GARDENS.

No person acquainted well with the aspects of our suburban and country roads, their monotony, dreariness in shade, garishiness in sunshine, but would wish to do something to render them more interesting and fair. The trees that overhang roadways are seldom of more than five or six sorts within a radius of a mile, the shrubs are not only mainly alike, but each is repeated half a dozen or more times in each garden; hedges are all of euonymus or privet, laurel, or yew.

Owners of front gardens possess each a great opportunity, therefore, since a very little originality ensures a great amount of appreciation; but of all the features that gain praise the most successful, as the least expensive, will be a striking colour scheme. If all the plants are those with golden flowers, the result will be an appearance almost of perpetual sunshine; a few dark evergreen, or crimson, foliaged shrubs are advisable, but the majority may be yellow-leaved, or so variegated that gold enters largely into their composition. An all-scarlet garden arrests notice instantly, and it is not difficult to carry out, since the popular pelargoniums can be pressed into service during summer to aid the perennials in maintaining the brilliant show. This is especially the garden to create on the east or west side of a road where there is sunshine only for a short period of each day. The neighbourhood of a red brick house will be no detriment, though a white or grey one will prove a far better foil to the glory of the vermilion flowers.

Blue gardens are suitable in hot situations, either by red, white, grey, or yellowish brick houses. On the whole, the result is better when variegated shrubs are freely used, and golden privet, golden elder, can also be recommended for their vivid contrast, intensifying every shade of blue. Groups of these shrubs will sufficiently separate different shades of blue, for the tone of delphiniums, Centaurea montana, gentians, borage, annual cornflowers, anchusa, is quite antagonistic to that of campanulas, violas of most sorts, asters, Michaelmas daisies, etc. Azure blues, as represented by many delphiniums, Polemonium Richardsoni, and forget-me-nots, ought also to be massed in unison.

An orange front garden, before a grey or white house, is remarkably effective and easily planned. The hues of marigolds, French and African, or the old English calendulas, of chrysanthemums, dahlias, and Tagetes signata pumila, gazanias, heleniums, rudbeckias, begonias, zinnias, day lilies, Iceland poppies, offer variety.

Arches in front gardens afford excellent patches of shade, as well as giving shelter from devastating winds. One charming example of the employment of arches was seen in a seaside town, the supports being of varnished wood, the climbers clematises of different shades, on a foundation of Japanese honeysuckle. It is often advisable to use this hardy climber with others of less strong character, as it enwraps the more delicate stems, which would otherwise suffer from cold gales. The arches, six in number, started at the entrance gate, and continued at intervals until one formed a porch.

A large centre rockery mound would make a novel ornament for a small front lawn, in place of the usual round bed, and a much greater diversity of plants could be grown. To scatter large rocks, singly, also in groups, over side borders, will be found to add interest, as well as to produce a novel effect.

M. H.

# THE VALUE OF BIRDS TO MAN.

(Continued from page 58.)

## Value of the Bird in Checking Insect Irruptions.

The marvellous powers of flight and perception possessed by birds ably fits them to perform the office of a swiftly-moving aerial army, large forces of which can be massed at any given point to correct disturbances caused by abnormal outbreaks of animal or vegetable life.

When the Mormons first settled in Utah their crops were destroyed utterly by myriads of black crickets that streamed down from the mountains. Promising fields of wheat in the morning were by evening as bare as though the land had not been sown. The first year's crop having been destroyed, the Mormons had sowed seed the second year, and again the crop promised well. But again the crickets appeared, devouring every blade of wheat, and the followers of Joseph Smith were on the verge of starvation. At this juncture, Franklin's gull came by hundreds of thousands, and, feeding greedily on the crickets, freed the fields of the pest. The settlers at Salt Lake regarded the advent of the gulls as a heaven-sent miracle, and practically canonised the birds. Several times afterwards the crops of the Mormons were attached by the crickets, and were saved by the gulls.

In the early days of the colonisation of New Zealand swarms of caterpillars infested the open tussock-clad country. When the white man began to cultivate the land this caterpillar disappeared from its old haunts and attacked the English grasses and cereal crops, increasing so enormously in numbers by reason of a more favourable environment, that they quickly became a blasting plague. They came not singly, or even in battalions, but in mighty armies, which laid waste the land. I have seen regiments of this invading force cover the pastures in such numbers as to make the green one brown. I have seen them march out of one cornfield—having stripped every stalk bare—cross the road in solid phalanx, and pass into another. I have seen big mobs of sheep mustered in hot haste and driven backwards and forwards to crush the atoms with their hurrying feet. I have seen every available horse-roller in a district brought up hurriedly, like engines to a fire, and dragged to and fro over the crawling masses until the huge cylinders stuck fast in a mire of crushed insects. I have seen large ditches dug in an attempt to stop the invaders' progress. The effort was as futile as that of a child who builds a bank of sand by the sea, thinking it will stem the oncoming tide. Even railway trains were brought to a standstill, the wheels of the engines being unable to grip the rails owing to the countless hordes of caterpillars which were crossing the line.

In time it became abundantly clear that if this disastrous condition of affairs continued it would be useless to attempt to carry on agriculture in New Zealand. Realising that any attempt which they might make to rid the smitten land of the plague would be but a mockery, the farmers turned their eyes longingly to the natural enemy of the caterpillar—the bird. But the native birds—though they had lived in closest companionship with the Maoris—had been taught the treachery of the white man in a school that reeked with blood, and those that had not been killed had retreated from the vicinity of the settlements, visiting the insect-ridden fields occasionally only.

Wherefore insectivorous birds from the old country were introduced, and the one that multiplied most rapidly was the sparrow. And the sparrow soon cut short the career of the caterpillars.

I have said that birds, because of their unrivalled powers of locomotion, are peculiarly adapted to suppressing unusual outbreaks of vegetable as well as of animal life. Here is an instance of this.

That formidable imported weed, the variegated Scotch thistle, threatened at one time to overrun the whole of New Zealand. Where it had once fairly established itself it seemed well-nigh impossible to eradicate it; and it was spreading with the speed of scandal. Much time and money was spent in cutting off the plants close to the ground, and in pouring turpentine upon the stumps. But the wind-driven clouds of thistle-down, which were planting the weed far and wide, grew yearly denser and more frequent. At length the fields became a thickly-packed growth of prickly plants, which nothing could face.

The sparrows took to eating the seed. In tens of thousands they fed on it, giving it the preference of all other hard food, and the weed was conquered.

To-day, in New Zealand, the sparrow is looked upon as an impudent thief, without a redeeming feature in its character.

No one, of course, can say what would happen if the sparrow was dismissed from New Zealand, but it is as certain as anything in this world can be that the Dominion would be again overrun with caterpillars and thistles.

As it is, the good the sparrows do must far outweigh the mischief which is laid to their charge. This statement receives the amplest confirmation in the bountiful harvests with which New Zealand is blessed. Never were the sparrows more numerous, never the complaints against them more bitter; yet the yield of grain is without precedent.

The growling of the New Zealand farmer at the sparrow, again justifies Virgil's complaint of the "miserly husbandman." Miserly, indeed, and blind. Not a grain will he give the bird which has laboured unceasingly for eleven long months to free the soil from grubs; but whole fields of wheat to the caterpillar!

## Birds in Woods and Forests.

Birds attain their greatest usefulness in the woods and forests, because the conditions there closely approach the primeval.

Forest trees have their natural insect foes, to which they give food and shelter, and these insects in turn have their natural enemies among the birds, to which the tree also gives food and shelter. Hence it follows that the existence of each one of these forms of life is dependent upon the existence of the other. Birds are not only essential to the well-being of the tree, but the tree is necessary to the life of the bird.

Consider for a moment the life of a tree in connection with the insects that prey upon it. At the very beginning, before the seed or nut has germinated, it may be entered by a grub which destroys it. Should, however, the seed or not be permitted to grow, the roots of the seedling may be attacked by beetles. Escaping this danger, a worm lays its eggs in the cracks of the bark. On hatching, the worm, or borer, perforates a hole in the stem. This hole, admitting water from every passing shower, causes a decay in the wood to commence, from which the tree may never recover. Other borers feed upon the bark, eating the soft inner layer and the sap. The twigs are affected by the larvæ of certain beetles, which act as girdlers, sometimes destroying limbs over an inch in diameter. Weevils bore under the bark and into the pith, making excavations in which the eggs are laid. For the same purpose the cicada makes a terrible wound, which often proves fatal. The limbs of trees are affected by aphides which puncture them, and feed upon their juices, exhausting the sap. Many species of plant lice and scale insects infest trees, doing great damage, while over 100 different species of gall flies are parasitic upon them. The buds of trees are entered and destroyed by the larvæ of certain moths, while the leaves are devoured by caterpillars. To take the oak as an example, it is known that altogether over 500 species of insects prey upon it. Finally, be it remembered that in the bark and in the underlying tissues lie the vital energies of a tree.

I spent the formative period of my years in, or in close proximity to, primeval forests, and going often to Nature's mighty school to learn her secrets, I was lastingly impressed by the way in which the care of the tree is kept up throughout the changing seasons by bird life, each species exerting its peculiar repressive influence upon the increase of this or that one of the various forms which insects assume.

How dependent trees are on birds for their existence may be gathered from the following illustration, instances of which I have often seen when the services of one or more of their natural protectors have been withdrawn. As now so generally known, trees breathe through their leaves. Consequently, if the buds of the leaves are prevented from developing by worms, or are eaten, when developed, by caterpillars, the tree is weakened. Many coniferous trees will die if stripped of their foliage for one year. Deciduous trees, if deprived of their respiratory organs for several years in succession will also perish, though these trees linger as a rule for two, or even three, years before finally succumbing.

Nor is injury to its breathing organs the only danger to which a tree, afflicted in this way, is subjected. The tree, being in a weakened condition, is at once beset by beetles, and other borers, who, multiplying rapidly under such favourable conditions, tunnel under the bark until all the vital tissues of the poor tree are wasted. Thus a tree, which might have recovered from the injury to its lungs, falls a victim to the attacks of an insidious enemy which took advantage of its feeble state.

Woodpeckers, or other birds of similar feeding habits, would have flown to the rescue of the tree, and possibly saved its life; but, when that corrective influence is missing, the tree must die.

This illustration of the dependence of the tree on the bird, and of the bird on the tree, is, of course, but one of a long series that could be cited, and it is because of this most delicate adjustment between the tree, the insect, and the bird, that I regard as profoundly true Frank M. Chapman's statement "that it can be clearly demonstrated that if we should lose our birds we should also lose our forests."

## The Value of the Bird in the Orchard.

For man's purposes the work of the bird in the orchard is not so thorough as that done by them in the forest. Birds are the slaves of Nature, and, in the main, Nature's endeavours are put forth only to produce such fruits as will ensure the perpetuity of each species of tree. With man the case is altogether different. His main object is not the propagation of trees, but the production of heavy crops. Moreover, by introducing arsenical syraying, tarred and greased bands, and other devices to counteract the evil action of insects, he has, to a certain extent. taken upon himself the office of the bird. In this he is wise, for it must be admitted that if he wishes a large crop of fruit, he must himself prevent the inroads of those insects which attack the fruit directly. It cannot be expected of the bird that it will become an efficient ally of man in protecting the artificially produced fruit from the attacks of the numerous insects that are drawn to the orchard by a vastly increased quantity of fruit of a vastly better quality than the natural product.

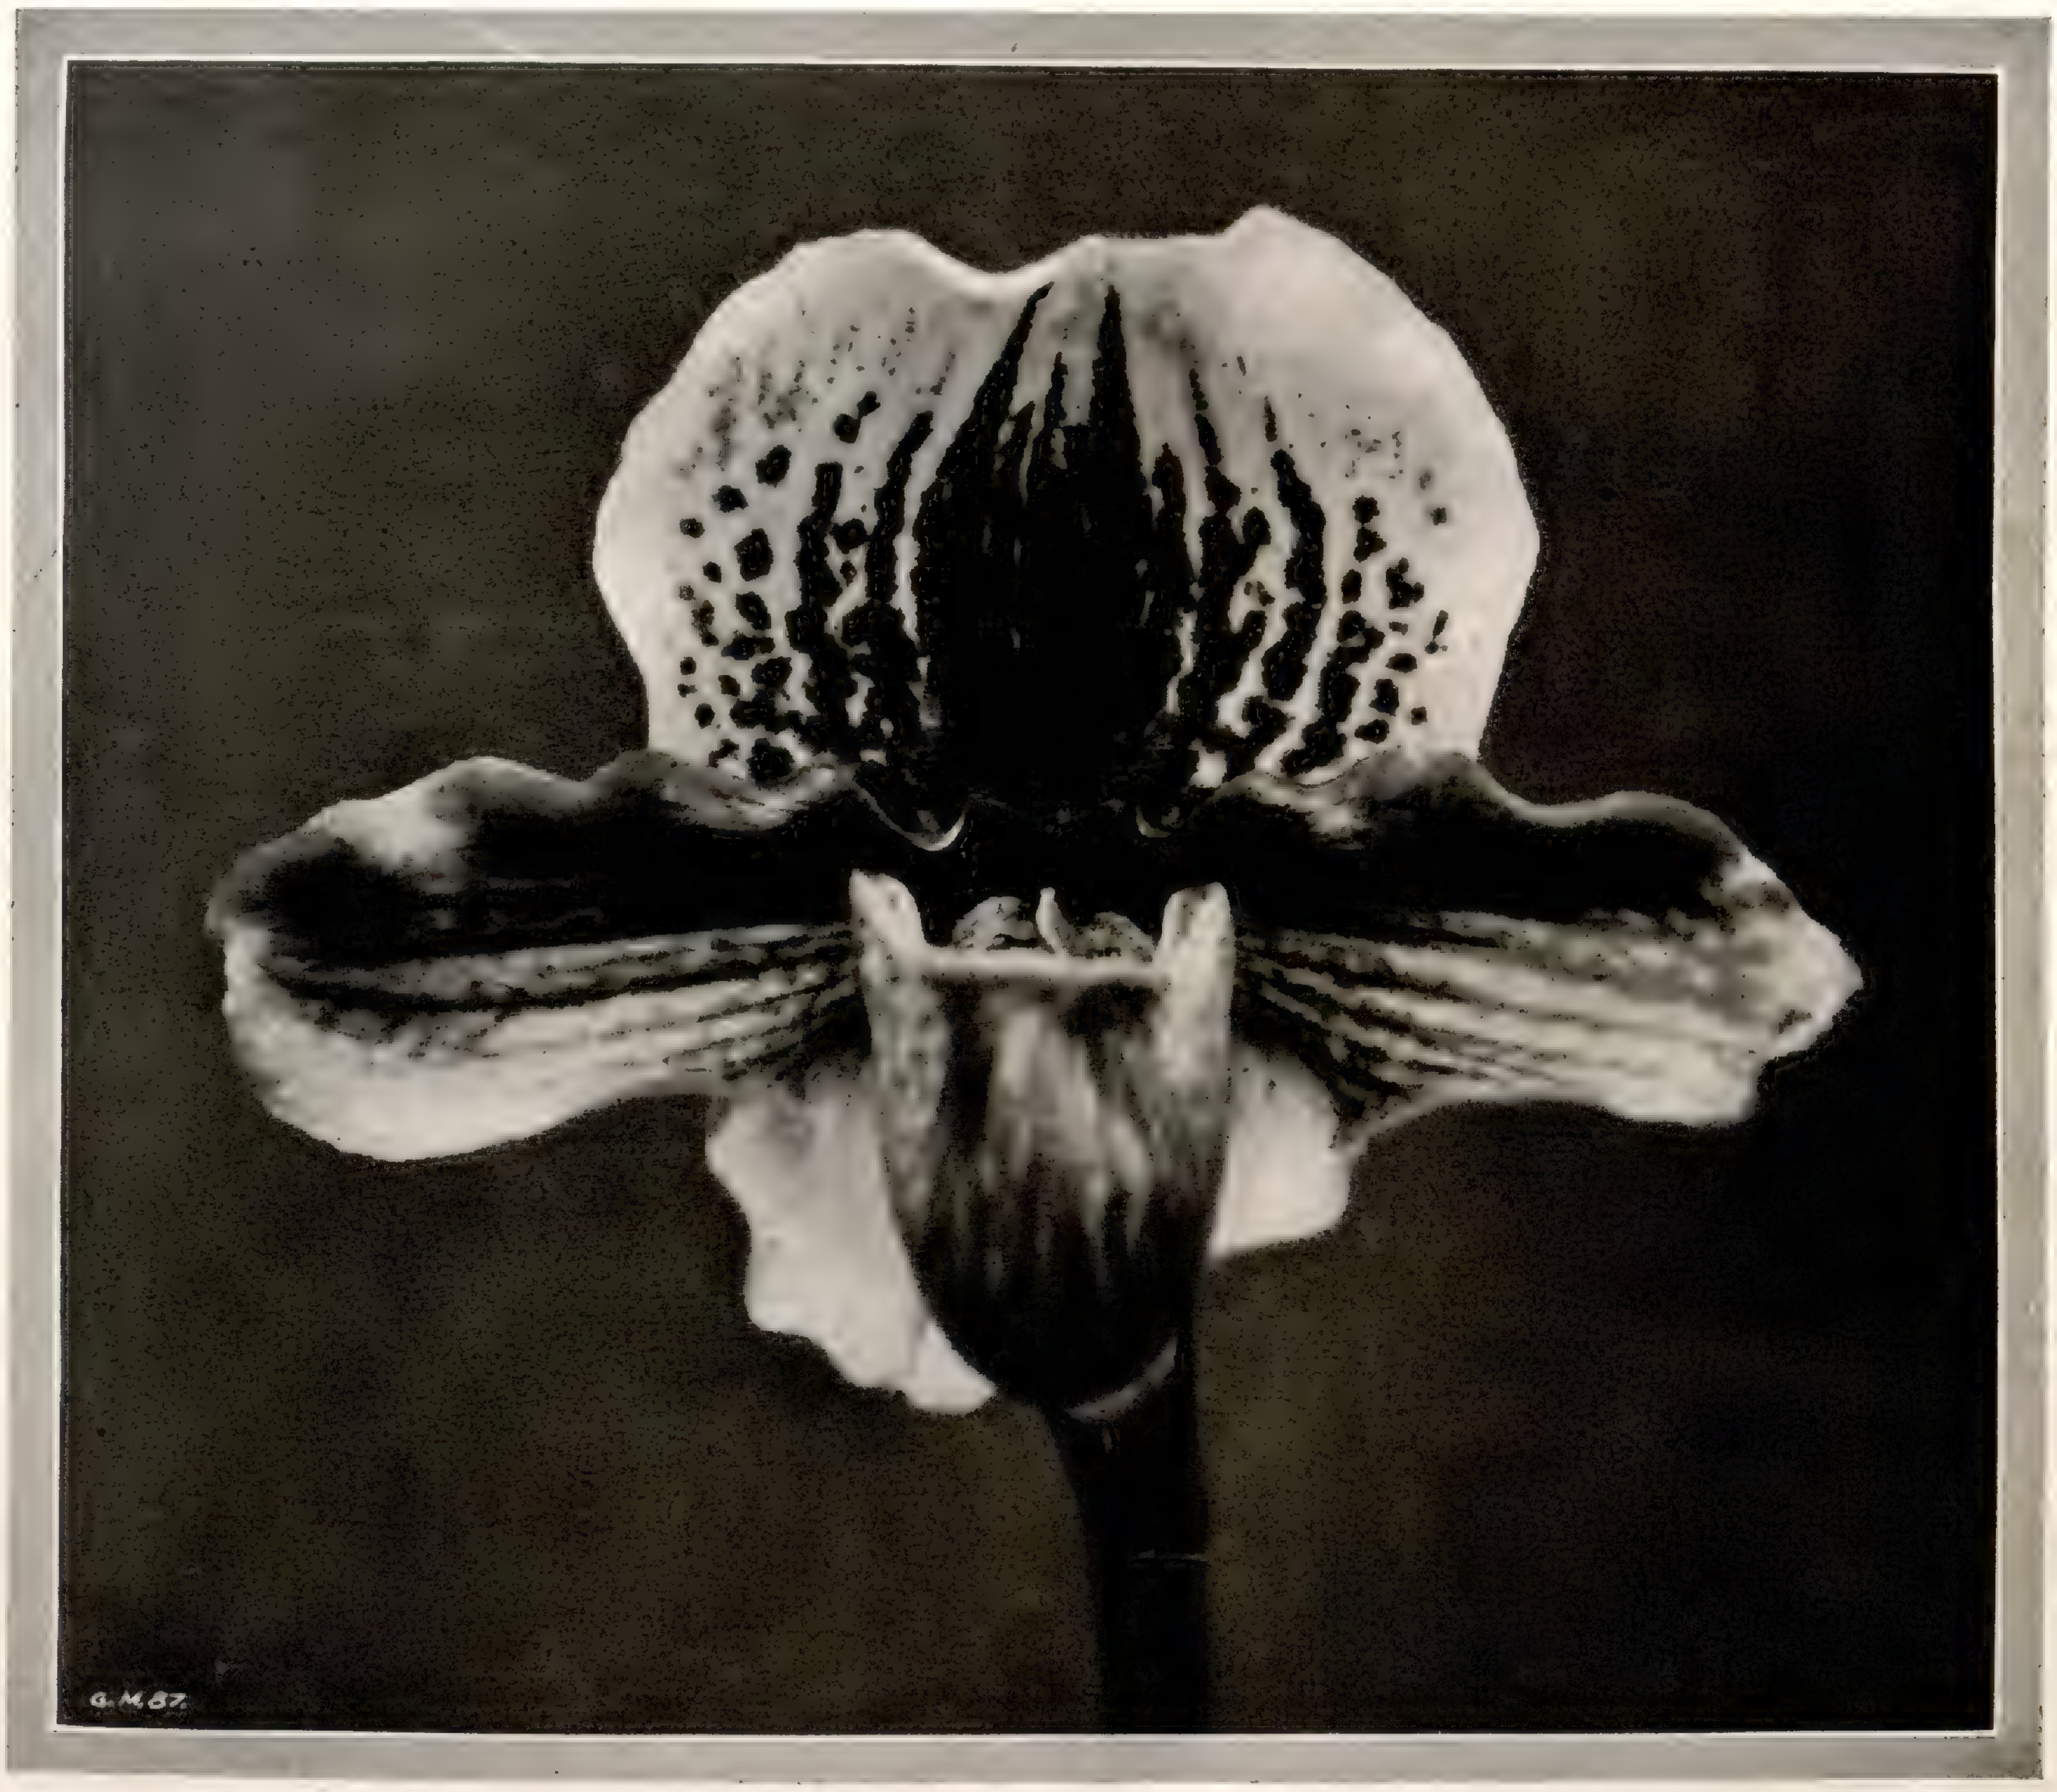
For all that, fruit-growers are largely indebted to the bird for a great part of their annual crop. There are a host of tiny creatures that are not affected by spraying. These lilliputian pests are the plant lice and their allies, bark lice and scale insects. Usually their presence is unnoticed on account of their diminutive size; but they suck out the juices of the tree, and are exceedingly harmful. If their multiplication remained unchecked, the ultimate result upon the development of the fruit, if not upon the life of the tree, would be very great. But nothing, however small, escapes the prying eyes of a bird, and it clears the trunk, branches, and twigs of the tree of these encumbrances.

(To be continued.)

# NEW PLANTS.

### CYPRIPEDIUM NORAH.

A handsome, large-flowered, and distinct cypripedium, obtained by crossing C. Mons. de. Curte with C. aureum Œdippe. The flower has a quite rounded outline, the petals being relatively short and very broad, yellowish, heavily shaded with red-brown. The dorsal sepal is large and rounded, purple, shaded with brown, and with a large white apex. Lip red-brown, shaded with yellow along the rim. The flower exhibited had two staminodes. F.C.C., R.H.S., January 23. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.



CYPRIPEDIUM NORAH.
Awarded F.C.C., R.H.S., January 23. Lieut.-Colonel Sir George Holford.

### CYMBIDIUM SCHLEGELI.

A fine new hybrid cymbidium figured in our issue of January 27. It was raised by crossing C. Wiganianum with C. insigne. The bold flowers have creamy, pink-tinted sepals and petals, these being strewn with dust-like dots of red-purple, the markings being larger and more numerous towards the base. The lip is white, with yellow throat, and has a number of fairly large bright red-brown spots. A.M., R.H.S., January 23. Messrs. J. and A. McBean, Cooksbridge.

### CYPRIPEDIUM DUKE OF MARLBOROUGH.

This large-flowered hybrid has a big dorsal sepal that is white with a green base, and a row of purple spots. The petals broaden towards the apex, and are green, shaded with brown, these colours being repeated in the lip. A.M., R.H.S., January 23. Duke of Marlborough (gardener, Mr. Hunter), Blenheim, Woodstock.

### ZYGO-COLAX CHARLESWORTHI, COBB'S VAR.

A well-grown plant of this form of a striking bigeneric hybrid was exhibited, and the flowers appeared somewhat larger than those of the original hybrid, and the violet colouring on the lip, and the violet veins on the creamy sepals and petals, seemed of brighter shade. A.M., R.H.S., January 23. Walter Cobb, Esq. (gardener, Mr. C. J. Salter), Normanhurst, Rusper, Horsham.

### LÆLIO-CATTLEYA AMABILIS.

A fine hybrid with stout, broad, pure white sepals and petals, and a large wavy lip, purple, margined with white, and with yellow markings in the throat. A.M., R.H.S., January 23. Messrs. Charlesworth and Co., Haywards Heath.

### ZYGOPETALUM MACKAYI CHARLESWORTHI.

A distinct and notable addition, being an albino form of the species, with pale green sepals and petals, and a pure white lip. A.M., R.H.S., January 23. Messrs. Charlesworth and Co., Haywards Heath.

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

# GOOD SUMMER-FLOWERING CLIMBING ROSES.

The best summer-flowering climbing roses, apart from the Wichuraianas, must be looked for chiefly in the multiflora scandens section, popularly known as the Ramblers. Two-thirds of the climbers described in this article belong to this section, the remaining third is made up with one sempervirens, one hybrid China or Musk, one hybrid tea, and one hybrid from Lævigata. Many might think that the Ayrshire and Boursault roses should be represented, and, of course, no collection of climbing roses would be complete that did not include some of these. But in so small a selection as twelve, I do not think they can find a place. The Ayrshires, though splendidly hardy, vigorous, and free-flowering, have not the variety and brilliancy of colour to be found among the multifloras, while the Boursaults, though delightful to hand and eye, on account of their almost spineless red shoots, do not give such a wealth of bloom, as would entitle them to rank among the best summer climbers. If, however, any of my readers should be looking for roses suitable for somewhat wild gardens in rough and perhaps shady places, it is to the Ayrshire and Boursault sections they must turn, for the Multiflora roses want good cultivation and plenty of sunshine.

Crimson Rambler (mult. scan., Turner, 1893), although to my mind by no means the most beautiful, is by far the most popular of the Ramblers—wherever roses are grown at all, one is almost sure to see a pillar or weeping standard of Crimson Rambler covered in July with the big, closely packed crimson bunches characteristic of this variety. If we are planting for distant effect undoubtedly there is much to be said for Crimson Rambler—a good plant makes a brilliant patch of colour in the garden—but seen close at hand the bunches are too heavy for real beauty, and its tendency to mildew is a serious drawback.

Leuchtstern (mult. scan., Schmidt, 1899), with single rose-pink blossoms and white eye, has many of the qualities, both good and bad, of Crimson Rambler—that is to say, it is very effective in the garden, and the flowers last in good condition much longer than is the case with most roses, but they are so closely packed together in the bunches that, unless severely thinned, do not look well when picked, and the plant almost always is attacked by mildew sooner or later.

Blush Rambler (mult. scan., B. R. Cant, 1903) is one of the loveliest climbers we have. It makes magnificent stout shoots of a bright green colour, which, with its large leathery leaves, give a happy impression of health and vigour. Throughout the greater part of July and beginning of August it is covered with huge erect sprays of blush-pink flowers, so delicate in colouring as to remind one of apple blossom.

American Pillar (mult. scan., Conard and Jones Company, 1909) is a good companion to Blush Rambler, with wonderful shining leaves of a very dark hue—in some lights they are almost purple—and so beautiful and persistent that this rose would be worth growing for its foliage alone. Fortunately, however, the flowers are quite worthy of the foliage. The N.R.S. catalogue describes them as deep pink, but I think vivid rose colour with paler centre more accurately expresses the tints. They are single, and borne in very large bunches. American Pillar comes out earlier than Blush Rambler, and this year a plant in our garden was in perfection at the time of the N.R.S. summer show, July 7, when I found its handsome bunches very useful in the decorative classes—and in spite of the great heat of the tent, they kept bright and fresh throughout the day.

Tea Rambler (mult. scan., Paul and Son, 1903), till recently called a Tea, is the result of a cross between Crimson Rambler and a Tea rose. The stems are smaller than those of many of the Ramblers, and the ruddy brown leaves tell of its relation to the teas. The coppery-pink, almost double flowers are large for a rambler, hang loosely and artistically on the branch, and have one delightful attribute lacking, I fear, in most of the Multifloras, that of fragrance. The very vigorous, hardy growth and the absence of a second season of bloom, however, have caused it to be placed among the Multifloras, and it is much more convenient that it should be so. The foliage is retained very late. Looking at a plant of Tea Rambler on December 13, 1911, I found it thickly covered with foliage, while a plant of Blush Rambler close at hand has only a few leaves at the very top.

Tausendschön (mult. scan., Schmidt, 1907) is a seedling from Crimson Rambler, and inherits from its parent the unfortunate tendency to mildew. The leaves are rather far apart on the reddish-brown stems, giving the foliage a thin appearance—but the stems are delightfully smooth and the large deep pink flowers, with curious crinkled edges, came early in mid-June, and last in perfection on the plant an unusually long time. They always remind me of oleanders, though unfortunately they are not such a pure pink; in fact, out of doors they are apt to get a magenta hue which, with the mildew on the stems, spoils them very much. The growth is strong, but by no means rampant. The flowers, if grown under glass, are a much clearer pink than when exposed to all weathers.

The good yellow ramblers are not so numerous as they might be. On the whole, I think

Aglaia (Lambert, 1896) and Claire Jacquier (Bernaix, 1888) are about the best. Aglaia takes time to establish itself, and may be some three or four years before it flowers, but when it does, always provided plenty of room is allowed it, the profusion of little pale yellow flowers, with a slight tinge of apricot in the centre, makes a very charming picture. Here we have it growing up a screen, but it is apt to get too leggy in such a position, and it is much more beautiful in a neighbouring garden where it has been allowed to form itself into a big bower and its long shoots can bend over naturally. The flowers come very early, and are somewhat fleeting; to me they have a scent too like paragoric to be altogether pleasant.

Claire Jacquier is the only rose I am writing about that I have not grown myself. Wall space is precious here, and this rose is said to be tender, and for this reason we have not tried it. But I have seen a big specimen, grown in the open border, transplanted from one Hertfordshire garden to a similar position in another without injury to the plant, so the reputation for tenderness may hardly be deserved. Provided, however, a south or west wall can be spared, Claire Jacquier will be grateful for the shelter, and will show its appreciation by rapidly covering the space at its disposal with its rampant shoots and its multitude of nankeen yellow blossoms. Where a wall cannot be given, the newer Goldfinch, with single yellow flowers, changing to cream colour, may be tried. Goldfinch has a good habit and nice dark foliage, but with us has not yet shown itself as free flowering as could be wished; but probably, like Aglaia, it takes two or three years to become established.

The Garland (hybrid musk, Wells) and Felicité Perpetué (sempervirens, Jacques, 1828) are two very beautiful summer-flowering roses that have stood well the supreme test of time. With all the wealth of new rambling roses given us by the multifloras and Wichuraianas, we can ill afford to dispense with these two veterans.

Few garden sights are more lovely than that of an established plant of The Garland covered with clusters of warm white flowers, and soft fawn-coloured buds. The individual blossoms are quite tiny, and little more than single, but they are produced in such profusion as almost to hide the foliage. I shall not easily forget the picture made by this rose one sunny day of late June in an old Middlesex garden. A long grass path, leading to a formal rose garden, was flanked on either side with tall standards of The Garland in full bloom, the snowy branches drooping almost to the ground, made veritable garlands of roses. But the soft attractive appearance of these wreaths of blossoms is deceptive, and would furnish a text to a moralist discoursing on the danger of trusting in external beauty. Behind those lovely blossoms are myriads of black, peculiarly sharp thorns, making it the least pleasant of roses to deal with from a pruner's point of view. The leaves fall rather early, and are followed by clusters of small orange berries.

Felicité Perpetué is a very vigorous climber that will grow in almost any position, and is specially suitable for covering a bower or summer-house; the great branches are almost evergreen, and the bunches of creamy-white flowers, with rose-tipped buds, are freely produced. They are better left on the plant than cut, as they drop their petals very quickly when picked.

Paul's Carmine Pillar (Paul and Son, 1895) is described as a hybrid tea, and in foliage and way of growth is certainly like this section. But it comes in my list of summer-flowering roses, as it only has one period of blooming, and that an early one, the brilliant carmine-crimson single flowers being produced throughout June. The blossoms are large, quite three inches across, and as far as brilliance and purity of colour goes, are perfection. If the new red perpetual climber Sheilagh Wilson equals Carmine Pillar in respect of colour and freedom of bloom, and in addition flowers again in autumn, it will indeed be an acquisition.

Rosa sinica Anemone, brought out by F. Schmidt in 1895, is the last rose I have in my list. It is a hybrid of Lævigata. Though hardier than Lævigata, it appreciates the shelter of a wall. The N.R.S. catalogue describes it as a semi-climber, but we have found it very rampant on a south wall, where it has smothered its companion on either side with its beautiful glossy foliage, and when in May the soft rose-pink single flowers appear they are so lovely that it is easy to forgive the encroachments they have made. The form of the flowers is prettier than that of any single rose known to me—it is incurved and cup-like, with rounded petals, and the fine golden anthers show up well against the Rose du Barri tint of the inner side of the petals. Unfortunately, the blossoms are somewhat fugitive, but this is partly compensated for by the ample foliage which is retained in perfection well into the winter. WHITE LADY.

---

**The Blue Starwort.**—Very few of our aster species are natives of Europe, but the Blue Starwort (Aster acris) is one of them, and though several varieties have been raised differing in height and time of flowering, the original species remains one of the most beautiful of the family notwithstanding the 300 or 400 varieties at present known to florists. It is a slender plant, rarely attaining a height of three feet under the best conditions, and usually not more than two. It possesses an additional claim to regard with some people in that it does not spread, as so many kinds do, and, in fact, in a very heavy soil will not increase as one would like it to do. It may be left untouched for several years in the border, the only reason for moving it being its deterioration owing to the exhaustion of the soil or the desire to propagate it. It is one of the earliest of the asters to come into flower, and when one sees its minute flower buds on the tips of its slender stalks in mid-August one would never think it could make any show at all. Yet its colour is one of the best; its massed blossoms being highly effective, and for cutting it is perhaps the most useful of all. Mr. William Robinson tells us how he had some thousands of plants of this and the large Italian starwort (A. amellus) growing beneath a group of half-grown firs, and that he never had such a return of beauty from anything else. No matter what the weather the mixture of blue and purple was a picture. As a pot plant it is useful for massing in the conservatory before the chrysanthemums are put in, and though single plants look leggy, the effect of a dozen or so with some low-growing plants in front of them is very fine indeed.—ALGER PETTS.

## CYPRIPEDIUM VENUS.

This hybrid was first recorded in a catalogue of the Woodlands Collection of Cypripediums, at Streatham, which was published about the year 1895. The hybrid was described as having been obtained from the intercrossing of Cypripedium insigne Sanderæ and C. niveum. If I remember correctly it was not until the spring of 1902 that the late Mr. Norman Cookson showed Cypripedium Venus, Oakwood variety, which was said to be superior to the plant which had flowered in the Woodlands Collection, and the R.H.S. Orchid Committee conferred on Mr. Cookson's plant a First Class Certificate.

For some years this plant was regarded as the only one that had been raised at Oakwood, but from a batch of plants with unrecorded parentage a second example flowered, and this has proved to be more vigorous in constitution than the original C. Venus, Oakwood variety. The flowers are larger and whiter, and the creamy-yellow tint almost entirely disappears with age; the spottings are larger also, and the flower better filled up than in the original form. The flower-stalks are correspondingly longer, and the flowers are held well above the foliage. This vigorous grower was exhibited with the original C. Venus, Oakwood variety, at the Manchester and North of England Orchid Society's meeting, on January 20, 1910, as Cypripedium Venus Oakwoodiense superbum, and received the unanimous award of a F.C.C.

The accompanying illustration will show the strength of a batch of this vigorous form, and it is from a photograph taken in Mrs. Norman Cookson's garden at Oakwood, Wylam, on New Year's Day of this year.

The plants illustrated were grown in a compost of about equal proportions of loam, fibrous peat, and chopped sphagnum, with a liberal addition of sand and finely broken crocks, the latter to assist in rendering the compost porous. The plants are divided and repotted annually, as soon after they have finished flowering as possible. They are raised to within a reasonable distance of the roof glass to prevent the leaves becoming drawn and weakly. The normal temperature of the house is from 60 to 65 degrees in winter, and 68 to 70 degrees in summer. C. Venus likes a liberal supply of root moisture at all seasons, and as it has thick robust roots an abundance of water is necessary when the pots have become well filled with them.

H. J. Chapman.

## CHRYSANTHEMUM MRS. GEORGE RUNDLE.

With an occasional exception this has been almost ousted from cultivation by the larger-flowered members of the incurved section, yet it is such a charming flower that I should not be surprised to see it regain a good deal of its old-time popularity. On the show boards it would be, of course, quite overshadowed by the giants of the present day, but for decorative purposes, especially where the blossoms are brought near the eye, so that their refined character may be duly apparent to the observer, there is, I am convinced, a future before it still.

Without referring it is difficult to say how many years back this dates from, yet with the exception of its sports, there has been nothing since then its equal in a similar way. The flowers are pure white, and the sports referred to, Mr. George Glenny and Mrs. Dixon, have primrose and deep yellow flowers respectively. These are by no means the only old chrysanthemums that have practically disappeared from gardens, and yet are, in my opinion, well worth preserving. Especially noteworthy among these is the brilliantly coloured Tokio.

S. W.

## DECIDUOUS HEDGES.

(Concluded from page 55.)

### The Whitethorn, or Quick.

This, the favourite plant for forming hedgerows throughout estates, is so well known that any special description thereof would be superfluous. That the thorn will thrive in most localities goes without saying, but, all the same, there are but few common plants that respond more readily to good treatment. The great drawback in existing hedgerows is, too often, the presence of large, spreading trees, beneath the shadow of which no hedge plant will thrive satisfactorily, though the line of fence may be maintained, for appearance sake, by the addition of wire or other extraneous aid to strengthen what otherwise must always be a weak part.

The thorn will thrive equally well upon level ground or upon a bank of soil thrown out on one side or the other from the line of the proposed fence. After clearing away all rough herbage to a width of about six feet along the line, or site, a space not less than thirty inches in width, and fully half this in depth, should be thrown out, so as to form a trench, the lower strata of which can then be deeply broken up. If the soil is poor, liberal supplies of manure, turf, or even leaf-mould, can, with much after benefit to the plants, be well incorporated with the excavated soil, as it is returned to the trench, care being taken that a good portion of the best and most finely pulverised is kept near the surface to receive the roots.

Plants, which, having been twice transplanted, at least, once from the seed bed to open quarters, and again twelve months later to afford them necessary space, will, by this time, have attained a height of two feet, more or less, and be proportionately furnished with fibrous roots. Should a single line of plants be decided upon a space approximating four inches apart throughout the line is ample, but double lines, and rather more space between the plants, is preferable, placing these in alternately, and about eight inches apart every way. The usual method of placing the roots at about the same depth as before, and making all firm around them should be followed. Planting may take place at any time between October and April, but where the ground can be made ready in time the late autumn is best, the plants thus getting partly established before severe weather sets in, and are thereby better able to resist drought during the ensuing season. Protection from both game and cattle may be necessary, and must be carried out according to needs, and the exigencies of the situation.

Having completed a season's growth, in the spring following upon this, the plants may be hard pruned to induce a branching habit, thereby laying the foundation of the future hedge. With a sharp knife, or small hook, make a severance at about six inches from the soil, thus entirely removing the tops of the plants. Weeds will now have become troublesome, and should be cleared away, following up this operation, as the necessity for it becomes apparent, at intervals during the ensuing summer, after which the plants will largely take care of themselves in this respect, but rank grass at the sides should for several years be kept under control by means of the scythe.

Should the seasons prove favourable growth will accordingly be rapid, and rather than allow this to proceed unchecked a slight cutting of the tops with the hedge bill at midsummer would be time and labour well spent. In the autumn following close cutting, to incline the hedge to the desired shape, may be practised.

For agricultural land the square, or upright, form of hedge meets with most favour, owing to the small space it occupies at the base; but where ornamentation with utility is desired the slightly oval form will give more satisfaction. The triangle, or wedge shape, is well adapted for exposed situations, as wind and snowstorms have but little adverse effect thereupon.

### Flowering Currants.

The ribes, in various shades of colour, make a good hedge where flowering shoots in late spring are valued, and they bear the trimming process very well.

### Dogwoods and Roses.

Both green and variegated varieties of the dogwood make excellent, compact, low hedges, the coloured stems of which are very attractive when leafless.

Recent additions to the various classes of roses, more especially the Wichuraiana type, have provided quite a new departure in the making of hedges, for which purpose several varieties are well adapted, continuing in great beauty and gracefulness, both in regard to foliage and flowers, for a long period. These, of course, must be pruned, cutting away old and superabundant growths, and, occasionally perhaps, more severe measures, on the attainment of age and roughness. JAMES DAY.

Galloway House, Garlieston.

**Cotoneaster rotundifolia.**—We have had great additions to the cotoneaster family within recent years, but this old species still retains its position as one of the best. The small, dark green, box-like leaves are retained throughout the greater part of the winter, and often at that period they assume a more or less bronzy hue. The berries are bright scarlet in colour, and borne in great profusion, while, as a rule, they seem less palatable to birds than those of some other species.—T.

## ALPINE FLOWERS FOR SUNNY LIMESTONE ROCKERIES.

It is not everyone who can afford to bring stone from a distance for his rockeries, and there are many in limestone districts who have, perforce, to build them of the native stone, which is, after all, an excellent medium for the cultivation of alpine flowers. Many, indeed, of these gems of the mountains grow naturally on limestone, and some of them, in fact, will not thrive unless they are supplied with a certain amount of calcareous matter. But all lime-lovers cannot stand a hot and sunny place, and, as there are many alpinists who have a rockery with a full south exposure, a few notes on the suitable plants will probably be of value to them. Others who have rockeries of other stones and who wish to cultivate any of these plants can easily supply them with some limestone chips or old broken mortar mixed with the soil.

Some of the acænas, or New Zealand Burs, neat little carpeters, as a rule, will do well in such a place. A. argentea is as good as any, and is handsome with its silvery leaves. A. Buchanani, pea-green, will also thrive. They soon cover a good space, and a group of some early bulb, such as Scilla bifolia looks well spearing through these acænas. A choice and somewhat difficult acantholimon, or Prickly Thrift, called A. venustum, with spiny leaves, and neat rose flowers, should flourish if the place is quite well drained. A few of the choicer achilleas, or yarrows, may be chosen, A. argentea, sometimes called Anthemis aizoon, being as good as any. It has silvery, crinkled leaves, and bears daisy-like white flowers in summer. A. rupestris, only some four inches high, is of rather prostrate habit, and has white flowers. A. Clavennæ, also white, has pretty silvery foliage. Some of the æthionemas, or Lebanon candytufts, are lovely little plants for such a rockery. Æ. cordifolium, about six inches high, and rosy-pink, is lovely, as is Æ. grandiflorum, rosy-purple.

For an effective bold plant, Aciphylla Lyalli may be commended. This is one of the Bayonet plants, striking things on good-sized rockeries, with long, rigid, sharp-pointed leaves. Such alyssums as A. saxatile, the well-known Gold Dust, or Madwort, will flourish, but some choicer ones are alpestre and argenteum, both yellow, and spinosum, white. Androsace sarmentosa and A. foliosa are the best of these exquisite flowers for limestone rockeries, and either is lovely indeed, A. sarmentosa being especially pretty. A. Chumbyi is a fine variety of the latter. Anthemis montana and A. macedonica are both lovely little chamomiles with white flowers, and about six inches high. Anthyllis montana is a pretty Kidney Vetch, with whitish leaves and rosy-purple flowers.

Save in cold, wet districts, two snapdragons, named Antirrhinums asarina, white, and glutinosum, primrose, will give pleasure. Quite a striking plant is Astragalus tragacantha, a spiny-looking plant, with pale violet flowers, not often seen. Practically, any aubrietia may be chosen with confidence, and the curious little Centaurea stricta, which often dies out elsewhere, will grow in a satisfactory way. Campanula garganica hirsuta is one of the best of its race for limestone. For rough rockwork any of the cerastiums may be chosen, but they spread too quickly for small rockeries. Coronilla iberica will give pretty clusters of yellow flowers; and the lovely Cyananthus lobatus thrives in some places under these conditions, but, it may be said, not in all.

All the glaucous-leaved pinks will make nice cushions of foliage and flower, and our native Dianthus cæsius, the Cheddar Pink, is quite at home. Erodium guttatum, white, with deep blotches, is charming, and E. supracanum, pink, is a lovely thing. Erysimum pulchellum, although a little coarse, is a pretty hedge mustard, with yellow flowers in spring. The quaint Euphorbia capitata gives heads of greenish-yellow in plenty, though it is a trifle coarse for association with choice plants. Genista pilosa is a fine little woolly broom with yellow flowers, and the lovely Geranium argenteum, with pink, deeper-veined blossoms, is excellent. All the helianthemums, or Sun Roses, delight in such a rockery, and will give abundance of bright little flowers. Lithospermum Gastoni is a choice Gromwell for the limestone rockery, giving charming flowers of blue. Then Lychnis pyrenaica affords little heads of red. An oxytropis named campestris, though a trifle coarse, has pretty yellow pea-shaped blooms.

Some of the spring phloxes, such as The Bride, Nelsoni, Fairy, atropurpurea, and others are lovely with flowers of different colours in spring. They ought not to be forgotten. Potentilla valderia, with silvery leaves, is a nice white-flowered little plant. For a lime-loving primula we have no prettier thing than P. marginata, with flowers of a kind of lilac, and silver-margined leaves. The silvery saxifrages, i.e., those of the encrusted section, may all be grown, but a word of caution is required, and this is not to allow them to become too dry at the root in a season like the last. They are all charming, from the tall S. cotyledon to the minute S. cæsia.

Sedums, or stonecrops, are at home here, and spathulifolium and obtusatum are among the best of a wide choice. As for sempervivums, or houseleeks, their name is legion, and any of them will thrive. Such a rockery is just the place for all the cobweb kinds, such as S. Laggeri and S. arachnoideum. We may finish for the present with the pretty little rock speedwell, V. saxatilis, with blue flowers, with the white variety, V. s. alba, and the pretty trailing Vicia argentea, with silvery leaves and white flowers with purple markings.

Such are some of the many lovely alpine flowers which will adorn to perfection our sunny limestone rockery.

S. ARNOTT.

## PELARGONIUMS AS PYRAMIDS.

It is not often that pelargoniums are seen grown in pyramidal form, yet when so treated they form exceptionally handsome objects. There were two pyramids of this popular bedding plant growing in the gardens at Elsham Hall, Lincolnshire, the picturesque country residence of Sir Francis Astley-Corbett, Bart. These plants were fully twelve feet in height, and were planted round the outside of two round beds eight feet in diameter. The tops of the plants were brought together to form pyramids, and when in full flower they formed objects of especially beauty. The variety is an old, but free-flowering, one called Sultan, and the blooms are an intense scarlet. The plants were struck from cuttings in the year 1868 by Mr. Gardner when he first took up his duties as head gardener at Elsham. The plants are taken up every autumn, and potted, to be kept during the winter under glass. These are probably the only specimens in the country of such dimensions. J. G.

# LILIUM AURATUM AND ITS VARIETIES.

During the winter season bulbs of the Golden-rayed Lily of Japan are imported in immense numbers, and are frequently offered in tens of thousands at the auction sales of bulbs held in London. This alone furnishes a guarantee of its present-day popularity, for it is, as a matter of fact, universally grown, despite its, at times, erratic behaviour. The Queen of Lilies is a popular name applied to this Japanese representative of a noble family, and I do not think anyone will dispute the correctness of this title.

It is now nearly fifty years since Lilium auratum unfolded its earliest blossoms is this country. As a matter of fact, it was first shown by Messrs. J. Veitch and Sons at a meeting of the Royal Horticultural Society, on July 12, 1862, the bulbs having been collected by the late Mr. John Gould Veitch when travelling in what was then the comparatively unknown country of Japan. It was some years after this before it became generally cultivated in this country, as all the early importations were from bulbs collected in a state of Nature. After a time, however, it became evident to the Japanese that its culture would prove to be a remunerative one, and now it, and, in fact, many other lilies, are grown, and sent to this country in immense numbers. What is more, they are now sold so cheaply that their beauty can be enjoyed by prince and peasant alike.

A notable feature of Lilium auratum is the great amount of individual variation which is to be found when it is grown in quantity. I do not refer to the generally recognised and well-marked varieties, but what may be regarded as members of the rank and file. Some are comparatively dwarf, the sturdy stem being clothed with numerous thick-set pointed leaves. As a rule, the flowers of these are of good shape, with the spotting and golden rays clearly defined. The direct opposite to this is a form much taller in growth, with fewer and broader leaves, and flowers borne on long, rather weak stalks, so that they partially droop, and are consequently much less imposing than the others. In some of these the segments are too narrow to form an ideal bloom. Beside these two extreme forms there are many intermediate ones, so that even out of a large batch it is often difficult to pick two alike, as the points of difference are to be found in height, foliage, size, and shape of the flowers, and markings. The bulbs also vary greatly, but I have never succeeded with Lilium auratum, as I have done with Lilium speciosum, in selecting the forms with a certain amount of accuracy from bulbs alone.

The fully-recognised varieties that can be purchased true to name are L. a. platyphyllum, a noble grower with a massive flower. It differs from the ordinary L. auratum in the scale of the bulb being much broader and thicker, while the stem is stouter, and the leaves wider. The flower, too, is more saucer-shaped. In colouring the variety platyphyllum varies somewhat, the blooms being, as a rule, not much spotted, and with a clearly defined golden stripe down the centre of each petal. Occasionally a flower may be met with that is almost entirely white, and sometimes more spotted than usual. This variety was first sent home from a small island on the south-east of Japan by Mr. Charles Maries, when travelling in those regions. It is now, however, cultivated in quantity in Japan, and large numbers are every winter sent here from that country. Beside the varietal name of platyphyllum it is also known by that of macranthum.

L. a. rubro-vittatum, sometimes called cruentum, is a particularly striking form. The bulbs that reach this country are, as a rule, smaller than those of the average L. auratum, but they usually flower well. In this variety a rich glowing crimson-coloured band extends down the centre of each segment. When the flowers are first expanded this band is exceedingly bright and attractive, but before long it changes to a chocolate tint, and is then not nearly so effective as at first. This change is hastened if the weather happens to be hot. Sometimes the margins of the segments have a crimson suffusion.

A direct contrast in colour to this is another small-bulbed variety, namely, L. a. virginale, or L. a. Wittei. In this the petals are thick, wax-like, and of a pure unspotted white, with a golden stripe down the centre of each. The flowers of this remain fresh and bright longer than those of rubro-vittatum. In L. a. pictum we have a variety more densely spotted than the typical L. auratum, with a slight suspicion of the crimson band of rubro-vittatum. It (pictum) is now not often imported, and it varies somewhat in marking, being, apparently, a selection from seedlings of L. auratum itself.

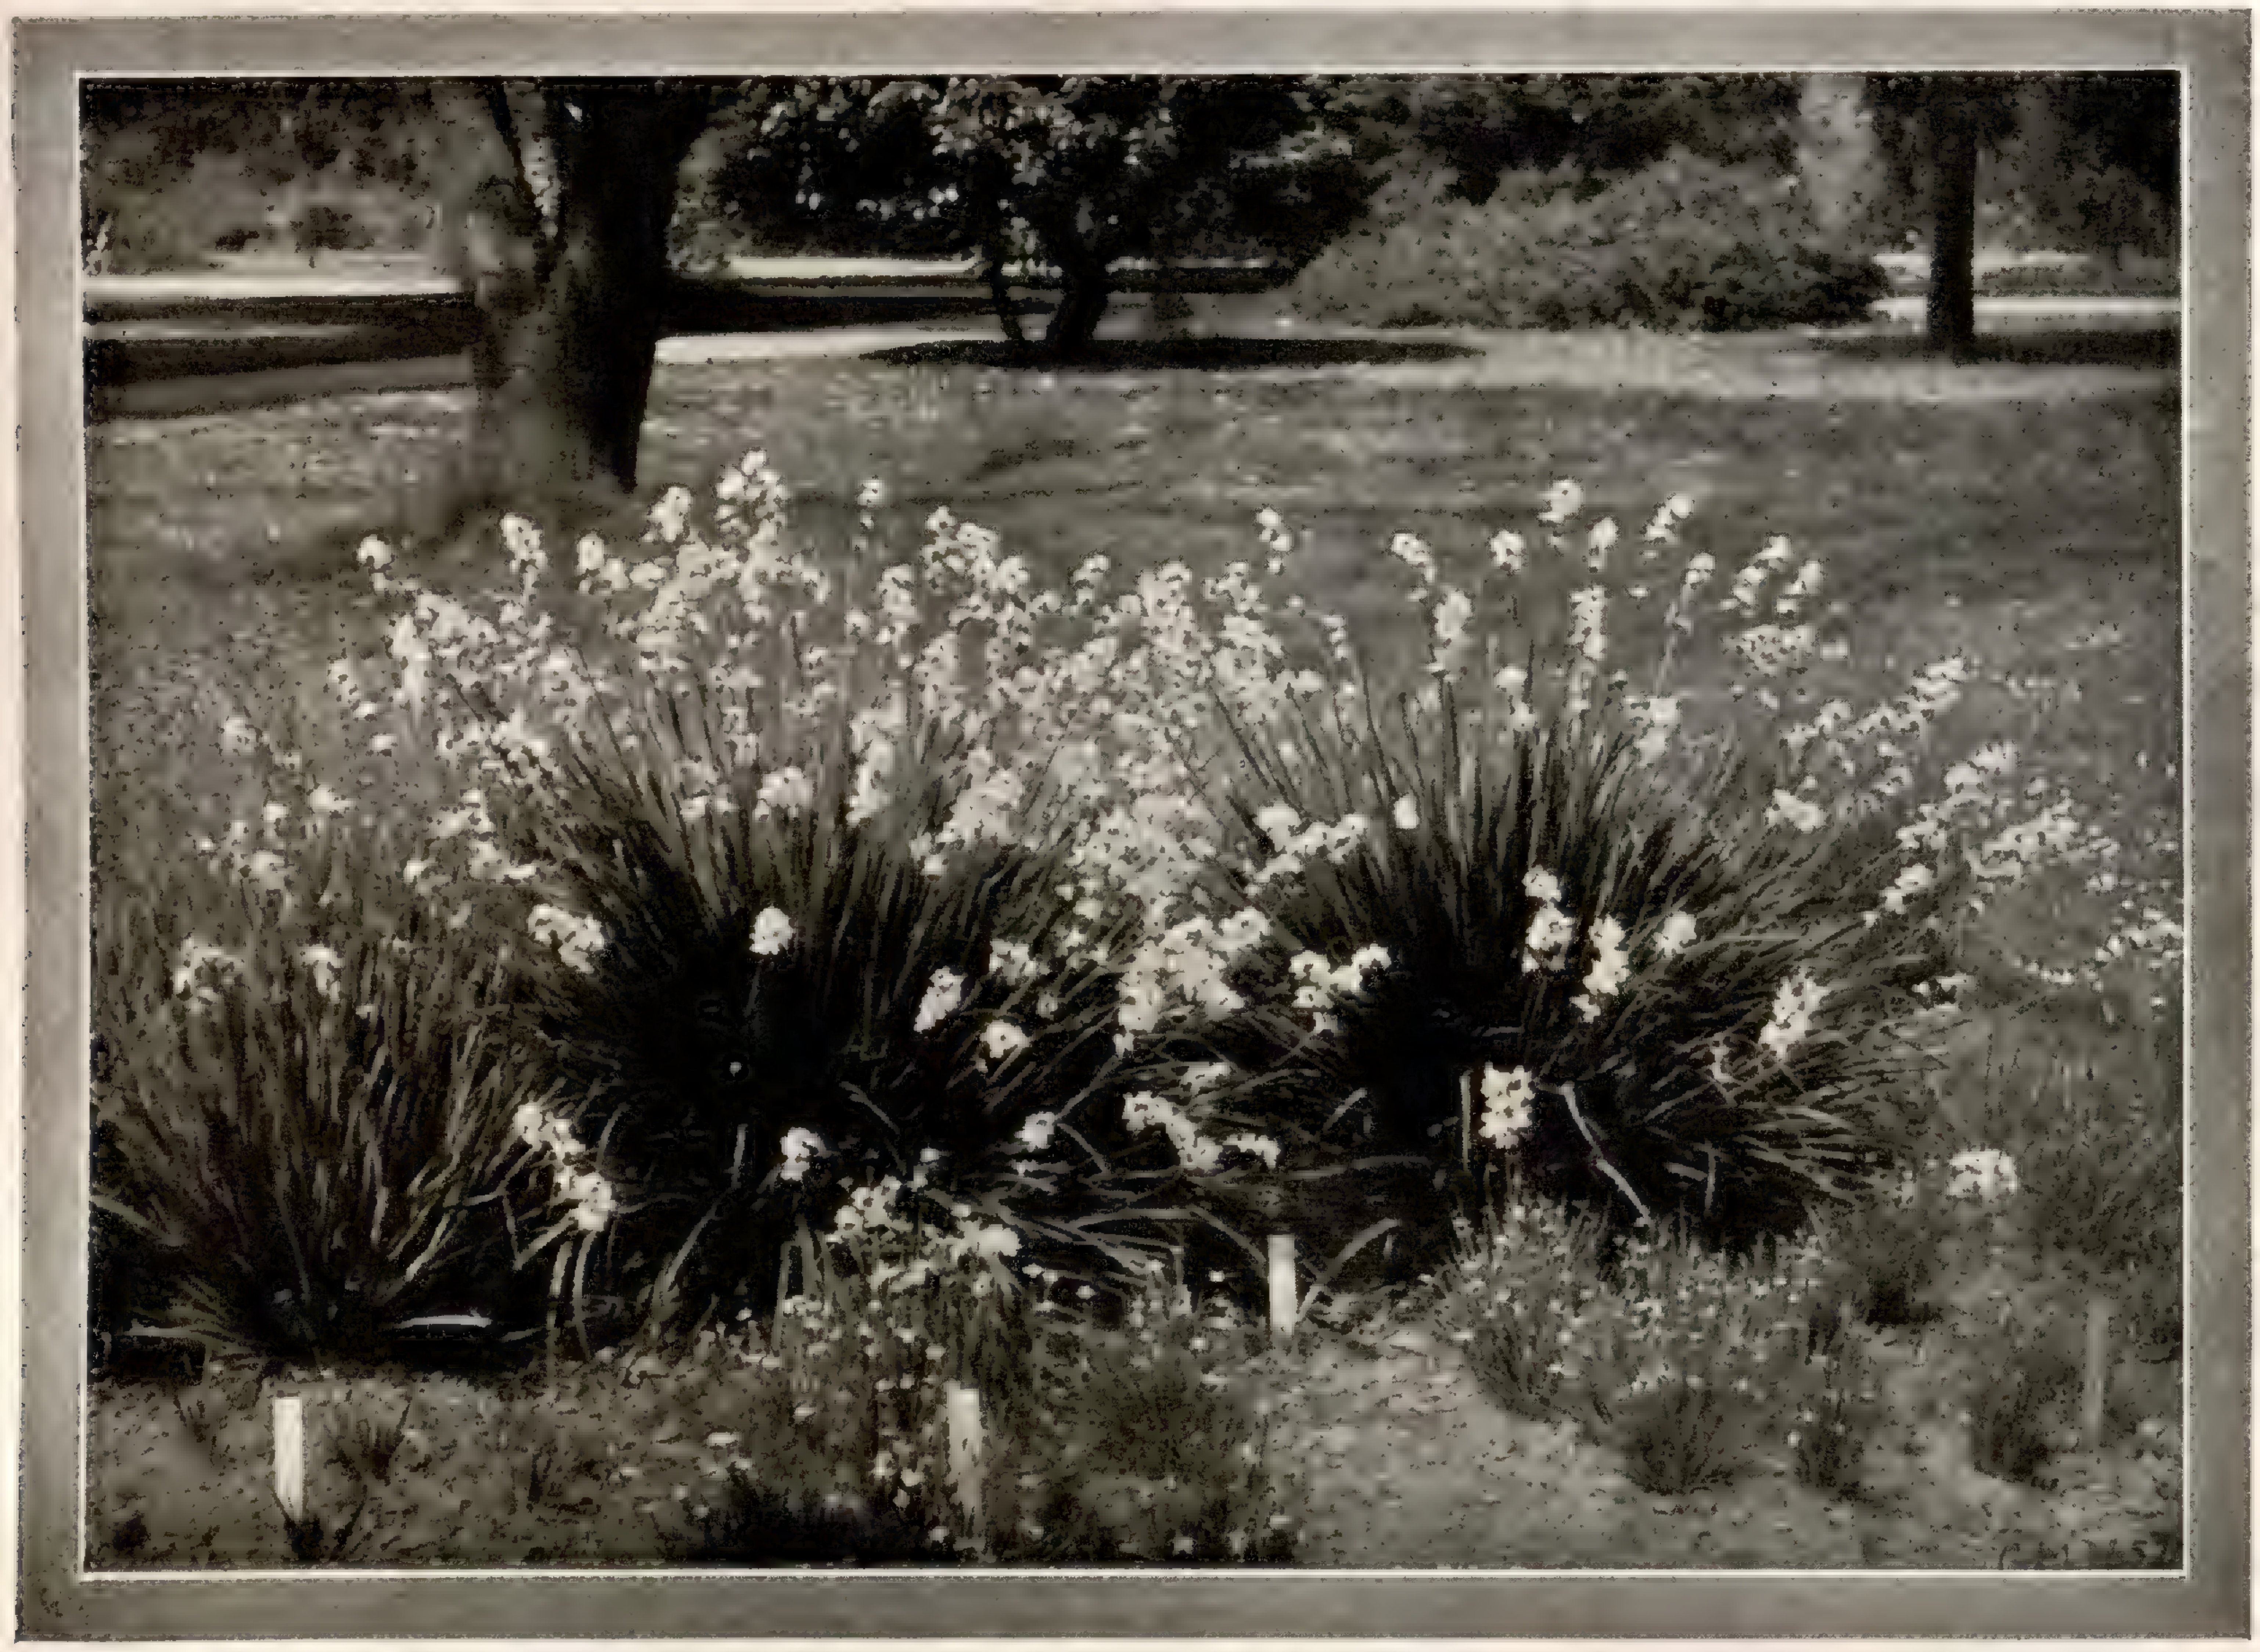
Volumes have been written regarding the cultural requirements of L. auratum, but from whatever standpoint it is viewed it must be set down as a decidedly erratic lily, for, while in some cases it will thrive without any special attention, in others, whatever care be taken, it is not a success. We have been told by travellers in its native country that Lilium auratum thrives on the outskirts of woods, where the amount of shade is just sufficient to break the hottest of the sun's rays, especially on the lower part of the stem and surrounding ground. This has proved to be the most satisfactory mode of treatment under cultivation in this country, where the practice frequently prevails of planting this lily in beds of rhododendrons, or associated with other shrubs, that serve to shade the base of the stems. The peaty soil in which rhododendrons thrive is a good substitute for the vegetable humus in which it grows in its native country. In any case, effective drainage is very necessary.

Not only is Lilium auratum looked upon as a plant for the open ground, but it is also extensively grown in pots, and employed for various decorative purposes. For grouping its grand flowers and noble proportions stand it in good stead, the one drawback being that, in confined places at least, its perfume is too powerful. It is one of the lilies now retarded by keeping the bulbs in refrigerators, so that the blossoms may be had at various periods of the year. It does not, however, prove to be so amendable to retardation as Lilium

A FINE POT SPECIMEN OF LILIUM AURATUM.
Grown by Harry Simpson, Esq., F.R.H.S., at Wandsworth.

longiflorum or L. speciosum, which are the two lilies most generally employed for this purpose.

When nearly all kinds of plants yield as they now do to the skill of the hybridist it is remarkable that there are still so few lilies of hybrid origin. There was (for one can unfortunately only speak of it now in the past tense) a very beautiful hybrid in the production of which Lilium auratum played its part. This hybrid (L. Parkmanni) was raised in America between L. auratum and a deep-coloured form of L. speciosum. It afterwards crossed the Atlantic, passing into the hands of Mr. Anthony Waterer, of Knap Hill. From there it was flowered and exhibited, but, inheriting the capricious character of L. auratum, it did not prove amenable to cultivation, and in time disappeared. It must be nearly twenty years ago since I last saw it exhibited, and enquiries a year or two ago elicited the reply from Mr. Waterer that, as far as he knew, it was no longer in cultivation. W. T.



LIBERTIA FORMOSA AT KEW.
A spring-flowering Chilian plant, carrying elegant spikes of pure white blooms.

---

**Greenhouse Acacias.** — While many of the Australian acacias need to attain tree-like dimensions before they flower, such as the mimosa of the florists' shops (Acacia dealbata); yet some of them will bloom freely in a quite small state. From this circumstance they are very popular for greenhouse decoration, those most generally employed for the purpose being Acacia Drummondi, A. ovata, A. armata, A. hastulata (cordata), A. pulchella, A. grandis, and A. platyptera. All have flowers of some shade of yellow, and with the exception of A. platyptera, flower in the early months of the year. This last-named blooms in autumn. —K.

## LIBERTIA FORMOSA.

It is a pity that such an elegant and beautiful plant as the Chilian Libertia formosa is not perfectly hardy all over the United Kingdom, as it possesses attractions of a high order. Where the winters are mild, or even where the protection of bracken, or handlight, can be afforded in cold, wet weather, it may be grown with considerable success, but though it will live and flower in loamy soil, it thrives much better in a medium composed largely of sandy peat or leaf-soil. A warm position in the rock garden, or a sheltered spot on the sunny side of a rhododendron group, will suit it, but the planter must not expect too much in a short time, as, even when quite at home Libertia formosa is not by any means a fast-growing plant. The illustration shows specimens flowering at Kew, in May and June, at which time the 2 feet to 2½ feet spikes of pure white flowers are abundantly produced, and look well, rising from the tufts of erect, pointed, sword-like, deep green leaves.

Libertia formosa may be raised from seeds sown in a frame, but seedlings come into flower slowly. The usual method of propagation is by division of the clumps in early spring, when new growth commences. A careful hand and a sharp knife are essential to the proper division of the tufts.

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price, 7s. 6d. net by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## ACOKANTHERA SPECTABILIS.

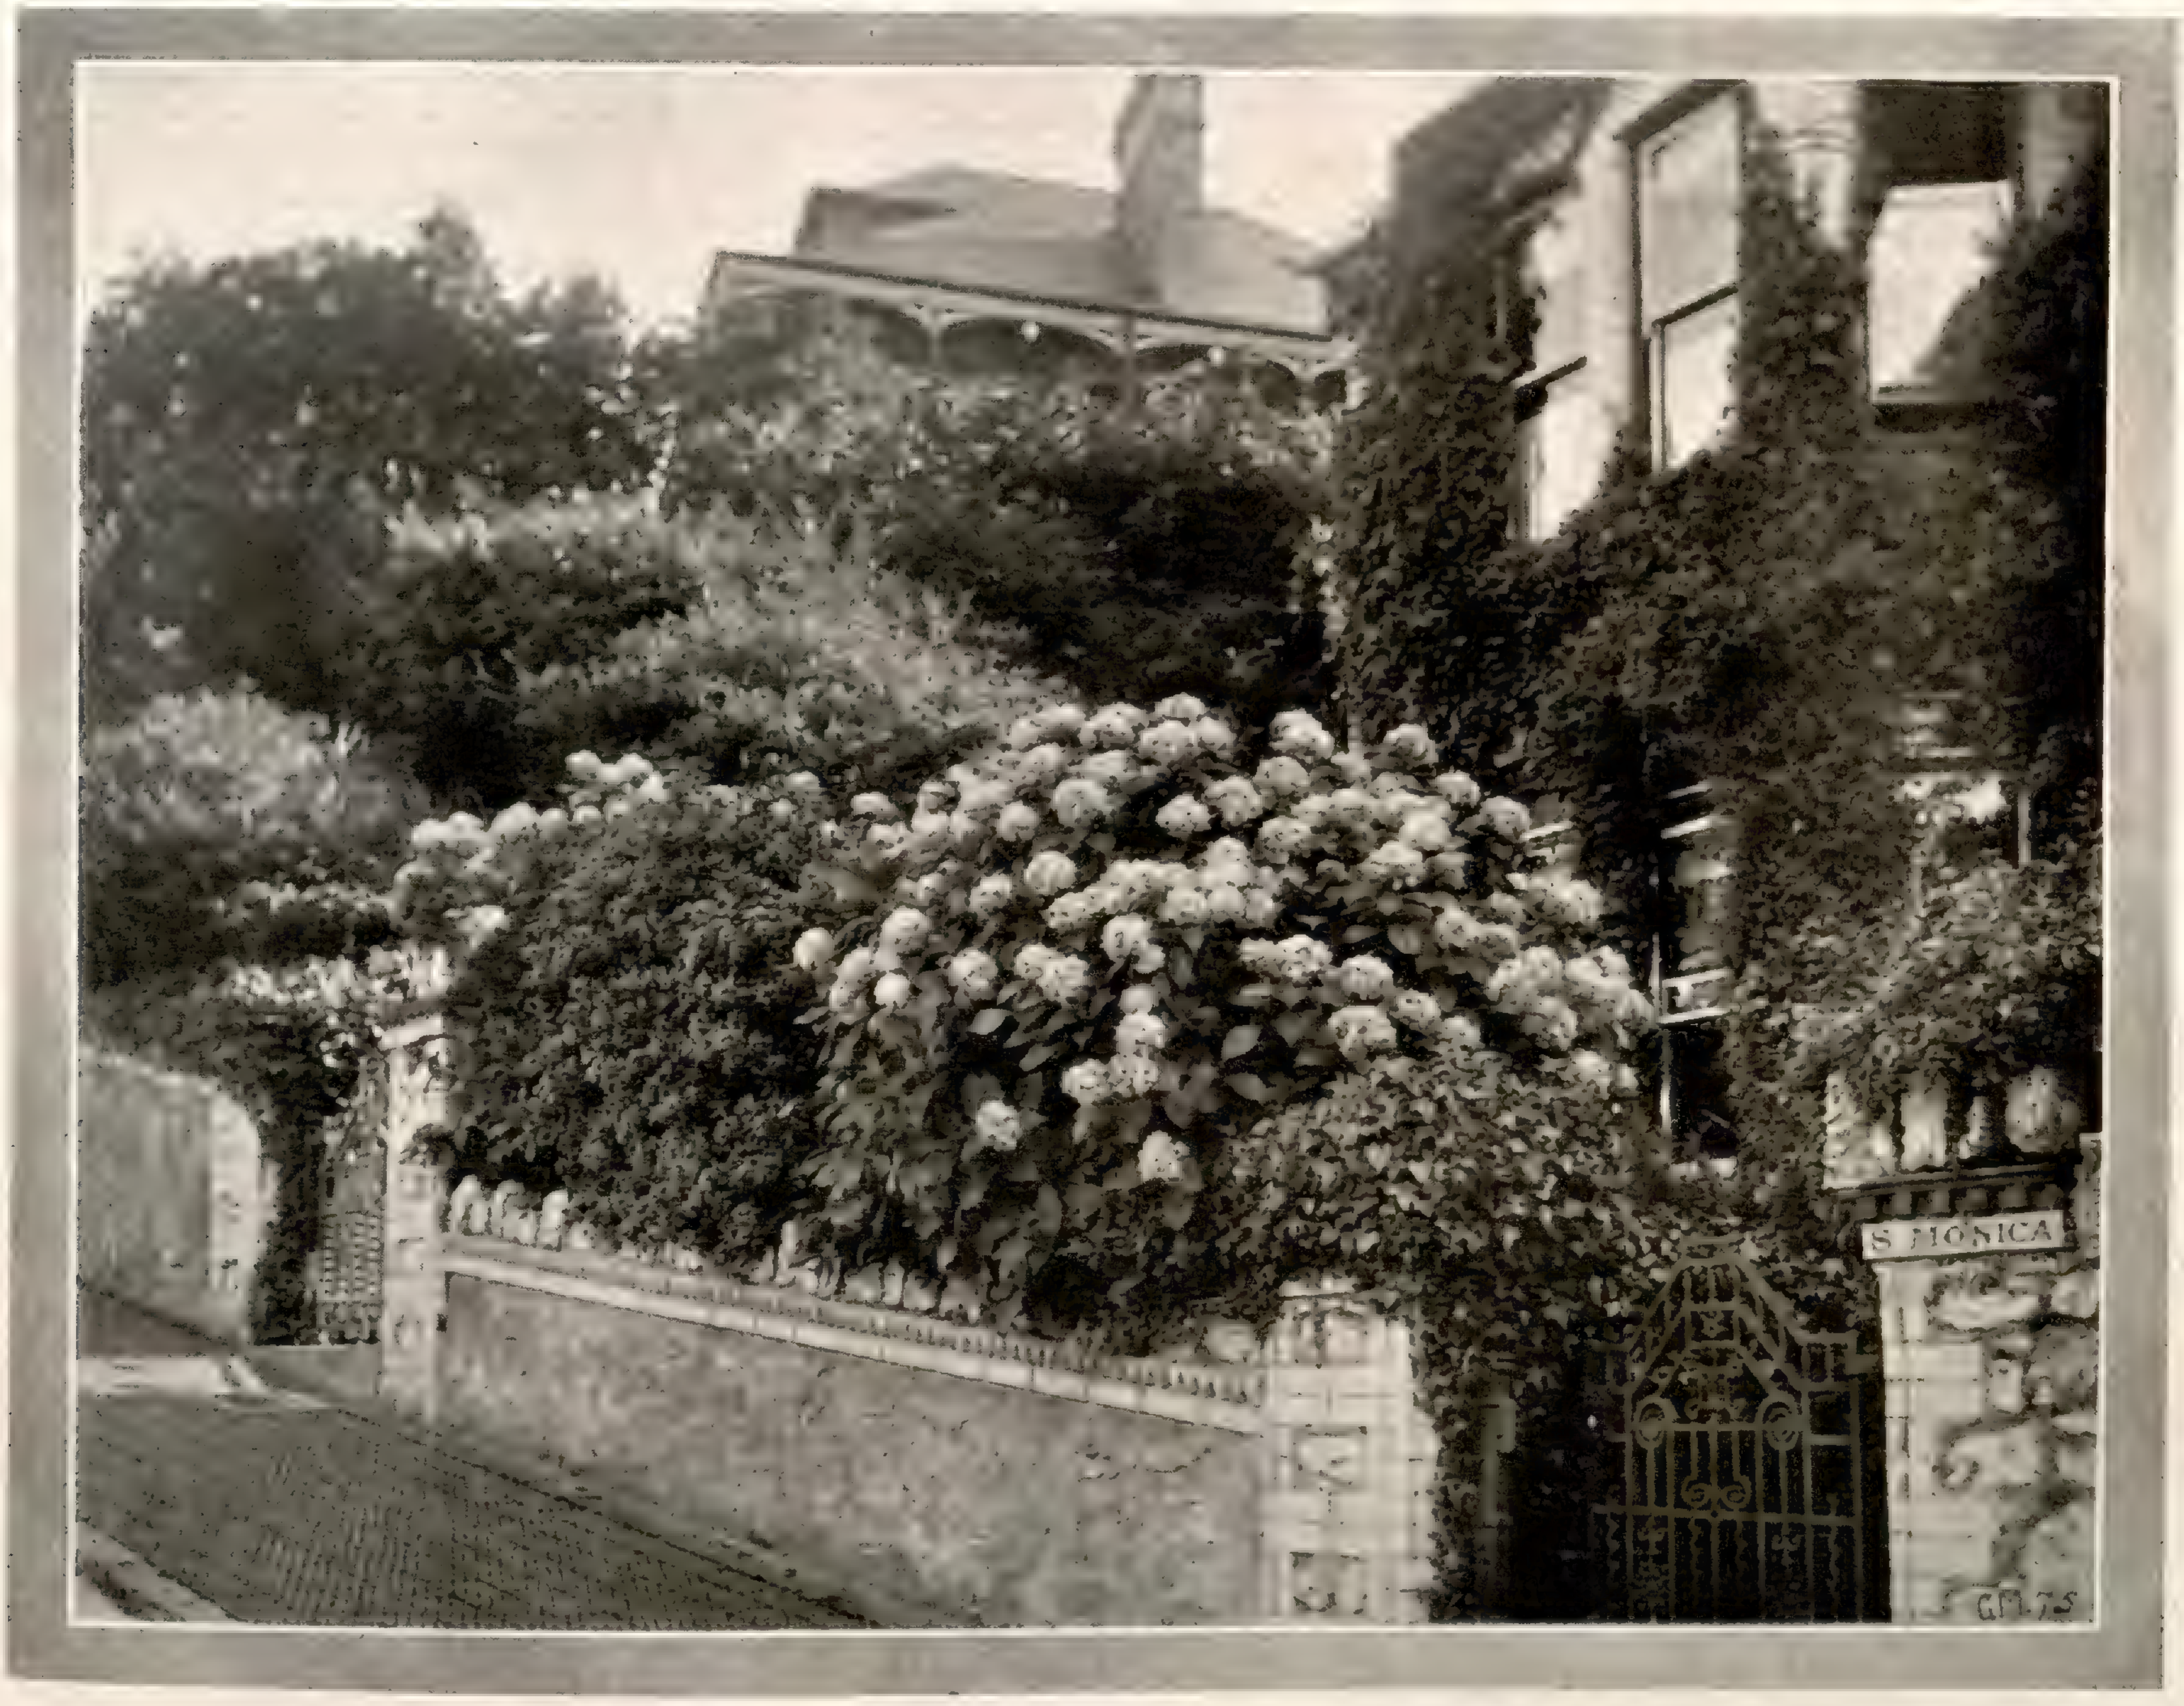
This South African evergreen shrub is very attractive just now in an intermediate house, as, being a native of the warmer parts of the southern portion of that Continent, it is more at home there than in the greenhouse proper, associated with heaths, pelargoniums, and such other of the many beautiful and interesting plants that have been introduced from Cape Colony.

Planted out in a suitable structure, and stopped freely when young, it forms a somewhat upright, dense-growing bush, clothed with oval leaves, four to five inches long, and of a dark green leathery nature. The flowers are borne in very dense clusters from the axils of the leaves, especially towards the upper parts of the shoots. They are small and white, but, being present in considerable numbers, they impart a decidedly ornamental feature to the specimen. What is more, the blossoms possess a sweet honey-like fragrance, that renders their presence manifest throughout a good-sized structure.

If allowed to mount upwards this acokanthera may be trained to the roof of a warm house, or as a screen plant for the end thereof. Furthermore, when struck from cuttings taken from the upper part of the specimen the young plants so obtained will flower freely when quite small. Beside the name at the head of this note, it is also known as Toxicophlæa spectabilis. A second species, less attractive than the first, is Acokanthera venenata, also known as Toxicophlæa Thunbergi. K.

# LARGE HYDRANGEAS IN THE GARDEN.

An illustration of fine hydrangeas in the portico at Buxted Park recently appeared in our pages, and the specimens shown indicated high-water mark in pot or tub culture. Hydrangea hortensis and H. Otaksa grow and flower well enough in many of the southern counties without any protection, but one has to go westward to see huge specimens in abundance. In Cornwall and in Devon, especially at Torquay, Ilfracombe, Clovelly, and other favoured and well-known holiday resorts, hydrangeas are splendid, and form a prominent feature in very many gardens. The accompanying illustration shows a front villa garden on one of the steep hilly roads of Ilfracombe. Here two big hydrangeas are prominent objects, and nearly one hundred heads of bloom can be counted on the plant in the foreground. Popular as hydrangeas are, especially as pot plants and for market culture, it is not too much to say that they do not receive that attention they deserve as flowering shrubs in the garden. In many places no protection would be needed, while in others a careful consideration of position would lead to happier results, and, yet again, where the winters are more severe, and suitable shelter not available, moderate protection would suffice to keep the plants safe from harm. In some gardens the practice is adopted of leaving the old heads on the plants throughout the winter.



FINE SPECIMEN HYDRANGEAS IN A FRONT GARDEN AT ILFRACOMBE.

# SPRAYING FRUIT TREES WITH LIME.

The time is again approaching when gardeners and fruit growers will be turning their attention to the spraying of their apple trees before growth commences, and, possibly now some are asking themselves the question, "What shall I spray with?" Though the spraying that is done, say, in March, before growth commences, is generally termed winter spraying, the term seems hardly a right one, as it would be more correct to call it early spring spraying, and the first point for consideration is, what are its objects? One is to clear the stems and branches of moss, lichen growths, and rough bark, all of which are natural harbours for insect pests, apart from the fact that parasitic vegetable growth must choke up the pores of the bark. In other words, it is assumed that cleanliness of the bark is essential to the good health of a fruit tree as is a cleanliness of skin to a human being.

This point about cleanliness reminds us of the early days of spraying, when caustic soda was first used for the purpose, and since then dozens of winter washes of a proprietary nature have been introduced. In short, there is no difficulty in obtaining a winter wash that will clean trees, and leave quite a polish on the bark, and if that were all there would be no need to resort to the uncomfortable work of lime spraying at all. There are the eggs of insect pests, however, to be considered in what is called winter spraying, and one remembers the time when it was claimed for the caustic soda wash that it would destroy the eggs referred to. The same thing has been claimed for different proprietary washes, but many growers have been disappointed, after making their trees as clean as a new pin, to see them later on ravaged with hungry caterpillars, and infested with apple sucker.

Possibly it was the failure of winter washes to destroy eggs and prevent attacks of insect pests that first led growers to turn their attention to lime, and the use of this material is, in a way, a case of history repeating itself. By this I mean that many a long year ago, when insect pests were classed comprehensively under the general heading of "blight," and their ravages were accepted as something that was inevitable, it was customary to paint the stems and lower branches of standard trees as high as a man could reach with lime wash, but I question whether the growers had any clear idea as to what they were doing it for. In a word, it was a custom, and as such it remains, and is practised in many places to the present day. The use of the brush, however, has largely given place to the sprayer, and instead of merely painting the stems and lower branches a thin film of the limewash is deposited all over the tree. The claims for lime spraying are that it will do everything that any other winter wash can effect in the matter of cleansing and destroying vegetable growth, and if it does not pretend to kill the eggs of insect pests, it will seal them to the twigs, so that they cannot hatch out. This particularly applies to apple sucker, and it is also claimed for lime that it has a check on that disfiguring fungus known as apple scab, but last season there was little evidence forthcoming in support of this, because apples generally grew particularly free from scab, which shows that climatic conditions are largely responsible for this trouble.

In connection with the use of lime some use a lime spray pure and simple; others employ lime and sulphur, which adds to its value as a fungicide; others pin their faith to lime and salt; but there is some variation of opinion as to whether there is any advantage in the addition of salt at all, and this view is held, by the way, by one noted grower in the West of England, who swears by the virtues of the plain lime spray; while some go further, and employ a lime-sulphur and salt wash. The worst thing about lime spraying is that no stretch of exaggeration could call it a desirable job, from the point of view of personal comfort, but difficulties have been reduced considerably by the introduction of improved machines and nozzles, and in this matter manufacturers have had an incentive, for, apart from fruit trees, the sprayer for lime-washing purposes has largely taken the place of the old-time brush. For effective lime spraying a fine day is essential, and, above all, it must be still. The operators should also protect themselves with overalls, and with some persons the lime has a painful effect on the skin. In some cases gloves are worn to avoid this, but the best thing I have found is to thickly cover the hands with grease before commencing the work.

In the use of lime as an insecticide it is desirable that a few simple rules should be observed. In the first place, the spraying is most effective if it is left as late as is consistent with safety. To be more precise, a good time to do it is from the middle to the end of March, just before the buds commence to swell. Secondly, only the best white lime should be used, and this should be obtained in the lump direct from the works. The lime should be placed in a tub at the rate of one bushel to twenty-five gallons of water, but the latter should be added a little at a time as the mixture boils, and if salt is added a quarter of a hundredweight to every one hundred gallons of limewash is the standard quantity. Thorough and effective straining is very essential, and if this is neglected a lot of time will soon be lost through the choking of nozzles. Another important point is the desirability of applying the lime wash while it is warm, and I heard one grower express the opinion that if he could not use it in this state he would not use it at all.

Let it be remembered also that the tree should be sprayed all over, and it is really more important to apply the wash to the tips of the twigs and the wood bearing the fruit buds than to the stems and thick limbs. The way that the wash sticks is the proof as to whether the best lime has been used, properly mixed, and applied at the right temperature, and consistency, but little good is done if the coating of lime scales off as soon as it gets dry.

After being sprayed the trees naturally present a ghostly appearance, which is a reason why lime spraying is not permissable in some private gardens, and, again, it is not an easy matter to lime spray trees in kitchen gardens where vegetables are growing round about them, such as winter greens, but on the other hand a good deal of the ground is unoccupied with crops when this spraying is done.

Lastly, it is wrong to claim for lime spraying that it will do everything, and to think that after doing it one's troubles will be over, but a strong point in its favour is that commercial growers have great faith in it. Last spring I travelled through some of the most famous apple-growing districts in England, and saw miles of orchards and plantations which looked as if they were covered with snow or hoar frost. These were orchards belonging to men who grow fruit for a living, and they are much too shrewd and business-like to spend time and money on lime spraying for mere amusement. When a commercial man begins a thing, and follows it up, you may generally depend that there is something in it, and lime spraying has increased because growers have derived benefit from it, and believe in it. At the moment of writing spraying apparatus is being put in order, and in those districts where fruit growing is a commercial industry, many a broad acre of apple trees will be covered with a white mantle before the buds burst into growth. H.

## REVIEW OF BRITISH-RAISED PERPETUAL CARNATION NOVELTIES FOR 1911.

One of the most difficult tasks I know is for one raiser to criticise the work of others, and do it perfectly fairly and still retain their friendship, because all of us think our own crow the blackest, just the same as the mother fails to see the shortcomings of her fondled firstborn.

The two most-talked-of British novelties of last season were R. F. Felton and Lady Alington. Both received an Award of Merit from the R.H.S., and F.C.C. from the Perpetual Carnation Society, and many thousands of young plants of each variety were sold. Which is the better of the two it is unnecessary to say; both can be excellent without belittling the other's greatness.

R. F. Felton is the result of a cross between Enchantress and Mrs. H. Burnett. One would almost guess the parentage from the habit of growth, for it might be termed an improved Mrs. H. Burnett. The flowers are of a delightful shade of salmon-rose and of good size; also, while it makes an exceptionally fine bushy plant, the growth is slow in running off to flower. R. F. Felton has a rival in the new American variety Gloriosa, the two being similar in colour. However, perhaps, the British variety will suit the private grower best, though the American novelty may become the most popular with the market grower.

Lady Alington was obtained by crossing Britannia on to White Perfection. The cross was made five times, and 243 seedlings were raised, but out of this lot there was but one Lady Alington. The growth is much freer and quicker than in Britannia, making a larger plant, and it also grows much quicker in mid-winter. The flowers are a deep shade of salmon, almost a Leander pink, quite a distinct and beautiful break, strongly perfumed, and very large in size. In fact, owing to this and the excessive vigour, the flowers split just a little in dull weather. This, however, can be coped with by growing the plants in a smaller-sized pot and not feeding until spring. A small failing in Lady Alington is that the flowers take rather long to open owing to their size, and so do not last as long as some varieties when cut, but no perpetual carnation is perfect, and this is undoubtedly a great variety.

Mrs. C. F. Raphael belongs to the new perpetual-flowering Malmaison class. It is massive in size and build, and quite excellent in form for a Malmaison. The colour of the flower is cherry red, and the growth is quite the quickest in this class. This variety is undoubtedly a decided acquisition.

Rex, being a pale rose-pink, met with keen competition. In some respects it has proved rather disappointing, not flowering quite as freely as was expected. Yet many varieties have less to commend them than Rex, and still remain in cultivation.

Colossus is certainly a good variety which has never had the recognition it deserves. The flowers are cerise in colour and large in size, with an ideal stem and calyx. It also has a robust growth, not quite free enough for the market grower, but certainly of a quality sufficiently high to command a position in all private collections.

Regina, salmon-pink, was somewhat of a dark horse, but has proved quite a good variety, making a large plant. The flowers are of a good size. The same raiser, however, is sending out Lady Northcliff this season which should be superior.

Fireglow and Harlequin, both yellow fancy varieties, rival each other for premier place. The general voting is that the former is more beautiful in individual flowers and the latter has a quicker habit of growth.

La Mode, heliotrope, shaded deep pink in the centre, is a delightful break which has a great fascination for many members of the fair sex. However, this season we have that sterling novelty Geisha, which has caused such a sensation at the shows, challenging all its rivals successfully.

Edith Waters, deep bright cerise, is probably a hybrid border carnation, and not quite free enough flowering in mid-winter to claim a high position as a "perpetual."

Marchioness of Linlithgow has some merit. Being a seedling from White Perfection it has purity of colour and freedom of growth, but in comparison with White Wonder it can scarcely hope to survive.

Duchess of Devonshire is undoubtedly a good crimson, rich in colour, refined in form, and robust in growth. As a variety for cultivating in pots it has undoubtedly a future.

There may be other good varieties, but these are all of importance, that were shown before the Perpetual-Flowering Carnation Society, and that can hope to survive, and those that fail are of little importance, they do not rouse the sympathy or court the interests of anyone, and most of us, if we had a retentive mind, could recall a few failures, both of our own and other peoples.

Montagu C. Allwood.

---

**Aster Lil Fardel.**—This very desirable Michaelmas daisy belongs to the Novæ Angliæ section. It is a very fine form, growing about five feet in height, and bears a great profusion of bright reddish rose-coloured flowers. A very symmetrical shaped specimen, occupying an isolated position, was much admired here last autumn. A feature of the Novæ Angliæ group is that the flowers are at their best in the first half of the day, as they partially close in the afternoon or when the weather is dull. I do not remember seeing this mentioned in any of the notes on Michaelmas daisies, and only in one catalogue that has come under my notice, namely, in that of Mr. Norman Davis, the chrysanthemum specialist, of Framfield, Sussex.—W.

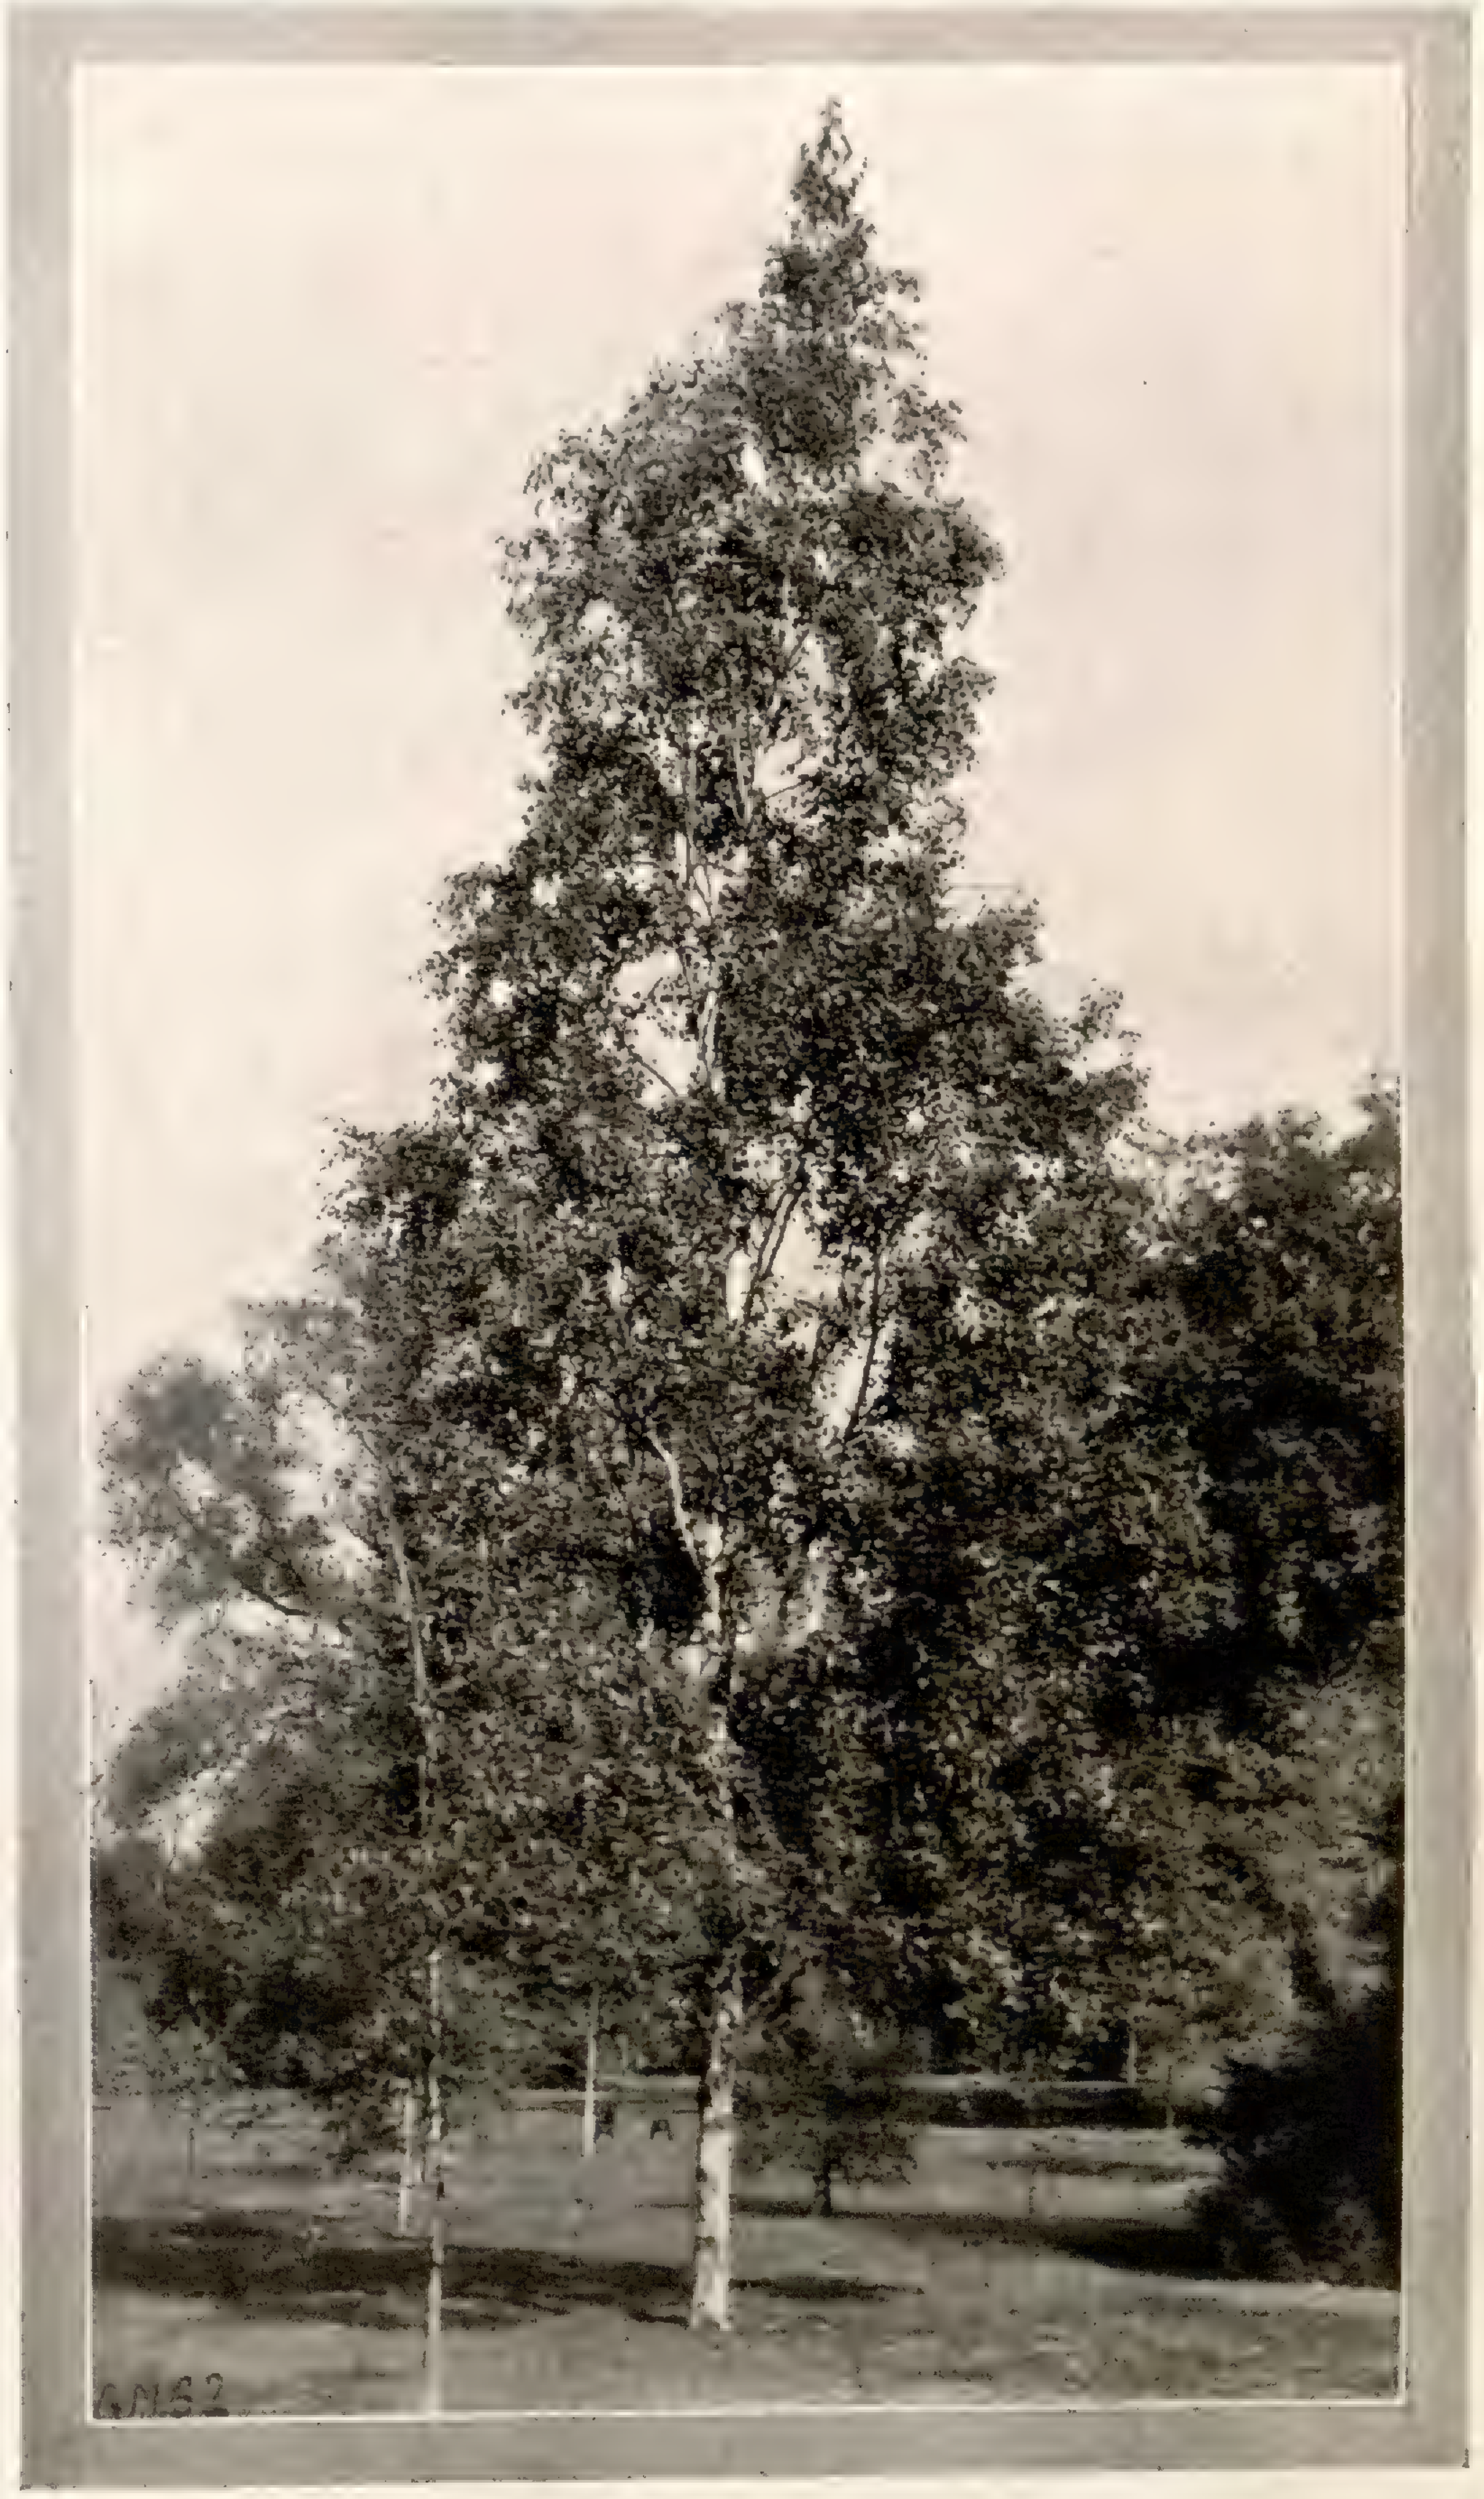
PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, writen for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## THE ERECT-GROWING BIRCH.

The varietal forms of the Silver Birch (Betula alba) are many, and of these the majority possess sufficient merit to justify their inclusion in a selection made for beautifying pleasure grounds that extend over a large area, or for the formation of a distinct feature in the park. For comparatively small gardens, a few of the more distinct will suffice; and in making a selection for these, as for the larger areas, the varieties should, as a matter of course, be selected with due regard to their adaptability for the positions in which they are to be planted.

The most desirable of the varieties for general planting are the Broad-leaved (Betula alba latifolia); the Toothed-leaved (B. a. dentata viscosa); the Erect-growing (B. a. fastigiata), the Weeping (B. a. pendula), Young's Weeping (B. a. pendula Youngi), the Purple-leaved (B. a. purpurea), and the Nettle-leaved (B. a. urticifolia). The popular names indicate the distinctive characteristics of the several varieties, and serve as a very good guide to the plants in making selections for various positions. If a tree of pendulous habit is required, the planter has the choice between the ordinary weeping variety and Young's Weeping, and as these differ much in habit, the planter should take advantage of any opportunity he may have for seeing trees of the two forms; but those who have no such opportunity, and require the tree or trees for a small garden, should select Young's variety. In large pleasure grounds, both weeping varieties might with advantage have a place. If it is desired to produce a contrast to one of the several golden-leaved trees the purple-leaved must be selected, and if a tree of erect growth would be the most appropriate for a given position, the fastigiate form, of which an illustration is given herewith, will be found of much value.

The last-named variety of the Silver Birch occupies much the same position among the birches as that occupied by the Lombardy poplar among the species of Populus, and consequently is well able to render good service as a component part of garden scenery. It is not suggested that it is superior to either the typical Silver Birch or any one of its varietal forms; but it is remarkable for its light and elegant aspect, and for the distinct and charming effect it produces, whether growing singly among its near relatives, as in the case of the specimen herewith illustrated, or arranged in groups in spacious pleasure grounds or park lands. The tree is not new, rare, or expensive, and consequently there is no obstacle to it being utilised in the creation of a distinct feature in the scenery of park or garden. G.



BETULA ALBA FASTIGIATA.
An elegant variety of the White Birch of upright growth at Kew.

---

**Semi-double Zonal Pelargonium Chavarri Hermanos.**—This pelargonium belongs to that strong-growing section, "a gros bois," of our French neighbours, of which King of Denmark is one of the best known examples. In Chavarri Hermanos the flowers are large, with petals of unusual substance, and of a vivid scarlet tint. When grown for the purpose it flowers well during the winter.—T.

**Sericographis Ghiesbreghtiana.**—Several acanthaceous plants bloom during the winter months, and this is by no means the least attractive of them. The leaves, which are ovate lanceolate in shape, are of a very dark green tint, and the scarlet tubular shaped blossoms continue to develop throughout the late autumn till the spring. It flowers best when the plants are well exposed to light and air throughout the latter part of the summer.—W.

## THE SCIENTIFIC INTEREST IN SWEET PEAS.

Mr. T. H. Dipnall's writings are always very interesting to me, therefore I read, two or three times, his article in your last issue under the above heading.

I cannot see very clearly his meaning in the following paragraph: "Last year it was discovered that if you cross these exceptional members of a coupling system, you reverse the system in their progeny, so that if in your seedlings of the second generation you find an extra sterile plain standard and an extra fertile wavy pea, and cross these two, you obtain a race in which the great majority of the waved peas will be extra fertile and the plain standards sterile."

That may be so. Has it been proved? Briefly, I think Mr. Dipnall means that in the F2 we will get varieties with waved standards which will be good seeders, but it seems to me we take a retrograde step to obtain this by crossing with the plain standard varieties at all—we introduce trouble for ourselves We have a few good waved varieties which are good seeders, notably Mrs. Hugh Dickson, which seeds as well as any plain standard variety ever did. My idea would be to utilise such a one for crossing to breed for free-seeding qualities.

May I point out to Mr. Dipnall something which he might think about when pondering over the problem of burning or scalding? King Edward Spencer never burns, never goes dingy purple under glass, and I could name many others which do not. Underneath that fact lies the same analogy as Mr. Dipnall thinks he has discovered out of doors. Wm. Cuthbertson.

Edinburgh.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street. London.

## ROSE NOTES.

We have enjoyed a prolonged season for planting, and there should be no more to do wherever the ground was available. Plants that were put in early have greatly benefited by the ground settling so firmly around the roots, but in many cases the soil is now very wet, and should a spell of severe frost set in, it may have a bad effect unless some means are taken to drain the base of plants.

We are well aware of the good results from earthing up the base of dwarf roses, both as a protection from frost and to throw off excessive wet; but few of us use the same precaution in the case of standards. Why not? One of the most vital parts of a standard is the base, and, although we do not protect the rose growth by earthing up soil around them, we avoid considerable swaying of the stems, but what I feel to be of still greater importance is throwing off water instead of allowing it to lie in a small hole around this most vital part. Upon more than one occasion, I have noticed the heads of standards "trussed up," and yet no protection was afforded to the base of the brier itself, while the plants were swaying sufficiently to form a hole that held water all the longer because of the smooth sides made by this swaying.

I would like to say that enough care is not given to protecting the junctions of rose and brier upon standards. It is not enough to put a little litter among the points of growth, and leave this part so open. Why should it not be protected as much as in the dwarfs? But, so far as protection is concerned, we do comparatively little of it now, being convinced that it is not so necessary as was once thought. We also have a much hardier race of varieties.

The old methods of using litter or manure are not practised to anything like the same extent as formerly. Experience proves that keeping the base of the plants as dry as possible is preferable to the risk of wet combined with frost, which results in a frozen mass all around the plants. Frost-laden winds are easily guarded against by using branches of fir or birch, which not only answer the purpose excellently, but stay where placed, and do not hold so much moisture. Litter either blows away to some sheltered nook where it is quite useless, or becomes a saturated mass in a very short time, in which condition it can be of little service.

Considering how very mild the winter has been so far, our roses, more particularly the ramblers, are keeping their growths more quiet than might have been anticipated. Even Dorothy Perkins, Crimson Rambler, and Claire Jacquier are quite dormant here. Doubtless, this is partly caused by their extended annual growths. Several seasons I have noticed this class of rose push out in a dangerously precocious way by this date, but it has always been after an early ripening. At present many of our roses are quite clothed with foliage. More so than I remember before.

It is pleasing to note how well the buds that were inserted last summer have set. Of course, they have had no trials yet; but I have more than once noticed how much better they set or unite to the stock during a dry season for budding, than when we have a dripping summer, and doubtless this is the same as with grafted plants in the propagating case; any wet between scion and stock being decidedly unfavourable to the formation of callus.

Rosarian.

## HARDY FLOWERS FOR ROCKWORK EDGINGS.

A rockwork edging to a border of hardy flowers forms a pretty feature of many gardens. A free use of really good plants for this purpose is also to be advocated as affording to many an excellent means of cultivating alpine and other dwarf subjects without the erection of a rockery. If the border can be raised about six inches above the path, and then edged with stones, however rough, firmly fixed in the soil, so as not to be easily displaced by a foot coming in contact with the edging, it can be made suitable for covering with plants of this class.

On such an edging many charming flowers can be cultivated, and these will be in perfect harmony with the taller plants of the border, besides affording a succession of flowers for many months in the year. By a judicious selection of such alpine flowers there need be no monotony in the border, and the bright and pleasing effect can be maintained for many years with the very minimum of trouble. Some will require clipping back to prevent them from encroaching on the paths, but, as a whole, they will not be troublesome in this respect.

Acænas are excellent for the purpose, and among the best of these, which are prized for their foliage rather than for their flowers are A. Buchanani and A. microphylla, with A. argentea. Achilleas are ornamental with their white or yellow flowers, and A. Clavennæ, A. Jaborneggi, and A. umbellata, all white, are among the best for our purpose. A. umbellata has pretty silvery leaves. For a choice sunny part, we may have Æthionema persicum, a dainty plant with glaucous leaves and rosy-lilac flowers— a gem for the edging where it will not be overgrown.

In Ajuga reptans variegata we have a pleasing trailer with silver and green variegated leaves, but the flowers are poor. It is a nice plant, however, and is cultivated in many gardens of choice flowers. Alyssum spinosum, silvery-leaved, and with white blooms, looks very pretty, and A. montanum, yellow, is a neat little subject, though far from showy. A. saxatile is decidedly on the big side for any but large edgings.

For a choice spot beside the æthionema we may have a plant of the exquisite Androsace lanuginosa, which, however, must be sheltered from rain in winter. Silky-leaved and with lovely lilac flowers, it is a choice flower indeed. Antennaria dioica rosea is a neat white-leaved carpeter for low stones, and it delights in a fairly moist place. With some lime about it, and in full sun, we can grow Anthyllis montana, with silvered silky leaves and heads of rose-pink; it is a dainty little plant only six inches high. Arabises can be named without any detail, as they are so well known, but those who want one seldom seen can add Arabis Sturti, a miniature with white flowers. For a portion of the edging with some shade, the pretty Bear-berry, a nice trailing shrub, called Arctostaphylos uva-ursi, is excellent as a trailer; and in a similar place the tiny creeping Arenaria balearica will cover a moist stone with green, all starred with white flowers. Arenaria montana, for sun or shade, is bigger, and has larger flowers, and is more a trailer than a creeper.

Armeria maritima laucheana is a pleasing thrift, with almost crimson flowers, and aubrietias will give us choice and to spare among their many varieties, none of which are unworthy, although some are better than others. A. tauricola alba, A. Moerheimi, A. Dr. Mules, and A. Hendersoni, with Bridesmaid, will give a nice variety. Campanulas, also, are plentiful, and we may choose from garganica and G. hirsuta, both blue and white; Portenschlagiana major, pusilla, and turbinata, without making any mistake, as all are so fine in every way.

Cerastums only require mention, and any of those in the trade will do, but they want to be cut back freely. Coronilla iberica is a nice yellow trailing plant, and Crucianella or Phuopsis stylosa is good with its heads of pinkish flowers. Pinks of many kinds look well over the stones, and we may choose among the heaths, such as E. carnea and E. c. alba for winter blooms and as lying nicely over the stones.

Erodiums macradenum and guttatum may be recommended to those who like dainty subjects, their bright flowers lasting well on the drier parts. Geraniums argenteum and cinereum, allied to the last-named, are lovely hardy flowers for edgings, and Gypsophylas prostrata and repens are fine as well, trailing over the edgings. Helianthemums make good sheets of bloom, but need clipping back, except where there is plenty of space; and Hypericums fragile and reptans have delightful yellow flowers on neat little plants. Iberises, or candytufts, are attractive, with sheets of white flowers, corifolia and sempervirens being among the best for general use. These, also, want to be well cut back, save in wide edgings.

Lithospermum prostratum is of a delightful blue, and Lotus corniculatus plenus is a double form of our "Lady's Fingers" of much beauty. Lychnis alpina, red, and Lysimachia nummularia aurea, the Golden Creeping Jenny, may be added, and on a dry edging Onosma taurica will supply drooping yellow blooms.

Such spring-flowering phloxes as reptans, and the many lovely varieties of P. subulata, such as The Bride, Nelsoni, and a host of others, are without rivals for beauty on the edgings. Prunella grandiflora, though a little coarse, is good; and Saponaria ocymoides on poor soil gives sheets of rose flowers. Almost all the saxifrages are of rare worth for our purpose, and sedums and sempervivums may be cultivated with great success, but, like the saxifrages, are too numerous to detail. Silenes alpestris and S. maritima plena, both white; Thymuses lanuginosus, Serpyllum coccineum and album, and vulgaris variegatus may be added where there is room. Tunica saxifraga and Silene Schaftæ are lovely for late bloom, and we may add Veronica prostrata and Waldsteinia trifoliata, for a profusion of bloom earlier in the year.

Many more alpine flowers present themselves, but a wide enough choice is offered in those named already.

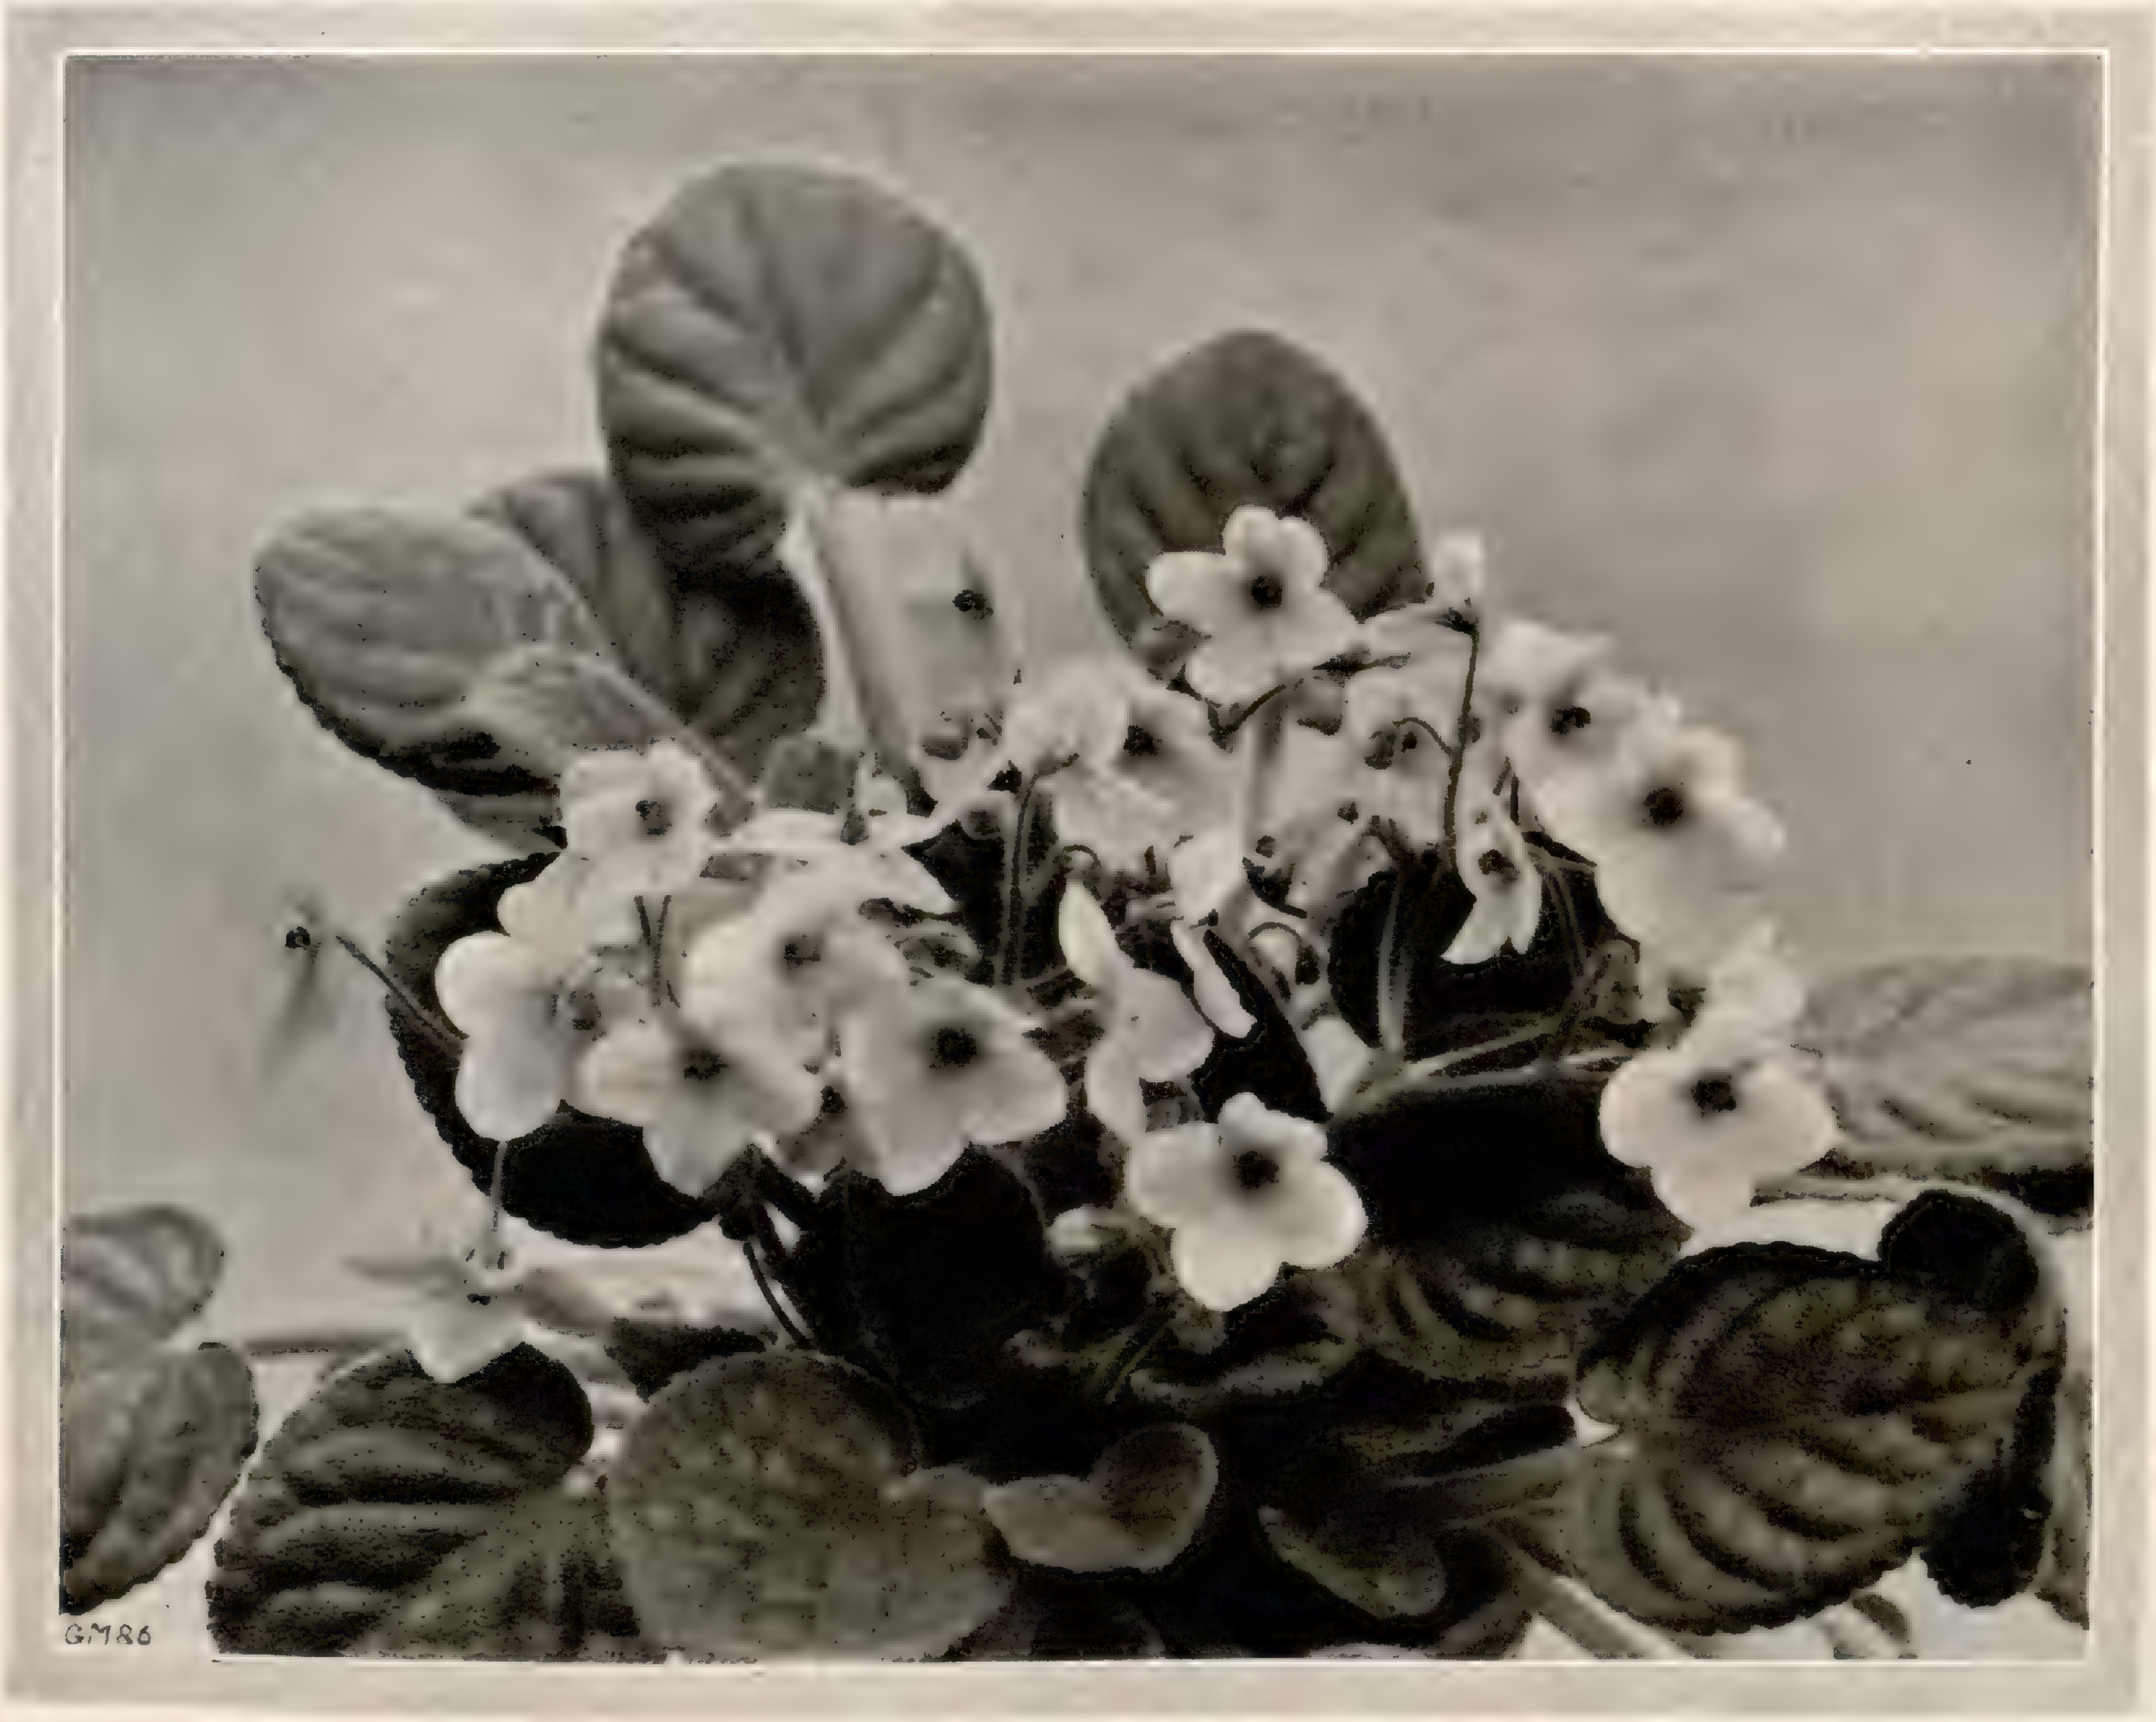
S. Arnott.

---

**Gloriosas.**—The tubers of gloriosas should be potted up and started into growth early. Shake away the old soil, and repot, using pots just large enough to hold the corms; then, as growth advances, shift into larger pots in which they are to flower. Two or three tubers may be placed at once into the flowering pot if desirable, but in such a case great care is necessary in affording water, or the soil will become sour and the roots refuse to work in it. After potting the treatment at first accorded should be similar to that usually adopted for caladiums. Watch should be kept for slugs, which are very partial to the young succulent shoots when they appear above the soil. A piece of cotton-wool tied loosely round each growth at the ground level will generally make them secure from these depredators.—H. T. Martin, Warren Wood Gardens.

## SAINTPAULIA IONANTHA.

This beautiful little gesneriad is a particularly charming plant for the warm greenhouse or intermediate house, and, as with a little extra care it can be induced to produce its bright violet-blue flowers towards the end of winter, as readily as at the end of summer, it becomes the more valuable. At no time is propagation difficult, either by seeds or from leaf cuttings, and if two or three sets of plants are produced the flowering season is thereby extended. Mr. H. Prime, gardener to the Marquis of Salisbury, Hatfield House, Hatfield, grows Saintpaulia ionantha unusually well, and the plant illustrated in the present issue is one of many equally as good exhibited by him at the meeting of the Royal Horticultural Society, held at Westminster on Tuesday, January 23. Mr. Prime will, we hope, tell our readers how he obtains such fine plants of this useful subject in January.



SAINTPAULIA IONANTHA.

One of several finely-flowered examples of this handsome blue-flowered stove plant, exhibited at R.H.S. Meeting, January 23, by Mr. H. Prime.

---

**Ardisia crenulata.**—A prominent feature of this ardisia is the length of time the bright red berries remain fresh and consequently attractive. It is an old plant in gardens, but I scarcely think it is now grown to the same extent as it was years ago. Why this is so, I cannot say, for it is a very ornamental subject, and nothing else has cropped up to supersede it. It is sometimes referred to as a stove plant, but the temperature of that structure is not essential to its well doing, as it will thrive in a warm greenhouse or in an intermediate temperature. There is a variety with white berries, but it is not nearly as showy as the typical kind.—S. W.

## DIANTHUS CHINENSIS.

The Heddewigi group of Dianthus chinensis is one of the best, and affords cut flowers in abundance, and fine floral displays in the garden from the early part of summer to the month of November. Indeed, I have had batches of plants flowering almost as late as Christmas in a mild season.

From a packet of mixed seeds a large percentage of double flowers may be obtained, but I prefer to sow seeds of single and double-flowered varieties separately. Some of the double flowers are exquisite, and great beauty is to be found among the singles. For many years I have grown large numbers of these plants from seeds, and have been much struck with the decided improvement in the quality of the flowers from year to year.

The seeds should be sown in boxes or pans (I prefer the latter) filled with sandy loam, and well-rotted leaf soil, in equal proportions, with coarse sand added. Where a steady temperature of about 60 degrees can be maintained during the day seeds may be sown early in March; if a lower temperature prevails then defer the sowing until early in April.

I do not believe in covering the seed pans with paper to keep the surface of the soil in darkness, as it weakens the seedlings; but a square of glass may be used to retain moisture and induce early germination. The glass must, however, be removed at an early stage, or it would have a similar effect on the seedlings. The plants must afterwards be grown in a cool frame; the heat applied in the first place is only to aid in securing stock for the production of early flowers. A second sowing may be made at the end of April in a cold frame.

Instead of disturbing the seedlings and transplanting them very early—as they do not then possess many roots—keep them in a cool frame so as to induce a stocky growth. One transplanting in a prepared bed in a cold frame prior to removing them to their flowering quarters will be sufficient. The ground must be deeply dug, well enriched with rotted manure if poor in quality, and made moderately firm while fairly dry, if light in character, before the plants are put in about one foot apart each way.

Suitable varieties are: Dianthus Heddewigi alba; D. atropurpurea, blood-red; D. diadematus, D. hybridus, and D. laciniatus Lucifer, orange and scarlet, are excellent double-flowered varieties. Of singles the following may be grown: Salmon Queen, salmon; Eastern Queen, mauve and lilac; Crimson Belle, crimson-lake; Queen of Holland, pure white; and Snowdrift, pure white. GEO. GARNER.

---

**Antirrhinums.**—There are some lovely varieties among the snapdragons, and when massed in the mixed border they are very effective, as indeed they are if planted in narrow borders in one colour. The tall varieties are useful for the back of the borders, but the intermediate type are special favourites, and when such colours as apricot, yellow, rose-pink, bright scarlet, and crimson are grown, they are very pleasing. Sown in boxes at the present time, and pricked off early, they make vigorous plants that flower freely and continuously over a long period.—J. GARDNER.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

MASDEVALLIAS.—The pure white flowers of Masdevallia tovarensis are now making a fine show in the cool house, and will last a long time in perfection, provided no moisture is allowed to settle upon them. After the flowers have fallen, the plants will soon commence to grow, and then will be the best time to repot them. Any plants which have become bare in the centre should be broken up, and either be made up into a specimen again, or the portions may be potted separately in small receptacles. I prefer what are known as half-pots, as the plants require no very great depth of compost. These should be filled to about one-third their depth with clean crocks, covering these lightly with a layer of clean sphagnum moss, and adding a compost of equal parts of peat, polypodium or osmunda fibre, and sphagnum, with a fair sprinkling of half-decayed leaves, which have been rubbed through a half-inch sieve.

THE CHIMAERA GROUP.—This is also an excellent time to give additional rooting space to M. Chimæra, M. Bella, M. Carderi, M. Chestertoni, M. Gongora, and others of the Chimæra section. These should be grown in shallow teak wood baskets, as their flowers are produced from descending stems; no crocks must be used for drainage, but, instead, some fern rhizomes may be used to prevent the compost being washed through. All masdevallias are liable to attacks of red spider and yellow thrips, and these pests must be kept in subjection by frequently spraying and sponging the leaves with some weak insecticide.

THE COOL HOUSE.—There are many plants in this house, particularly Odontoglossum crispum and it varieties and hybrids, that are now developing their flower spikes. These should be frequently examined, otherwise the spikes may be devoured by slugs before the grower is aware that they are showing. The usual means of trapping slugs, woodlice, and other pests should be continually in use. The plants may be kept fairly moist at the roots, but do not water a plant until the compost is dry. It is very detrimental to the plants to allow large spikes of bloom to remain on them for a long time, or to permit small or unhealthy plants to carry too many flowers.

ONCIDIUMS of the macranthum section, such as O. superbiens, O. undulatum, and O. macranthum itself, that are showing flower spikes, will for some time to come need constant attention, as, owing to the rambling habit of the spikes (which often grow many feet in length) some kind of training is necessary. Three or four strong stakes may be placed firmly near the edge of the pots, and the spikes trained around these, keeping the spikes at first as low down as possible.—J. T. Barker, West Hill Gardens.

## STOVE PLANTS.

CODIÆUMS.—During late years some splendid varieties of the useful crotons or codiæums have been introduced, many of them great improvements upon older varieties, so that we may well discard some and grow only the best. To obtain symmetrical specimens with the whole of the foliage richly coloured, they should have a house or pit devoted to them, as they can then be given that special treatment so essential to success. Abundance of heat and moisture, and scarcely any shade, are necessary during the growing season. Now is a good time to overhaul the plants and well cleanse the structure. Any plants that have become leggy should be placed on one side for propagation. Repot all specimens that are intended to be grown on. Turn each plant out of the pot and reduce the old ball of soil and roots, carefully, with a pointed stick, and repot in the size of pot most suitable for the requirements of the place. Let the pots be quite clean and well drained. The compost should consist of three parts rich fibrous loam, and one part peat, adding plenty of sharp sand, small nodules of mortar rubble, and charcoal.

RINGING CODIÆUMS.—The method of ringing tops of old plants that have grown leggy is the best for producing good specimens quickly, and this may now be performed. This method is now very much practised, and need not be explained in detail in these notes. To increase any particular variety in large numbers, the smaller side-shoots may also be taken off and inserted in small pots filled with sandy soil, and plunged to the rim in the propagating bed.

CALADIUMS.—These also should be potted up with as little delay as possible. Many losses occur through leaving the corms too long dormant. Use a similar compost to that recommended for gloxinias, and avoid over-potting. It is far better to repot into larger receptacles later on when new roots are formed. Use sharp sand freely both under the corms and round about them. The useful miniature C. argyrites should be grown largely, and 60-size pots are large enough for them. A high temperature and plenty of moisture are necessary to these plants, especially immediately after they are potted up. If the pots can be plunged in a hotbed so much the better for a rapid start into growth.—H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

PINE APPLES.—At this season of the year great care should be exercised in giving water to the plants; they should be examined at least once a week, and if the soil is at all dry, sufficient water, at a temperature equal to that of the bottom-heat, should be given to thoroughly soak the soil and roots. Fruiting plants will require a bottom-heat of 80 degrees, and a house temperature of 70 degrees at night, with 75 degrees by day, allowing a rise of 10 degrees with sun heat; admit air on all favourable occasions, but in such a manner as not to materially lower the temperature. For successional plants a bottom-heat of from 70 to 75 degrees will be sufficient, with a house temperature of from 60 to 70 degrees. Prepare a sufficient quantity of fairly dry soil for potting, also a supply of tan or leaves for plunging purposes; this work will greatly facilitate operations when a general shift is given to the plants at the latter end of this, or the beginning of next, month. Pineapples will not succeed in a close, heavy, retentive soil; a light fibrous loam should be used, broken up roughly. A good mixture is as follows—to every five barrowfuls of loam, add one barrowful of oak or beech leaf-mould, half a bushel each of crushed bones and charcoal, a good sprinkling of old mortar rubbish, and well pulverised cow manure.

EARLY VINES.—Stopping the laterals will now require constant attention. Pinch the points out of the young growths two leaves beyond the fruit, and stop all sublaterals at one leaf; carefully draw away with thin raffia any growths that are near the glass, but at the same time the final tieing down, and the proper regulating of the growths must be deferred until the flowering period, when, with ordinary care, there is no risk of the shoots breaking off. Thin the bunches to the required number immediately it can be seen which are the best to select; admit air in suitable weather, and maintain a moist atmosphere until the flowering period, when drier conditions should prevail, until the berries are set.

SECOND EARLY VINES.—Give the borders a good soaking with clean water, afterwards closing the house; commence with a night temperature of 45 degrees, and from 50 to 55 degrees by day. Syringe the rods and damp down the house once or twice a day to generate a moist atmosphere. When the buds commence to swell gradually increase the night temperature to 60 degrees in the daytime.

CUCUMBERS.—Fruiting plants will be benefited by frequent top-dressings with a light rich compost, also with occasional doses of weak liquid manure, or some approved chemical stimulant; pinch the laterals at the second leaf, carefully tie in, and thin the growth sufficiently to avoid overcrowding. Syringe the plants when possible, and maintain a moist atmosphere by damping down the house several times a day. Little or no air should be given at this season of the year. Maintain a minimum night temperature of 60 degrees, and a day temperature of 70 degrees, allowing a rise of 10 to 15 degrees with sun heat. Place young plants in their fruiting quarters as soon as ready, and sow more seeds for succession.

TOMATOES.—The earliest plants will be ready for their fruiting quarters, either in pots, boxes, or borders underglass. Use a compost of three parts good loam and one part leaf-mould, with a little old mortar rubbish added. Make the soil very firm as planting proceeds. Sow a small quantity of seeds thinly in a light compost, and place in a temperature of 60 degrees. Put the seedlings into 3in. pots when fit to handle, and place near the glass. If carefully attended to these plants will supply a good quantity of fruit next June.—H. R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

SEED SOWING.—To obtain strong sturdy specimens of certain kinds of summer-flowering plants, seeds should be sown at the present time in gentle heat. Fairy Queen Begonia, Ricinus, and verbenas should be sown at once. Sow thinly, and as soon as the seedlings appear give them a position near the glass in a house with a temperature of about 60 degrees. When large enough to handle, prick them off separately into small 60's, and grow in the same temperature.

PENTSTEMONS.—Those that were rooted from cuttings in the autumn are now ready to be put separately in 60-sized pots, and if given this treatment they will make sturdy specimens by the time for planting out. Keep them in a cold frame and protect from frost during severe weather. Pentstemons can be raised from seed sown now in shallow boxes, and these seedlings will flower late in the summer, if they are pricked out when large enough, and carefully grown until planting time.

EAST LOTHIAN STOCKS.—These are very popular, and are especially useful for bedding purposes, as they make a fine display, and produce handsome flower spikes under good cultivation.

THE RECENT SNOW.—Owing to the heavy fall of snow recently experienced in many places, outdoor operations have been considerably hindered, and, unfortunately, much damage has been done to conifers and evergreen trees where it was not possible to relieve them of the weight of snow soon enough. In many cases, large limbs and smaller branches have been split off, and the resulting snags must be carefully cut back with saw and pruning knife, afterwards applying a dressing of gas tar to the cuts. In the case of cupressus, Irish yews, and other trees of a similar nature, where the branches are bent out, they must be tied back into position with strong cord or wire, but when the latter is used, it is necessary to place a pad of cloth or leather next to the branch to prevent the wire cutting into the bark.

THE SHRUBBERIES.—The present time affords a good opportunity for examining the stakes and ties of all trees and shrubs, and after the recent weather a good many will require attention. Complete planting as soon as possible, so that the soil may become well settled around the roots before the growth commences. It is well to dig or fork over the shrubberies now, but when doing this take care not to damage the roots of any of the valuable or surface-rooting shrubs. Do not break up the soil too finely, as it will crumble down later on.—J. Gardner, Batsford Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Gardeners' Royal Benevolent Institution.

The seventy-second annual meeting of this great charity was held at Simpson's, 101, Strand, W.C., on Thursday, January 18, commencing at 2.45 p.m. Mr. Harry J. Veitch, the treasurer, presided, and there were about two dozen subscribers present when proceedings were opened.

The usual formalities finished, the Secretary, Mr. G. J. Ingram, read the annual report, which we give in abridged form:

### REPORT OF THE COMMITTEE FOR THE YEAR 1911.

The committee desire, as in former years, to express their thankfulness at having been enabled to maintain the good work of benefiting those horticulturists or their widows who, through sheer calamity and misfortune, have been obliged to seek assistance. Established in the year 1839, the charity has since that time distributed in relief no less a sum than £137,000, whilst during the past year £4,344 was disbursed in permanent assistance alone, being £150 more than in any other year of its history.

At the commencement of 1911 there were 246 persons (140 men and 106 widows) in receipt of annuities of £20 and £16 a year respectively. During the year thirteen men and ten widows have passed away, and the committee now recommend the election of twenty candidates from an approved list of seventy-one applicants. They deeply regret it is not possible to place a larger number on the funds, especially as so many poor and deserving cases must necessarily be left over for another year.

The "Victorian Era Fund" and the "Good Samaritan Fund" are still proving of the utmost value and help. The former fund is for assisting unsuccessful candidates who have been subscribers whilst awaiting election, while the latter fund dispenses temporary and immediate relief in urgent cases of trouble and distress. It may again be mentioned that the income only of these two funds is available for distribution, so that any augmentation in the way of donations to one or either of them will be gratefully welcomed.

The annual festival dinner took place in June last in the Hall of the Worshipful Company of Grocers, by kind permission of the Court. Ladies were, for the first time in the history of the institution, present, and Sir Marcus Samuel, Bart., presided, to whom the committee tender their sincere thanks, not only for his able advocacy of the claims of the charity, but for his generous contribution and personal services which resulted in the dinner being a great success. They also take this opportunity of expressing their thanks to stewards and collectors, to the donors of flowers, to the decorators of the tables, to the horticultural Press, and to other friends in all parts of the country who contributed in any way towards the satisfactory result.

The committee have again to express their indebtedness to those noblemen, ladies, and gentlemen, who have so kindly allowed their beautiful gardens to be thrown open to the public for the benefit of the funds of the institution, amongst whom may be mentioned: The Right Hon. Earl Beauchamp, Madresfield; the Lady Battersea, Overstrand; Sir Frank Crisp, LL.B., J.P., Friar Park; and E. J. Wythes, Esq., Epping. The committee have also to thank the "George Monro" Concert Committee for again allocating a portion of the proceeds of their well-known annual concert in aid of the work. Mention must also be made of the kindness of Messrs. Sherwood, Sutton, Rochford, and Monro, for their handsome donations for unsuccessful candidates. The recipients of these gifts were most truly thankful.

The committee gratefully acknowledge the services of the hon. officers of the several auxiliaries, which have been and are of such invaluable assistance to the institution. Unfortunately, the committee have to deplose the loss of a large number of subscribers by reason of death during the past year. Amongst those may be mentioned: Mr. James Douglas and Mr. James Walker, members of committee, the former having served on the board for 35 years. Both these gentlemen were whole-hearted supporters of the institution, and their presence and help will be sadly missed.

In conclusion, the committee most earnestly appeal for further support and renewed effort on behalf of this national horticultural charity. After to-day's election, there will be 51 applicants left on the list who are appealing for aid—everyone of them fully investigated and deserving cases. To help them an increased income is sorely needed, and, although the committee are deeply sensible of the generous support accorded to them in the past, they again plead for further aid to enable them to extend the benefits of the charity to those who are in so much need.

The chairman, before speaking upon the report, and when formally moving its adoption, expressed the sympathy of all members and friends of the institution with the families of the late Mr. James Douglas, and Mr. Jas. Walker. He said that the institution was making fair progress, and the income of 1911 was larger than ever before. Postages, etc., proved a heavy item, but this was due to the fact that practically all the business was done through the post. He felt sure all would agree that the institution was carried on at the least possible expense. Mr. Veitch referred to a recent meeting at Worcester, organised by the Worcester Auxiliary, attended by himself and Mr. Ingram. He said that two beautiful pieces of Worcester porcelain were offered as prizes, and Mr. W. Crump, of Madresfield, won the specimen offered in reward for securing the largest number of new members during the year; the other prize was for securing the largest amount of subscriptions and donations. Recently, from Reading, the Auxiliary there had paid in £84. The work was proceeding steadily all round, and it only needed a material increase of income to permit of increased usefulness. Mr. Harry Veitch was thanked for his past services, and unanimously re-elected as chairman and treasurer, on the motion of Mr. A. W. Sutton and Mr. W. Iceton.

Mr. George Monro moved the re-election of Mr. G. J. Ingram as secretary, and paid a high compliment to the secretary for the excellence of his work and the charm of his personality. The Chairman seconded the motion, which was heartily carried.

Messrs. W. Y. Baker, W. Crump, J. Hudson, A. Mackellar, Alderman Piper, S. M. Segar, P. C. M. Veitch, R. G. Waterman, and Edward White, were all re-elected on the Committee of Management; and Messrs. Donald Macdonald, E. A. Bunyard, and R. J. Cuthbert were elected new members in the places of Messrs. E. T. Cook, J. Douglas, and J. Walker. The auditors were duly thanked and re-elected, and an arbitration board was elected on the motion of Mr. P. Rudolph Barr.

### ELECTION OF PENSIONERS.

Messrs. F. Cooper, B. Monro, and Percy White were elected scrutineers of the ballot, and the meeting then stood adjourned for the election of pensioners. About 4.30 the result of the poll was declared, the following being declared elected: Jane Field (3,670 votes), Jas. Auton (3,501), Henry Payne (3,386), John Bolton (3,233), John Hill (3,205), Samuel McMaster (3,176), David Dunstall (3,128), Marie Baillie (3,087), Julia Baker (3,054), Maria Elworthy (3,039), Emma Lamkin (3,009), R. W. Todd (2,899), Elizabeth Goldsmith (2,823), R. J. Watson (2,677), Thomas Osborne (2,674), Thomas Frost (2,611), James Chorton (2,599), Amos J. Keen (2,563), Maria Mackay (2,561), William Hobbs (2,527), two pensioners were, under Rule III., elected by the annual general meeting, and, in addition, a grant of £20 for one year was given by Mr. A. W. Sutton, George D. Chisholm being the recipient.

On the motion of Mr. McKerchar, a cordial vote of thanks was accorded to the scrutineers, and one to the chairman.

### FRIENDLY SUPPER.

After the close of the business proceedings, a few members and friends dined, or supped, together under the chairmanship of Mr. Segar. The attendance was rather small, owing, doubtless, to the inclemency of the weather.

After dinner and the loyal toasts, Mr. Segar, in proposing "Continued Prosperity to the Institution," said they had all great reason to be proud of the progress of the charity; each year the income had increased, but so had the liabilities. In the future there would possibly be financial difficulties, and so it behoved everyone to do his best to secure additional subscribers. At present the institution had liabilities of about £4,000 a year, and from the Victorian Era and Good Samaritan funds about £500 was disbursed last year. He coupled the toast with the name of Mr. Harry J. Veitch, the treasurer, who, as he said, had been such a splendid worker for the institution.

Mr. Harry J. Veitch, in response, thanked Mr. Segar for his presence, and referred to the beginning of the institution when one candidate was elected, and after two years elapsed two more were elected; whereas today twenty candidates were elected, two others were put on, and both Mr. A. W. Sutton of Mr. G. Monro had each promised a pension for the year to very needy pensioners. Mr. Veitch pleaded for increased help, and pointed out that there were 72 candidates for the pension, and only twenty-four had been granted direct help. He hoped they would not in the future have to curtail their work because of lack of funds. It was the duty of those in whose power it lay to render assistance to those who were in great need, and this help should be given by all who had a real love for the profession of horticulture.

Mr. N. N. Sherwood, V.M.H., in a charming little speech, proposed "The Committee," and spoke of the keen interest every member took in their work, giving time and money to its advancement; and, further, the committee had a very capable and businesslike chairman in Mr. H. J. Veitch, who had also been treasurer for 26 years. He concluded by offering £20 to go to the assistance of any specially needy and deserving unsuccessful candidates. Mr. G. Monro replied, and referred to the loss of Mr. J. Douglas and Mr. J. Walker, both members of committee, the former the oldest member at the time of his death. The committee was, he was glad to say, a national one, and not a London one. Mr. Monro closed with a very kindly word for the good work of the secretary, Mr. Ingram, and the chairman, Mr. Harry Veitch.

Mr. P. Rudolph Barr proposed the health of "Our Country Friends," and paid a high compliment to the splendid work of provincial members, and especially of the Auxiliaries. With this toast were coupled the names of Mr. W. Atkinson (Sheffield), Mr. Percy White (Worcester), and Mr. L. Castle (Reading), each of whom responded appreciatingly, Mr. Atkinson expressing the hope that the forthcoming Royal International Exhibition might be such a success as to bring some funds to the institution.

The Chairman proposed the health of Mr. G. J. Ingram, the secretary, and this was accorded with the greatest possible enthusiasm. Mr. Ingram suitably responded, and the meeting concluded with "The Chairman," very ably proposed by Mr. William Iceton.

## Liverpool Horticultural Association.

The annual meeting of this society was held on Saturday at Hackins Hey, Liverpool, Mr. W. Mercer in the chair.

The report stated that the spring, rose and sweet pea, and autumn shows had been much better attended than those of the previous years, while the exhibits and competition was above the average. The statement of accounts showed subscriptions amounting to £273 6s. 6d., admissions £144 15s. 4d., and prize money £217 9s. 6d., leaving a credit balance of £152 9s. 9d., or loss on the year's working of about £20, chiefly in subscriptions. Arrangements are in hand for again holding three exhibitions during the ensuing year in the Corn Exchange.

A vote of thanks was tendered to the officers and committee for their excellent services during the past year. The election of officers resulted as follows: President, the Right Hon. the Earl of Derby; treasurer, Mr. W. F. Rogers; sub-treasurer, Mr. G. Blackmore (re-elected for the twenty-fifth time); secretary, Mr. Harold Sadler, 31, North John Street, Liverpool (re-elected). A cordial vote of thanks to the chairman terminated the proceedings.

## Southampton Royal Horticultural Society.

The forty-ninth annual meeting of the Southampton Royal Horticultural Society was held at the Audit House, Southampton, on Monday afternoon, when Mr. A. J. Day, J.P., presided, in the absence of the Mayor.

The Chairman briefly expressed his interest in horticulture, and observed that it was not altogether satisfactory that such a society, which had been in existence for nearly fifty years, did not receive more general support. Speaking of the summer shows, he said he felt that the visit of the National Rose Society would be a very great attraction, and he hoped they would have good attendances.

The annual report stated, iter alia, that the financial position of the society had improved since the last account was issued. Although a small sum was due to the treasurer, the council had been able to meet all liabilities. Although many new members had been added during the past year, a larger number of former subscribers had unfortunately been lost. The society was fortunate in having secured the present Lord Swaythling to the vacant office of president, who is taking great interest in the jubilee of the society. The rose show was a decided success financially, and the exhibits, although showing a falling off in some classes, were generally of the highest order of merit. The carnation show was seriously affected by the exceptionally dry season, which caused the absence of many usual exhibitors. The autumn show was undoubtedly the best of the season, but unfortunately the attendance was very disappointing. The council are much encouraged by the support it is receiving in its endeavours to arrange an attractive programme for the society's fiftieth anniversary. The proposed visit of the National Rose Society would be received with much satisfaction, as it would ensure the largest and most interesting exhibition of roses seen in the county. A liberal and comprehensive schedule of prizes was being prepared for the great Jubilee Show, to be held in July, and it was hoped that the above exhibitions will attract not only the best exhibitors in the kingdom, but also many visitors to the town.

Mr. E. Kemp Toogood, in proposing the adoption of the annual report, impressed upon the members and his fellow townsmen the necessity of increased support to enable the council to make the society's fiftieth anniversary a notable event in an eventful history.

On the proposition of the Chairman, seconded by Mr. Ebborn, Lord Swaythling was unanimously elected president. The vice-presidents were also re-elected, with the addition of several patrons. Messrs. Green, Moberly, and Green were also re-elected as hon. solicitors. Mr. Toogood was enthusiastically re-elected chairman of the council. Mr. A. Doggrell was re-elected vice-chairman, and Mr. A. G. Thompson was again chosen as hon. treasurer.

Another popular re-election was that of Mr. C. S. Fuidge as secretary for the fortieth year, which was on the proposition of Mr. Glasspool, who observed that Mr. Fuidge's experience was probably unique in the history of secretarial work in Southampton. Mr. F. Chandler seconded, and the Chairman supported, remarking that his own father-in-law, General Lacy, who was instrumental in founding the society, was very appreciative of Mr. Fuidge's services.

Mr. S. D. Bartlett was re-elected members' auditor, and the retiring members of the council were re-elected as follows: Messrs. F. G. Bealing, T. Hall, W. Valentine, F. Chandler, and F. Green, with the addition of Mr. H. E. Molyneux.

The meeting closed with the usual votes of thanks.

## Bickley Horticultural Society.

At the recently held annual meeting of this society, Mr. Whitelegge, of Chislehurst, gave a lecture on "Orchids," which proved most interesting and useful. Before dealing with methods of cultivation and kinds, species, varieties, and hybrids to grow, Mr. Whitelegge pointed out that the orchid family contained some 9,000 species, of which from 40 to 50 were British, while from 5,000 to 6,000 hybrids had been obtained during recent years. The order had wide distribution, examples being found in every country excepting those situated within the arctic and antarctic zones, where, up to now, they had not been discovered, and the presumption was against their existence there, as orchids seemed to congregate as near the equator as they could. Burma, India, Brazil, Central America, and East India, Java, etc., were particularly rich in orchids. Though they grew in the warmer regions of the earth, it did not necessarily follow that orchids required intense heat. The majority of orchids loved fresh air, and in the desire for that, or in their struggle for existence against other plants, they had ascended the hills and mountains, and for the most part were found at considerable altitudes, often approaching and even intruding on the frost line, a fact that should be remembered by those who cultivated them.

The order was divided into three sections, epiphytal, terrestrial, and saprophytal. The last named lived on decayed wood chiefly, and had but little floral beauty. It was practically impossible to keep them alive under cultivation, and he only mentioned them in order to show that no orchid yet discovered was parasitical, as they were popularly but erroneously considered.

Epiphytal orchids grew on trees and large shrubs, moist rocks, or in any favourable position where they could fix themselves and obtain sufficient nourishment from any decayed debris and moisture. Terrestrial orchids had usually a more or less tuber-like root stock. Most of the British species belonged to this section, of which the common orchid, Orchis maculata, was a good example. The division between the last named sections was not by any means well marked, for the two often merged into one another. Botanically the nearest allies of orchids were the lilies and iris, from which they were distinguished chiefly by the curious formation of the pollen, which, instead of being granular and dust like, as in most plants, was formed into wax-like balls, in twos or multiples of twos.

With the exception of cypripediums, masdevallias, and a few minor genera, the growth of an orchid was analagous to that of a bulb. Cattleyas were perhaps the extreme example among epiphytes, one or more bulbs being freshly made each year, the older ones, up to a certain age, acting as food reservoirs, from which they derived their name of pseudo, or false bulbs. In terrestrial orchids the same rôle held good, but the pseudo bulb was often entirely underground. In fact, if some of the British orchids were dug up in late autumn it would be seen that the last year's bulb had almost vanished, having supported the plant during the formation of the present season's tubers, which in turn would wither. In nearly every case orchids seemed adapted to exist for considerable periods without rain, as, in fact, many of them did, the seasons in their original surroundings having well defined periods of heavy rain, alternating with long, dry summer seasons. Very few orchids were difficult to grow.

## Birmingham Horticultural Society.

At a meeting held at Fletcher's Restaurant, Birmingham, on January 22, the old Handsworth Horticultural Society ceased to exist, and the new Birmingham Horticultural Society came into being. Mr. E. H. Weaver presided, and there was a good attendance.

Mr. Silver, treasurer of the Handsworth Society, explained the situation, and showed that there was a desire for a society and exhibition worthy of the great Midland city. They had £237 in hand, and properties worth £100, but to enable the new society to compete with Wolverhampton, etc., a larger income was necessary. Promises of prizes to the extent of about £100 had been received, but this was by no means sufficient. He suggested a guarantee fund, and said that if Birmingham was to rival Wolverhampton and Leamington there must be a larger financial backing.

The Lord Mayor of Birmingham (Alderman W. A. Bowater) was elected president, Mr. W. G. Griffith, deputy president, and Mr. E. H. Weaver chairman. The exhibition for 1912 is fixed for July 19 and 20, and it will be held in Handsworth Park.

## Brighton Horticultural Society.

At the annual meeting of this society, held in the Pavilion, Brighton, Mr. W. Balchin presided. The annual report showed that the net loss on the Rose and Sweet Pea Show was £95 11s. 3d. To meet the desire for economy, this show was held in the Dome and Corn Exchange, the lawns and promenade being dispensed with, but the exceptional heat proved the futility of the experiment. The Chrysanthemum Show was held at a net loss of £51 9s. 1d. This show was acknowledged to be a successful achievement otherwise than financially, and in connection with the success the committee expressed their gratitude to the firms who so materially enhanced the show by their magnificent non-competitive exhibits. The loss on the year's working amounted to £43 2s. 4d., compared with £51 15s. 3d. in 1910, £76 19s. 11d. in 1909, and £64 18s. 3d. in 1908. With regard to the financial aspect of the society, the committee was at first prepared to advise what seemed to be the only solution of the difficulty, viz., the "winding up" of the affairs of the society. However, the President suggested the formation of a guarantee fund of about £50, as an experiment for next year, himself offering £10, and promising to appeal to his friends who were interested in horticulture. In addition, he suggested the election of a smaller committee, willing to become guarantors for £2 individually. The balance-sheet stated that the cash at the bank on January 1, 1911, was £1 1s. 11d., the deposit account £50, and the cash in hand £2 19s. 6d. The subscriptions amounted altogether to £194 18s. 6d. The gate receipts at the Rose and Sweet Pea Show were £56 3s. (first day), and £37 5s. (second day); and at the Chrysanthemum Show, £50 10s. 6d. (first day), and £68 15s. 5d. (second day). The receipts at the Rose and Sweet Pea Show were £112 15s., and at the Chrysanthemum Show £185 1s. 2d. The expenditure on the shows was respectively £208 6s. 3d. and £236 10s. 3d. The cash at the bank on December 31, 1911, was £11 19s. 10d. The rules were slightly altered in accordance with the findings of the report, and then the officers were elected as follows: President, Alderman Colman, J.P.; chairman, Mr. Balchin; treasurer, Mr. George Miles; vice-chairman, Mr. Frank Woollard; secretary, Mr. A. J. Gaston; members of committee (elected by ballot), Messrs. Steers (42 votes), Tebbs (41), Shrubsole (36), Pelley (34), Pratt (31), Howell (29), Greenfield (24), G. A. Miles (24), and Watson (24). In the course of the election of officers, Mr. George Miles thanked the society for the honour they had conferred upon him by allowing him to hold the position of chairman for so long. It was his jubilee in connection with the society, and he had without exception had something to do with the shows for fifty years. He had to give up the position of chairman, and thanked them for giving him a little to do to keep in touch with the society as treasurer. At the close of the meeting a vote of thanks was accorded the chairman.

## North of Scotland Hort. and Arb. Association.

The third lecture of the 1911-1912 series, under the auspices of this association, was given in the Botany Classroom, Aberdeen University, on Wednesday evening, 17th inst., by Mr. J. G. White, head gardener, The Orphanage, Aberlour. The subject was "Vegetables and Fruits: Their Dietetic Value." There was, as usual, a very good attendance, the president, Mr. John McKinnon, head gardener to the Earl of Aberdeen, Haddo House, occupying the chair. To illustrate his lecture, Mr. White had on view some thirty-two different varieties of common garden vegetables, all grown in the north of Scotland. Commencing with the classification of the ordinary vegetables into the classes, pulses, roots, and tubers, green vegetables, etc., Mr. White detailed their qualities both from a dietetic and medicinal point of view. Although not a Scotsman himself, he upheld, he said, the Scottish oatmeal for purposes of diet, and humorously remarked that the old saying, "Waterloo was won on the cricket field," should have been with more truth, "Waterloo was won on the breakfast table." Scientists agreed that in vegetables and fruits there were all the elements necessary to supply the needs of the human system. The diet of vegetarians who abstained from flesh meat of every form, proved the truth of the statement. The dietetic value of onions was perhaps greater than that of any other vegetable. Coming to deal with fruits, Mr. White said the great advantage of a fruit diet lay in the fact that the work of the digestive organs were greatly lessened. The consumpton of fruit per head at the present time was greater than ever before. People were beginning to understand that the food value of fruit was very high. It was not merely a luxury, but a health-promoting form of sustenance. Apples especially were now much in demand, as proved by the enormous quantities imported into this country.

At the close a short discussion followed, and several questions were asked by members relating to potatoes, and some of the other vegetables mentioned in the lecture, all of which were satisfactorily answered. A hearty vote of thanks to Mr. White, on the motion of Mr. C. S. France, concluded a most instructive evening.

## Reading Gardeners' Association.

The opening meeting of the present session took place in the Abbey Hall, Reading, on Monday, the President, Mr. F. B. Parfitt, occupying the chair. On this occasion a departure from the usual fortnightly lecture on a strictly horticultural subject was made, as, through the kind intermediacy of Mr. T. J. Powell, head gardener to Mrs. Noble, of Park Place, Henley-on-Thames, Mr. W. Marshall, the well-known photographic artist, of the famous Thames-side town, had kindly consented to display his unique collection of "Direct Colour Photographs" to the members of the association and their friends. A very large and appreciative gathering of those connected with the association was present, including, in addition to the President, the vice-president (Mr. Leonard Sutton) and Mr. and Mrs. E. P. F. Sutton. The audience was augmented by an invitation extended to the Reading Natural History Society, about twenty members with their president (Mr. W. E. Butler) being present. Several of the horticultural students from the University College were also among the company.

A few business formalities, including the election of six new members, having been disposed of, Mr. Marshall at once proceeded to display his lovely pictures. He informed the audience that the views were almost entirely taken in the grounds of Sir Frank Crisp, Friar Park; Mrs. Noble, Park Place; and Mr. C. J. D. Eveleigh, Wilminster Park, all in the close neighbourhood of Henley-on-Thames. The photographs were taken on autochrome plates direct from the flowers, and the exactitude with which the varied shades, both in the colours of the flowers and their foliage, were depicted, together with the wonderful accuracy of detail which appeared in the beautiful trees, evoked the wonder of all present, who showed their appreciation by unstinted applause. Many beautiful views in the grounds of Park Place, showing its charming water garden and wealth of lovely forest trees, were thrown upon the screen, while the wonderful rock garden with its replica of the Matterhorn, together with pictures of the topiary and water gardens, formed the subjects of a number of pictures taken at Friar Park. From Wilminster came many beautiful scenes, and in particular may be mentioned those showing bulbs, narcissi and tulips naturalised on a wild slope where previously nothing could be induced to grow. A number of miscellaneous subjects included many charming sunset and cloud effects, and pictures portraying autumn tints.

A hearty vote of thanks, proposed by Mr. Leonard Sutton, and seconded by Mr. Drew, with which the president also associated himself, was accorded Mr. Marshall for having so kindly provided such a delightful entertainment.

## Horticultural Club.

On Tuesday, the 23rd instant, this club held its usual monthly dinner at the Hotel Windsor, Mr. Harry J. Veitch occupying the chair, and a good number of members and guests being present. After dinner Mr. Chas. E. Pearson gave a very interesting lecture on "Birds' Eggs: Some remarks on the Evolution of Colour," illustrating it with a large number of beautiful lantern slides depicting the nests and eggs of many birds rare and otherwise, and also clutches of eggs minus nests which are laid among stones and under other conditions where their peculiar colour renders them all but indistinguishable from their surroundings. Mr. Pearson broached the theory that all birds' eggs were primarily white, as are those of the lizard and other reptiles, from which undoubtedly the Birds have been evolved. In course of time, what may be termed accidental variation led to natural selection of types, which happened to be protective, and eventually in this way a great variety of colouration was brought about, which in these days is exemplified by collectors by innumerable types so beautiful and so brilliant in tint and design as to render them marvels of evolutionary development. Cases of such examples were exhibited both by the lecturer and by Mr. Percy Bunyard, another expert in the cult, which, though only relating to two species of marine birds, the Guillemot and the Herring Gull, represented the cream of many hundreds of eggs collected from many sources, every one differing markedly, and most of them so brilliantly and variedly pigmented as to fully justify the enthusiastic admiration of everyone. The question of the protective character of this colouration seems, however, in many cases to be an open one, though the fact that the eggs of birds of prey, which lay their eggs in inaccessible places, usually have white eggs, of what Mr. Pearson considered the primary type, speaks somewhat in its favour, as did also a number of slides to which we have alluded, where the eggs were laid amongst waterworn stones which they so closely imitated as to be discovered on the screen with difficulty. It was also mooted in the course of the discussion which followed the lecture, and was participated in by Messrs. P. Bunyard, E. Bunyard, W. R. Darlington, and others, that old birds are prone to lay less highly coloured eggs than are young ones, losing the power of pigmentation to a greater or less degree. Apart from the variation in the eggs themselves, the different modes of construction and situation of the nests, as depicted on the screen evoked considerable interest, as did numerous interpolated anecdotes of bird and egg colecting and photographing experiences at home and abroad.

A hearty vote of thanks concluded a pleasant and instructive function.

## Bristol Gardeners' Association.

A largely-attended meeting was held on January 25, at St. John's Parish Rooms, presided over by Mr. A. Perry. Mr. Strugnell, gardener to Walter Long, Esq., gave an interesting lecture on "Hardy Fruit." The lecturer said the effects of the summer of 1911 left many and varied impressions. Many trees suffered, and some totally collapsed in soils of light texture. There would be no mistake about the ripeness of the wood this season. Speaking on the colouration of fruit, Mr. Strugnell said it was chiefly set up by sun and vapour. The following are a few hints given by the lecturer: Protect fruit blossom by the use of branches of yew, etc.; use lime rubble liberally for peach trees, also ashes from garden fires; mulching is a good practice, except on heavy lands; train gooseberry bushes on wire trellises, and enclose the whole with netting; where raspberries are unsatisfactory, a change of stock or varieties is advisable.

For three table plants, Mr. Jennings was first, and Mr. Bastin second. Two new members were elected.

Eckford's
Giant Sweet Peas

**SWEET PEA PERFECTION.**

When growing Sweet Peas, grow only the best. To obtain the very best, send direct to ECKFORD for your Seeds; but remember they are only genuine when obtained direct from Wem. Eckford's are the largest retailers of Sweet Peas in the world, and do not supply the trade.

**£1,000 in CASH PRIZES given away. Send a postcard for particulars.**

**SPECIAL COLLECTIONS FOR 1912.**

| | |
|---|---|
| **Exhibitors' (E) Collection.**<br>24 giant waved varieties, new and up-to-date fine for exhibition, 10 seeds of each, **5s. 6d.**, post free cash with order. | **Exhibitors' (D) Collection.**<br>12 giant waved varieties, new and up-to-date; fine for exhibition, 10 seeds of each, **2s 9d.** post free cash with order. |
| **Villa (C Collection.**<br>12 splendid varieties, suitable for exhibition, 50 seeds of each, **2s.9d.** post free, cash with order. | **Half-Villa (B) Collection.**<br>25 splendid varieties, suitable for exhibition, 25 seeds of each, **3s.** post free, cash with order. |
| **Villa (B) Collection.**<br>24 splendid varieties, suitable for exhibition, 50 seeds of each, **5s.6d** post free, cash with order. | **Villa (E) Collection.**<br>12 splendid varieties, suitable for exhibition, 25 seeds of each, **[illegible]s.6d.** post free, cash with order. |

*A specially written booklet on Sweet Pea Growing given with every order. Send to WEM to ensure satisfaction.*

**FREE** Send a postcard to day for large illustrated and coloured Catalogue. It gives full particulars of all novelties in Sweet Peas for 1912, also complete particulars of the £1000 offered in Prizes for growers of Eckford's Sweet Peas, and contains full list of all Flower and Vegetable Seeds.

**HENRY ECKFORD, F.R.H.S.,**
**(Dept. 221) WEM, SHROPSHIRE.**

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

DIMORPHOTHECA HYBRIDS.—E. P. R., Malvern: The dimorphotheca hybrids offer a considerable range of colour, and all are beautiful. We saw a small batch flowering last year, and were struck by their grace and general attractiveness. There was a rumour to the effect that the hybrids had been derived from Dimorphotheca aurantiaca, fertilised by the pollen of the common Pot Marigold; but probably the latter was confused with the Cape Marigold (Dimorphotheca pluvialis), a white flowering species, which has no doubt combined with the handsome D. aurantiaca to produce the new race. The hybrids are half-hardy annuals, and when they are raised in gentle heat, each plant should be potted separately as soon as it can be easily handled, otherwise there will be losses when the time comes to transfer the plants from boxes to the border or the rock garden.

JAPANESE LILIES.—K. W., Waterford: The present is a capital time to obtain Japanese lily bulbs, as large importations are arriving, and it is always very desirable to pot up the bulbs or put them in boxes as soon as possible after importation. Except in very favourable circumstances of soil and climate, it is not a good plan to plant newly-imported bulbs straight away where they are to bloom. A better plan where a number of bulbs are to be placed in a bed is to put the bulbs in boxes in suitable soil, and keep them dark and free from frost until growth begins; by this time the weather and soil will be favourable for planting, and the bulbs, already nicely rooted, may be put out without harm. Use leaf-soil freely in the compost.

DAMPING OF FERN PROTHALLI.—"W. T." writes: Under "Answers to Correspondents" (page 82), the damping of fern prothalli is explained, and the remedy given. Having had a considerable experience in raising ferns from spores, a few notes may be of interest to your correspondent. Damping is far more likely to occur when the spores are sown too thickly, which, from their exceedingly minute character, is very liable to happen in the case of a beginner, and, for the matter of that, to old hands as well. Some ferns, too, are far more liable than others to damp off in this way. One of the worst is the popular Australian bracken (Pteris tremula), and as soon as it is attacked the disease spreads with great rapidity. Directly a pot of prothalli shows signs of damping I find the only course to save the remainder is to prick them off into fresh soil. This soil must be sterilised before use, otherwise insects and vegetable pests will often do a good deal of damage. Pots five inches in diameter are a very suitable size for pricking off these small prothalli. or, if preferred, pans may be used. In any case, ample drainage must be provided, and the pots then filled to within an inch of the rim with the prepared and sterilised compost. Next, some of this soil is passed through a sieve with an eighth of an inch mesh, and the remaining space to the rim of the pot made up with this fine soil. While the coarser compost should be pressed down moderately firm, that on the top must be levelled, but left as light as possible. Having prepared the pot or pan in this way, a small skewer-like stick, with the pointed end slightly flattened, should be obtained, and with it a very small tuft of the healthy prothalli taken up, and transferred to the pot, which has been prepared for its reception. As the soil is very light this small cluster of prothalli may be pressed into its place with the finger, and, if carefully done, no injury will result. A space of a quarter to half an inch should be allowed between each tuft, and when the pot is finished it should be watered through a very fine rose, using tepid water for the purpose. This will settle everything in its place, and the growing prothalli will extend and fill up the intervening spaces. I have sometimes pricked them off three times before the least signs of fronds were visible, and have consequently obtained a very large number from a single pot. When the pots are prepared for pricking off the prothalli some cultivators prefer to water the soil before transferring the little tufts into their new quarters, but, having given both systems an extended trial, I much prefer the first-named plan. In carrying it out only one pot at a time should have the fine soil put on the top; otherwise, if several are prepared at once the compost becomes too dry and the pricking off then is not so satisfactory.

PROTECTING CHOICE TULIPS AND DAFFODILS.—M. E. H., Bedford, whose daffodils are now pushing through the soil, inquires as to the best means of protecting these flowers and tulips from spring frosts. Daffodils and tulips are so hardy that, except in the case of some rare species of the latter, they do not need protection for the purpose of saving their lives, but some protection is often desirable, especially in a season when long continued open weather has induced early growth, and it is followed by severe frost. Sharp frost has the effect of stunting the advancing growths because under its influence the hard surface soil grips the developing stem very hard. This trouble may be guarded against by laying heather, furze, or birch twigs over the beds or borders containing daffodils and tulips, but the protecting material must be lightly laid on, or it will "draw" the plants up. A good layer of cocoanut-fibre refuse is also a good protection.

GLAZED FROST.—M. J., Streatham, and E. R., Weybridge, write asking for an explanation of the term "glazed frost," which phenomenon was mentioned in a recent issue as having occurred at Wisley: A glazed frost such as that experienced at Wisley and in the metropolitan district on January 18, is of somewhat rare occurence. It is caused by the falling of rain at a time when the temperature is below freezing point, and the result is that leaves of evergreen shrubs, twigs, arches, etc., are covered with a film of water that freezes as it settles, and if rain continues to fall for some time during the frost all the wetted surfaces become coated with a film of clear ice, this film varying in thickness with the position of the leaf or twig, and the amount of rain and frost. On the morning of January 18, the "glazing" varied from the merest icy film up to a thickness of two-tenths of an inch. Although glazed frosts are rare in this country they are fairly common in many parts of America and France, and it need hardly be pointed out that such frosts sometimes do a great deal of harm.

EDIBLE AND POISONOUS FUNGI.—C. P., Doncaster, is anxious to obtain an inexpensive book with coloured illustrations of edible and poisonous fungi: You can obtain a booklet entitled "Edible and Poisonous Fungi," from the office of the Board of Agriculture, Whitehall Place, London, S.W., for 1s. This contains coloured illustrations and descriptions of twenty-five species, and is a very useful little work.

NEMESIAS FOR POT CULTURE.—J. S. S., Hitchin: The seeds of nemesias should be sown now to provide flowering plants for conservatory decoration by the end of May or early June. Sow thinly, just covering the seeds with sandy soil, and place in a temperature of about 60 degrees; prick off the seedlings as soon as they can be handled, and eventually pot each plant separately, growing them in a light greenhouse or warm frame, where ample ventilation in good weather and a position near the glass will produce good results.

### NAMES OF PLANTS.

S. S., Tenby.—Zygopetalum Mackeyi.

W. H., Ongar.—Zygopetalum Mackeyi.

T. R. C., Alnwick.—1, Cypripedium Hera Euryades, a good form; 2, Asparagus verticillatus.

G. P. R., Abingdon.—1, Linum trigynum; 2, Begonia fuchsioides; 3, Curculigo recurvata; 4, Sarracenia Drummondi.

B. E. S., Ilfracombe.—1, Ruscus racemosus; 2, Cissus discolor; 3, Buddleia asiatica; 4, Primula floribunda; 5, Cycas revoluta.

R. E. W., Buckley.—1, Fittonia argyroneura Pearcei; 2, Acacia cultriformis; 3, Primula frondosa; 4, Iris stylosa; 5, probably Selaginella Emileana; 6, Cotoneaster horizontalis.

## GARDENING ENGAGEMENT.

Mr. George Carver, for the past thirty years gardener to the late Mrs. Fenwick, Allerton Hill, Chapel Allerton, Leeds, has been appointed head gardener to C. F. Ryder, Esq., The Grange, Scarcroft, near Leeds.

## METEOROLOGICAL OBSERVATIONS.

TAKEN IN THE ROYAL HORTICULTURAL SOCIETY'S GARDENS AT WISLEY, SURREY.

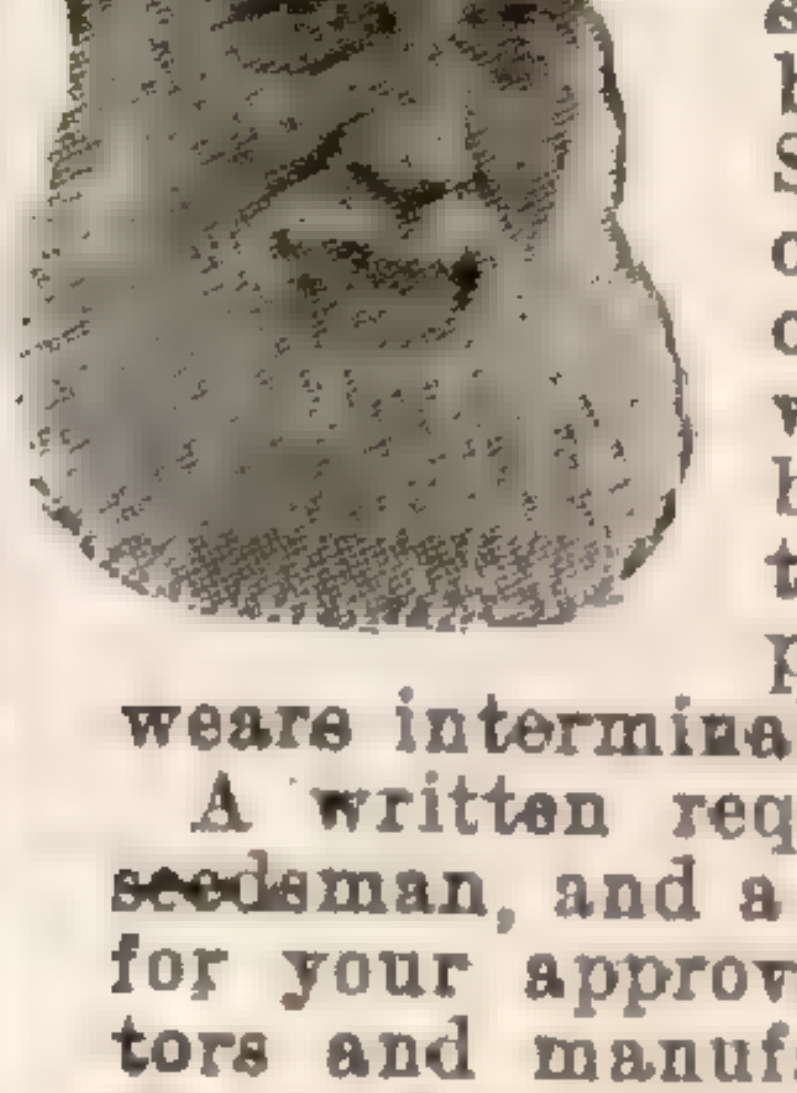
A slight fall of snow was observed on Saturday morning, January 27.



**The only resemblance** between a Pine Spray Syringe and others is in the shape of the barrel. The metal is more substantial. For the rest, the combination spraying head renders Spray, Rose, and Bend instantly obtainable without the addition or removal of a single fitment, while the adjustable leather bucket plunger gives perfect suction, never allows water to escape past it and up your sleeve, and wears interminably.

A written request from your ironmonger or seedsman, and a Syringe will be sent in 24 hours for your approval. Price **10/6.** Sole proprietors and manufacturers, **Robinson Bros., Ltd., West Bromwich.**

**PINE SPRAY SYRINGE** (patent).

## THE DECLINE OF BIG CHRYSANTHEMUMS.

There is this difference in the arguments used by Mr. Wells and myself on this subject. I give facts, names of tried exhibitors who have retired from the exhibition arena, and who we all deplore; while Mr. Wells indulges in sarcasm and ingeneralities about those to come into the front rank.

I was not alluding to the one great show only, that of the N.C.S., but to shows all over the country where the leading growers are in the habit of competing; the reports of the various shows tell whether my fears were well grounded or not. I hope he is correct in his suggestions that there are plenty of new men coming on; never was the almost worn-out, yet true, saying, "Wait and see," better applied. I did not say there were as many shows twenty years ago as there are now; but I think it is true there are not so many now as there were a few years ago. If there were not so many, but a little more concentration of societies into one centre in many districts, we should see finer displays. I doubt, however, if the local shows in any neighbourhood could present as fine a display as was the case a few years ago.

When these now departed giants took part in the more concentrated shows, good prizes were a strong stimulant, and we could see dozens of the leading varieties of both sectons, instead of the few now used to meet vase-class requirements, which are not a success in any way. Mr. Wells makes much of the Reigate Show held last year, and implies that, from it I should learn who were the young and rising competitors coming on to take the place of "the few old exhibitors." I quite feverishly searched the reports in the GARDENERS' MAGAZINE, which so ably gives a lucid description of all important shows, but, lo and behold! I could not find a mention of this magnificent display! I turned to three other leading contemporaries for this desired information, but with no better success! Mr. Wells must in the future see that this show on which he sets so much store for argument is duly reported.

There is one paragraph with which I find Mr. Wells and myself are quite in accord, that relating to the vase classes, and in which he invites those who would banish the boards from the tables to try their hand at vase class competition, and honestly note the result in the GARDENERS' MAGAZINE. I am glad to notice Mr. Wells's closing remark anent the large number of orders he is receiving for Japanese varieties. The public are evidently hoping for a return to the board classes, which certainly provides one way of giving a filip to the extended growth of big blooms.

E. J. MOLYNEUX.

Our Spring Catalogue
——Just Issued.——
Of interest to all who have Gardens.
SENT TO YOU
POST FREE for POST CARD.

From the selected lists of Bulbs, Herbaceous and Alpine Plants, we offer the following varieties of recent introduction:—

**Gladiolus Mrs. F. King** (flaming scarlet, **3/6** doz
" **Baron Jos. Hulot** (fine violet blue), **3/6** doz.
**Primula Forresti** (The New Chinese Cowslip), **1/6** ea.
" **Pulverulenta** (possibly the finest species cultivated), **9d.** each
**Anemone pulsatilla**, the Pasque flower, mauve coloured, highly decorative in Spring, **4d.** each; **3/6** doz.
**Montbretia Germania** (large scarlet flowers), **3/6** doz.
**Meconopsis Wallichi** (The Blue Himalayan Poppy), strong plants, **7/6** doz.
**Pentstemon Myddleton Gem** (the Pink Newbury Gem), **7/6** doz.

These have almost all received Awards of Merit from R.H.S.
We are Winners of over 600 Awards, including 32 Gold Medals for Exhibits.

**R. WALLACE & CO.,** Hardy Plant Nursery,
COLCHESTER.

## NEW BOOKS.

◆

"AMATEUR GARDENING ANNUAL AND YEAR BOOK 1912." Compiled by T. W. Sanders, F.L.S. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, E.C.) Price 1s. net.

This new addition to the list of annual publications associated with gardening differs appreciably both in plan and purpose from those with which we have for so long a period been familiar; and presenting a highly attractive appearance, and being well stored with useful information on the various details of garden practice, should attain to a high degree of popularity among amateur gardeners.

The two hundred odd quarto pages of which the book consists are filled with articles relating to the several aspects of garden management, and illustrations of plants, fruits, and flowers, and beautiful garden scenes, the latter being numerous, and, with the text, are of a high order of merit. To indicate the scope of the work, it may be mentioned that the text includes lightly written essays on annuals, bulbous plants, carnations, dahlias, hardy azaleas, pæonies, roses, sweet peas, water gardens, water lilies, flowering shrubs, orange trees, winter salads, etc. There is also a comprehensive and admirably arranged calender of work in the garden and greenhouse for each month of the year; also a series of tables of hardy perennials for growing in sunny and shady beds and borders, annuals both hardy and half-hardy, biennials, and perennials, that can be readily raised from seed, vegetables that can be grown to maintain a supply all the year round, and a host of other data specially prepared to assist the beginner in gardening.

The "Amateur Gardening Annual and Year Book" is in every way a publication of much merit, and is admirably adapted to the requirements not only of amateurs of some experience in gardening, but also of those who are turning their attention to gardening as a relaxation from the ordinary affairs of life, and need such information as will enable them to become conversant with the many details that the cultivator must be acquainted with before he can achieve a high degree of success in cultural methods. Not only is information throughout the work thoroughly sound, but it is given in a style that is at once bright and fresh, and therefore free from the dullness which characterises so many books on gardening. It is an excellent shillingsworth, and the general body of amateurs will do well to give the book their immediate attention.

## FORTHCOMING ENGAGEMENTS.

MONDAY, February 5.—National Chrysanthemum Society's Annual Meeting, Carr's Restaurant, Strand, W.C., at 7 p.m

TUESDAY, February 6.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m. on "Plants of Fiji and other South Sea Islands," by Sir Everard im Thurn; Scientific Committee at 4 o'clock.

WEDNESDAY, February 7.—National Amateur Gardeners' Association Bohemian Concert, Holborn Restaurant, 7.30 p.m.

THURSDAY, February 8.—Manchester and North of England Orchid Society.

FRIDAY, February 9.—Royal Gardeners' Orphan Fund Annual Meeting and Election at Simpson's Restaurant, Strand, at 3 p.m. Friendly Dinner at the same place, 6.30 p.m.

THURSDAY, February 15.—Croydon Gardeners' Association, Annual Dinner, Greyhound Hotel, 7.30 p.m.

## CATALOGUES RECEIVED.

AMOS PERRY, ENFIELD, MIDDLESEX.—In this seed list flower seeds only are offered; and these are of perennial hardy plants, including many new and uncommon species not usually offered.

FISHER, SON, AND SIBRAY, LIM., HANDSWORTH NURSERIES, SHEFFIELD.—A useful, illustrated catalogue of vegetable and flower seeds and of bulbs for summer and autumn flowering.

S. BIDE AND SONS, LIM., FARNHAM.—A very select list of vegetable and flower seeds; sweet peas, including several novelties, are a speciality.

G. COOLING AND SONS, BATH.—A comprehensive list of seeds and bulbs; collections of vegetable and flower seeds at stated prices are a feature.

FIDLER AND SONS, READING.—The special features of this firm's seed catalogue is the list of seed potatoes it contains. The descriptions are good, and the list includes several good novelties raised by the firm.

JOHN K. KING AND SONS, COGGESHALL.—A remarkably extensive list of flower and vegetable seeds, and bulbs and flowering roots; culinary peas, potatoes, and sweet peas are special features. The whole is freely illustrated and makes up a book of 150 pages.

## Situations Wanted.

ANYONE requiring thoroughly experienced WORKING and HEAD GARDENER, confident giving every satisfaction; twenty years all branches, large establishments, also on commercial lines if desired; home or abroad; age 35. C. ROWLAND, Ash House, Botcherby, Carlisle.

COL. MULLENS highly recommends his GARDENER (Second) for a similar position or Single-handed; age 26; single; abstainer; excellent references. Apply, E. DAMANT, Oaks, Langham, Colchester.

C. WINGROVE, The Gardens, Heath Lodge, Englefield Green, Surrey, requires Situation as JOURNEYMAN (Inside and Out); 2½ years here; five years' experience; age 20. For particulars apply as above.

FOREMAN (Inside); age 27; 12 years' experience with Vines, Peaches, Melons, Stove and Greenhouse Plants, Chrysanthemums, and Carnations, House and Table Decorations; good references. J. INGALL, Gate Burton, Gainsboro, Lincs.

GARDENER (Head) seeks SITUATION where two or more are employed; age 36; married, no family; life experience, Inside and Out, Roses and Carnations; excellent references. J. SMITH, 2, Lyncombe Vale Farm, Bath.

GARDENER (Head Working) seeks SITUATION, where one or more are kept; thoroughly experienced in all branches, Inside and Out; early and late forcing; 7 years' excellent character; middle aged; married, no family. Apply GARDENER, 11, Thornbury Road, Spring Grove, Isleworth.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### A Splendid Record.

The report that will be presented by the Council of the Royal Horticultural Society to the Fellows assembled in annual meeting on Tuesday next will be found of quite exceptional interest, not only to those who are more or less closely associated with the work that has been accomplished at Westminster and Wisley, but to all who are in any way concerned with horticultural progress. It is now many years since the annual reports of the society have been otherwise than of a satisfactory character; but the report to which reference is now being made is especially gratifying from the fact that it marks the completion of the first quarter of a century of a strictly horticultural regime, and affords ample evidence that the policy initiated in 1887 has been an unqualified success. The success achieved by the society during this period has indeed been so great that it can hardly have failed to far surpass the anticipations of the most sanguine of those who unhesitatingly engaged in the task of rehabilitating the society, and placing it in a position worthy of its traditions, and of a country that, as a centre of horticultural enterprise, has no superior in any part of the world. There is no occasion to recount the history of the Royal Horticultural Society during the quarter of a century that immediately preceded its quitting the South Kensington Gardens, or to discuss the position in which it was when it made Westminster its headquarters. Suffice to know that the history of the period mentioned, however lightly told, would not be particularly pleasant reading, and it has not yet been forgotten that when the society obtained a new home its fortunes were as low as they well could be. Remembering how great were the difficulties that had to be contended with in 1887 it is pleasant to turn to the report and balance-sheet for the year ended December 31 last for the purpose of obtaining official information with regard to the position of the society at the present time. A mere glance at the balance-sheet is sufficient to show that during the past twenty-five years the Council have been able to invest £52,383 10s. 9d.; but to be able to fully appreciate the care and judgment that has been shown in the administration of the finances, it is necessary to remember that a new hall has been built and furnished at a cost of upwards of £43,000, and that a sum of nearly £12,000 has been expended on the equipment of the Wisley Gardens. Not less satisfactory is it to know that there were, at the end of last year, 12,839 Fellows, associates, and societies in affiliation, or a gain of 796, as compared with 1910, and that the annual subscriptions amounted to £17,965 12s., or an increase of £1,336 13s. Possibly some of our friends might be of the opinion that the Council are investing too large a proportion of the income annually, but, so far from being in agreement with such opinion, we feel that it would be an immense advantage to the progress of horticulture were those responsible for the management of horticultural societies generally to show a similar degree of prudence in the administration of the funds at their disposal. In the case of local societies it is not always possible to avert disaster by building up a substantial reserve fund during years of prosperity; but in the majority of cases a moderate reserve fund will enable the society to tide over an unfavourable period, and again proceed with its work with the vigour necessary to obtain useful results. There has been no lack of vigour in the manner in which the work of the society has been conducted during the past year, and there are to be new developments during the present one. The first of these is the exhibition of daffodils, which will be held in April, and the second the exhibition of orchids in November, this latter being arranged for the purpose of demonstrating beautiful and highly interesting plants. The bulb, fruit, and vegetable shows, which formed such useful and interesting features during 1911, will be repeated, and there will consequently be no lack of competitive gatherings at the Royal Horticultural Hall, apart from those that will be held by special societies. There will not be any show in the gardens of the Inner Temple, owing to the great International gathering taking place in May, but the summer show will again be held in the grounds of Holland House, and will extend over three days instead of two, as on former occasions.

MR. JAMES PULHAM.

The Fellows, and, indeed, all who are interested in the welfare of the society, will be much gratified in learning that the loss on the Olympia show in July last was but trifling. The conditions under which the experiment was made of holding a summer exhibition at Olympia could not well have been less favourable, for the temperature was abnormally high, and the sunshine so intense as to spoil the beauty of the cut flowers by the close of the first day, and to prove trying to visitors. Much good work has been done at Wisley during the year, and of special importance has been the construction of the extensive rock garden, including a small bog garden and a miniature moraine by Messrs. Pulham and Son. This garden covers what was formerly a rough grass-grown hill above the water lily pools in the south-west corner of the old garden, to which it will, when planted, make a most attractive addition. It is pointed out in the report that the garden is not designed to afford the most artistic arrangement of stonework, so much as to provide a suitable home for rock and alpine plants. A more suitable home for the denizens of alpine regions it would be difficult to obtain, for it is just such a home as Nature has provided in various parts of the Alps of Southern Europe, plus greater facilities for growing a representative collection in a given area than is found in natural rock gardens. This department has been placed in charge of a foreman, having a special knowledge of rock gardening, and there is full justification for the belief that when the garden has been fully furnished it will form a feature immensely attractive and of much importance educationally. The experimental work at Wisley is being greatly extended, and, in consequence of the increased demands it is making upon the time of the Director of the Laboratory and the necessity for his constant presence in the garden to watch experimental work, the Council have had a house built for him in the gardens and appointed an assistant lecturer. It is also satisfactory to learn from the report that the library which is now under the direct control of the Council, received a full share of attention during the year, and that about 300 volumes, involving an expenditure of between £800 and £900 were, on the advice of the Library Committee, purchased. It will thus be seen that the Council, while taking care of the profits resulting from the work in which the society is engaged, have given the fullest attention to the several branches of the society's activities, and maintained the whole of the departments in a high degree of efficiency.

---

**Mr. James Pulham,** whose portrait we have the pleasure of giving in this issue, is the leading member of the old-established firm of Messrs. Pulham and Son, who, for at least half a century, have enjoyed a high reputation for the great excellence of their varied activities in beautifying gardens. The firm has, indeed, been so long established that they might well claim to be the pioneers in the art of naturalistic rock and water garden scenery, and also of formal garden craft carried out in the Pulhamite and all kinds of natural stone. The well-planned and tastefully-arranged rock garden, if produced with a true conception of the teachings of Nature in her most charming aspects, is one of the most delightful and interesting adjuncts to a garden with some pretension to versatility, and will afford an abundant return for the cost of construction and the time devoted to its management. It is surprising what can be accomplished in the improvement of the scenery of the garden and the attractions of its environment when a full acquaintance with the essentials of success in the formation of rock gardens and the necessary taste are forthcoming. In not a few instances, the Messrs. Pulham have been able to show how the aspect of some part of the garden may be changed, and a quite new and attractive feature be developed by a simple method of procedure. As for example, by the removal of a hedge and the transformation of the ditch on the outer side into a running brooklet, with rocky margins and waterfall, and spanned by a miniature bridge, or approached by picturesque stepping stones, a pleasing feature in which both rock and moisture-loving plants may be so combined as to produce a charming effect, and afford much to interest the plant lover. We mention this as evidence of the versatility of Mr. Pulham's taste, and as showing that he is not less successful in the construction of rock and water gardens where the area available is limited than in carrying out elaborate designs in great gardens. This versatility of taste is also shown in the skill with which the design is adapted to the environment and the special purpose the rockery or water garden is intended to serve. The number of gardens in which the Messrs. Pulham and Son having during the past fifty years constructed rock gardens, and formed, or greatly improved, lakes and streams are so numerous that it would require much space for the mention of any considerable proportion of them. It must, therefore, suffice to say that examples of their work may be seen at Aldenham House, Buckingham Palace, Batsford Park, Battersea Park, Lockinge, Preston Park, Sandringham, Newport, Welbeck Abbey, Glenart Castle, Co. Wicklow, The Dell, Englefield Green, Bawdsey Manor, Waddesden Manor, and Worth Park. Among the more recentwork that has been carried out has been the enlargement of the lake and water course, with a series of waterfalls, at Beaudesart for the Marquis of Anglesea, the construction of rock and water garden, lake and balustrade of terrace garden at Thornby Hall, Northampton; terrace gardens, balustrade, steps, fountain, etc., at Ardross Castle, under Mr. E. White; rock and water garden, with waterfalls and pools at Stanmore Hall; and a new terrace garden at The Node Welwyn. In addition to these works is the construction of the rock and water garden in the gardens of the Royal Horticultural Society. This garden has an area of nearly two acres, and, as we have already intimated, is not less remarkable for the judgment and taste shown in its design and construction than for its large area. As tasteful design and utility have been happily combined, the garden will long be regarded as a model of what a rock garden should be, irrespective of its area, and Mr. Pulham, who is assisted in the various branches of the business by his sons, may be heartily congratulated on the success achieved.

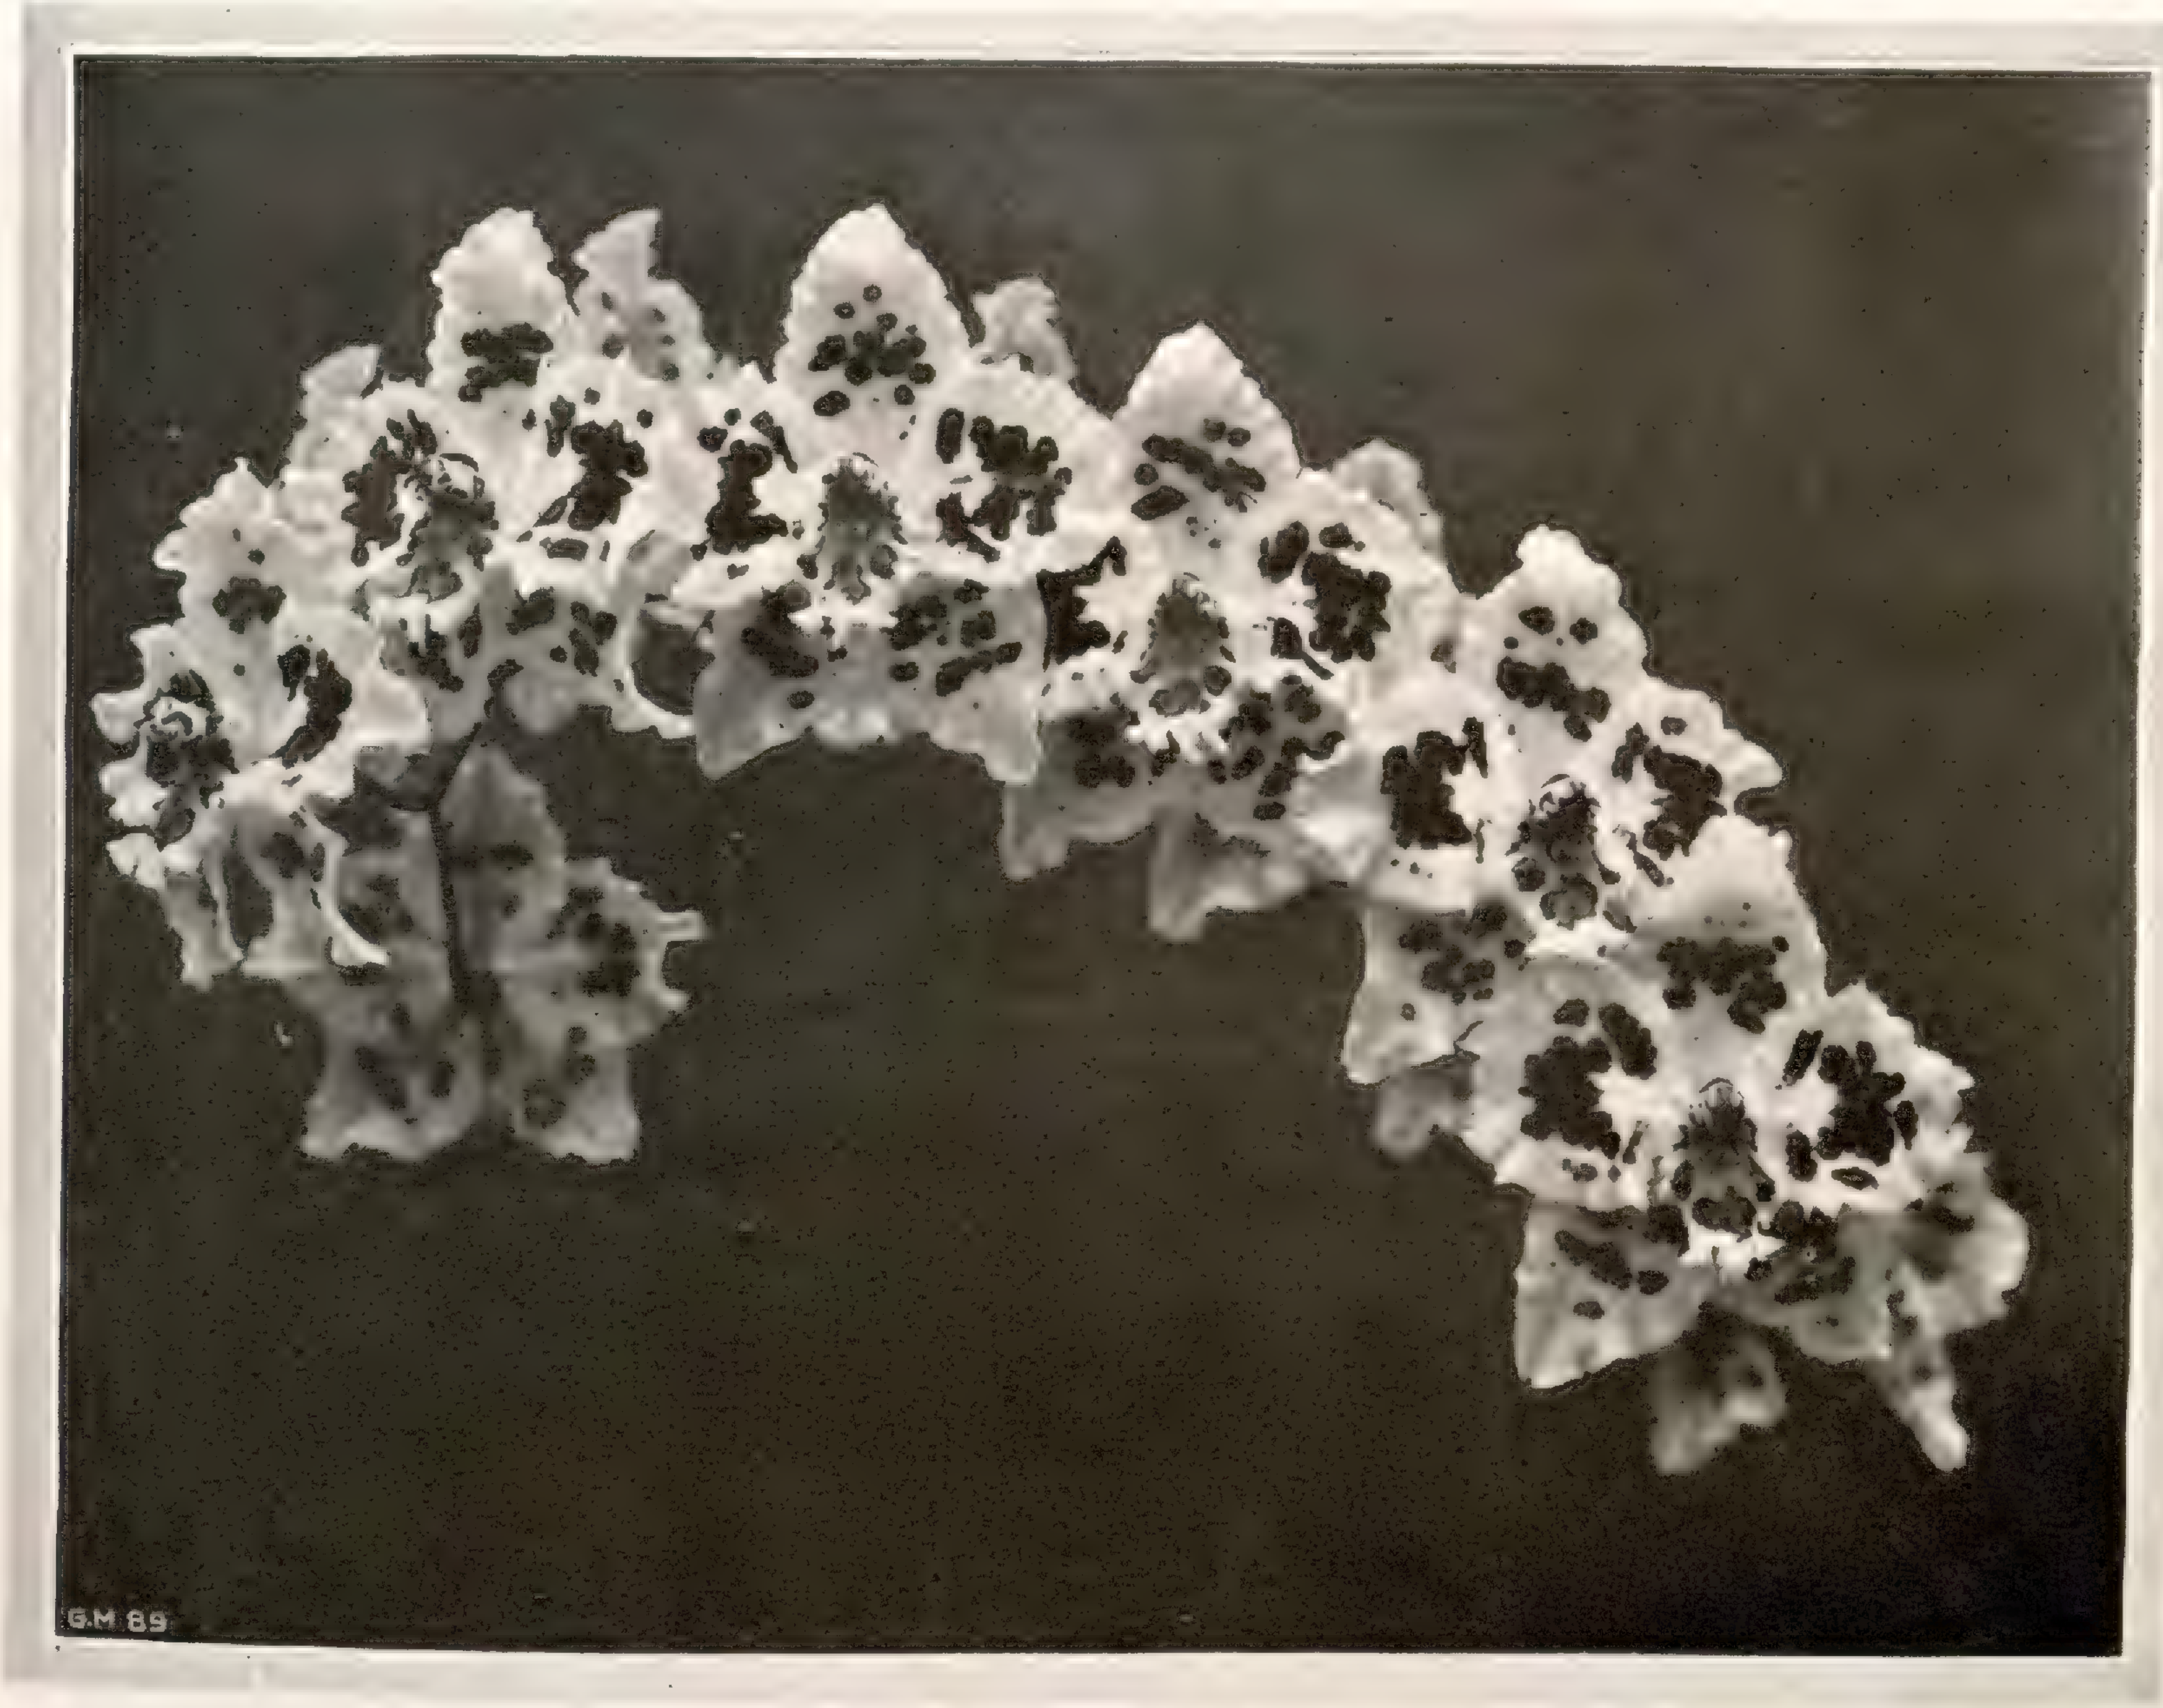
**Interest in the International Horticultural Exhibition.**—Great interest is being manifested in the forthcoming exhibition by Continental horticulturists. A proof of this is afforded by the fact that the secretary of the Société Nationale d'Horticulture de France, M. Abel Chatenay, paid a visit to London on the 30th of last month, and interviewed the directors on the subject of arrangements for the French exhibits. Invitations to attend the Exhibition have been distributed over the whole world, and official representatives of all foreign countries and of every Colony have been invited to the various functions and conferences. Since the issue of the last published list of presentation cups and other special prizes the directors have been informed, through Mr. James Whitton, one of the secretaries for Scotland, that the city of Glasgow will offer a silver cup for the best exhibit of hardy trees and shrubs suitable for planting in congested areas. The question of the suitability of various trees for cultivation in densely-populated towns possesses great interest for every park superintendent, and for all who are engaged in public gardening. Arrangements for the social functions in connection with the Exhibition are nearing completion, and the Reception Committee, through the chairman, Sir Albert K. Rollit, has presented its report to the directors. The Right Hon. W. Runciman, a member of his Majesty's Government, will attend and speak at the lunch to be given in the Exhibition grounds on the opening day to the members of the jury and administration.

**The Scientific Interest in Sweet Peas.**—Mr. T. H. Dipnall, M.A., writes, in answer to Mr. Cuthbertson: "My authority for stating that 'if you cross the exceptional members of a coupling system you reverse the system of their progeny' will be found in a paper 'On the Inter-relations of Genetic Factors,'" by W. Bateson, F.R.S., and R. C. Punnett, published in the Proceedings of the Royal Society, B, Vol. 84, 1911. In the "Sweet Pea Annual" of 1912 will be found, under my name, a review—or, rather, an epitome—of this paper, and another by the same authors, in which this question of coupling and repulsion is treated.

**The Late Sir Joseph Hooker.**—The current issue of the "Kew Bulletin" (No. 1, 1912) is of special interest; for, in addition to various contributions of scientific value, it contains a full and admirably-written biography of the late Sir Joseph Hooker. This biography extends over thirty-four pages, of which one-half are devoted to an enumeration of his writings during his long and remarkably active life. With reference to the position occupied by this distinguished botanist, the writer observes: "It is to his contributions to the field of botanical philosophy that Hooker largely owes his place in the roll of fame. His floristic work, though done with the hand of a master, is, after all, work that, if not done as well, might still have been done by others. But the philosophical papers, which commence with his share in the introductory essay to the "Flora Indica," in 1855, and end with his sketch of the vegetation of India in 1904, are those in which stand revealed the teacher we have lost." A feature of these philosophical contributions which arrests the attention and compels admiration is the style in which they were written.

**Potato Culture in Western Australia.**—The Government of Western Australia placed an order with Messrs. Sutton and Sons for 165 tons of seed potatoes, to be shipped to the Western State of the Commonwealth. The selection was made with the greatest care under the direct inspection of the British Board of Agriculture. The first consignment of 30 tons was despatched by the ss. Masunda. The object of this importation is to improve the type of potato grown in the State and to secure immunity from disease. Potato growing is an expanding industry in Western Australia, and great care is being taken, both by the grower and the Government, to prevent contamination by disease. The Capel district is one of the best for the cultivation of potatoes in Western Australia, and it is stated by the State Agricultural Commissioner, Mr. J. M. B. Connor, in a recent official report, that the south-western portion of Western Australia enjoys the distinction of being the only part of the Commonwealth in which absolutely clean potatoes can be procured. We learn that the balance of the order—viz., 135 tons—was shipped for their long voyage, on board the steamer "Jeanara," on Monday, February 5. The tubers, after being carefully examined and handpicked by Messrs. Sutton's staff, were specially packed in boxes (in expressly-prepared material), with a view to the protracted journey, each box containing 1cwt. of seed potatoes. The total consignment therefore consisted of no fewer than 3,300 cases. This is not the largest potato order exported by Messrs. Sutton. A year or two back an order for as many as 336 tons of one variety was executed for South Africa.

**Honorary Fellows and Corresponding Members of the N.C.S.**—At the annual meeting of the National Chrysanthemum Society, Mr. G. L. Caselton, superintendent of the gardens at the Crystal Palace, and for many years a member of the Executive Committee; Mr. George Gordon, V.M.H., Editor of the Gardeners' Magazine, member of the first General Committee of the National Chrysanthemum Society; Mr. W. Howe, member of the Executive Committee since 1897, and member of Floral Committee since 1898; Mr. George Langdon, member of the old Stoke Newington and Borough of Hackney Societies, and member of Executive Committee from 1883 to 1903; and M. Philippe de Vilmorin, Paris, were elected Honorary Fellows, while Dr. Chifflot, Lyons; Mons. A. Nonin, Paris; and Mons. Rodrigues, Biarritz, were elected as Corresponding Members of the society.



ODONTOGLOSSUM MERLIN.
Flowers white, with crimson markings. F.C.C., R.H.S., February 6. Lieut.-Colonel Sir George Holford.

**Winter Flowers at Kew.**—Just now, when the gardens are frost bound, and a biting easterly wind makes the inspection of outdoor plants anything but a pleasant pastime, it is a pleasure to turn into No. 4 house at Kew, where, in a comfortable temperature, an abundance of flowers are to be seen. A few days ago we made a note of the chief subjects in bloom, and now give the list as it may be useful to those who have conservatories to keep gay at this season. Among forced flowers there were double peaches and cherries, and pyruses, the old Kerria japonica fl. pl., tulips, daffodils, hyacinths, jonquils, and lily of the valley. Shrubby plants included a variety of heaths and epacrises, Sparmannia africana, Chorizemi illicifolius, Buddleia asiatica, Correa alba, Daphne indica, Indian azaleas, camellias, Abutilon megapotamicum, Polygala myrtifolia, eriostemons, Acacia longifolia, Jasminum primulinum, and cestrums. Besides all these there were batches of Primula chinensis, P. malacoides, P. obconica, and a few P. floribunda, with cyclamens, quantities of perpetual carnations, Begonia manicata, B. semperflorens gigantea, B. Gloire de Lorraine and its varieties, B. Gloire de Sceaux, arums, cinerarias, poinsettias, bouvardias, amaryllis, lachenalias, the Kew wallflower (Cheiranthus Kewensis), Coleus thyrsoideus, Eranthemum pulchellum, Centropogon Lucyanus, Impatiens Oliveri, Eupatorium Purpusi monticola, Erlangea tomentosa, Calceolaria Burbidgei, Peristrophe speciosa, Senecio petasites, and the bright and curious Strelitzia Reginæ.

**Gardeners' Tickets for the Royal International Horticultural Exhibition.**—Particulars of the reductions the International Exhibition authorities allow in the case of professional gardeners who obtain their tickets beforehand have already been published. We are now asked by the hon. Press secretary (Mr. R. Hooper Pearson) to state that application forms for these cheap tickets have been sent to the various county secretaries. As the tickets are available for the use of bona fide gardeners only, full particulars must be furnished to the secretary, and the tickets obtained before the opening date of the exhibition. All who have the requisite qualifications should apply at once to the secretary for the county in which they reside. The secretary will then send a form, which the applicant must fill up and return to him. Any delay may lead to disappointment.

**The Sweet Pea Annual** for the current year has been issued to the members of the National Sweet Pea Society, of which it is the official publication; and, as in the case of the previous issues, it is remarkable for its interest and usefulness to cultivators of sweet peas. The contents include articles on "Genetic Coupling and Repulsion," by Mr. T. H. Dipnall, M.A., which will be of interest to those who concern themselves with the scientific aspect of raising new sweet peas; "Life on a Californian Sweet Pea Ranch," by Mr. Frank G. Cuthbertson; "Sweet Peas in the Lake District," by Mr. F. J. Harrison; a report of the conference held on the occasion of the annual meeting; an audit of the National Sweet Pea Society's exhibition; an account of the several outings of the members; and many other matters relating to the work accomplished in 1911. The book is freely illustrated, and especially noteworthy among the illustrations is that of a Californian sweet pea farm.

**"George Munro" Concert.**—We would remind our readers that the 16th annual concert, under the direction of Mr. George Munro, V.M.H., of Covent Garden, in aid of the gardening and other charities, will be held at Queen's Hall, Langham Place, on the 15th inst. Last year the sum of £43 was distributed among charitable institutions; the Gardeners' Royal Benevolent Institution receiving £12 12s., the Wholesale Fruit and Trades' Society £8 8s., and the Royal Gardeners' Orphan Fund, £2 2s. The programme is an excellent one, and tickets may be obtained from Mr. H. Baker, 42, King Street, Covent Garden, London.

## CHRYSANTHEMUM MRS. G. RUNDLE.

I was very pleased to read the notes on Chrysanthemum Mrs. G. Rundle from your correspondent "S. W." because I look upon it as one of our most useful decorative sorts. In the late seventies it was a popular incurved form, but the advent of the modern type soon consigned such varieties to oblivion as far as our exhibitions were concerned, but one is pleased to know that it is still appreciated for decorative effect, and still finds a place in our gardens. It is also largely cultivated for Covent Garden market, and would be still more so if the buyers would pay the same prices for incurved as they do Japanese blooms. Strange to say, although the buyers appreciate the incurved flower, they evidently think these are easier to produce; the cultivator thinks otherwise. For market work ten to twelve blooms per plant will finish off well, in fact, almost as well as the old orthodox three flowers did. As a decorative sort it fails somewhat, owing to the weakly stem, but after Mr. P. Craggs advice to use superphosphate in such cases, I have no doubt it will be utilised with good effect. It is a perfect little gem for wreaths and other floral designs. I have not seen Mrs. Dixon or George Glenny for some years, but the former I know is still to be obtained.

What a pity it is the N.C.S. does not institute a class or classes for these little gems. Now that this body is trying to popularise the anemones and pompons, we may hope that the Rundle family will receive the recognition it deserves. Another old variety, Mr. Bunn, now practically out of cultivation, is of the same type, a beautiful golden yellow. The Dalston Chrysanthemum Society has a class for this variety in memory of one of its old members, and it is generally well filled. The growers there tell me they get the best flowers by growing seven to nine blooms on a plant; they then finish off well, with little or no dressing.

J. B. Riding.

## ANNUALS IN ROSE BEDS.

The late Mr. Wildsmith, when once complimented on the fine display of annuals he had in the garden, and asked what he did to secure such marked success, replied: "I give the plants the same care and treatment that I bestow on crops of more value, or supposed to be of more value, such as roses, and the more expensive bedding-out plants."

Annuals, well grown, are very beautiful indeed, and during the past few years much more attention has been given to them than formerly and by more cultivators. Undoubtedly, the unsatisfactory condition of annuals, as seen in many gardens, has been caused by lack of attention on the part of the cultivator. If seedlings are raised in boxes and allowed to become spindly before they are transplanted; or if those in the open beds are not thinned and cared for, the plants cannot be satisfactory at their flowering stage.

Half-hardy annuals should be raised in pans, pots, or boxes in a mild heat. I have found that the plants are more valuable when so raised and given a fairly long period in which to grow before they are finally put out than when raised later on and subjected to a higher temperature.

The seeds of hardy annuals should not be sown too early, or the resultant seedlings will be checked, and then the very best could not be expected of them.

The late Mr. Wildsmith grew many annuals in the rose beds at one time, and I did so after learning of his success. Of course, no one would think of growing these or any other kinds of plants among roses which are being grown for the production of exhibition blooms. In small beds the annuals should be confined to the outer portion. In large ones, clumps of annuals may be grown all over them, but not to such an extent as to cause overcrowding; and, furthermore, the annuals themselves must be thinly disposed; one plant, so grown, is far more effective than half-a-dozen in a crowded state. I will not refer to cultural details here, but simply name a few annuals that are very charmingly grown among roses. Half-hardy—Asters, stocks, zinnias, celosias, marigolds, Nicotiana affinis, Phlox Drummondi, godetias, early sown mignonette. Hardy.—Candytuft, Clarkia elegans rosea, Chrysanthemum Burridgeanum, Eschscholtzia californica, Limnanthes Douglasi, Nemophila insignis, saponarias, Phacelia campanularia, and Shirley poppies.

Geo. Garner.

## ROCKERY PLANTS OF EVERGREEN HABIT.

Alpines of evergreen habit, as also plants that are not, strictly speaking, alpines, but that are universally recognised and employed as rockery plants, play an important part in rendering this indispensable feature of the garden attractive in winter. Visitors to Kew Gardens and other public parks and gardens cannot fail to note that a good deal of colouring is to be found amongst the plants under notice, and apart from the numerous shades of green which alone form an interesting study, purple, silver, grey, crimson, and bronze colouring is represented in subjects while in undress uniform.

The delightful Gentiana acaulis presents a cheery and fresh appearance in winter, and one need not dwell upon the beauty and rare colouring of its flowers. Iberis gibraltarica supplies us with great sheets of greenery, and the same applies to the aubrietias and arabises, not forgetting the variegated forms.

It is true that the armerias have grass-like foliage, and this is very pronounced when a dense colony is formed. They, however, contribute their quota of life in the dull season. One or two of the hardy heaths arrest attention in Erica cinerea alba, Foxi, and minimum, and then we have the woolly Thymus languinosus and the rampant Muhlenbeckia complexa, which is capable of converting a large boulder or tree bole into a thing of beauty within a comparatively short period. Megasea cordifolia and others give us ruddy colouring, their bristling flower bracts forming an additional charm. The trailing veronicas as V. saxatilis and gentianoides, also the alpine pinks, are invaluable, while Arenaria balearica hides all traces of flat boulders. The edelweiss (Gnaphalium leontopodium) is attractive by reason of its silvery foliage, and another brilliant foliaged subject is seen in Galax aphylla.

It is superfluous to sing the praises of the saxifragas and sempervivums. The first-named is finely represented in S. sancta, S. rotundifolia, S. aizoon, S. muscoides, S. hypnoides, S. Wallacei, and S. aizoon var. paradoxa, while sempervivums in S. arachnoides, S. Reginæ, and S. triste are first-rate for our purpose. The above is not intended as an exhaustive list, but each and all should be represented by bold groups in the rockery in order to ensure life and beauty when winter is upon us.

Walter H. Aggett.

## FRUIT CULTURE FOR MARKET IN AMERICA.

The feature of the annual meeting of the Ulster Fruit Growers' Association, held at Portadown a few days ago, was a lecture delivered by Sir Frederick Moore, Curator of the Glasnevin Botanic Gardens.

Sir Frederick's lecture was entitled "The Cultivation of Hardy Fruits for Market Purposes in the Eastern Portion of the United States and Canada." When visiting the eastern districts of the two great North American countries, one of his chief objects was to discover what was being done in the development of the hardy fruit industry. In this connection the Irish growers could hold their own fairly well with the Americans. Their average fruit-grower was quite on a par with the average fruit-grower in America. If in Ireland they were going to live as fruit-growers it was only by conducting the industry on the best lines that they could hope to succeed. If fruit-growing was judiciously and carefully done it would pay, and he had not the slightest doubt as to the future success of apple-growing. In the United States and Canada the fruit-growers worked on a co-operative system, and they thought that without co-operation there was a poor chance for the future. They felt inclined to work more and more on that system, and to bring co-operation into every branch of industry. Irish growers sometimes said they could not compete with the Americans, who had better climatic conditions. As a matter of fact, they were fighting against the brains and skill of the Americans, and they could never succeed as apple-growers unless they adopted a system that would give them the best results. A paying orchard was invariably a cultivated orchard. The grass orchards were the second-rate orchards. In the fruit-growing districts of America he travelled for miles through orchards, every one with the surface cultivated. The ground was kept stirred up with cultivators two or three times a year, and the sole crop was apples. The best cultivators all said that for best-class produce open ground was necessary, and, notwithstanding that labour was so dear, they were able to compete successfully with the Irish fruit-grower.

One of the reasons for that was the enormously larger crop they were able to get from the same amount of ground. He was struck with the symmetry of the trees in the orchards in America. Thinning the branches or pruning was extensively practised there, and was encouraged by the Government. Most of the big growers pruned their trees twice a year. In all the fruit-growing districts thinning was done extensively, scientifically, and intelligently by men who had made a study of it. In Ireland it was often said that spraying was not worth doing. That was not the opinion in America. There it was one of the essential things, and one of the things that the Government had done its best to promote. American fruit-growers strongly recommended farmyard manure as best for the fruit trees, and with that they used wood ashes. They manured their young trees, and helped them along so as to get results as quickly as possible.

There were several strong fruit-growers' associations in America, and they had a central association, where the district associations met together to discuss the various problems that arose in different parts of the country. He was assured that great progress had been made through these associations for the mutual benefit of the fruit-growers. Drastic regulations were drawn up for dealing with farmers who neglected their orchards, and so contributed to the propagation of insect pests with which the intelligent fruit-growers had to contend. That was the fruit-growers' suggestion for their own protection, and the Government adopted it. The Americans were opposed to autumn planting, and were strongly in favour of spring planting as being much more likely to bring good results.

# CHINESE PRIMULAS.

There are many species of primulas that have come from China, and the hardy kinds form a most interesting group, but when a gardener speaks of Chinese primulas he almost always refers to the varieties of P. sinensis. These form a group of plants varying in colour from white to deepest crimson and purple; in habit from the dwarf, densely-flowered heads of the older florist's forms, to the tall, elegant, and free-branching Star primulas; and in form from the small stellate flowers up to the doubles and the giant-flowered varieties with exquisitely-frilled blooms. Not only have the seedsmen improved the size, form, and colouring of the primula, and varied their habit, but they have secured varieties which are identical, save that one has dark stems and leaves, and the other pale green ones; or one has plain foliage of the ordinary type, while the other has elongated rather than palmate leaves, and these crisped along the margin in such a way as to suggest the title of Fern-leaf.

SINGLE CHINESE PRIMULA CORAL PINK.
A distinct and beautiful variety raised by Messrs. Sutton and Sons with flowers of a charming shade of pink.

But all this variation—a variation so considerable that practically all tastes are now catered for—has not been brought about by chance or in a short time. One has only to visit the nurseries of Messrs. Sutton and Sons, at Reading, at this time of the year to understand all that is meant by patient care, quickness to detect minute improvements and variations, and skill in cultivation. The Reading firm has always occupied a foremost position as raisers and growers of Chinese primulas, and every effort is made each year to enhance that position. Besides the big blocks of catalogued varieties there are scores of selections and cross-breds, all occupying valuable space, but all showing evidence of a forward policy.

It is by means of these selections that new, vigorous and improved stocks of certain varieties are produced in a few years, and this improvement may be in substance, form, colour, or habit. With rare exceptions, the Reading primulas are practically re-made every few years. The firm knows quite well how to re-create each variety, and so, as the years proceed and the parents of a given variety show improvement, that variety is re-produced in better form than previously. For instance, supposing such a thing were possible that the famous Duchess primulas were entirely lost, seeds and plants destroyed; it could be raised over again by effecting a certain cross, and in two or three years would be offered for sale again. The records of the various crosses made, and the results accruing therefrom are systematically and most carefully kept, and when these records are not in actual use they recline in a safe, away from possible harm.

It was in 1873 that Messrs. Sutton and Sons took up the work of improving primulas, and they had but few varieties to work upon. Nevertheless the work was carried on with skill and judgment, and in 1879 the firm received a certificate from the Royal Horticultural Society for a variety named Ruby King, and within ten years had secured no fewer than seven similar awards. In more recent times other honours have fallen to the Reading primulas, but outstanding novelties, like the Duchess, new forms, like the Star series, or distinct colours, are far more difficult to obtain now than they were thirty years ago.

The popularity of Chinese primulas shows no decline, and though perhaps fewer plants are grown now than formerly for early winter flowering—due possibly to improvements in the varieties and culture of chrysanthemums, easy methods of forcing, etc.—larger numbers are cultivated for flowering early in the new year, when their brilliant colouring and handsome heads of bloom render them particularly suitable for conservatory or room decoration, either alone or in association with early forced bulbs, ferns, and palms. In 1874 the Messrs. Sutton and Sons saved five ounces of primula seed in their own nursery, and this was regarded as a large amount in those days, and the experiment began in 1873 was considered to be amply justified. We may assume that primulas are twenty-six times more popular now than in 1873 because whereas five ounces of seed was then a large amount, the firm now annually saves about 130 ounces, this amount varying a little according to the weather experienced during January, February, and March, bright weather always ensuring the best "set" and the finest crop of seeds.

Regarding varieties not much need be written, especially as the Messrs. Sutton have reproduced six popular sorts in colour in their new catalogue, and the latter is sent on application to prospective customers. The Reading primulas fall into four groups, i.e., single, double, giant, and Star varieties, the latter group being again subdivided into ordinary, double, and giant flowered forms.

Taking the groups in order of mention, an excellent half-dozen varieties would be The Duchess, white, with a carmine zone round the orange eye; Crimson King, deep vivid crimson; Coral Pink, a lovely form, which sweet pea enthusiasts would probably describe as cream-pink; The Czar, deep purple-violet; Reading Blue, of fine habit; and either Pearl or Royal White for a white variety. From among double varieties the scarlet, pink, and white forms are of the finest quality, and wonderfully useful; while Double Duchess is extremely effective, and Double Salmon Pink gives a shade of colour that is especially desirable in late winter.

The giant race has been evolved at the expense of fertility, and in this group it is quite possible that the limit of size and substance of blooms has been reached—at least, it seems that if larger flowers could be obtained these would yield no seeds, as under present conditions seed saving is a difficult matter among the giants. But they are a noble set, and if they do require a little more warmth and attention than the others, these are well repaid by the magnificence of the plants when in flower. Giant White, Giant Royal White, Giant Crimson, Giant Salmon Pink (a wondrously beautiful and effective primula), and Giant Pink, are a good set.

The Star varieties are immensely popular because of their taller and more graceful habit of growth, and because of their adaptability for cutting and for house decoration. In point of popularity the original White Star, with white flowers over dark foliage, has not yet been beaten; White Queen Star gives flowers of greater substance; Pink Star, and both Light Blue Star and Dark Blue Star, make excellent companions to the white varieties; while Ruby Star gives a welcome glow of rich colour. Double Star varieties are now offered in mixture, and there are Giant Star forms, with white, ruby, or carmine flowers, the blooms being much larger here than in the typical Star primulas.

Although Chinese primulas provide the great feast of colour and beauty at Reading just now, filling many houses and exciting wonder at the skill of the cultivator as well as the skill of the raiser. There are other displays of note, and these include a splendid lot of cyclamens, probably the finest lot that even Messrs. Sutton and Sons, have produced. The varied colours of these useful flowers and the freedom with which they are produced make it quite certain that cyclamen culture will not abate for long years to come. The firm has also a first-rate strain of Primula obconica, the plants strong and vigorous, the flowers large, and the colours distinct and good.

**Lantanas.**—Last year, when the summer was wet and cold, the different lantanas proved in many places to be among the most satisfactory of summer bedding plants, and this year, with quite opposite summer conditions, they have been equally satisfactory. That the very hot weather experienced during the present year has been in their favour can be fully understood, for in many parts of the tropics lantanas are among the commoner weeds, growing luxuriantly, and flowering with great freedom. Of those employed for bedding in this country the most generally met with is Lantana salviæfolia, far better known, however, as Lantana delicatissima. The flowers of this have been during the present season unusually deep in colour. This lantana is generally seen as dot plants over low-growing subjects, and in this way some of the other varieties are very effective. They are, however, like heliotropes, inasmuch as a bed may be planted entirely with them, dwarf and tall plants being grown in association. Of the bright scarlet forms, Incendie is one of the best, being free growing and profuse flowering, while two especially good dwarf growing varieties are Chelsea Gem, bright crimson and amber; and Drap d'Or, orange-yellow.—W. T.

# MANURES AND MANURING.

## Important Points for Gardeners.

Fertilisers that are used in an intelligent manner are undoubtedly a source of profit to both fruit and vegetables growers, especially the latter; but carelessly used, they may be a source of great loss. To suggest that they can ever take the place of cultivation is, of course, absurd; in fact, it is only in conjunction with the most thorough working of the soil that they will prove profitable. And it is safe to say that success in gardening operations depends primarily upon the continual use of the spade and the hoe, and unremitting warfare against insect and fungoid enemies. Generally speaking, the use of chemical fertilisers in the garden may be directed according to a few fundamental rules, although, of course, local soil conditions and other active influences will enter largely into consideration.

These rules may be outlined briefly as follows: Plants grown for the sake of their leaves and stems—the cabbage tribe, lettuces, asparagus, onions, and a great many others—require an excess of nitrogen. For the legumes which gather their own nitrogen, and potatoes, which use up large amounts of potash, potassic manures can safely be recommended. Root crops, such as carrots, parsnips, turnips, beet, etc., require a fair amount of leaf growth in order to be able to store up the sugar and the starch and other nutrients in the root; and in order to secure this, generous applications of potash must be made, as well as phosphatic and nitrogenous manures and lime, sufficient to give the requisite amount of growth. The swollen roots of such plants as are named above are merely storing-places for an excess of food assimilated by the plants during summer.

The cultivator should have in his mind at least one principal object in manuring; that object should be the conversion of the soil into a medium suitable for the cultivation of the plants which he intends to grow therein. Prior to the application of manure, however, a necessity arises to consider the distinctive features of the soil, for a knowledge of these features renders the choice of suitable manures and crops much easier. Generally speaking, light sandy soils are poor in phosphoric acid, and often deficient in lime; they require liberal manuring and frequent applications of lime, and the introduction of humus is necessary in order to improve their texture and to increase the supply of nitrogen. Heavy clayey soils of a more retentive nature are generally rich in potash and nitrogen, but deficient in lime and phosphoric acid; organic matter is often needed here, and applications of lime are found beneficial. Further, although containing a full complement of potash, the amount of this essential plant food which may be available for a growing crop has often to be augmented by judicious applications of potassic manures. Alluvial soils and good loams are usually regarded as fertile soils, inasmuch as their mechanical conditions leaves nothing to be desired, while the chemical constituents include liberal supplies of all the necessary plant foods, without any trace of poisonous substances.

The problem of manuring, therefore, resolves itself into the "making" of soils by the application of manures designed to supply all the deficiencies required, both on behalf of the soil itself and the plants cultivated therein. Farmyard or stable manure has served many generations of farmers and gardeners, faithfully and fairly efficiently in this respect, but as this material is more or less fixed in its composition, its use is subject to some drawbacks. From an analysis of an average sample of fresh dung, we may quote the following: Total nitrogen, 0.439 per cent.; insoluble nitrogen, 0.317 per cent.; total phosphoric acid, 0.271 per cent.; soluble, 0.138 per cent.; total potash, 0.435 per cent.; soluble potash, 0.330 per cent.; dry matter, 22.49 per cent.; organic matter, 16.58 per cent.; ash, 5.91 per cent.

From these figures it may be noted that dung is a complete manure; and by reason of the large proportion of organic matter or humus which it contains, may often produce better results than where equivalent amounts of nitrogen, phosphoric acid, and potash are supplied. However, as we have before noted, the composition of dung is invariably fixed, and therefore admits of no special consideration of the particular requirements of soils or crops. For this reason it is preferable to use artificial manures in conjunction with moderate quantities of dung. This plan enables the cultivato to supply with greater certainty the particular anurial constituent or constituents at a time when they are most needed by the crop. The manurial requirements of special crops, such as celery, onions, carrots, asparagus, vines, gooseberries, chrysanthemums, and a great many others, can then be attended to more effectively.

Nitrification in the soil, or the conversion of the existing nitrogen into nitric acid or nitrates, proceeds most favourably when the soil is moist and porous and the weather warm. In the winter and early in spring, the nitrates formed in the preceding summer, are washed down into the subsoil by rain, and are lost; thus the early spring crops are denied this most essential stimulant unless some readily available form of nitrogen is supplied at the proper time. Undoubtedly the most suitable form of nitrogen for rapid work is nitrate of soda, although a less well-known but quicker acting manure is to be found in the shape of nitrate of lime. The effect of these fertilisers is short-lived, but they are only supposed to supply active stimulant at a particular time, and therefore should be used in moderate quantities.

Where it is necessary to push on lettuces, cabbages, or other green crops for special purposes, 1oz. or 1½oz. per square yard may be applied with safety; but strong growing crops, such as rhubarb and asparagus, demand more than this, and as much as 2½oz. is a suitable dressing. In order to facilitate the distribution of the nitrate, it may be mixed with a quantity of fine dry earth. Sulphate of ammonia is a nitrogenous fertiliser, which gives a more lasting effect than nitrate of soda; it undergoes certain changes in the soil owing to the action of bacteria, the process consisting of conversion into nitrate of lime in the first place, and nitrate of lime in the second place. This process does not take place very rapidly, and so the fertiliser produces available nitrogen throughout the whole of the growing season. In exceptionally hot and damp seasons, however, it will soon become exhausted. As regards the amount of sulphate of ammonia to be used in gardens, it may be said that from ½oz. per square yard for small effects to 1½oz. for greater effects generally answers the purpose well and efficiently. At all events, there are many reasons why it should be preferred to soot, which is so commonly used in many gardens. In the composition of the latter substance only 6lbs. out of every 100 consist of sulphate of ammonia. J.

(To be concluded.)

## THE NEWER ZONAL PELARGONIUMS FOR WINTER FLOWERING.

Although not cultivated to the same extent as they were some few years since, the zonal pelargoniums comprise some of the most showy of the winter-flowering plants available for cultivation in the warm greenhouse. The ease with which they can be cultivated and the length of time they will, under careful treatment, remain in bloom, marks them at once as the most useful subjects for making a display in the houses. They are not so useful for the supply of cut flowers as some other subjects, the winter-flowering carnations, for example, but where a very bright display of colour is required for a limited time only, they are of much value. In brightness of colour, some of the varieties far surpass the carnations, which, it may be observed, have done more to reduce the cultivation of the zonal pelargoniums than any other.

ZONAL PELARGONIUM HIS MAJESTY.
A brilliant scarlet variety of special value for winter flowering, raised by Mr. W. H. Page.

In the country, where the atmosphere is clear, and fogs are not prevalent, they produce a bright display in the conservatory, and if this is a light structure and provided with a heating apparatus which will allow of a little roof ventilation practically every day, they may be regarded as one of the permanent inmates for the winter, but where fogs are prevalent, and the atmosphere of the district more or less humid, it is not wise to place too great a dependence on them, as they might fail and thereby prove disappointing.

For a number of years Messrs. Cannell and Sons have taken the lead in raising new zonal pelargoniums, and the sets they introduced some few years ago under the names of ships, mansions, and towns have not, as a whole, been superseded. Since then, however, a few varieties of sterling merit have made their appearance, not the least prominent among these being three varieties raised by Mr. W. H. Page, of Hampton, and of these the finest is His Majesty, which may be described as one of the best crimson-scarlet zonals I have ever seen, its effectiveness being greatly enhanced by the white eye of the blooms. This variety is a good grower, and profuse in blooming, the flowers being produced throughout the winter. Fiscal Reform is another good variety, the flowers bright salmon-rose; they are not perhaps quite so large as those of the preceding variety, but they are most pleasing. Winter Cheer is very distinct, the flowers a bright cerise. It has the promise of becoming popular when better known.

Another novelty of much merit is the new orange-scarlet Maxim Kralesky. It is very striking, having more yellow in its flowers than any of the zonals I know. Prince of Wales is a very large-flowered variety, bright magenta, with a splash of scarlet in the top petals. Scarlet King, as its name denotes, is a very bright scarlet, and the plant has a good bushy habit, and is very free in flowering.

Rider Haggard is a form of flower much in the way of Sir T. Hanbury, the two colours in the top and lower petals being, if anything, more decided, and the flowers more effective.

Salmon Paul Crampel is a sport from Paul Crampel, and is an exact counterpart of its parent, except that it has rosy-salmon flowers. Another good new salmon zonal is Mrs. J. Ward, which has probably larger flowers than those of the variety immediately preceding.

In addition to the foregoing new varieties, the following is a list of the older zonals that may be thoroughly relied upon to produce a continuous display of flowers during the winter months, and, as the present month is the best time to root cuttings for an autumn display, it may help those who contemplate making a selection for next winter.

Salmon.—Ascott, Mrs. George Cadbury, and Ian McLaren.

Blush.—Mauretiana, Cevic, and Lady Roscoe.

White.—Snowstorm, Venus, and Goodwood.

Pink and rose.—Hatfield, Caronia, Sydney, and Mrs. Brown Potter.

Purple. — Frogmore, Lusitania, and Royal Purple.

Orange. — Prince of Orange, Cleveden, and Donald Beaton.

Crimson.—Leonus, Maris, St. Louise, Sir Thomas Hanbury, and Aldenham.

Scarlet.—Naples, New York, Chatsworth, and Lord Kitchener.

All the above are singles, and for the supply of cut flowers, the following semi-doubles are useful: F. V. Raspail, Improved Hermoine, King of Denmark, Lave, Pink Raspail, and Fire Dragon.

T. STEVENSON.

## TREES AND SHRUBS FOR CLIFF GARDENS.

During the past thirty years I have had considerable experience with trees and shrubs in gardens near the sea, both in northern and southern countries, and the following notes may be of use to inexperienced cultivators, especially those who are now contemplating the planting of such subjects.

I am referring to gardens placed close to the sea, and particularly those on rather high cliffs. The latter position is much sought after for a dwelling-house, but very often much trouble is experienced in inducing many kinds of shrubs and trees to flourish there; indeed, it is absolutely necessary to have a protecting band of trees in many cases.

A gentleman recently said to me, "Those trees are badly bruised by the south-west winds; it is a wonder the owners do not plant fresh ones." I pointed out to him how unwise it would be to interfere with the protecting trees, as they had grown up with those in the pleasure grounds surrounding the dwelling-house, and that the lawn and border trees and shrubs were very beautiful and very fresh and healthy; also that, if the protecting band was removed, the trees inside would suffer very considerable damage before another windbreak could be obtained by planting young, hardy subjects, and even then, the new, outer bank of trees would be as bad as the existing ones. Then he at once realised the true position.

Before any trees or shrubs are planted the soil must be deeply trenched, whether it be light, gravelly, and poor, or loamy and rich. But I have found it advisable not to make any soil very rich by the addition of much manure. When the trees make a very luxuriant growth in such exposed positions, they suffer all the more when severe weather or strong gales from the sea come. A moderate growth well matured is the most satisfactory in every way. I have seen both trees and hedge plants a mile inland, and for many miles along the coast, seared as if with fire, by the salt spray blown from the sea when gales have been strong, and tenderer shrubs close to it, duly protected, almost untouched.

The shape of both trees and shrubs is better and more uniform where the annual growth is moderately strong, than where it is very luxuriant.

Good trees and shrubs for protection are Pinus insignis, P. austriaca, P. maritima, evergreen oak, Lombardy and white-leaved poplar, silver fir, sweet bay, tamarisk, sycamore, thuiopsis, wych elm, elder, Cupressus macrocarpa, and Arbutus Unedo. The taller-growing trees and shrubs must not be planted too closely together, as overcrowding would mean, eventually, weakening of the belt; each specimen must have sufficient space to develop in.

The under shrubs in the outer belt should be mainly Aucuba japonica, escallonias, berberises, hollies, privets, veronicas, sea buckthorn, and Olearia Haasti.

Inside, in the most exposed positions, plant the mountain ash, beech, Buddleia globosa, Garrya elliptica, Genista hispanica, Choisya ternata, euonymuses, Mahonia japonica, laurestinus, laburnum, Guelder rose, pernettyas, Skimmia japonica, snowberry, white and pink thorns, single and double flowered.

Rhododendrons, lilacs, mock oranges, flowering currants, pyracanthas, Jasminum nudiflorum, deutzias, almonds, sweet briars (Lord Penzance's hybrid briars), honeysuckles, and mollis azaleas may all be planted in the sheltered garden by the sea. It is much more satisfactory to have such subjects thriving and healthy than very choice ones in poor condition.

GEO. GARNER.

## AMONG THE ALPINE FLOWERS.

> "While the daffodils still waver,
> Ere the jonquil gets its savour,
> While the linnets yet but pair,
> You are fledged, and everywhere.
> Nought can daunt you, nought distress,
> Neither cold nor sunlessness."

So sings the Poet Laureate of the primroses, which, in cosy nooks, attest the truth of the picture of their hardiness he presents. Beautiful indeed are they, although the weather is unkind enough even for them. One day they are silvered by the hoar frost or are shrouded in snow; the next they are bathing in a clear, sun-lit air; and the next again they may be soaked and beaten to the ground with drenching rains or driving sleet. Many of these primroses must, however, "die unmarried, ere they can behold Phœbus in his strength," and we have a feeling that they are unhappy at present in this climate of ours, natives though they be. Yet they flower away in the sheltered parts of the rock garden. Some are true representatives of this "pale primrose" of the bard; orders are pure white, lightened, it may be, by a little yellow eye; others are warm red, pale pink, or pale or deep blue. Lovely flowers are they, though not yet in the full beauty of their true flowering time. Among them Harbinger is the first of the whites to come with any freedom, and it charms us as we look upon this flower of the season.

### Snowdrops.

Still more truly might Alfred Austin have applied the above lines to the snowdrop, whichever comes soon after the dawning of the year, and to which we might say, "Nought can daunt you, nought distress." A little poetic license is always allowed, and is required as well, as sometimes even the primrose or the snowdrop is distressed and daunted by the weather of the time. Do we not see the primrose reduced almost to pulp? Do we not observe the snowdrop bowing towards Mother Earth in keen frost as if to supplicate her to take it to her bosom again? Yet, in the main, it is true, for these flowers reck but little of weather which would destroy many of the sister flowers of the garden.

And now these galanthuses abound. They are in masses, they are in clumps, and here and there a few of the choicer snowdrops droop their flowers of white, decked with green, to tempt us to compare their beauty with that of their more common sisters. Here are the common snowdrops, modest as ever, less opulent in their charms than some of their kinswomen, but hardly eclipsed in point of real beauty. Here are forms of Galanthus plicatus, the Crimean snowdrop; over there are plants of the Nikarian species, Galanthus Icariæ, with its broad, green, arching leaves and beautiful flowers. Elwes's snowdrop is here in several forms, and many of the scarcer and most beautiful of the named snowdrops show their virgin flowers in nook, on mound, and on rocky terrace.

### Crocus hyemalis Foxi.

Here, too, are a few flowers of Fox's winter-flowering crocus, C. hyemalis Foxi. It isn't a showy flower; it lacks the size and brilliancy of those wonderful forms of C. vernus we get from Holland, and which glow and almost seem to palpitate with colour in the sunshine of the later days. But Fox's crocus is more modest in its charms, and appeals, in the main, to those who love to observe the more minute points of beauty. The little cones of white, suffused in part with light purple outside, please us as we lovingly study their form and their colouring. Symmetrical and beautiful are these flowers in that state, but it is when the pallid sun of the winter days musters all his little strength and shines on these flowers that we fully realise their beauties. The cone expands, the flower opens into a charming cup of white, touched with yellow at the throat, with gold wire-like stigmata, and anthers of deep black. A combination of colour as this we hardly expect at this season—and a very charming one it is, worthy of our unalloyed praise. Yet, truth to tell, this little crocus is not quite happy in our northern land, and longs for a happier home. Our winters are too unkindly, and it frequently seeks in vain to unfold its blooms, although it will live for years in our gardens. And so we will do well to shield it a little from our rough weather, and shelter it by glass, even on the rockery, from the inclemency of the time.

### Crocus vitellinus.

Worthy of this also is Crocus vitellinus, whose beauty is of another degree. It seems to afford us, though with hardly such lavish benison, the brilliance of the golden yellow crocus of the later months. A bright little thing it is, and we are charmed with its yellow flowers as they meet our eyes on the rockery. They also are grateful for a little shelter from the inclemency of the time, and we may well grant their petition, knowing full well that they will reward us more than fully for our care.

### Other Plants.

As this is written, frost holds a brief apparent sway, and the flowers are at a standstill. Yet there are a few to greet us as we wander through the pathways and see what we have in bloom. There are other crocuses, there are winter aconites, snowflakes peering amid their incipient leaves, a few viola glooms give bits of colour, though one has seen more individual blooms to dare the season than this year. Christmas roses are yet snowy, and their sisters of Lent show bits of colour on the way. There are many evergreen plants to tell us that even greenery alone has countless beauties. Little shrubs and mounds, and carpets of blue-green, deep green, emerald green, pea-green, and an unlimited range of colours, through whites and silvers, some with red and purple tones, abound. And amid all are to be seen swelling bud or shooting bulbous plant, all on the way to respond to the joyous call of the spring.

S. ARNOTT.

## THE BUCKLER FERNS.

The Buckler Ferns (Lastræas or Nephrodiums) of Great Britain, consist of six definite species, viz., L. filix-mas, the Male Fern; L. dilatata, the Broad Buckler Fern; L. montana or oreopteris, the Mountain or Lemon-scented Fern; L. æmula, the Hay-scented Fern; L. rigida, the Limestone Buckler Fern; L. thelypteris, the Marsh Fern.

All these derive their generic name from the shape of the indusium or little cover which protects the dot-like heaps of spores on the frond backs, and are kidney or buckler shaped. The name nephrodium is derived from "nephios," a kidney, that or Lastræa from a French botanist, while the popular name of Buckler Fern explains itself. We have termed these "definite" species because several others are recognised by botanists—viz., L. spinulosa, L. ulignosa, and L. cristata. All these, however, are considered by experts in Brtiish ferns as representing merely grades or forms of L. dilatata. This species varies considerably in make and form of frond, and these three last pseudo species merge so much into one another, as well as into L. dilatata, that their distinct specific character can hardly be established.

The Common Male Fern (L. filix-mas), on the other hand, has been legitimately divided by the late Mr. G. B. Wollaston into three sub-species—L. f.-mas, L. propinqua, and L. pseudo-mas, each characterised by constant differences in make and detail, and even in deciduous or non-deciduous character, L. pseudo-mas, or the Hard Male Fern, being much tougher in texture, and, under protection from destroying winds, quite evergreen; while the other two are quite deciduous. We do not, however, propose here to go into these minutiæ, for such they are as compared with the varietal "sports," which most of the species named have yielded under wild conditions in the first place, and under culture by selection in the second.

Taking the Male Fern in all its three subdivisions as the chief contributor in this direction, we will begin with L. pseudo-mas cristata, found many years ago in Cornwall, which has been justly termed the "King of the Male Ferns." This belongs to the evergreen section, and has the peculiarity of a rising crown, while the crowns of the others grow horizontally, or nearly so. The result is that in time, if the lateral offsets be removed as they appear, a trunk is formed, and a tree fern of bold habit, and with beautifully tasselled four-feet fronds, is produced.

Another of the evergreen type, and a fine companion to the "King," is L. p.-m. polydactyla Wills. This grows much larger even than the "King," but has fewer fronds, and the tassels, though larger, are flatter and less divided. Both these under glass retain their fronds well into the following season, and until, indeed, the new growth is fairly well developed. Wills' variety produces few off-sets, and does not assume the tree form. The "King" has yielded several sub-varieties—viz., a form with narrow fronds (L. p.-m cristata angustata), but otherwise identical except in size, the fronds being somewhat shorter. Some spores from the same source have also undoubtedly produced two remarkably beautiful varieties, L. p.-m. cristata fimbriata, a lucent fronded and fringed gem of moderate size; and L. p.-m. percristata apospora on even prettier lines, but handicapped by a weak constitution. It has, however, the probably unique peculiarity that the smallest tip of a division, if layered on moist soil, rapidly produces prothalli from its edges. These breed other prothalli, and in a very short time an indefinite number of typical plants arise from these by buds.

The rest of the Male Fern group have produced a considerable number of tasselled and congested varieties on different lines, and also some very pretty dwarf forms, plain and tasselled, all of which are well worth growing.

L. dilatata, the Broad Buckler Fern, has also yielded a number of crested and crispate forms, of which we may mention L. d. polydactyla, L. d. grandiceps Barnes, L. d. crispata cristata Oscroft, L. d. Howardii (a curio), L. d. lepidota, finely cut, and a crested form of some; and from the Azores we have L. d. folioso-cristata and folioso-cristata and folioso-digitata, which are exceptionally handsome and evergreen under glass. L. montana, once considered as non-variable, has belied that opinion subsequently by yielding a very large number of distinct varieties. The best of these are L. m. plumosa Airey, L. m. coronnus Barnes, L. m. cristata, L. m. cristato-gracile Druery, L. m. grandiceps, and L. m. Barnesi, the last a tall, erect, narrow form, with the side divisions flat like the steps of a ladder. L. æmula has yielded one very pretty crested variety, L. æm. cristata and L. thelypteris, a polydactulous form, which, however, was introduced from the United States.

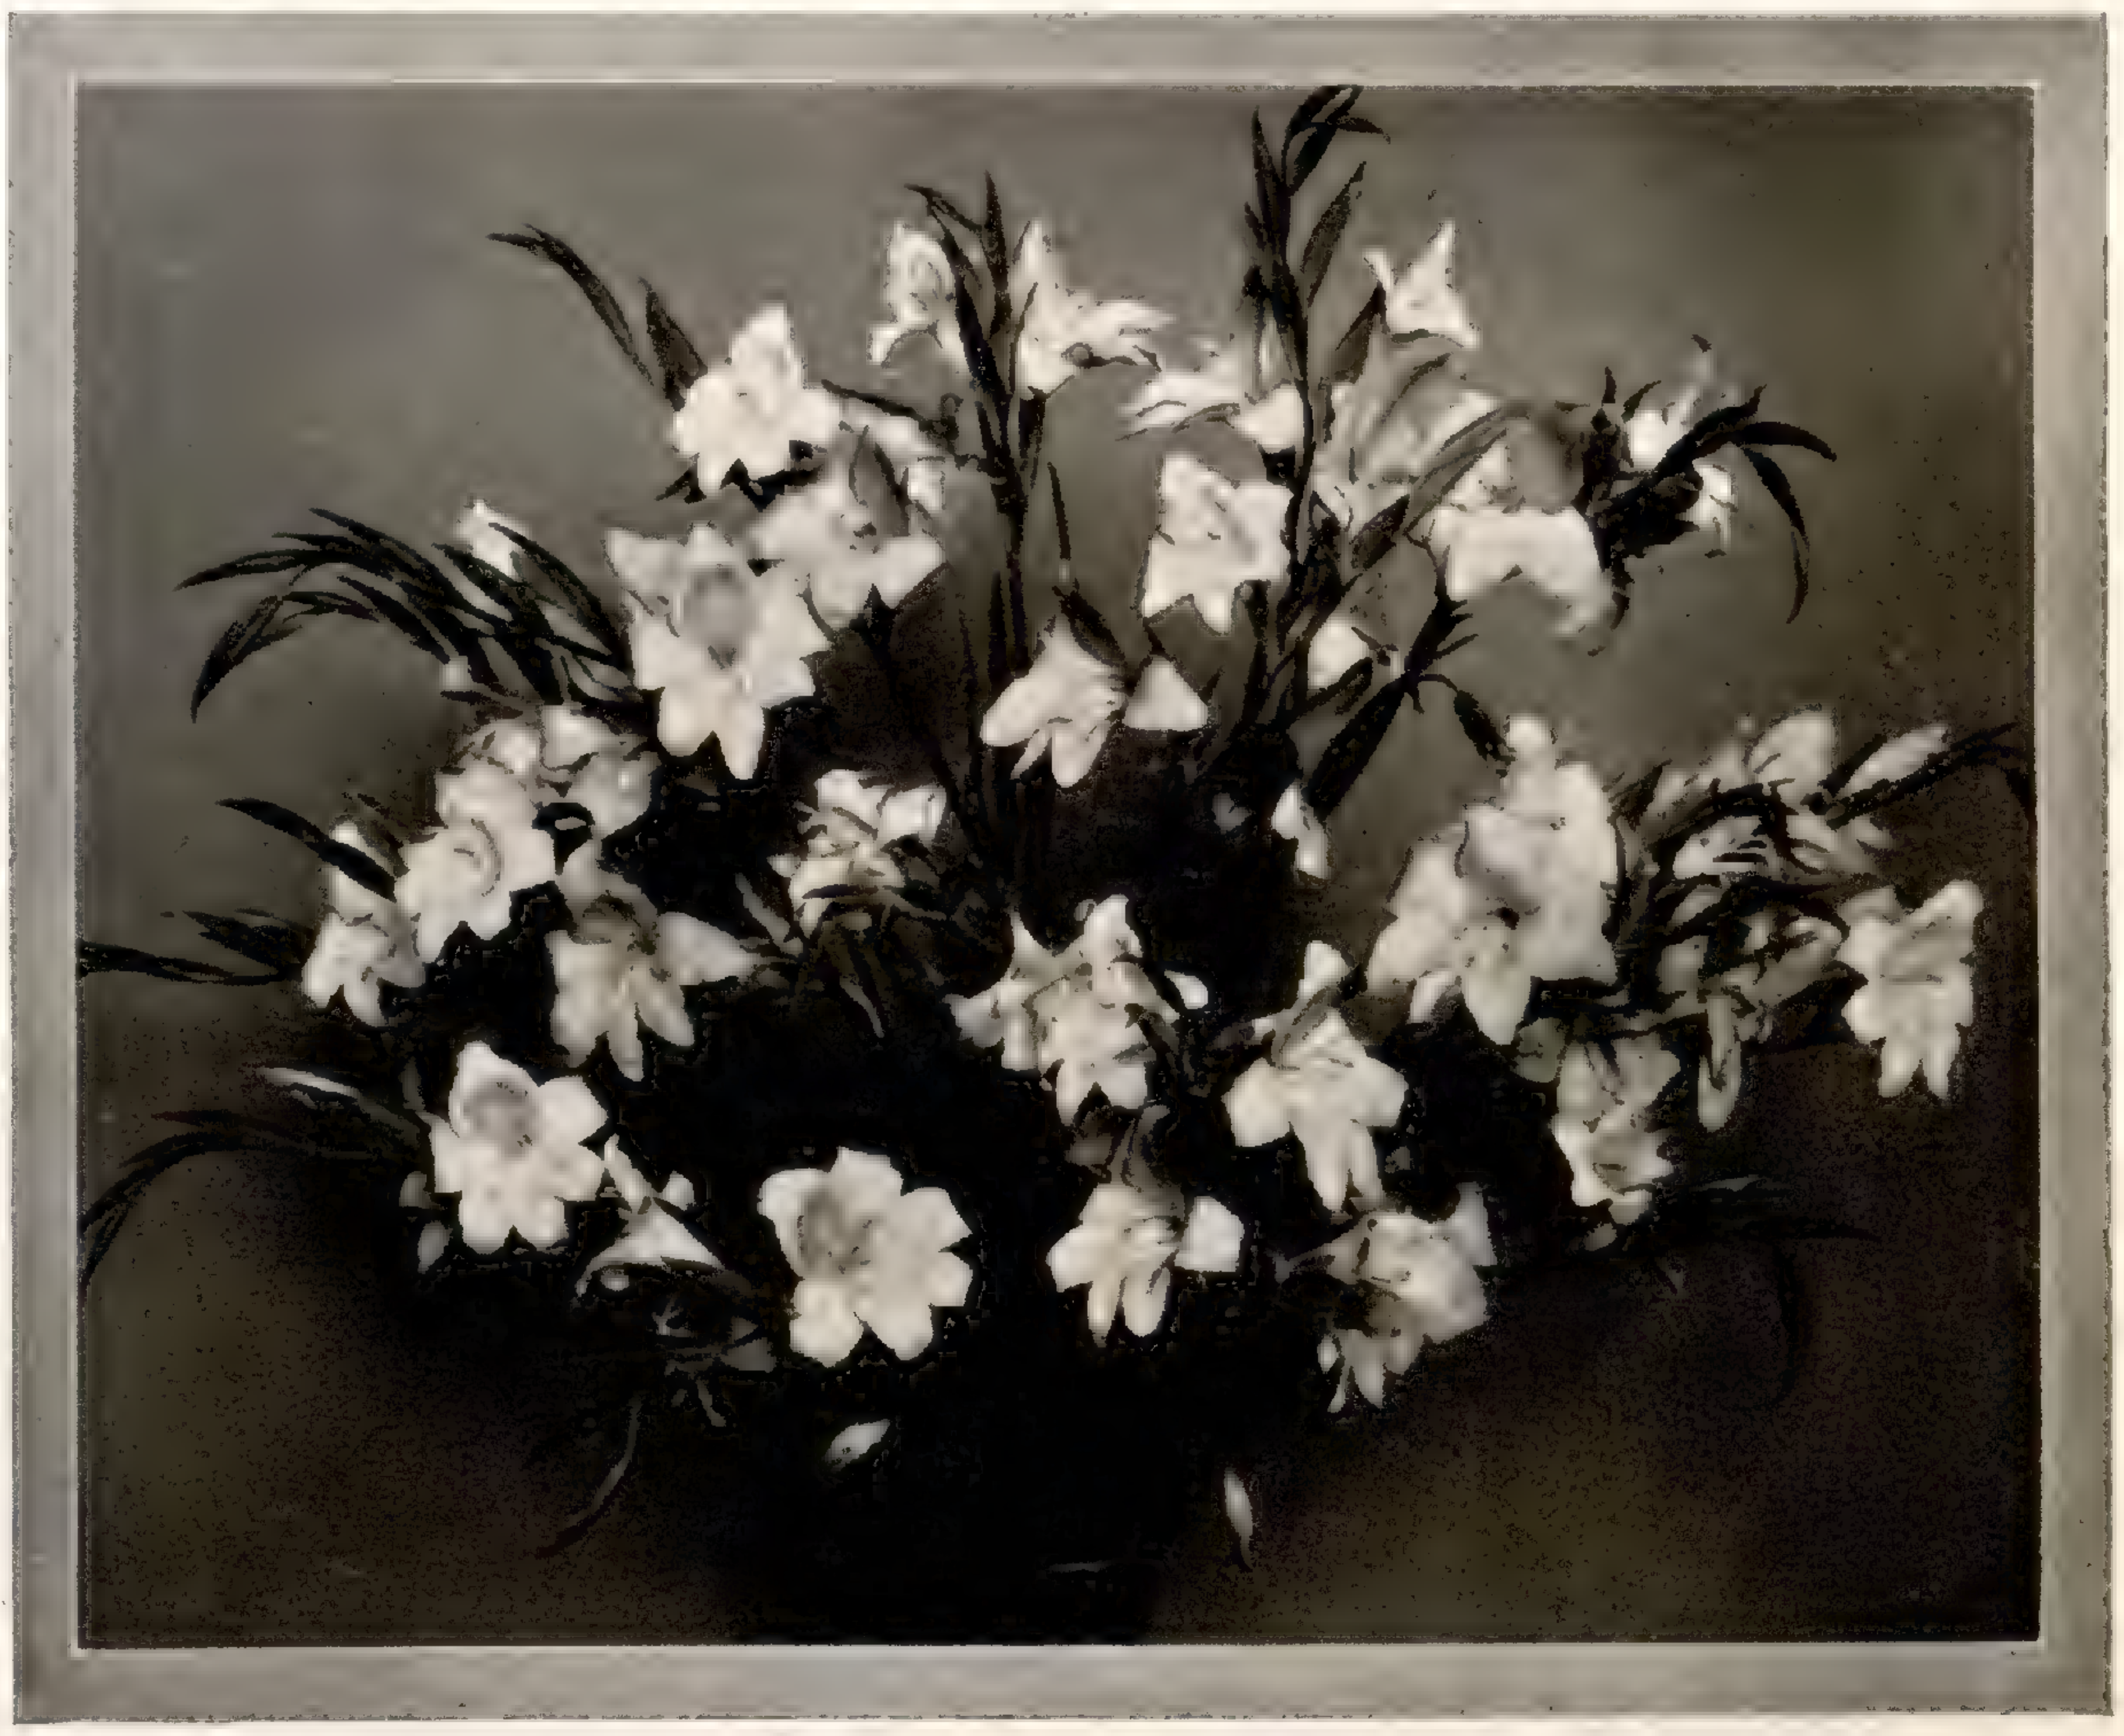
With regard to the culture of these ferns, the Male ferns will grow in any good soil, and thrive in ordinary garden mould. L. dilatata likes abundance of leaf-mould and plenty of moisture, but is by no means dainty. L. montana prefers good friable yellow loam with a little leaf-mould; it can stand much sunshine, but dislikes lime or hard water, and resents drought at the roots. When once established in the open, however, it will hold its own well, and makes handsome specimens. L. æmula is more delicate than its near relative, L. dilatata, and needs a moister atmosphere, doing best in pots in a cool house.

L. thelypteris is a thorough bog fern, its travelling root stocks revelling in quite wet soil. It does well in pots or pans standing in saucers of water. Soil peaty. For cool conservatories a selection of the above cannot be too highly recommended, and most of them do well in the open ground, where a little shade and protection from strong wind can be afforded.

Chas. T. Druery, V.M.H., F.L.S.

## GLADIOLUS QUEEN MARY.

The early-flowering gladioli, of which Gladiolus Colvillei and its varieties are the best known, steadily grow in favour, and the colour range steadily widens. Some of the varieties are very robust, and produce tall spikes, while others are of moderate height, and are more valuable for pot culture on this account. While under ordinary conditions producing their flowers at a comparatively early period, anything approaching severe forcing these gladioli dislike. But if they are grown in pots and brought into a warm greenhouse when well rooted, care being taken to give them plenty of light and air, their cultivation is followed by success, and the elegant spikes are capital for conservatory decoration or for cutting. A new introduction of much merit is G. nanus Queen Mary, a variety that attracted much attention at the great exhibition held by the Royal Horticultural Society at Olympia, July 4, 5, and 6, 1911. On that occasion it figured in the collection from Messrs. Barr and Sons, Covent Garden, this firm very kindly taking charge of it for Messrs. Smith and Son, of the Caledonian Nursery, Guernsey, by whom it was raised. Those who have the pleasure of knowing this Guernsey firm and their remarkable nursery of rare and beautiful plants will readily believe that they would not introduce a new plant that was otherwise than of the highest merit. Their new gladiolus has soft salmon-coloured flowers, with cream-coloured blotches on the lower segments, and the two colours form a most pleasing and effective combination. This variety gained an Award of Merit at the Olympia show, and is a valuable addition to its group.

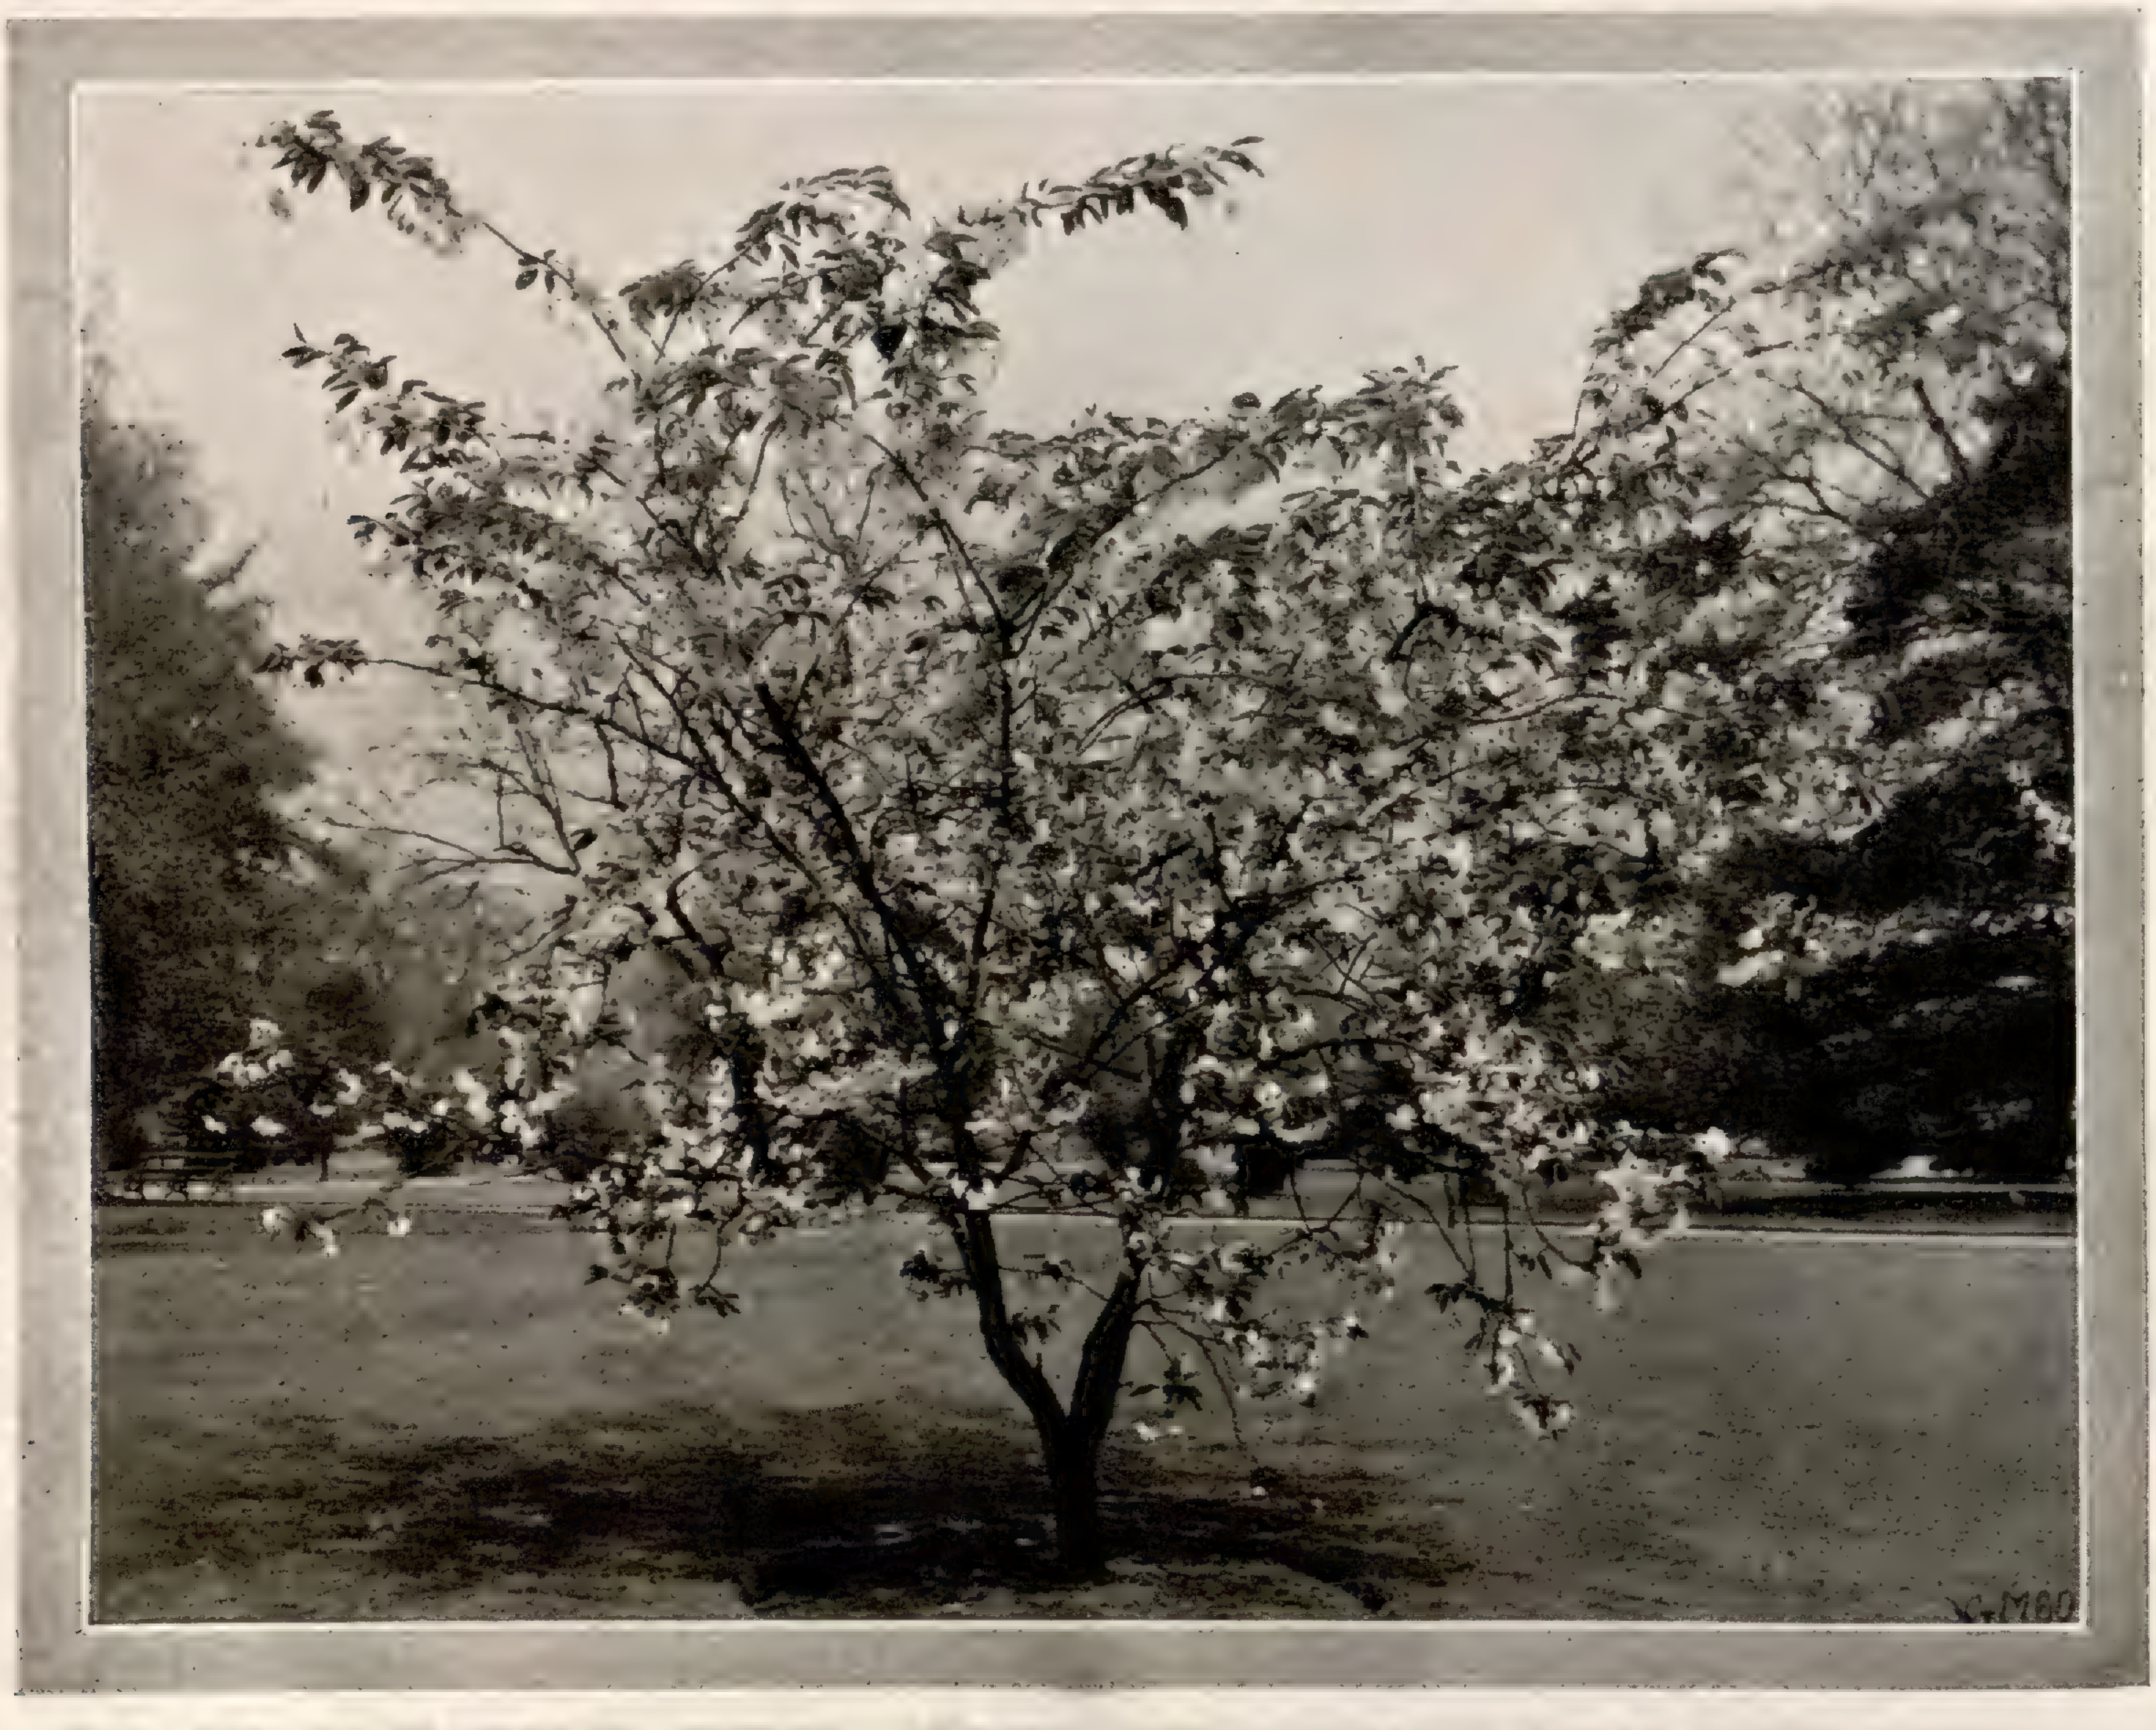


GLADIOLUS QUEEN MARY.

A distinct early-flowering variety bearing soft salmon-coloured flowers, raised by Messrs. Smith and Son, Caledonian Nursery, Guernsey. A.M., R.H.S., July 4, 1911.

## THE YELLOW-FLOWERED CHERRY.

Although not equal in effectiveness when in bloom to some of the Japanese cherries that now have a place in British gardens the yellow-flowered variety of Prunus pseudo-cerasus is so remarkable for its distinctness and beauty that it is surprising it should not have been distributed, and owners of gardens had an opportunity of enjoying its charms with other hardy trees of value for their flowers. It will not produce so rich a colour effect as will the variety known as J. H. Veitch when enwreathed with its large rose-pink flowers; nor, perhaps, is it quite equal to the typical form of P. pseudo-cerasus, and those who have so limited a space for flowering trees as to be compelled to confine their selection of the forms of this cherry to two would do well to plant the type and its variety, J. H. Veitch. Happily, there are many thousands of gardens within the British Isles which place no such limit upon the planter, and in these the yellow-flowered form would contribute its full share to their attractions. It is quite distinct from all the other double-flowered cherries whether native or exotic, and its large blossoms, with their soft colouring present a pleasing contrast to the rich warm hues of the flowers of J. H. Veitch, and the pure cold whiteness of those of the double form of the English Bird Cherry (Prunus avium fl. pl.), which also possesses merit of a high order.



THE YELLOW-FLOWERED CHERRY (PRUNUS PSEUDO-CERASUS FLORE LUTEO PLENO).
A handsome variety with large deep cream-coloured flowers.

So far as we are aware, Prunus pseudo-cerasus flore luteo pleno, to give the yellow-flowered form its scientific designation, has no place in trade catalogues, and can only be met with in the Royal Gardens, Kew. If this be not the case we shall greatly appreciate the kindness of those of our readers who have seen trees elsewhere, if they will give us particulars of those they have met with. The variety was first presented to public notice in this country at the meeting held by the Royal Horticultural Society on April 7, 1896, when Messrs. J. Veitch and Sons exhibited specimens. In our report it was described as a pretty unnamed cerasus, and in another report we have before us the flowers are described as white, shaded with green and tinted with rose, a description which suggests that the flowers shown had attained to considerable age, and lost something of their freshness. With reference to the colour it must be remembered that the light of the Drill Hall in which the R.H.S. meetings and shows were then held was usually such as to frequently render it difficult to distinguish the colours. Moreover, a few sprays of flowers or small plants wholly fail in conveying an adequate idea of the beauty of the tree. It is only when the tree has attained to a considerable size, as in the case of the Kew specimen herewith illustrated, that it is possible to properly estimate its decorative value. It is now some years since this tree came under our notice, and year by year we have been much surprised to find how greatly it has increased in beauty in process of development.

As the yellow-flowered cherry does not appear to advantage in a small state it made its appearance in this country at a rather unfortunate time. At this period increased attention was being paid to the beautiful P. pseudo-cerasus, which had been long in cultivation, as indicated by the fact that at the second of the April meetings, held in 1896 by the Royal Horticultural Society, it had an Award of Merit made in its favour. In addition, the variety J. H. Veitch had been introduced, and its merits fully known to those instrumental in its introduction. Whatever may have been the cause of the yellow-flowered cherry not having made its way into cultivation, the fact remains that it is a fine tree and worthy of a place wherever the charms of ornamental trees are fully appreciated. The colour of the flowers, it should be added, is rich cream colour, lightly tinted buff, and is closely approximate to that of the sweet pea known as Clara Curtis.

## BOX HEDGES.

Like the yew, the box is of slow growth, with dense habit, and therefore a valuable hedge plant. In some parts of the country the evergreen box has developed into tree-like proportions, and visitors to Hitchin will remember a number of large and old examples, carefully preserved by the side of the road near the main street and on the way to the station. But very large box hedges are not so common as high and broad yew hedges; nevertheless, some good examples are to be found in various parts of the country, and one of these figures in the present issue. This is a roadside hedge in Berkshire, and is a prominent and much-admired feature in a village through which one passes to the Berkshire downs.

It is not necessary to enlarge here upon the usefulness of Buxus sempervirens for hedges, as this matter has been dealt with so fully in recent issues by Mr. J. Day, chief of the Galloway House Gardens.

## PERPETUAL CARNATIONS.

Those readers who hold the idea that the high-water mark in raising perpetual carnations has been reached should realise that the perfection which we have sought is not yet with us. There is much to be done, and good as present-day varieties are, there is a need for far better. With all the new varieties that the last few years have brought us, we have not secured the permanent good that had been hoped for. Varieties arise and quickly pass from cultivation, leaving but a memory behind them, and one has to record against them—weakness of stem, slowness of flower production, poor constitution, or or some other weak point.

It looks as if raisers had relied too much upon the inherent good qualities of Enchantress in the production of seedlings, and these same seedlings have not gained in build, or vigour, upon that famous variety. A great failing of many varieties is the inability of the stem to support the blossoms erect, and I may name among others Mrs. C. Knopf, Roseate Dawn, Regal Mauve, Lady Dainty, Helen Gould, etc., as being deficient in stem vigour, the heavy blossoms of these and other varieties being more than the stems can carry. Engelmann's Rex is on the right lines; it is of perfect form, and exactly erect, and, though smaller than some other novelties, will provide an object-lesson to those who are making a hobby, or a business, of raising new varieties.

Varieties of the Lawson type, are among the most satisfactory. Sangamo is one; this is an improving variety, and habit and stem are excellent. Mrs. C. W. Ward is another free easy grower, with fine blossoms, and the approved Lawson habit and stem.

Taking another standpoint, we consider the claims of such ultra-vigorous varieties as Rose Doré, Afterglow, Pink Delight, Mikado, etc. These I like very much, but their great rambling stems make them appear somewhat ungainly in habit, and too much time is expended by the plant making these over-long stems. If one could reduce these varieties to the neat Lawson habit, their value would be greatly enhanced.

May Day is a good model, quick in growth, neat habited, good in colour, and possessing erect stems, and it should be recognised as a good type by raisers of novelties. This quickness of growth will be a great point with growers in the future, as a speedy succession of blossoms means a great difference in the profits of those who grow for market.

Fancy carnations are not greatly in demand, but there is no doubt that a few really "good" fancies, particularly white and yellow grounds, would be welcomed by private growers. One or two varieties, with a distinct shade of orange, or bright terra-cotta without any secondary colouring or markings, would be received with favour by all carnation-lovers.

Finally, I would urge the private grower to watch his stock, just as keenly as the trade grower. A close study of the varieties will repay for the trouble, as one can then note all the points of the differing forms.

P. S. Hayward.

## SEAKALE AND ITS PROPAGATION.

The dry and trying summer of 1911 must have taught many of us a lesson. By having a bountiful supply of home-grown seakale crowns a crop is assured; when other choice vegetables partly fail, seakale has done remarkably well here, standing the drought with impunity, and it is now appreciated. A little forethought and preparation are required to secure success. All crowns should be taken up by this date, so as to be in good time to prepare crowns for next season's forcing. Immediately the crop is lifted, the "root thongs" should be taken off, and cut into seven-inch lengths, the crown end to be cut square, and the base diagonally. This method of cutting will prevent confusion as to which is the growing bud; size the thongs in bundles, and stand the bundles upright in deep boxes, filling in around them with fine soil. Leave the tops exposed, well water in to settle the soil, and place the boxes in a frame or fruit house, exposed to the light. In a few weeks the growing crowns will form, when they must be gradually withdrawn to cooler quarters to keep the growths sturdy, previous to planting out in April. If treated in this way a gain of two months' growth is obtained over ordinary outside root planting, and this makes all the difference to the strength of the crowns when forcing time arrives. The plot intended for the "sets" should be well prepared by trenching as early as possible, incorporating farmyard manure, leaf-soil, burnt garden refuse, etc., and leaving the surface rough. Previous to planting well fork the plot over, bringing it to a fine tilth, over which a broadcast sowing of soot will be very beneficial.

G. Ellwood.

## SPRING SOWINGS IN THE KITCHEN GARDEN.

The season of sowing commences in real earnest as soon as the month of February is ushered in. A great many seeds have to be got in during this month, and very frequently it happens that the vegetables are neglected. Dwarf peas of a good variety may be sown at the end of the month in eight-inch pots, and sometimes a few peas and beans are sown outside before the end of January, but the latter are at the best chance crops, and it is doubtful whether the attention bestowed on them is ever rewarded with success. Certainly, a useful crop to sow towards the end of January or during the first week in February is tomatoes, provided they can be grown on steadily near the glass; a too strong heat must be avoided, however, for the plants become soft and long-jointed, and produce few early bunches of bloom.

### Peas.

On light soils and in early localities no time should be lost in making a first sowing of this important crop. In every garden, large or small, peas are given precedence over all other vegetables, and earnest attempts are made to provide the first dish at the earliest possible date, and the last at the latest. It is recognised by every professional gardener that peas grown on heavily manured soil are not only superior in quality, but the crop is far heavier, and the peas keep fresh for a far longer period.

Light soils require to be made fairly firm, for the pea does not seem to succeed at all well in a loose rooting medium. Also, on any description of land, thorough deep trenching is a necessary part of the preparatory work for peas; indeed, the difference between peas grown on deeply trenched soil and on that which has been merely dug over, is sufficient to demonstrate this point.

Of the earliest varieties, Carter's Eight Weeks, Gradus, Reading Wonder, and Early Giant are all deserving of attention, the first-named kind being a very hardy pea of the marrowfat type, growing to a height of only fifteen inches. About three weeks after the first sowings the mid-season varieties may be put in, a good selection being Duke of Albany, Centenary, Dreadnought, and Quite Content. The last-named is considered by some growers to be the best pea now in cultivation, especially for exhibition, as it bears pods seven inches in length.

### Cauliflowers and Broccoli.

Where frames can be spared, it is well to sow a pinch of seed of some of the earliest kinds of cauliflower, such as Snowball and Early Dwarf Forcing; if they are carefully hardened before being planted out in a rich soil they will be both early and useful. Only a limited quantity should be sown, however, as they do not stand very long. Where cabbage has suffered badly during the winter, the blank can be almost filled by sowing Flower of Spring cauliflower in heat in February, pricking off into boxes as soon as ready, and placing as near the glass as possible. As soon as they commence to show the rough leaf, remove them to frames, and gradually harden. Other good varieties of cauliflower to sow are White Queen, Veitch's Autumn Giant, Sutton's Purity, Veitch's Pearl, and Early Emperor.

Broccoli depends a great deal on the weather, but if brick pits are available, a succession from October to June can be easily obtained. Michaelmas White and A. Walcheren are both excellent varieties for autumn use, while of other varieties which head in twelve months after sowing the seeds, there are Snow White, Leamington, Sutton's Perfection, and Reading Giant. Late Queen and Latest of All are later-maturing kinds.

Some gardeners prefer to roll all seeds of the cabbage tribe in red lead before sowing, in order to prevent injury from birds or mice. In dry weather it is well to stir the soil well between the rows of cabbage, Brussels sprouts, and spinach, etc, for this will conduce materially towards rapidity of growth.

### Broad Beans.

For first sowings, Green Longpod is a serviceable kind, and is almost as early as Mazagan. A well-prepared soil is most essential for beans, and the work should have been got in hand some time previous to sowing. Little trouble will then be experienced in levelling down and planting. Any deep, cool, and retentive soil does for beans, and profitable crops can be secured from well-cultivated clay lands. The main supply is derived from the crop raised from seed sown in February or March, and for succession in April and May, in double rows, three feet apart.

### Lettuce.

Both the cos and cabbage varieties of lettuce are extremely popular in all gardens, and with good reason, for they adapt themselves to practically all soils, and furnish a wealth of valuable greenstuff during the summer months, when salads are so much in request. Sowings should be made at once under glass, and in the open from the first week in March until midsummer. This will enable the growers to keep up a successional supply during the whole of the season. Watering is most essential, for the plants are so constituted that a more than usual amount of moisture is required to start and keep them going than is the case with most other subjects. Among the best varieties of letuce are All the Year Round, Golden Ball, Grosse Pareusse, and Drumhead, of the cabbage section; and Mammoth White and Superb White of the cos lettuces. A Dutch hoe is a very useful implement to use between rows of lettuce, and copious supplies of water are further beneficial during dry weather.

### Radishes.

A dry, warm spot is best suited for early sowings of radishes made during February, and during severe weather it is well to cover them with fern or bracken, or light litter, so as to form some protection against exposure. The turnip-rooted radishes are the best to sow during the present month, about one ounce of seed being used to every two square yards of ground, the seeds being covered with an inch of fine earth, and the surface made firm with the back of a spade if necessary. Large seeds are best, it being advisable in all cases to discard the smaller ones. J. C. Newsham.

Old Basing.

---

**Rubus lasiostylus.**—For a great many years, the Himalayan Rubus biflorus has ranked as the most noteworthy of the white-stemmed brambles, but it has now a formidable rival in the newer Chinese Rubus lasiostylus, in which the whitened stems are very pronounced. There are several species in which this character is more or less prominent, but the two above-named are the best, and in a mass or clump they form a striking woodland feature. They are much more effective when arranged somewhat thinly in comparatively large groups than when planted singly.—W. T.

## CHOICE EARLY-FLOWERING HARDY SHRUBS.

Singular importance invests the early-flowering hardy shrubs; precocious by nature, they brighten our gardens at the dullest period of the year, yet it is probably on account of this attribute that we find them entirely ignored in the majority of gardens. In many instances the colouring of the flowers is extremely vivid, so that when in season they impart a rich glow of warmth to their surroundings; others there are that excite unstinted admiration owing to the curious character and arrangement of the flowers.

Although perfectly hardy, as far as growth is concerned, all early-flowering shrubs have their beauty marred when the flowers are subjected to rigorous weather, either in the form of intense frost or violent winds, hence it is imperative when planting, to choose a position where the exposure to these climatic conditions is not unduly strained. This is best attained by planting in sheltered ravines or glades, or a position in the angle of shrub beds would readily invite success.

To this group of hardy plants belong Hamamelis arborea and H. mollis, two shrubs of inestimable value in garden decoration, as, although comparatively slow growing in their early stages, when once established they make annual growths a yard in length that, later, becomes entirely wreathed with flowers of a bright yellow or orange colour, so that both plants are capable of a bright and lasting display. They succeed in a loamy soil inclined to heaviness, and they generally prove most satisfactory if left uninterrupted for a number of years.

Another meritorious spring-flowering shrub is Daphne Mezereum; this species, like, the foregoing, produces the flowers on the naked branches; the type gives flowers of a rich purplish-red, the colour varying to some extent in different individuals, while there are also single and double white forms, all of which are deliciously scented. Daphne Mezereum, although an old shrub, still forms one of the most delightful spring pictures when wreathed with its ruddy scented blossoms.

A choice and interesting subject is found in Edgworthia chrysantha, a shrub that is hardy in mild and favoured districts; it froms an erect bush, producing early in March, on the naked branches, tubular flowers in inverted clusters; in the individual flower the lower part of the segments are united into an elongated tube, that is white and downy; while the free ends reflex and are coloured a bright orange-yellow, the whole aspect of the flower being wax-like in testure, and suggestive of some tender exotic.

Of the earliest flowering rhododendrons, R. præcox and R. Nobleanum are two important examples for garden decoration, as they unite extreme floriferousness with great beauty of colour, and both are reliable. They are hybrid forms of garden origin, the first-named being a cross between R. dauricum and R. ciliatum; the latter a hybrid of R. arboreum and R. caucasicum. Both are evergreen, but entirely distinct from each other. R. præcox has small hirsute leaves, and produces small rose-pink flowers on the terminal points of the branches, and they open kindly with the first warm days of March. In habit it is a much branched shrub, resembling R. dauricum in this respect, but being a better grower, and having larger, paler-coloured flowers than this parent; it is altogether more desirable as a garden plant. Rhododendron Nobleanum forms a low bush of spreading habit, somewhat after the character of the more familiar garden hybrid rhododendrons; it bears its flowers in erect globular heads, the colour being a rich rose-red, and it blooms in the open toward the end of February or early in March, according as the season is early or late.

Of other shrubs worthy of a place on account of their earliness, are the various forms of Cydonia japonica. When given the protection of a wall, and with the branches widely trained and the side growths spurred in, it flowers all along the branches, and presents a picture of exquisite beauty when in bloom, which frequently occurs in February, although plants growing entirely in the open do not flower until early in March; it is thus possible, by varying the position, to prolong the season in which this valuable shrub may be enjoyed in flower.

Thomas Smith.

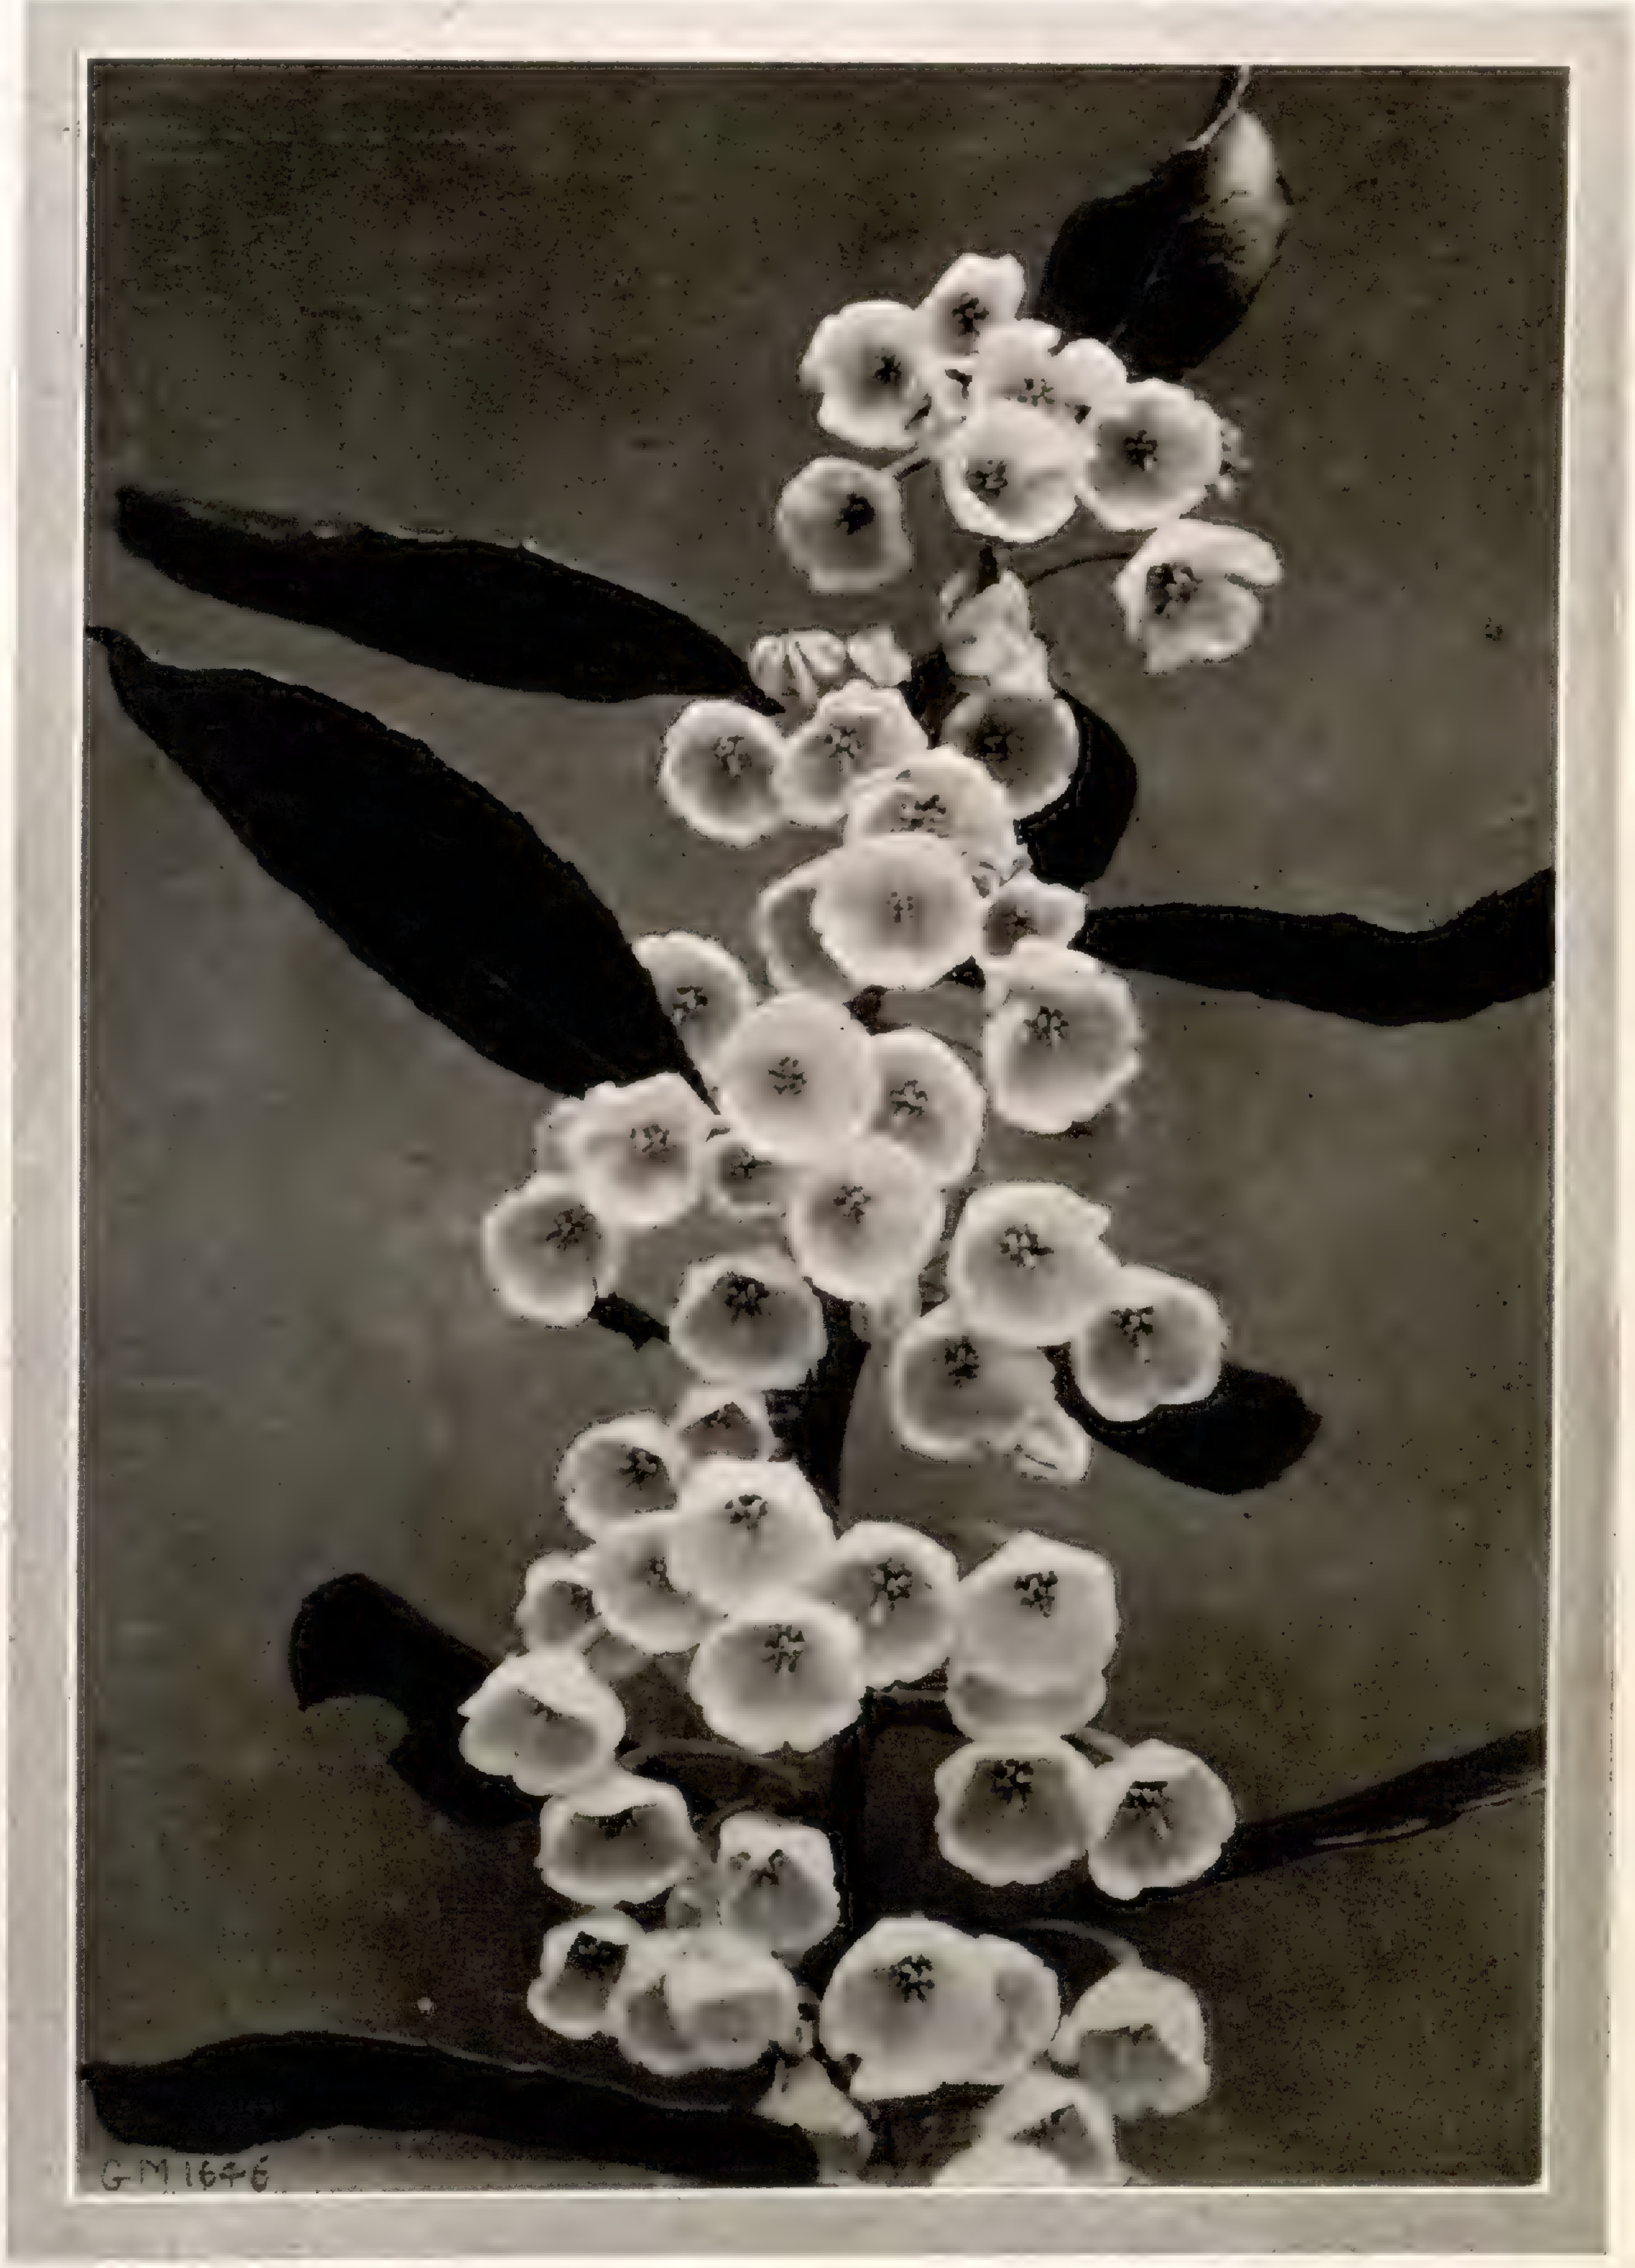
Coombe Court Gardens.

## ZENOBIA SPECIOSA.

One of the most beautiful of those flowering shrubs that pass under the general title of "American plants" is Zenobia speciosa. It has not the gorgeousness of the deciduous azaleas, or the grandeur of the finer rhododendrons, but it possesses an exquisite grace and modest beauty that brings it right into the forefront of shrubs cultivated for their flowers. The flowers, produced in little axillary clusters along the branchlets, are of the purest white, and individually they resemble the bells of a lily of the valley. The leathery leaves vary in shape, but are usually oblong-lanceolate, with crenate or serrate margins. Peaty soil suits Zenobia speciosa best, but moisture at the roots is essential to its well being, and, like the rhododendrons it does not like lime in the soil. Propagation is readily effected by layering the lower branches.

It was about the year 1800 that Zenobia speciosa was introduced from the Southern United States. In 1803 the variety Z. s. pulverulenta, which has a downy undersurface to its leaves, was figured in the "Botanical Magazine (t. 667) under the name of Andromeda pulverulenta, and the accompanying text reads: "For this valuable acquisition to our gardens we are indebted to the indefatigable Mr. Fraser, of Sloane Square, who found it in North Carolina, where, however, it had been observed long before by Mr. John Bartram. It is capable of withstanding the cold of our winters in the open air, but the beautiful foliage is better preserved by the shelter of a greenhouse; nor, indeed, have we yet seen it produce its flowers in perfection without some artificial heat, though there is reason to believe that older plants may not stand in need of such assistance."

At the end of 1806, in the same work, Zenobia speciosa was figured (t. 970) under the name of Andromeda cassinefolia, and there the question of whether the pulverulenta character of the leaves of Z. s. pulverulenta was due to disease was discussed. The writer says: "Whether this plant and the Andromeda pulverulenta ought in reality to be considered as distinct species, or merely varieties, may be doubted; they are certainly very nearly related, but this (Z. speciosa) is a smaller, less robust shrub, the leaves are not so bluntly crenated, but rather serrated, and quite entire at the base. At the time the pulverulenta was published, we had not seen Michaux's work, or we might have been induced to have adopted his name. Yet his assertion that the mealy appearance on the leaves is certainly the effect of disease, may be rendered dubious by the consideration that the pulverulenta is a much larger and in every way more robust plant, bearing flowers of greater size, and more in a bunch than the cassinefolia, circumstances difficult to be attributed to any malady. Our drawing was taken at Mr. Fraser's, in Sloane Square, who, we believe, first introduced it into this country. We received specimens also from Messrs. Malcolm's Nursery at Kensington. Native of North Carolina, about Fayette-town and Wilmington. Flowers in June."



ZENOBIA SPECIOSA PULVERULENTA.
A distinct and beautiful shrub; the flowers pure white.

**Gloxinias.**—All corms still unpotted should now be brought out of store, and, after shaking away the old soil, be repotted and placed in a brisk temperature near the light. A good compost consists of two parts loam, one part peat, and one part leaf-soil, adding sand, a little charred refuse, and dried cow manure. Six-inch pots are large enough for ordinary corms. Unless it is desired to perpetuate any particular variety, I do not advise keeping the old and large corms.—H. T. Martin.

## DWARF CAMPANULAS.

The bellflower family provides a large number of suitable plants for furnishing the rock garden, and these hold an important position among other subjects. The list of species and hybrids is an extensive one, but a select collection is indispensable to any rockery. The colours are mostly blue and white, with varying shades, some of the flowers being bell-shaped, others open and flat like a saucer. The majority are of easy cultivation, and providing a sandy soil is afforded them in a sunny position, they grow freely, producing a wealth of blossom, which is highly appreciated.

C. isophylla, C. i. alba, and C. i. Mayi are excellent for trailing over a ledge of stone, where their slender growths are seen to the best advantage. C. i. Mayi is the most robust and fastest growing of the trio, with whitish foliage and pale blue flowers. The growths usually die back in the autumn, and new shoots take their place in the following season. C. fragilis is another good trailing species, perhaps not quite so strong and vigorous as C. i. Mayi, yet, nevertheless, one which should be given a place among the best. C. muralis (portenschlagiana) has a tufted habit, with flowers of a pale blue colour; it is only three or four inches high, and produces flowers in such abundance that the foliage is quite hidden from sight. C. garganica is splendid for trailing, and has large pale blue flowers, with white centres. The white form of this species is very beautiful, and by no means common. C. garganica hirsuta is quite distinct, the foliage being covered with hairs.

The hybrid C. G. F. Wilson is of exceptional merit, and is said to be the result of a cross between C. carpatica and C. pulla. It has large purplish-blue flowers on short stalks, and is very compact in growth. The new forms of C. carpatica, which have been introduced during recent years, are highly appreciated for the size and colour of their blossoms; White Star, Riverslea, Profusion, and Robert Parker are deserving of great praise. White Star is a lovely variety, with large, open, saucer-shaped blossoms, which are freely produced. It is a vigorous grower, with stiff wiry stems, capable of holding the flowers in an upright position. Robert Parker has white flowers, with blue centre. Riverslea is quite distinct among the blues, with flat open flowers. C. turbinata Isabel is a handsome and effective form, of recent introduction, compact in habit, and free flowering. These forms of C. carpatica and C. turbinata vary in height from six to twelve inches.

C. rhomboidalis, with its arching sprays of pendant, bell-shaped flowers, is exceedingly graceful, sometimes reaching the height of nine inches. C. barbata is an interesting species, growing about twelve inches high, and bearing hairy bells, of a pale blue colour. It is advisable to treat this as a biennial, for in many gardens it has a habit of dying off after flowering. C. cæspitosa is a vigorous grower, and quickly makes larger patches of foliage, from among which rise slender stems bearing pale blue pendant bells. C. pumila is a dwarf variety of cæspitosa, and rarely grows more than four or six inches high; there is a white form of this variety. C. soldanellæflora, the double-flowered variety of rotundifolia, is a beautiful plant, with flower stems about twelve inches in height, carrying pendant blossoms.

C. Barrelieri closely resembles C. fragilis in habit of growth, and is a useful plant for a position where its trails can hang over a ledge of stone. C. Raineri should have a place in every collection, as it is of very dwarf habit, having upright, bell-shaped blue flowers. C. pulla and its hybrids are all choice plants, rather slow in growth compared to many others, and having neat foliage, produced from underground shoots. Careful cultivation is necessary when dealing with this group, a well-drained flat shelf or pocket being the most suitable place for them, while the compost should consist of gritty loam, leaf-soil, and a little peat. As the foliage usually dies down in the winter one must be careful not to disturb the roots. C. Allioni has large blue flowers, borne singly on dwarf stems, and should be given a good position. It has a strong dislike to limestone, and this fact must be borne in mind. A mixture as advised for C. pulla will be found agreeable to it.

There are many other bell flowers equally suited to rock garden cultivation, as those enumerated by no means exhaust the list of really good sorts.

E. C. Pooley.

## SINGLE-FLOWERED CHRYSANTHEMUMS.

Of the many sections of chrysanthemums none have made such rapid progress during the last twenty years as single-flowered varieties. It was in 1883 I saw the first variety, Magenta King, sent out by Teesdale, followed by America the next year, by Crushed Strawberry in 1885, and the pure white Jane, sent out by Mr. Cannell, which maintained its popularity for many years. The year 1887 brought us two remarkable varieties, Admiral Sir T. Symonds, a rich yellow, and the largest bloom, even of any sent out in recent years; not that that was a boon, as too large a flower is not always the most admired. The other variety, Souvenir de Londres, was sent out by Delaux, and was the first of the rich coloured sorts, being brilliant magenta-crimson.

Since then we have had varieties in galore, until now we have colours sufficient to satisfy the most exacting. The tendency now seems to be towards medium-sized, shapely flowers, of which Mensa is the ideal. In this the florets are substantial, shapely, with an elegant recurve at the tip, and, what is of perhaps more importance, the colour is purely white, really an Elaine white. This latter has never been excelled in the purity of its colour, and is the one variety I have always employed as a test of any other so-called white. The small-flowered varieties of which Mrs. Langtry is a type, appear to lose popularity, owing to the smallness of their flowers, I presume. No chrysanthemum that I know has so pleasing a perfume as this, which is really worth growing, even for no other reason than its delightful fragrance. In colour it is a pretty pink, blossoming profusely.

We have during the last few years received a quantity of varieties that flower in the open in September, really when not wanted, and many of them are weedy in form and washy in colour.

There is no doubt but that single-flowered chrysanthemums will play a great part in the near future, where quantities of cut flowers are required for filling vases, especially for table decoration, as the double blooms, no matter how small they may be, have a distinctly heavy appearance in small vases, but where they can be employed in a bold manner, they are in great request.

For the amateur gardener with limited space, singles are just the thing, as the plants do not require so much root space as other sections, and they are effective either disbudded or grown in a mass, and allowed to develop all their blossoms. For the conservatory, grown as large specimens, ever with three plants in one pot, they make a rare display; dwarf plants in small pots are good for edgings or side stages, and they make a brave show. For exhibition in groups the singles always attract notice, and are becoming more in evidence. At Windsor, Cardiff, and York special encouragement is given to this section, and right well exhibitors respond, the public reaping the benefit of a handsome display.

The method of culture that finds most favour is the production of plants to give from twelve to a couple of dozen blooms, each shoot being allowed to carry one flower only. In this way the blooms are not unduly large, but they are shapely, true in colour, and, having a substantial stem, are so useful in a cut state, or equally valuable in groups. While the undisbudded plants, with their mass of flower may appeal to many, I do not think there is the same form or colour to be seen under such a system, as the small flowers do not represent the variety so faithfully as these medium-sized blossoms do.

Cultivation is simple. Short cuttings inserted in the usual way early in January will prove excellent plants if care is taken to grow them sturdily by affording plenty of space and air at all times. A weak growth is useless. Top the plants once at four inches high, and allow them to grow uninterruptedly afterwards, except for thinning the shoots for a given quantity of flowers. Secure the shoots early to supports, yet loosely, so that the flower stems are straight—an important item when arranging them in vases or in a group of plants. As the plants are often grown in smaller pots than is usual for other sections, and carry more foliage, owing to the extra number of stems, they naturally require more water and food.

The following two dozen varieties represent the very cream of selection: Mensa, pure white; Charles Kingsley, a magnificent yellow companion to Mensa; Edith Pagram, rich pink; Bronze Edith Pagram, bronze; White Pagram, white; Mary Richardson, reddish-salmon; Sylvie Slade, rose-garnet, with a white ring round the disc; Altrincham Yellow, yellow; Metta, deep magenta-red, with a white zone; Mrs. W. Buckingham, pink; Kitty Bourne, deep yellow; Ceddie Mason, bright crimson; Mary Anderson, blush-white; Mrs. R. C. Pulling, pink; Gertrude, white; Reginald Godfrey, clear yellow; Charles Dickens, orange-yellow; Arcturus, velvety-crimson; Ideality, pure white, circular form; Mrs. W. G. Patching, bronze; Crimson Mary Richardson, crimson; Merstham Jewel, reddish terra-cotta, with golden centre; Sandown Radiance, rich chestnut-crimson; and Manor Beauty, dark red, flushed terra-cotta.

E. Molyneux.

Swanmore Park.

---

**Hardy Pitcher Plants.**—Quaint beauty and an interest of no ordinary character surrounds insectivorous plants; to this group of the vegetable kingdom belong three distinct sets of plants which, in one form or another, develop organs for the capture of insects, which they use as a source of nutriment. In the first section we have a series of plant forms wherein chambers are developed, which admit of the entrance of small insects, but not of their escape. The second section embraces plants that perform definite movements in response to a stimulus caused by the contact of the insects with the object of covering the prey with as great a quantity of digestive fluid as possible. Lastly, there is a third section wherein the individual forms are neither provided with pitfalls nor capable of performing special movements, but have leaves converted into lime-twigs, and on them animals stick and are also digested. Peculiar interest attaches to the first of these groups of insectivorous plants, inasmuch as two members of the section are hardy, and are frequently represented in gardens by healthy, well-grown specimens. The species I refer to are Sarracenia purpurea, and Darlingtonia californica, and the best collection of these plants I am acquainted with are growing in the gardens of Sir Edmund Loder, Bart., at Horsham, in Sussex. In these famous gardens they are grown right in the open, on a steep hillside, from which a perpetual trickle of water oozes forth and keeps the beds continually moist—for there are several beds—and the number of specimens, many of gigantic size, must largely exceed one hundred, while the healthy appearance of all, and their great vigour, testify to the marked ability with which Mr. W. A. Cook (the gardener) ministers to their need.—T. Smith.

## NEMESIA STRUMOSA.

This half-hardy plant is one of the most beautiful annuals when it is well grown, but this latter condition is not always easy to obtain, which is doubtless responsible for the comparative infrequence of its growth. It is a native of South Africa, and plants from that part of the world are generally regarded as not only sun-loving, but accustomed to dryness. That might be regarded as the reason why this annual is so seldom a success in damp gardens, if it were not for the fact that it is often grown very successfully in the North of England. The finest heads of blossom I ever saw came from a North Yorkshire garden.

There is one very fine strain known as Suttoni, in many beautiful colours, the shades of orange and apricot being the most characteristic colours of the flower. A blue form has recently been raised known as Blue Gem, but for a bed there is little doubt that the various shades of scarlet, pink, yellow, and orange are best, without the admixture of blue or purple. The forget-me-not blue variety is a doubtful acquisition if it is going to be introduced into all mixtures of seed, as purples are in the case of verbenas and pentstemons.

Seedlings may be raised in any frost-proof structure, but if raised in a warm house they should be given very little heat, and water should be used very sparingly; while, as soon as the seedlings appear, they should be kept in a cool place, with plenty of ventilation, as they are as prone to damp off as stocks. A rich sandy soil should be used, and as soon as the plants are large enough to handle they should be pricked off into boxes; and they are even worth potting up for the sake of obtaining the best results. They should be bedded out about six inches apart each way in well-prepared soil in a sunny position; and if the soil has been deeply worked, so that the plants have an extensive root run, they will not need much water in an ordinary summer. At this distance apart they will grow together; and, as each plant sends up five or six stems of more or less equal strength, each crowned with a head of flowers, the whole bed will be a glowing mass of colour.

Seeds may be sown in the open ground after the first week in May, but it needs a favourable season and conditions for good results. They last in flower a fairly long time as annuals go, but, if the plants are raised early, so as to get them strong before the forcing weather of June, they must not be expected to make much show after the beginning of August—at least, in the South—and some reserve material should be in readiness to replant the bed for an autumn display.

These nemesias grow less than 1½ft. in height, even at their best, and they make excellent pot plants. They may be had in flower from May to September, according to the time of sowing. Though the Suttoni strain is the best known, having been longest in the field, other nurserymen are now raising their own strains, some growing less than 1ft. in height. A. C.

---

**Berberis Wilsonæ.**—This, one of the earlier introductions that we owe to Mr. E. H. Wilson when travelling in China, has proved worthy to rank with the very best of the deciduous barberries. It is of a neat compact habit, and very pleasing from the arching disposition of the shoots. The flowers are yellow, and the fruits when ripe bright coral red. Another notable feature is that the leaves die off very richly tinted. —K.

## THINNING FRUIT BLOSSOM

People sometimes make the remark that they get a better crop of fruit from a tree after a moderate amount of blossom than they do when it has been crowded with bloom. When we look at a tree which is one mass of flowers, and consider that practically all the substance of calyx, corolla, stamens, and pistil, has been produced out of the reserve material stored in the tissues of the tree during the previous summer and autumn, we are not surprised that the strain on the tree is so great that, after producing all this blossom, it has an insufficient reserve of strength to produce the quantity of fruit we should expect. This may show itself either in the failure of the blossom to give any appearance of setting, or in the dropping of the young fruits soon after they are apparently set. With Marie Louise pear, for instance, it is notorious that a poor crop often follows from a great display of blossom, whereas after a thin show of blossom, or after a heavy one which has been properly thinned, a good crop results, as this variety is usually a good setter.

There is no doubt that with choice trees of all sorts of fruit it is worth while, if the branches are easily accessible, or so far as they are within reach, to thin the blossom when it seems to be in excess of the strength of the tree, and this is especially the case with very young or newly-planted trees, when it will pay in the long run to pick off a large proportion of the bloom as early in the spring as it can be conveniently done.

The thinning of plum blossom, however, is not only a rather fiddling operation, but as a rule such a large proportion of the embryo fruits drop soon after they become visible, that thinning is generally applied to the young fruits rather than the blossom. The same practice is often followed with peaches and nectarines, thinning the young fruits of which is, of course, one of the routine operations in their cultivation; but, as the blossoms of these fruits usually sets very freely, it may well be worth while to do a preliminary thinning as soon as the buds begin to show colour, choosing those for removal which are badly placed between the wood and the wall, or very thick together. The buds removed should in all cases be the smallest and weakest. In the case of choice wall plums a quarter of an hour devoted to relieving a tree of a portion of its superfluous blossom before the buds expand is undoubtedly very well spent.

It is in the case of the apples and pears, however, that this work is most necessary, as the blossoms, being much larger in all respects, besides being produced in greater masses, take a correspondingly heavier toll of the energy of the tree. The operation should be begun as soon as the trusses of blossom are sufficiently advanced for the individual buds to be easily detached, as the sooner it can be done the less the strain upon the tree. In the case of apples, the finest blossoms are usually those at the top of the pyramid or truss, and these are the most likely to set, especially the central one. If three or four blossoms set on one truss, as sometimes happens, it is the fruit from the central blossom which may be expected to be the finest. In thinning, therefore, it is the buds at the lower part of the truss which should be selected for removal, as we shall then relieve the tree with the minimum risk of lessening the crop.

With pears the reverse holds good. Most would expect that the central or topmost blossoms of the truss, which often appear to be the strongest, would be the most likely to produce the best fruit. This is not so, however, at least with most varieties, as anyone can see for himself if he studies the setting of the blossom, for he will see that it is the side blossoms that most generally set; in fact, it has been stated that the central flowers are not fertile, either with their own pollen or any other. This latter statement, however, is given with reservation, as, in the fertility of pear blossom, so much depends upon the source of the pollen which comes in contact with the stigmas, most varieties needing the pollen of another variety to fertilise any of their blossoms, and in some cases, apparently, set better when crossed with the pollen of one variety than with that of another.

Of course, everyone knows that picking off a fruit bud of apple or pear in its unexpanded winter condition also destroys the possibility of future fruit buds at that joint, in other words, a spur. When, however, trees have become very thickly set with fruit spurs, or rather, elongated or much branched, and crowded with blossom buds, a common condition with pears, it is a good plan to go over the trees in the winter or very early spring with a sharp knife, and reduce some of the clusters of buds to two, or three at the most, on a spur. This is the best way of thinning the blossom on older trees, though the actual removal of some of the buds from the trusses will still be necessary in some seasons.

ALGER PETTS.

## CROTONS.

In the bright and long-continued summer of 1911 many of these beautiful foliage plants acquired a richness of colouring beyond what we generally see—that is, where sufficient atmospheric moisture was maintained to counteract the baneful influence of red spider, which was just suited by the season. As a result many plants under glass suffered considerably, not from this just-named pest alone, but from that tiny mite which is usually spoken of as the begonia mite, though a great number of other soft-wooded plants are liable to be attacked by it.

With regard to the crotons, or codæiums, the narrow-leaved varieties are, generally speaking, preferred in this country to the broad-leaved kinds, though these last are very effective as large specimens in the formation of extensive groups. Great numbers of the narrow kinds are, however, disposed of as table plants, for which symmetrical little specimens in pots from 3 to 5in. in diameter meet with a ready sale. In some nurseries subjects such as these are grown in large numbers, and in many private establishments also. They have many advantages over some decorative plants, inasmuch as cuttings from 4 to 6in. in length root in a short time if put in a close propagating case with a gentle bottom heat; and, if care is taken, they will retain all their leaves, so that, as soon as they are rooted, they form perfect little plants. Large-growing tops may be struck on the plant by partially cutting through the stem as in layering, and surrounding it with sphagnum-moss kept moist.

Though crotons make their quickest growth, and acquire their richest colouring, under the influence of a high, moist temperature and good light, they should be hardened off as much as possible before they are used for house decoration, as the dry atmosphere and lower temperature will cause the leaves to drop. Plants that have suffered in this way during the cold weather of winter and early spring will, however, quickly push out new terminal growths.

S. W.

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

DENDROBIUMS. — Many species and hybrids are now showing flower buds in various stages of development. Where good growth was obtained last year, and afterwards properly ripened, the plants may be allowed to carry them; but plants that failed to make satisfactory growth, or any that are weakly, from any cause, should be relieved of their flower buds, in order that they may make stronger growth in the coming season. Before the flower buds are far advanced, it is desirable that the plants should be thoroughly cleansed, so that after-flowering they may be repotted at once should this be necessary. The flowering plants will need a little extra moisture both at the roots and in the atmosphere, to enable the flower buds to expand satisfactorily. A temperature of 60 degrees will answer their requirements, and on no account must they be unduly forced. With dendrobiums it is as yet a little early to do very much repotting, but there are cases where a start can be made. Seedlings which are too small to flower may be potted. With newly-potted plants the watering must be done with great care until the new growths are well advanced, and the new roots taking a good hold of the compost. The temperature for these must be about 65 degrees, so that the growths may be healthy and sturdy. A suitable compost consists of equal parts of peat, polypodium and osmunda fibre, and sphagnum moss. I do not favour the use of leaves for dendrobiums.

IMPORTED DENDROBIUMS.—This is the best season of the year to acquire imported plants of D. nobile, D. Wardianum, and many others. After the plants have been thoroughly cleansed, they may be potted and treated in the same way as those that are now coming into flower. No effort to unduly bush the plants into growth should be made, and the compost should be kept somewhat dry until new roots are seen to be pushing from the base of the bulbs. Spraying overhead occasionally will be beneficial, and be conducive to growth. As the new growths gain in strength, and roots become plentiful, water may be more frequently and liberally given.

PHALÆNOPSIS. — These lovely winter flowering orchids are now practically over for this season, and will enjoy a slight rest. They should only receive sufficient water to support their large succulent leaves, which should remain at all times perfently plump and healthy. Having no pseudo-bulbs, these leaves are the mainstay of the plants, therefore every means should be taken to retain them as long as possible. I prefer pans in preference to baskets, or cylinders, as I think the majority of plants can be more successfully cultivated in pans than pots. When phalænopsis are seen to be moving into growth is the best time to overhaul them, and all those that are in want of new compost should have attention. A good compost consists of equal parts of peat, polypodium and osmunda fibre, and sphagnum moss, with a liberal addition of half-decayed oak leaves. After repotting the plants must be carefully watered, and shaded from strong light. All composts used in potting should be warmed quite up to the temperature of the house in which the plants are grown.—J. T. BARKER, West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

CANNAS.—During the last few years cannas have been greatly improved; they used to be grown chiefly for the fine effect they gave to sub-tropical bedding, the foliage being very effective, but the flowers were very poor and not of much account. They are now among our most gorgeous conservatory plants, and would be even more popular if their cultivation were better understood. The present is a good time to make a start. Seeds can be obtained, and if soaked in warm water for twenty-four hours by placing the vessel of water in the plant stove, before sowing, the plants are easily raised if sown in sandy loam and placed in a temperature of 60 degrees; but the varieties are generally so poor and disappointing from seeds that they are not worth the trouble. It is better to buy named varieties of merit to begin with. Plants that were grown last season, and have been rested under the stage, should now be placed in heat. In most cases they are a potful of roots, with one or two leading growths. When the leading growths have attained a height of 18 inches with the leaves developing, the rhizome should be cut clean through between the young growth and the old stool. The plants should then be knocked out of the pots, and the young growth with the roots attached to it pulled away from the side of the ball of soil, and potted, choosing large 32-sized pots. The compost should be good loam two parts, decayed manure one part, and plenty of coarse sand. The old stools should be thrown away unless required for stock. Cannas revel in plenty of heat and moisture, and they also like liquid manure when well rooted. When the flower-spike appears another young growth will start from the base, and when this is 18in. high, sever it from the plant, remove, and pot it separately as advised above, or it may take the lead, and very likely the flower spike will not develop. If this system is practised one may have cannas all the year round. A good selection of varieties is: Eliza Hoss, Oscar Dannicker, Black Prince, Gaekwar of Baroda, Mrs. G. H. Strohlein, Papa Crozy, W. Watson, H. Aldinger, and Goethe.

ROSES IN POTS.—These should now be pruned back to three buds on each growth. If the soil has become sour the plants should be shaken out of the soil and repotted. Trim back any long, straggling or decaying roots, and repot at once in a rich compost of fibrous loam, decayed manure, and coarse sand. If a top-dressing only is necessary, pick off as much of the soil as it is possible without injuring the roots, using a pointed wooden peg. Give a top-dressing of rich soil, adding a 5in. potful of some good fertiliser, such as Clay's, which is well suited for roses, to the barrowload of soil. When they have been potted or top-dressed, they should be placed in a heated frame, giving water sparingly. They should be syringed well overhead to encourage them to break freely; give on all favourable occasions. Such varieties as Marechal Niel, Niphetos, etc., trained on rafters, should be taken down and pruned hard, i.e., all the young growths made during the last summer should be tied carefully in their full length, as these varieties produce their best blooms on the last season's growth; but all old wood that flowered last season must be cut away.—LEWIS SMITH, Shotesham Park Gardens.

## HARDY FRUITS.

ORCHARDS.—The scathing remarks of our fruit-growing friends across the water on the management (or mismanagement) of our orchards are unfortunately in many cases only too true. In these days of efficient insecticides, washes, etc., and means of applying them, it is to be regretted that more time and energy is not given to the best of what may be a necessary evil, that is, to give the old trees, as far as possible, a new lease of life until such time as a younger plantation takes the place of the old one. Decrepit trees and worthless varieties should be removed and replaced by good varieties; the site should be trenched over, and, where necessary, fresh loam added before planting the young trees. Sadly neglected trees should first be pruned; usually this kind of tree is one mass of growth, and the work of thinning out must be drastic, with the object of allowing free admission of light and air to all parts. All dead wood and growths affected by canker must be cut away. The loose bark on the stems and main branches should be scraped off (a three-inch onion hoe is a handy tool for the purpose). To cleanse the trees of moss, lichen, etc., spray with a caustic wash, thoroughly wetting the main stem and branches to reach hidden insect pests. If growing in grass, remove the latter for a foot or fifteen inches clear of the stem.

AMERICAN BLIGHT.—Trees affected by this pest should be well brushed over with paraffin emulsion. The roots should be laid bare for a yard or so, and, if troubled with blight, damp the roots with the emulsion. The removed soil should be burnt and new put in its place. Old pear trees still retaining their vigour of growth, but if inferior varieties, may be cut back and grafted with choice varieties (this will be referred to in a later note.) To promote healthy growth a spring dressing of a suitable artificial mixture should be applied, and, if desired, a home-made mixture of superphosphate, sulphate of potash, and sulphate of ammonia can be used at the rate of 5cwt. of superphosphate, 2cwt. of sulphate of potash, and 2cwt. of sulphate of ammonia per acre, the whole to be thoroughly well mixed together before use.

BUSH TREES.—Arrears of pruning should be made good at the earliest opportunity, and the trees sprayed. When pruning apples discrimination and close observation of the various varieties are some of the prime factors of success, habit of growth varies considerably, and to prune all alike is to court failure. Varieties which form fruit spurs freely may be pruned back hard, leaving sufficient extension wood to fill up any gaps or weak places; there are several which form their fruit buds on the tips of the young wood, or in the forks of the branches, and Lady Sudeley is a well-known example of this type; with such varieties it is more a matter of thinning out the growths, leaving as much bearing wood as is consistent with admission of light and air; the main branches should be more thinly disposed to allow room for the young growths, but in many cases far too many fruit buds are allowed to remain on the trees. Many varieties of pears, if allowed to carry too many fruit buds, completely fail to produce fruit, and hard thinning will, in most cases, work wonders, and trees hitherto unfertile will set their fruits freely. Pears on the quince usually require a certain amount of thinning of the fruit buds, more particularly after a few years' growth. Trees making too vigorous growth and at the same time failing to crop should be root-pruned and allowed more growth until the balance of root action and growth is restored; once a tree becomes fruitful it continues so under ordinary circumstances and care. Young trees of both apples and pears, with an upright, close habit of growth, can be formed into shapely trees by tying out the branches.—W. MESSENGER, Wolverstone Park Gardens.

## THE KITCHEN GARDEN.

MUSHROOMS.—Prepare beds at frequent intervals to maintain a regular supply, this course being far more satisfactory than making very large beds less frequently. Oft'-times fresh horse-droppings are not obtainable in large quantities, therefore small beds made every three weeks will serve best and prevent deterioration of the manure, while trying to collect enough for larger beds.

ARTICHOKES (JERUSALEM).—Nothing is gained by leaving these in the ground after this date; lift the crop, choosing the larger tubers for use, and place them under a wall facing north till required; they should be "soiled" over to retain their freshness. The medium tubers of good shape should be planted back on the same plot, providing the ground is deeply dug and well manured. Artichokes answer well for hiding unsightly objects during the summer and autumn months.

GLOBE ARTICHOKES.—The old stools must have ample protection during cold weather; litter, bracken, or ashes answer well, but should be removed during open weather to prevent the growth from rotting or becoming drawn. Those growths that were taken off in the autumn and potted up, and are now in cold frames, should have all possible air given on favourable occasions; plant these out in March.

RHUBARB.—It is now an excellent time to replant a portion of the bed to keep up the vigour in the plants that are constantly forced. In this way a good maincrop is assured to succeed the forced crop, besides having a portion for forcing, viz., that which was planted two years previously. The ground for this crop should be trenched and well manured, placing leaf-soil, old mortar rubbish, or burnt garden refuse around the stools. Champagne is a very early variety, of splendid colour when cooked, and finely flavoured. The Sutton and Dawes' Champion are two excellent varieties for succession.

SPINACH.—To prevent a shortage in the supply that is at times felt during the next few weeks when cold weather is generally experienced, a sowing can be made with advantage on a hotbed, which can be succeeded by marrows from pots. The outside spinach should have every encouragement to hasten its growth; use the Dutch hoe freely, and give sprinklings of soot. Evergreen boughs placed on the cold sides of the beds will help materially to maintain a regular growth. The same system applies to lettuce, early cabbage, etc., and a small plot of each should always be planted on a sheltered site for early supplies.—G. ELLWOOD, Swanmore Park Gardens.

# THE VALUE OF BIRDS TO MAN.

(Concluded from page 86.)

## Birds Among the Fruits.

Birds are charged, as though the case were one of theft, with feeding to a greater or less extent on the fruit which they help to produce. In Nature, such services as the bird renders in direct protection of the tree is placed to its credit, and it receives its reward. Does man expect it, for his sake, to deviate from those habits which it has contracted under natural conditions? In other words, does he expect the bird to assist him in producing an unnatural surplus of fruit?

Call the bird in the orchard an evil—if you will. But it is a necessary evil, and the fruit-grower must make up his mind to pay the bird its wages, even though at times they may seem exorbitant.

What would happen to this poorer class of fruit-growers if they were deprived of the services of the bird is best seen in what happened to Frederick the Great. This worthy, in a fit of passion, because a flock of sparrows had pecked at some of his cherries, ordered every small bird that could be searched out to be instantly killed. Within two years his cherry trees, though bare of fruit, were weighed down with a splendid crop of insects.

## The Services of the Bird in the Garden.

The garden is the insect's paradise. It fares sumptuously every day on the most succulent of vegetable foods. Every opportunity is thus offered for its increase. The greatest insect enemy of the garden is a small, dull-coloured, hairless caterpillar, known as the cut-worm, which is the larva of a Noctuid moth. This chief of the brigand band of garden pests usually hides during the day beneath matted grass, or under the loose soil along the rows of plants. It comes forth at dusk to feed. The bird is abroad at the first peep of day, and it finds the robber-worm in the morning before it has retreated to its place of concealment.

The cut-worm, by the way, is the worm which is associated with the early bird in the well-known proverb.

But the bird has to come stealthily to the garden. Its visits are regarded by man with more than suspicion, and it is fortunate if it escapes with its life. In consequence, it snaps up a caterpillar and is off again, leaving thousands it would have eaten, if unmolested, to run riot among the vegetables.

Occasionally a bird more bold than its fellows will visit the garden in broad daylight to dig the cut-worms out of their hiding-places. Nature never having begrudged it the reward of its toil, the bird takes a few peas before leaving.

The gardener notices the damage done to his peas, and next morning is up betimes. He sees the early bird running along the rows of peas, stopping frequently to peck at something. There is a loud explosion, followed by a puff of smoke. The smoke slowly drifts away, to disclose a bird lying dead.

Caterpillars are not gifted with a voice. If they were, they would scarce forbear to cheer.

The bird is dead. Mark the sequel. One fine morning the gardener issues proudly forth to cut his mammoth cabbage—the one with which he intends to put to utter confusion all other competitors at the local fruit and flower show. Alas for human hopes, and the depredations of caterpillars. The cabbage is riddled like a colander.

The gardener, when he shot the bird, forgot, if, indeed, he ever knew, that the ancient law forbade a muzzle to the ox that threshed out the corn.

## Utility of Birds in the Meadow.

Each season, until hay-making commences, the grass offers cover and shelter for the nests of such birds as breed on the ground. The fields also provide food for birds, and for the insects on which birds feed. Thus there is established a natural inter-relation and interdependence between the bird and its food and shelter—that is to say, the insects and the grass. This simulates the condition of the earth before man made discord in the grand harmony of Nature's laws.

Where the birds of the field are undisturbed they tend to hold the grass insects in check. On the other hand, when the numbers of birds in the field are, for any reason, insufficient, the insects increase.

Here is an instance of this. Some years ago in Bridgewater, Massachusetts, a great battue was held by the ignorant townspeople in the spring of the year, and so many field birds were killed that their bodies were ploughed into the land for manure. The following summer whole fields of grass withered away and died. This was due solely to the fact that the number of field birds had been reduced, and, in cnsequence, the pressure which Nature demands the field bird shall exert upon the field insect had been released.

Again. At one time, in New Zealand, it was no uncommon thing to see English grass wither up in large patches, as though scorched by fire. This was due to the work of a crane-fly and click-beetle, the larvæ of both of which were addicted to the habit of eating the roots of the grass, just under the surface. English grass was then comparatively limited in the up-country districts, and, as there are large tracts of land in New Zealand destitute of native grasses, the depredations of these insects became a serious matter to those settlers who had stock to feed, and who were relying on the English grass to feed them. It was all the more serious because the insects were without any natural check, the native birds which had kept their numbers down before the advent of the white man having been scared from the vicinity of the homesteads. So the beetles continued to make merry, to marry, and to multiply. In a corresponding ratio the grass continued to fade, to wither, and to die.

Then came the English starling; and so voraciously did it feed on the larvæ that soon all was green again.

Without birds, provided insects were present, grass could not be grown. The grub of a single species of beetle, if unchecked, could destroy all the grass roots of our meadows, or any one of the several species of the cut-worms might be sufficient to destroy all the verdure above ground.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

In spite of the bad weather, there was a bright display in the Royal Horticultural Hall on Tuesday, February 6. Forced shrubs, carnations, camellias, and orchids provided the chief attractions. Novelties were few. There was a capital attendance in the afternoon.

### FLORAL COMMITTEE.

A delightful group of forced flowering trees and shrubs from Messrs. R. and G. Cuthbert, Southgate, was a prominent feature of the meeting, and an especially bright and interesting one, as it served once more to demonstrate the value of these subjects for conservatory decoration. Magnolias figured largely in the centre of the group, and standard wisterias were delightful, as were the tall lilacs, Jasminum primulinum, Pyrus malus floribunda, mollis azaleas, Choisya ternata, Forsythias, and other lovely things associated with palms and ferns.

Perpetual carnations were very much in evidence on this occasion. Mr. H. Burnett brought over some charming flowers from Guernsey, and staged these in capital style, setting up fine vases of R. F. Felton, White Enchantress, Mandarin, Mrs. H. Burnett, White Perfection, the bold Marmion, Bonfire, Orpheus, and Majara, the latter being a good white.

Messrs. W. Wells and Co., Merstham, contributed a small collection of perpetual carnations, and disposed the flowers among Asparagus Sprengeri, the leading varieties being White House, May Day, Marmion, and Mikado.

Mr. L. R. Russell, Richmond, contributed a batch of Debregæsia velutina, with its yellowish green fruits, a group of Prunus triloba, and some berried aucubas.

Messrs. T. S. Ware, Lim., Feltham, contributed a collection of alpine plants, in pans, and though few of these were in bloom, they proved interesting and attractive.

Bunches of the golden Senecio grandifolius were sent by Mr. Kempshall, gardener to Mary Countess of Ilchester, Abbotsbury, Dorchester, and were very effective.

Messrs. Barr and Sons, Covent Garden, had a bright little exhibit of early narcissi, snowdrops, lachenalias, and squills.

The cyclamens from Messrs. S. Low and Co., Enfield, were exhibited in large pans of a variety, and in this way they were very effective, especially Salmon King, and the fringed Mrs. Buckston. With the cyclamens were shown some hyacinths. Messrs. Stuart Low and Co. also displayed perpetual carnations in quantity, and made a specially good show of Lady Alington, Baroness de Brienen, Royal Purple, Beacon, and Fire Glow.

→ Spraying ←
The question to-day is not "**Shall we Spray,**" as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers Use **only** the **reliable** tested "FOUR OAKS" which have won **30** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-.** No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—**THE FOUR OAKS SPRAYING MACHINE CO., No. 3 C., SUTTON COLDFIELD.**

A large exhibit from Messrs. James Veitch and Sons, Chelsea, contained a goodly number of bright Indian azaleas, semi-double camellias, Acacia lineata, A. Drummondi, Prunus sinensis fl.-pl. alba, Amygdalus persica fl.-pl. rosea, Primula Kewensis, lily of the valley, and other interesting early-flowering plants.

Mr. C. Engelmann, Saffron Walden, was a considerable exhibitor of perpetual carnations, and staged the new clove-scented crimson Triumph (A.M.), in good form; Gloriosa, May Day, Elektra, Lady Northcliffe, and Vinca were other notable varieties.

Messrs. Thompson and Charman, Bushey, Herts, ne wexhibitors, put up a small rock garden, but this was rather too thinly furnished to be really effective.

Small models of garden fencing, seats, bridges, arches, arbours, and tea houses, submitted by Messrs. J. Cheal and Sons, Crawley, with a background of flowering shrubs, constituted a most interesting contribution.

Miss E. Ough, Streatham Common, submitted a collection of paintings of flowers and fruits, and Miss Massee, Kew Gardens, exhibited a very interesting and useful series of studies of fungi, fern fructification, wild flowers, etc.

Hardy cyclamen, all C. ibericum seedlings, were delightful, as shown by Mr. F. H. Chapman, Rotherside Gardens, Rye; Mr. Chapman also showed Narcissus Ryensis, a hybrid between N. triandrus and N. bulbocodium.

Messrs. W. Cutbush and Sons, Highgate, presented a very showy exhibit, consisting of forced lilacs and magnolias, Indian azaleas, prunuses and pyruses, early irises, the sweet Boronia megastigma, hamamelis, and a large collection of perpetual carnations, the flowers all bright and well arranged.

A nice little contribution of Richmond roses, beautiful blooms, sweet, bright, and on long stems, came from Messrs. G. Mount and Sons, Canterbury, and was greatly admired

The carnations from Messrs. Allwood Brothers included vases of Marmion, Scarlet Glow, the new Geisha, La Rayonnante, Lady Alington, etc.

Mr. Bertie Bell, Castel, Guernsey, again made a good show with his new deep pink perpetual carnation named Coronation.

Camellias from Messrs. W. Paul and Sons, Waltham Cross, filled one corner of the hall with beauty, and everyone admired the well-flowered, glossy-leaved bushes of Jupiter, Mercury, Donckelaari, Mars, Waltham Glory, Ceres, and other semi-double and single varieties.

A remarkable exhibit was the one put up by Messrs. H. B. May and Sons, Edmonton. It consisted of a long paper-covered board with about three fronds each of some twelve species, and fifty-eight varieties of nephrolepis. The development of plumosa nephrolepis from stolen sports, and variation from spores, is one of the horticultural wonders of modern times, and the whole history of that development was, so to speak, set out in detail by the fronds thus exhibited. The exhibit was of outstanding interest, and of considerable educational value, as it afforded ample opportunities for making comparisons between the many plumose varieties now on the market.

### ORCHID COMMITTEE.

A splendid odontoglossum named O. Merlin, very like a fine crispum, white, with rich crimson spottings, was exhibited by Mr. H. Alexander, grower to Lieut.-Colonel Sir G. Holford, Westonbirt, Tetbury, and gained a F.C.C.; the marks on the petals are richer in colour than those on the sepals; Cypripedium Helen II., Holford's var., and Sophrolælio-cattleya Marathon Vesuvius, also came from Westonbirt.

Messrs. Charlesworth and Co., Haywards Heath, showed Odontioda Bradshawiæ finely, as well as Odontoglossum crispum and antholes, the lovely yellow Lælio-cattleya Ixion, and Vanda teres alba.

From the Glebelands collection Mr. J. Davis, gardener to J. Gurney Fowler, Esq., brought up Odontoglossum Memoria Lily Neumann (A.M.), of unknown parentage; the spike carried a dozen beautiful blooms, heavily marked with maroon on a rosy ground, the tips being whitish; the lip has a golden crest.

Messrs. J. Cypher and Sons, Cheltenham, brought forward a few cypripediums and masdevallias; C. Beechense superba was particularly good in this group.

A charming hybrid is Brasso-cattleya Wellesleyæ (B. glauca crossed with Cattleya Mossiæ Wagneri), with pure white flowers of great beauty, with a lemon-yellow throat; this, as well as some good cypripediums, were exhibited by Mr. W. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking.

Mr. W. A. Manda, St. Albans, set up several forms of Cattleya Trianæ, one named American Beauty much resembling the variety Backhousiana.

A charming hybrid between Odontoglossum Phœbe and O. ardentissimum, with rich crimson markings, named O. Collieri, was shown by Mr. J. Collier, gardener to Sir J. Colman, Bart., Reigate.

Messrs. J. and A. McBean, Cooksbridge, showed Lælia anceps Schroderiana, L. a. Williamsiana, Cymbidium eburneo-Lowi, the lovely Brasso-cattleya Eudora splendens, and a good Odontioda Charlesworthi.

A few choice plants from Messrs. Hassell and Co., Southgate, included Lycaste Skinneri alba, Odontoglossum Lawrenceanum, and Cypripedium chrysotoxum Victor.

Some interesting orchids from Messrs. Stuart Low and Co., Bush Hill Park, Enfield, included the quaint black-flowered Pleurothallis Roezli, the fragrant Rodriguebia crispa, Platyclinis glumacea, and a number of bold sypripediums.

A showy group of orchids from Messrs. W. B. Hartland and Sons, Ardcairn, Cork, consisted of Odontoglossum Harryano-crispum, Cypripedium Actæus, C. Leeanum, C. callosum Sanderæ, C. Thalia, Cymbidium giganteum, etc.

### VEGETABLE COMMITTEE.

The early broccilis from Messrs. Sutton and Sons, Reading, formed a very attractive exhibit, the piles of neat heads of Snow White, Superb Early White—splendid heads, and Winter Mammoth proved very tempting and appetising, and showed how great has been the advance made with these useful vegetables in recent years.

### CERTIFICATE AND AWARDS.

First Class Certificate.—To Odontoglossum Merlin, from Lieut.-Col. Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

Award of Merit.—To Odontoglossum Memoria Lucy Neumann, from J. Gurney Fowler, Esq. (gardener, Mr. Davis), Glebelands, South Woodford; to Carnation Triumph, from Mr. C. Engelmann, Saffron Walden.

### MEDALS.

Silver-Gilt Flora.—To Messrs. R. and G. Cuthbert, Southgate, for forced flowering shrubs; to Messrs. H. B. May and Sons, Edmonton, for fern fronds.

Silver-Gilt Banksian.—To Mr. H. Burnett, Guernsey, for carnations.

Silver Flora.—To Miss Massee, Kew Gardens, for paintings of fungi, etc.; to Messrs. Wm. Paul and Son, Waltham Cross, for camellias; to Messrs. James Veitch and Sons, Chelsea, for greenhouse plants; to Messrs. W. B. Hartland and Co., Cork, for orchids.

Silver Banksian.—To Messrs. Sutton and Sons, Reading, for early broccolis; to Messrs. W. Cutbush and Sons, Highgate, for forced shrubs, etc.; to Messrs. S. Low and Co., Enfield, for cyclamen and carnations; to Messrs. G. Mount and Sons, Canterbury, for roses; to Messrs. S. Low and Co., Enfield, for orchids; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. Charlesworth and Co., Hayward's Heath, for orchids; and to Messrs. J. and A. McBean, Cooksbridge, for orchids.

Bronze Banksian.—To Mr. C. Engelmann, Saffron Walden, for carnations; and to Mr. S. Hanham, Goldhawk Terrace, N.W., for paintings.

### SCIENTIFIC COMMITTEE.

January 23.—Present: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair); Messrs. A. D. Michael, G. Massee, R. H. Curtis, W. Hales, G. Gordon, and F. J. Chittenden (hon. secretary).

GALANTHUS ELWESI VAR. POCULIFORMIS.—Mr. Bowles showed a flower of this beautiful and robust snowdrop, the inner segments being white without the green marks usual in snowdrops.

NANDINA DOMESTICA FRUITING.—Mr. Fox, of Carmino, Falmouth, reported the fruiting of Nandina domestica in his garden in 1911.

RASPBERRY CANES DISEASED.—Mr. Peters, of Ripley, sent canes of raspberries showing whitish patches on the skin with tiny black spots upon them. Many canes had died, and others attacked had grown and fruited but poorly. Mr. Massee recognised the disease as due to the attack of the fungus Hendersonia rubi.

## National Chrysanthemum Society.

A rather small gathering of members assembled at Carr's Restaurant, Strand, W.C., on Monday, February 5, at seven p.m., when Mr. Thomas Bevan, in the unavoidable absence of the President, Sir Albert Rollit, presided over the annual general meeting.

The annual report and balance-sheet were taken as read, and the Chairman formally moved their adoption, and this Mr. John Green seconded, remarking that the old society appeared now to be sailing in smooth waters. This was carried unanimously. The following is an abstract of the report:

### REPORT OF THE COMMITTEE FOR 1911.

The Executive Committee have pleasure in submitting to the members their annual report for the year 1911, a year which has been marked with considerable progress and development in the respective spheres of the society's work.

At the annual meeting held in February last, Sir Albert Rollit, D.C.L., LL.D., was unanimously re-elected president. The members will be interested to hear that early in the year he was appointed Knight Commander of the Order of St. Olaf of Norway of the First Class. The president continued his activities to promote the welfare of the society during the past year, and made special efforts towards increasing the membership of the society, with the result that many notable additions were made to the Society's roll of Fellows and ordinary Members. Your committee felt that they were only anticipating the wishes of the general body of members in expressing to Sir Albert Rollit their very high appreciation of his efforts in this direction. At a meeting of the committee held on November 20, it was resolved that an expression of the committee's thanks on behalf of the members should be suitably engrossed and formally presented to the president at the annual dinner on November 29.

Two shows were held as usual at the Crystal Palace on October 4 and 5 and November 1, 2, and 3. The early exhibition showed marked traces of the prolonged drought which afflicted the whole of the country, particularly in the South, during the spring and autumn of the past year. The competition was consequently not keen, and the quality of the flowers was hardly up to the usual standard. At the November Show the same influences were felt in a smaller degree. Members will be interested to hear that the Publications Committee have received special instructions to prepare and issue to the members a full descriptive record of the show. It is proposed to continue this plan in future so that these reports will be of permanent historical interest as showing the variations in the exhibitions from year to year.

The exhibits which were put up by the trade in November were stated by more than one horticultural paper to have been "more magnificent than ever," and nobody who was present at the show will be likely to dispute this statement. It is impossible to praise too highly the loyalty of the trade, who readily came to the society's aid in a year which was certainly not an easy one for the culture of chrysanthemums.

For the third year in succession the committee arranged a conference which was held at Carr's Restaurant on December 4, when the following papers were read: "Chrysanthemums for Market," by Mr. F. W. Ladds; "Soil Preparation and some Chemical Foods," by Mr. P. A. Cragg. The audience numbered over 100 enthusiastic growers, and each paper was followed by an animated discussion. The deliberations of the Floral Committee during 1911 have again formed a very important branch of the society's work. Eight meetings of the committee were held at Essex Hall and the Crystal Palace. Two hundred and twenty-seven new varieties were considered by the committee, and the following awards were made: 38 First-class Certificates, 33 Commendations, and 1 Award for Colour; whilst votes of thanks were awarded to Messrs. Wells and Co., the Mill Hill Vineyards, Lim., and Mr. J. Simon, for collections submitted at meetings held on September 4, November 20, and December 4, respectively.

The members of the Floral Committee paid a visit to the nurseries of Messrs. Lowe and Shawyer on October 7, and a further visit to the nurseries of Messrs. Cragg, Harrison, and Cragg on October 21. Both these visits proved most interesting and instructive. In the committee's last report mention was made of the fact that the Floral Committee were taking into consideration the whole question of classification with a view to revising the list of sections. The sub-committee which has been charged with the duty of bringing up a full report on the matter have not yet finished their labours. The exceptional difficulties of the task only became apparent when the matter came to be considered in detail, but the Floral Committee hope to complete their deliberations and make a report to the members in time for the 1912 season.

On July 17 about 120 members and friends paid a visit to Clivedon, by special permission of the owner, W. Astor, Esq., and all agreed that the day had been one of the most enjoyable outings ever spent by the society.

The annual dinner was held at the Holborn Restaurant, under the chairmanship of the President, Sir Albert Rollit, on Wednesday, November 29. The company numbered 110, and an exceptionally good musical programme was interspersed between the various speeches.

The medals of this society which were offered to the committee of the International Exhibition have been accepted, and a class appears in the schedule for twelve bunches of chrysanthemums.

Having regard to the nature of the class, your committee have made further representations to the secretary of the exhibition, and he has agreed to allocate space for non-competitive exhibits of chrysanthemums. It is proposed to offer to the committee of the International Exhibitions the small gold medal, silver-gilt medal, and large silver medal of this society, to be awarded in connection with these non-competitive exhibits.

It was particularly noticed that these types—pompon, anemone pompon, and anemone chrysanthemums—were not represented at the show as worthily as might be desired. At a subsequent meeting of the committee special attention was drawn to this matter, and it was suggested that steps should be taken to arrest the apparent decline in these sections. The matter was very fully discussed, and eventually a recommendation was made to the Schedule Committee that they should take this question into careful consideration, with a view to offering in the 1912 schedule special prizes for seedling plants to be exhibited in 1913 of pompons, anemone pompons, and anemone chrysanthemums. That recommendation will be carried into effect by the Schedule Committee.

The finances of the society still continue in a very healthy condition. The accounts show that there were no ordinary liabilities on December 31 last, whilst the assets amounted to £126 15s. 7d. The accounts for 1911, duly audited, are appended to this report.

During the year, 22 Fellows and 51 ordinary members have been added to the society's roll, and three horticultural societies have been admitted to affiliation. It is believed that the progressive policy of the committee in dealing more fully with the educational side of the society's work, and in issuing valuable publications to the members, will be the means of securing many more new members during the coming year. Members joining during 1912 will receive copies of the society's recent publication, "The Culture and Exhibition of Large Chrysanthemum Blooms," in addition to the publications which will be issued during the forthcoming year.

Early in the year the committee were enabled, by the kindness of Mr. R. Ballantine, to obtain complete sets of the society's

Eckford's
GIANT SWEET PEAS
P.B.B.

Another Record Sweet Pea Year.

ECKFORD'S GREAT £1,000 COMPETITION.

Open to all—over 200 Cash Prizes.

There are two reasons, both equally good, for this competition, as you will admit. First and foremost, Eckford's, as the premier Sweet Pea Specialists of the world, wish to mark their tangible appreciation of the public preference for their unsurpassed Sweet Pea Seeds—a preference based upon the unexcelled standard they have always maintained.

To grow from Eckford's Seeds spells success—there is nothing to be doubtful or dubious about, either as regards the magnificent quality of the flowers, or on the score of their hardiness.

Eckford's have made the culture of the Sweet Pea the aim and object of their existence, and as all know and appreciate—Eckford's Sweet Peas are unrivalled in the bewitching splendour of their hue and fragrance.

Again Eckford's desire to promote, even more than before, the cult of the Sweet Pea. They wish everyone to become experts in the art of growing Sweet Peas to perfection, and they imagine no better way than the medium of a friendly competition—open to all.

It matters not whether you grow extensively, or on a limited scale, for Eckford's have graded the contest in classes.

The professional grower is restricted to his brethren—the amateur who has the aid of help is in a division by himself; those with modest gardens are also catered for; whilst even children have a section to themselves.

The competition is open to all. Simply send now to Wem for free particulars, and enter at once.

SPECIAL NOVELTY OFFER FOR 1912.

CLARA CURTIS (Waved). — A fine waved primrose; very free flowering, fine for exhibition. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1/-.**

W. T. HUTCHINGS (Waved).—A very fascinating flower of soft cream overlaid with a delicate pink. In sealed packets, 7 seeds **3d.**; 15, **6d.**; 30, **1/-.**

OTHELLO (Waved). — A beautiful self-coloured giant chocolate, of splendid substance and robust habit. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1/-.**

APPLE BLOSSOM (Waved). — A beautiful flower of apple blossom colour, of giant size, frequently four-flowered. In sealed packets, 10 seeds **3d.**; 20, **6d.**; 40, **1/-.**

APRICOT (Waved).— A beautiful light apricot overlaid with rich cream pink; delightful for table decoration; one of the most superb. In sealed packets, 5 seeds, **6d.** 10, **1/-.**

Mrs. HENRY BELL (Waved). — A beautiful rich apricot ground overlaid with a soft pink, which deepens towards the edges of both standards and wings; finely-waved. In sealed packets 10 seeds, **3d.**; 20, **6d.**; 40, **1/-.**

TERRA-COTTA.—A bright cerise standard overlaid with terra-cotta; wings soft rose. In sealed packets, 5 seeds, **6d.**; 10, **1/-.**

Miss GUEST (Waved).— A pure, bright, almost self rose, robust and of giant size; beautifully waved. In sealed packets, 5 seeds, **6d.**; 10, **1/-.**

ASTA OHN (Waved).— A pretty waved lavender overlaid with rose; a very charming flower. In sealed packets, 10 seeds **3d.**; 20, **6d**: 40, **1/.**

CERISE (Waved).—A fine bold, beautifully waved, true cerise; a very strong grower. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1/-.**

SAINT GEORGE (Improved Waved).— This is a very charming flower; as accurately as one can describe, it is a deep exquisite coral of giant size and splendid substance. In sealed packets, 5 seeds, **6d.**; 10, **1/-.**

DODWELL F. BROWNE (Waved).—This is a very beautiful intense bright crimson, three and four flowered, almost a self. In sealed packets, 10 seeds, **3d.**; 20, **6d.**; 40, **1/-.**

EVELYN HEMUS (Waved).— A warm cream shading to yellow with a picotee edge of terra-cotta pink; standard and wings beautifully waved, In sealed packets, 10 seeds, **3d.**; 20 **6d.**; 40 **1/-.**

PICOTEE (Waved). — A giant waved flower, pure white with a beautiful picotee edge of carmine; a really beautiful flower and fine for exhibition. In sealed packets, 5 seeds, **3d.**; 10, **6d.**; 20, **1/-.**

SPECIAL OFFER.— One full-sized packet of each of the foregoing 14 charming and novel Sweet Peas, 11/6, post free, for cash with order. One half-sized packet of each of the foregoing charming and novel Sweet Peas, **6/-**, post free, for cash with order.

SPECIAL COLLECTIONS for 1912.

EXHIBITOR'S (E) COLLECTION.—24 Giant Waved varieties, new and up-to-date; fine for exhibition, 10 seeds of each for **5/6**, post free, cash with order.

VILLA (B) COLLECTION.—24 splendid varieties, suitable for exhibition, 50 seeds of each, **5/6**, post free, cash with order.

HALF-VILLA (B) COLLECTION.—24 splendid varieties, suitable for exhibition, 25 seeds of each, **3/-**, post free, cash with order.

EXHIBITOR'S (D) COLLECTION. 12 Giant Waved varieties, new and up-to-date; fine for exhibition, 10 seeds of each for **2/9**, post free, cash with order.

VILLA (C) COLLECTION.—12 splendid varieties, suitable for exhibition, 50 seeds of each, **2/9**, post free, cash with order.

VILLA (E) COLLECTION.—12 splendid varieties, suitable for exhibition, 25 seeds of each, **1/6**, post free, cash with order.

A specially written booklet on Sweet Pea Growing given with every order. ☛ Send to WEM for satisfaction.

FREE. Send a postcard to-day for large illustrated and coloured Catalogue. It gives full particulars of all novelties in Sweet Peas for 1912; also complete particulars of the £1,000 offered in Prizes for growers of Eckford's Sweet Peas, and contains full list of all Flower and Vegetable Seeds.

HENRY ECKFORD, Sweet Pea Specialist, Dept. 221, WEM, SHROPSHIRE.

schedules and other publications since 1883, and these have now been bound in suitable style, and form a valuable addition to the society's historical records.

Your committee have taken into special consideration the form in which the society's publications should be issued in the future, and it has been decided that for 1912 and subsequent years the "Schedule" shall contain only the list of members and affiliated societies, the list of classes at the society's shows, and such other matter as may have direct relation to our exhibitions. A separate book will be published each year to be called the "Transactions of the National Chrysanthemum Society."

An agreement has been signed with the Receiver of the Crystal Palace for the holding of two shows during 1912, on October 2 and 3 and October 29, 30, and 31. The date of the large show is slightly earlier than the committee would desire, but it has been necessitated by the fact that at the date when the agreement was signed the Receiver of the Crystal Palace had only been granted permission by the Court to make agreements for shows up to the end of October, 1912. Under these circumstances your committee are making special arrangements for the holding of a supplementary exhibition at Essex Hall, on November 20 next.

### 1912 MEETINGS.

The meetings of the Executive Committee for 1912 have been fixed as follows: September 23, October 21, November 18, and December 16.

The meetings of the Floral Committee for 1912 have been fixed as follows: September 9, September 23, October 2, October 21, October 29, November 11, November 20, and December 2. It has already been decided to hold the society's annual conference at Essex Hall, on Wednesday, November 20, the same date as that fixed for the supplementary exhibition and meeting of the Floral Committee.

A vote of thanks having been accorded to the auditors, the chairman, and vice-chairman, Mr. E. F. Hawes nominated Sir Albert Rollit as president in a few congratulatory remarks, and Sir Albert was unanimously re-elected. Messrs. J. B. Riding and G. Langdon moved the re-election of Mr. John Green as treasurer, and the motion was heartily carried.

Mr. Thomas Bevan was again re-elected chairman of committee, with applause, on the motion of Messrs. Moorman and Prickett. Mr. E. F. Hawes was then unanimously re-elected vice-chairman, and Mr. C. Harman Payne's re-election as honorary foreign corresponding secretary was equally unanimous and hearty, and he was congratulated upon the receipt of the Academic Palms from the Government of France—a high and rare honour.

The re-election of Mr. R. H. Witty was unanimous on the motion of Mr. J. Green and Mr. Hawes, the former adding a few appreciatory remarks that the meeting heartily endorsed. Mr. Witty gracefully acknowledged his re-election. Messrs. Cox and Stephens were elected auditors for the ensuing year.

The election of one-third of the committee as per rule, took little time, as the nominations only met the needs of the case, so there was no need for a ballot. Those elected were: Messrs. J. Emberson, D. Ingamells, C. Noyce, J. B. Riding, H. Runciman, G. Springthorpe, W. Wells, W. A. Cull, J. McKerchar, F. J. Toms, G. Caselton, A. Searle, and W. Wells, jun.

A vote of thanks to the chairman concluded the proceedings, which lasted about three-quarters of an hour.

## Manchester and North of England Orchid Society.

On the occasion of the meeting held by this society on the 25th ult. there was a good display of orchids, and the numerous contributions from amateur and trade growers contained many novelties of interest.

As usual, W. R. Lee, Esq., Heywood (gardener, Mr. Bunch), exhibited a remarkably fine group, and was awarded a silver-gilt medal. Odontoglossums were very strongly represented, especially noteworthy being the fine hybrids Harmac and Miranda. Sophro-cattleya Wellesleyi, Lee's variety, was especially noteworthy. Cypripediums were of a high order of merit, and chief among them were excellent examples of Lady Dillon, Magnificum, Queen Alexandra, Triumphans, Ville de Paris, Fascinator, Helen II., Sunrise, Rosette, and Marjorie, Lee's variety.

G. A. Ward, Esq., Northenden (gardener, Mr. Weatherley), was also awarded a silver-gilt medal, his collection being noteworthy for the number and the excellence of the plants it contained. The odontoglossums were of special interest, among them being fine examples of O. crispum Eric, Luciani, and O. L. White's variety; O. Prince Edward Ward's variety; O. amabile, O. Fascinator, O. ardentissimum Norman, O. Emperor, and O. Harryano-crispum. Cypripediums included such fine forms as C. Hilda, C. Thompsoni, C. Victor, C. aureum Hyeanum, and Dendrobium splendidissimum, the latter producing a good display of colour.

From S. Gratrix, Esq., Whalley Range (gardener, Mr. Brown), staged a small group, which was remarkable for the high quality of the kinds it contained, and the award of a silver medal was deservedly made. The Lady's slippers were especially interesting, as they included C. Alcibades Gratrix variety, C. Black Knight, C. Princess Wilhemina, C. Curtmani West Point variety, C. aureum Surprise, C. Mrs. F. Sander, and C. Alportense, O. crispum Ethel, and Cattlyea Trianæ Mary Gratrix, two beautiful forms, were also well shown.

Colonel J. Rutherford, M.P., Blackburn (gardener, Mr. Lupton), contributed a beautiful group, and was awarded a silver medal. Especially deserving of mention were Odontoglossum Luci Masereel, O. Canary, O. Rossi, a particularly fine form, Brasso-cattleya Rutherfordi, Cypripediums Actæus major, C. aureum Hyeanum, C. a. Virginale, C. Thompsoni, C. Earl of Tankerville, and C. Leeanum Clinaberryanum.

J. McCartney, Esq., Bolton (gardener, Mr. Holmes), contributed a varied and attractive group, in which the more noteworthy kinds included Lælia anceps Stella, L. a. Sanderiana, Cattleya Trianæ Donald, Brasso-cattleya Colonel J. C. Slater, B.-c. Mrs. Mary Gratrix, Lælio-cattleya Gottiana, Cypripedium Reginald Buller, C. Mrs. E. Carr, and C. Ville de Paris.

W. J. Hargreaves, Esq., Burnley, staged a nice group of cypripediums, to which a Bronze Medal was awarded, Cypripediums Minos Youngi, Thalia, Velma, Leeanum superbum, aureum Hyeanum, nitens, Euryades, New Hall Hey var C. aureum Virginale, and a light form of C. Leeanum were highly meritorious.

G. H. Pearce, Esq., Monton Grange (gardener, Mr. C. Mace), was also awarded a Bronze Medal for a small group, including Cypripedium aureum Hyeanum and C. a. H. Virginale, C. Leeanum Clinkoberryanum, C. aureum Œdippe, a nice variety of C. villosum, and Odontoglossums Harryano crispum and Pescatorei.

Rev. J. Crombleholme, Clayton-le-Moors (gardener, Mr. Marshall), also staged a small group, to which a Bronze Medal was awarded. It included Cypripediums Priam, Beekmanni, T. B. Haywood, Polettianum, Statterianum, and Chas. Richman, with varieties of insigne.

O. O. Wrigley, Esq., Bury (gardener, Mr. Rogers), was awarded a vote of thanks for a small group of very choice varieties, including Lycastes Skinneri alba, Purple Emperor, Robin, and Glory, with Cypripedium Beekmani, C. Thompsoni, C. aureum Œdippe, C. Leeanum Purity, C. Roweana, C. Beryl, and several unnamed seedlings.

J. J. Holden, Esq., Southport (gardener, Mr. Johnson), staged Cattleya Purity, Odontoglossum × George V., O. crispum Holdeni, and Cypripediums E. N. Holden (a variety of Chapmani), Archie Nield, and Ossulston var. Prime.

J. H. Craven, Esq., Keighley (gardener, Mr. Corney), staged Odontoglossum crispum Battle of Waterloo, O. crispum seedlings, and Odontioda Corneyanum.

H. J. Bromilow, Esq., Rann Lee (gardener, Mr. Morgan), staged Cypripediums Lord Wolmer, Euryades New Hall Hey, and a fine seedling of Actæus.

R. Ashworth, Esq., Newchurch (gardener, Mr. Gilden), staged Cypripedium Earl of Tankerville in good condition.

F. A. Hindley, Esq., Bradford, contributed a good example of Cypripedium Hindleyanum.

Messrs. Charlesworth and Co., Hayward's Heath, staged Odontioda Wilsoni and Lælio-cattleya Myrrah with yellow sepals and petals. Messrs. Hassall and Co., Southgate, contributed some fine examples of Odontoglossums Lambeauianum, ardentissimum, eximium, and Aireworth, with Cattleya Blacki.

Messrs. Stuart Low and Co., Enfield, showed two seedling Cypripedium Beekmani from a cross; and Mr. J. Evans, Congleton, had Cypripedium Venus and Odontoglossum Eximeum.

### AWARDS.

First Class Certificates.—To Odontoglossum Harmac, a full round flower, deep claret-purple, with white margin to sepals, petals, and lip; O. Miranda, good shape, rose colour, with brownish lines and spots, base of lip pure white; Sophro-cattleya Wellesleyi Lee's var., a good round flower, four inches across, rich scarlet colour—all from W. R. Lee, Esq. Cypripedium Alcidbiades Gratrix's variety, from S. Gratrix, Esq., a gigantic flower, good shape, with dorsal sepal well over three inches across. A silver medal was awarded in addition to the F.C.C.

Awards of Merit.—To Cattleya Lady Dillon magnificum, from W. R. Lee, Esq.; Cypripedium Black Knight and C. Princess Wilhemina, both from S. Gratrix, Esq.; Odontoglossum Prince Edward Ward's var., O. crispum Eric, and O. ardentissimum Norman, from Z. A. Ward, Esq.; O. Luci-Masereef and Brasso-cattleya Rutherfordi, both from Col. Rutherford, M.P.; Cattleya Purity and Odontoglossum × George V., both from J. J. Holden, Esq.

## Lee and Blackheath Horticultural Society.

At the recent meeting held in the Church Street Schools, a lecture on "Winter-flowering Plants" was given by Mr. R. C. Pullen, Councillor Balsdon taking the chair.

Bouvardias, said the lecturer, were among the very best of winter-flowering plants, useful alike for decorative purposes and for cutting, and they were very easily grown.

His method was to strike the cuttings in a compost of loam, leaf-mould, and sand, and when the cuttings were well rooted, pot them into three-inch pots and place on a shelf where they could receive plenty of light and air, stopping them as soon as they were properly established. In July they should be planted out on a good open border, very little attention being needed after planting them, except to give water, and an occasional stopping of long growths. In the early autumn they should be carefully lifted, potted, and plunged back into the holes they came out of. After about a fortnight they should be transferred to a cold frame or greenhouse, taking care to give them plenty of air.

The methods of propagating Euphorbia jacquinæflora, and the subsequent treatment, were well dealt with. Poinsettias, the lecturer said, should be grown out of doors in the summer, if strong, short, sturdy plants with big heads were to be obtained. The pots should be placed on a bed of ashes in an exposed position, thus keeping the plants dwarf.

A discussion took place at the end of the lecture, and a hearty vote of thanks to Mr. Pullen closed a very enjoyable evening.

## TRADE NOTE.

Mr. Leonard Cutbush, only son of Mr. Herbert Cutbush, has been admitted as junior partner to the firm of Messrs. Wm. Cutbush and Son, Highgate, N.

Snow fell at intervals on Friday

**Paper Pots for Sweet Peas.**—Accompanying Mr. Lewis Smith's article on "Sowing Sweet Peas" which appeared in our issue of January 27, were two illustrations showing the use of paper pots in the raising of sweet peas under glass. The photographs from which the illustrations were reproduced were received through Mr. Smith from Mr. Robert Holmes, of Tuckswood Farm, Norwich; but owing to a misapprehension they were not credited to Mr. Holmes as they otherwise would have been. The paper pots represented are those which Mr. Holmes has introduced, and Mr. Smith uses with the most satisfactory results.

## ANSWERS TO CORRESPONDENTS.

LOSS OF AUTUMN-SOWN ANNUALS.—S. F., Malden.—Please tell me why so many of my hardy annuals have died during the last week or so?—The loss is due to intense frost and biting winds following so sharply upon open weather. The wet and comparatively mild weather experienced until quite recently caused the annuals to grow freely, but the growth was soft, and not of that hardy sturdy nature which drier and colder conditions would have induced, consequently the plants have been unable to stand the severity of the past week. There will certainly be large losses among annuals and among winter greenstuffs as the result of the wintry weather we have had. Sow more annuals in a warm greenhouse at the end of February or in March to make good the losses experienced.

GARDENERS' BENEFIT SOCIETY IN THE NORTH.—M. E. S., Carlisle.—I believe there is a gardeners' benefit society, with headquarters in the North of England; if I am right can you tell me its name, and the address of its secretary?—The society to which you refer is now known as the Professional Gardeners' Lodge, and is branch No. 6,776 of the Grand United Order of Oddfellows. The registered office is Green Dragon Hotel, Leeds, and the secretary is Mr. George Carver, The Gardens, The Grange, Scarcroft, near Leeds.

BLACK DOTS ON BACK OF CYMBIDIUM LEAVES. — J. R. O., Sparkhill.—I send two leaves of Cymbidium Lowianum which have some blackish dots on the under surface; what causes the spots, and is there a remedy? I am a novice at orchid growing. —The small blackish spots on the cymbidium leaves are ample evidence of the presence of thrips, and some of these lively little pests were found on the specimens sent. It is probable that the atmosphere of the house has been kept too dry for some time, as this state of affairs encourages several pests, notably red spider and thrips. Thoroughly and carefully sponge every leaf with warm water containing a little insecticide, and repeat the operation once a week for a little while. Examine contiguous plants, as they also may be infested; if they are, treat them similarly, otherwise the thrips will eat away the green leaf substance, and materially weaken the plants.

MALCOLMIA OR MALCOMIA.—F. F., Taunton.—We were discussing certain annuals the other evening, with a number of catalogues before us, when a lynx-eyed member of the party noticed that the popular Virginian stock was variously listed as Malcolmia maritima and Malcomia maritima. Garden works were referred to, but these did not solve the question of which was the correct rendering of the generic title. We now appeal to you, as we are sticklers for correctness of nomenclature in this district?—This is something of a poser. Turning to Nicholson's Dictionary of Gardening, we find the Virginian stock given as Malcolmia maritima, and there is a note in parenthesis to the effect that the genus was "named after William Malcolm, a London nurseryman, who published a Catalogue of Greenhouse Plants in 1771." This seemed to settle the matter in favour of Malcolmia. Turning to find the author of the generic title, we found Malcolmia credited to R. Brown and Malcomia to Aiton. Aiton certainly uses Malcomia in his "Hortus Kewensis" and his spelling and title are used in the Kew Hand List of Herbaceous Plants. Steudel prefers Brown's Malcolmia to Aiton's Malcomia, but if priority counts for anything—and it is considered almost everything in botany—then Malcomia must stand as the correct title because Aiton was an authority long before Robert Brown.

PHOSPHATIC FERTILISER: G. G. A., Hull.—Please advise me as to the kind of fertiliser to use for adding phosphates to the soil, and the amount to apply?—For supplying phosphates to the soil basic slag is a popular fertiliser, and it is the best for heavy soils; this is best applied in autumn at the

Robinsons' Guaranteed Gardenalities

ARE ABSOLUTELY NECESSARY FOR YOUR GARDEN'S WELFARE, AND WITHOUT THEM YOU WILL BE SERIOUSLY HANDICAPPED.

You must foster and protect your plants, or they will not reach maturity, fulness and beauty. Give them the utmost encouragement. Let the soil be prepared with

"Carmona" Fertilizers,

and then the plants will go ahead. The poorest soil will rear the most delicate plant if this is done, and your garden will do you infinite credit.

The "Carmona" Fertilisers are prepared in many varieties, suitable for all needs, so your every want can be supplied.

Sweet Pea growers reap a rich reward if they use the "Carmona" Sweet Pea Fertiliser. Vitality of plants, beauty of flowers, is then assured.

"Carmona" Fertilisers are put up in quantities to suit everyone's needs. Prices follow:—1 cwt., 20s.; ½ cwt., 12s. 6d.; 28 lbs, 7s. 6d.; 14 lbs., 4s. 6d.; 7 lbs., 2s. 6d.; 1s. and 6d. tins. Of all Seedsmen and Agents, or direct.

ROBINSON'S GREAT £350 SHOW.

This will be held at the Botanical Gardens, Edgbaston, Birmingham, on September 5th and 6th, this year, and the sum of £350 will be given away in cash prizes. Also many Championship Medals.

You should enter for this. Someone must win the prizes, and why not you? Write to Robinson's, asking for the Show Schedules.

Entries are free to every purchaser of "Carmona" Fertiliser, for in each packet is an entry "fee" coupon.

ARE YOU PESTERED WITH INSECTS?

Exterminate them, or else your plants will suffer. Weak plants and poor results are inevitable, if the insects have their own way. Annihilate them in the most systematic, scientific, and sure manner, by using Clift's Fluid Insecticide, the never-failing destroyer of all injurious and deadly insect pests. Clift's Fluid Insecticide is superior to all others, and has absolutely superseded all rivals.

Prepared in handy quantities, and prices are reasonable:—40 galls. at 4s. 6d. per gall.; 20 galls. at 5s. per gall.; 10 galls. at 5s. 3d.; 5 galls. at 5s. 6d. per gall.; 1 gall. at 6s.

MORE VALUABLE GARDEN ADVICE.

The two following Gardenalities are the best of their kind:

1. "Eradiweed," guaranteed cent. per cent. weed killer.
2. "Velvas" Lawn Sand.

FREE.—You will find much valuable advice in Robinson's Guaranteed Gardenalities booklet (24 pages), and Robinson's Garden Enemies booklet (32 pages).

These are sent post free to any address upon application. Also Show Schedules included if desired.

GARDENER (Head Working, where several are kept); life experience in all branches, Inside and Out, in good establishments; especially well up in Hardy and Herbaceous Plants, Shrubs, and Alpines; 14 years and 7½ as Head; excellent references; married, no family.—A. T., 30, Askew Road, Shepherd's Bush, London, W.

GARDENER (Head Working), 14 years' thorough practical experience; five years last place; good references; disengaged; age 29; married when suited. D. NORMAN, Botolph Claydon, Winslow, Bucks.

GARDENER (Head Working). —CAPT. C. BEHRENS wishes to strongly recommend R. GOODALL, who has been five years in his service, as Gardener (Second of seven), with six years in previous situation; life experience in all branches of garden work. Apply R. GOODALL, The Gardens, Swinton Grange, Malton, York.

GARDENER (Head Working, or Single-handed); life experience in all branches; Inside and out; age 40; married, no family; good references. W. CURD, 36, Clarence Place, Gravesend, Kent.

GARDENER of Three or more. — F. WILES, Gardener to J. de Pass, Esq., Middleton Hall, Kings Lynn, recommends his Foreman as above; life experience, Inside and Out; married, no family; age 30. C. CRADWICK, The Gardens, Middleton Hall, Kings Lynn (bear own expenses)

GARDENER, Good (Single-handed, or where help is given), seeks SITUATION; life experience in all branches; single; age 33; abstainer; good references. H. HARDIMAN, Horton Hollow, Wimborne, Dorset.

GARDENER (Head Working). — Miss E. ROBERTSON, Sele Grange, Hertford, high recommends H. BATES, who has been with her eight years, to any Lady or Gentleman, where about four are kept; life experience in all branches; winner of Silver Cups for Vegetables; age 36; married, two children, ages 14 and 12. Apply, H. BATES.

GARDENER (Head Working).—G. CHEAL is anxious to meet Lady or Gentleman requiring the services of a good all-round man; thoroughly experienced, and highly recommended; disengaged any time. Bridley Manor, Worplesdon, Surrey.

GARDENER (Head of two or three, or good Second) seeks SITUATION; life experience, Inside and Out; excellent references; age 28 years; married when suited. Address, A. B., c.o. HOLLOWAY, 17, Windsor Road, Teddington, Middlesex.

GARDENER (Single-handed or otherwise), seeks SITUATION; 10 years' good experience Inside and Out; age 25; good references. H. DUDLEY, Remenham, Henley-on-Thames.

GARDENER (Single-handed, or help given), 12 years' experience; good references; single; age 36; abstainer. J. CHAPMAN, Ferry Hill, Chatteris, Cambs.

GARDENER (Single-handed or otherwise); 4 years' good character, age 23; single; abstainer. Apply A. F. ROOKE, Houndean, Lewes, Sussex.

GARDENER (Single-handed, or otherwise) requires SITUATION; fully experienced both Inside and Out; accustomed to large gardens; highly recommended; excellent characters; and takes great interest in his work; single at present; age 27; abstainer; Hants preferred; disengaged when suited. Apply, J. G., 997, " Gardeners' Magazine " Office, 148-9, Aldersgate Street, London, E.C.

GARDENER, Single-handed, or where help is given; thoroughly experienced; middle age; married, no encumbrance; wife would take charge of house during absence of family. J. G., 101, Liverpool Road, Watford, Herts.

GARDENER (Single-handed) seeks Re-engagement; life experience; can be well recommended; good references; age 26; single. W. SEAR, 51, Sumatra Road, West Hampstead, N.W.

GARDENER wants SITUATION (second), age 25 years; Single; 7 years' practical experience Inside and Out; Vines, Peaches, Chrysanthemums, Roses, etc.; abstainer; good refs. W. COOPER, Bell Lane, Alconbury, Huntingdon.

GARDENER, age 27, single, life experience, seeks SITUATION in London suburbs or near; good references; as good Single-handed or help given; will bear own expense. Apply, stating wages, to A. WHATMORE, Troed-y-rhiw, Merthyr.

GENTLEMAN wishes to recommend his GARDENER (Head Working) to any Lady or Gentleman; 15 years' experience in all branches; age 30; married, no children. G. BRUNTON, Charlesfield Road, Horley.

JOURNEYMAN seeks SITUATION; Second or Third, under glass; age 20; Bothy. W. GARWOOD, Clay Hall, Fornham All Saints, Bury St. Edmunds, Suffolk.

JOURNEYMAN (smart).—P. McLAREN, Head Gardener, Sandhills, Christchurch, wishes to recommend E. GUNTER as same; age 21; five years' good experience; Bothy preferred.

JOURNEYMAN (Inside or Inside and Out); 3½ years' experience; age 21; Bothy preferred. R. GOWARD, Ide Hill, Sevenoaks, Kent.

JOURNEYMAN (Second, Inside), age 20; good establishment; 5½ years' experience; good references; Bothy preferred. G. PAPWORTH, Great Barrington, Burford, Oxon.

J. FOSTER, Head Gardener to Sir David Tute, Hanstead House, Bricket Wood, St. Albans, with every confidence recommends excellent GARDENER, all branches; Head or Single-handed; married when suited. Apply above.

JOURNEYMAN (20) seeks SITUATION as Second; 6 years' excellent reference; experience Inside and Out; abstainer. Apply, GARDENER, Wanderwell, Gardeners, Bridport, Dorset.

LAD, age 17, seeks SITUATION in Garden; some experience; wish to improve; good character; Bothy preferred. S. RAYNER, Chart Road, Sutton Valence, Maidstone.

MR. SEDEN, West Grinstead Park, Horsham, wishes to recommend P. GEERING as FOREMAN (Inside); good experience in Tree Carnations and Malmaison, Fruit and Plant Houses; age 27; three years present situation.

MRS. JOHNSON, Silkmore Hall, Stafford, will be pleased to highly recommend W. CURTIS to any Lady or Gentleman requiring a good all-round Gardener, where two or three are kept; 12 years' practical experience; total abstainer.

YOUNG MAN, age 20, with five years' experience, seeks SITUATION in garden, where experience can be gained, both Inside and Out; strong, willing, and abstainer. Apply, COX, Old Forge, Wolverley, nr. Kidderminster.

YOUNG MAN, age 19, seeks SITUATION in garden as Journeyman, Inside or Inside and Out; 4 years' previous experience; can be well recommended by head gardener. F. BURDETT, Holdenby, Northampton.

YOUNG MAN (19) seeks SITUATION, Inside or Inside and Out; four years' good experience; excellent references; Bothy preferred. PENNINGTON, 49, Victoria Grove, Stoke Newington, London.

CARPENTER wants permanent job; Household, Nursery, or Estate; age 30; married, no family; good references. Apply, H. WATERS, Bifrons Estate, Bekesbourne, near Canterbury.

## SITUATION COUPON

*To the Advertisement Manager of* "THE GARDENERS' MAGAZINE," *148 & 149, Aldersgate Street, London, E.C.*

**For FEBRUARY 17, 1912.**

**Please Repeat my Advertisement.**

Name........................................

Address ........................................

........................................

Date ........................................

**THIS COUPON**, duly filled up, should be forwarded not later than Tuesday for the next issue.

## Situations Vacant.

CANADA.—Wanted, 15 GARDENERS or NURSERYMEN, complete orders. Good wages. Definite situations. Apply early, UNION TRANSIT CO., 381 Argyle Street, Glasgow.

WANTED, a capable MANAGER, to take charge of NURSERY, FRUIT TREE, and ROSE GROWING BUSINESS; about 60 acres, with considerable amount of glass; salary, £150 per annum, with allowance for house, and a bonus on a satisfactory yearly profit. Apply, with references, stating age and past experience, to R., "Gardeners' Magazine" Office, 148 and 149, Aldersgate St., London, E.C.

WANTED, good SECOND GARDENER for Inside and Out; single; must be willing and obliging; age about 25. Apply, W. HASLAR, Blake Hall, Ongar, Essex

WANTED, YOUNG MAN, about 20, for INSIDE AND OUT; Bothy, etc.

Apply to C. FRONDE, The Gardens, Cusworth, Doncaster.

rate of 4oz. per square yard, but we should not hesitate to use it now if a plot is being dug. For lighter soils a dressing of superphosphate of lime, 1oz. to the square yard, will prove valuable, and this may be given in spring. Bone-meal is also excellent for practically all soils and crops, 4oz. to the square yard, but it is best applied in the autumn.

PLANTING VIOLAS.—B. W., Peterborough.—What is the best time to plant out violas raised from cuttings or from seeds?—If the plants are sturdy and well rooted advantage should be taken of good weather in March to plant out the violas, but if from any cause the plants are backward, or if the weather in March is all against successful planting, defer the operation until April offers a favourable opportunity.

EMPLOYMENT AT KEW: W. R., Lewisham.—How should I proceed in an endeavour to obtain employment at Kew?—Write to the Curator, Royal Gardens, Kew, Surrey, stating your wish, and giving the amount and kind of horticultural experience you possess, and your age.

PUBLIC PARKS: E. S., Stourbridge—Being anxious to obtain experience in some of the leading public parks, I write to ask whether there is an inexpensive book giving the name, extent, place, and superintendent of the principal public parks in this country, so that I might write for information regarding employment?—The only book we know which deals with this matter fully is the "Gardening Year Book" of 1912. This gives all the information you require, and also states the extent of the parks and public gardens listed, and this should prove of special interest to you, and be a good guide to the selection of places to write to. The book deals with many other gardening matters, and contains a descriptive, illustrated list of the new plants of 1911; it may be obtained, post free, for 1s. 2d., from the Gardeners' Magazine Office, 148, 149, Aldersgate Street, London, E.C.

SWEET SCABIOUS: R. N. T., Corbridge.—Curiously enough, notwithstanding a long gardening experience, I have never grown sweet scabious, that is, the annual sorts. My employer saw some very fine strains last year at some of the London exhibitions, and ordered seeds. The scabious are needed for cut flowers rather than for garden effect, as flowers are used freely in the house, and large quantities are given away to friends and public institutions, such as hospitals, churches, etc. I imagine that if the scabious are raised and treated generally like asters they will succeed; kindly tell me if this is so?—Yes, the treatment for scabious is like that for asters; sow thinly in gentle heat in March, prick off into boxes, harden off in a frame or pit, and plant out at the end of May or early in June. Scabious thrive better in a moderately retentive soil than most annuals do.

### NAMES OF PLANTS.

B. G., Ludlow.—Helxine Solieroli.

H. P., Croydon.—A moderately good form of Cattleya labiata.

W. P., Smethwick.—1, Pteris tremula; 2, Notholæna sinuata; 3, not recognised.

S. N. S., Hessle.—1, Centropogon Lucyanus; 2, Peristrophe speciosa; 3, Cypripedium Actæus; 4, Lælia anceps, a good form.

H. S. M., Beaumaris.—1, Veronica buxifolia; 2, Abutilon meganotamicum; 3, Begonia manicata; 4, a dried flower of Rhodanthe Manglesi.

## GARDENING ENGAGEMENTS.

Mr. John Corrie, formerly head gardener at Cronmore Place, Chislehurst, has been appointed head gardener to E. Eversfield, Esq., Denne Park, Horsham.

Mr. W. J. Cowan, late inside foreman at Netherby Hall, has been appointed head gardener to Mr. Fletcher, Stoneligh, Workington.

Mr. John Kydd, for some years gardener at Drumcar, Dunleer, Ireland, has been appointed head gardener to W. D. James, Esq., Greywalls, Gullane, N.B.

Mr. W. E. Trevithick has been appointed head gardener to the Marquis of Headport, Headport House, Kells, Co. Meath.

## FORTHCOMING ENGAGEMENTS.

THURSDAY, February 15.—Croydon Gardeners' Association, Annual Dinner, Greyhound Hotel, 7.30 p.m.

THURSDAY, February 15.—The "George Munro" Concert, Queen's Hall, Langham Place, London.

TUESDAY, February 20.—Royal Horticultural Society. Fruit, Floral, and Orchid Committees, 12 noon. General meeting, with lecture at 3 p.m. Scientific Committee, 4 p.m.

North of England Horticultural Society. Meeting Queen's Midland Hotel, Leeds. Council Meeting, 2 p.m. Lecture on the Wisley Rock Garden, by Mr. Pulham, jun., 3.30 p.m.

THURSDAY, February 22.—Manchester and North of England Orchid Society. Meeting, Manchester Coal Exchange, 12 noon.

| 56 AURORA SPENCER, orange-salmon flakes on a white ground, beautifully waved, and very free | 15 | 3d. |
| 57 PRINCE OLAF, white, flaked clear blue; plain type; a strong grower | 50 | 3d. |

### WHITE.

| | | |
|---|---|---|
| 58 DOROTHY ECKFORD, the best pure white of the plain type; an old favourite | 50 | 2d. |
| 59 ETTA DYKE, the best white of true Spencer form, and the best for exhibition | 25 | 3d. |
| 60 NORA UNWIN, a fine waved pure white | 50 | 3d. |

Sixty large packets, one of each sort, for 12/6, carriage paid.

### TUCKSWOOD GIANT-FLOWERED HYBRIDS (Mixed).

This strain has produced many beautiful novelties, and will include the Finest and Newest Varieties in commerce.

When exhibited in a class open to all England, with 9 competitors, a collection from Tuckswood was awarded First Prize and the Silver Medal of the N.S.P.S. In another open class for Best Sweet Pea Novelties not in commerce, the First, Second, and Third Prizes were awarded to three Tuckswood Novelties against strong competition.

Per packet of about 50 seeds, 3d.

### MIXTURE.

This is again made up with the finest seedling Spencers, as well as a large number of the best-named varieties. This mixture is highly recommended to anyone who does not care to grow each colour separately. Per lb., 4/s; per ¼lb., 1/3; per oz., 6d.; per pkt., 2d.

### COLLECTIONS.
### No. 1.—SHOW COLLECTION.

Nine varieties, 25 seeds per packet. Price 1/6, post free.

CLARA CURTIS, primrose; FRANK DOLBY, lavender; COUNTESS SPENCER, pink; HELEN LEWIS, orange; ETTA DYKE, white; OTHELLO SPENCER, deep maroon; EVELYN HEMUS, cream picotee; KING EDWARD SPENCER, crimson; MRS. HARDCASTLE SYKES, blush pink.

The above nine varieties are all exhibition sorts.

### No. 2.—COLLECTION of 12 EXTRA FINE VARIETIES

Twelve varieties, 50 seeds per packet. Price 1/6, post free.

A. J. COOK, violet-mauve; KING EDWARD VII., crimson; BLACK KNIGHT, maroon; LORD NELSON, dark blue; COUNTESS SPENCER, pink; MISS WILLMOTT, orange; FRANK DOLBY, lavender; MRS. COLLIER, cream; HELEN PIERCE, marbled blue; NORA UNWIN, white; JOHN INGHAM, rose-carmine; PHENOMENAL, white picotee blue.

The above twelve are really good varieties, and form an excellent collection for anyone requiring a fine show in the garden, and who does not wish to exhibit.

### CULTURAL HINTS.

Trench the ground at least 2ft. in the autumn, or early winter, working in farmyard manure, and leave rough. Sow the expensive varieties in pots or boxes in January, and keep in a frame, giving as much air as possible when weather permits. At the end of January lightly fork into the prepared ground a good dressing of superphosphate of lime (two handfuls to the square yard), and plant out the first opportunity in April, planting firmly 6in. to 12in. apart. Sow also in the open 2in. apart, the end of February or the first week in March; early in May thin out to 6in. to 12in. apart. As soon as the plant shows through the soil, dust along the rows with soot to keep off slugs, and cover with a few strands of black cotton as a protection against birds. Stake when 4in. high, using small twigs at the bottom to encourage the plants to climb. Sulphate of ammonia or nitrate of soda, at the rate of 1oz. to 6 gallons of water, may be given once a week when the plants are in flower, but must only be applied to the roots. All faded flowers should be removed daily to ensure continuance of bloom. Sweet Peas are quite hardy if not coddled, and the longer the period of growing before flowering the better.

**Carlton Sweet Pea Fertilizer, large tin, 1/3, post free.**

**MALMAISON CARNATIONS, Strong, Stout, Norfolk grown, in 4in. pots, 25 for 12/-; 50 for 22/6.**

## NOTE OF THE WEEK.

### Snow Flowers.

In a recent Note of the Week, relating to frosts, we alluded to the curious fact that, at the moment of crystallisation or congelation of water, etc., molecules so arranged themselves as to require greater space than they occupy as a liquid, the resultant phenomena being of vital importance in the great scheme of Nature as regards climate and the conditions generally in which organic life exists. This increase of area, however, is accompanied by other phenomena than those mentioned, and especially those relating to crystallisation. If when snow is falling, particularly when the flakes are fairly large, we permit a flake to fall gently upon our coat-sleeve, even with the naked eye we can detect that it is not a mere woolly conglomeration of particles, but rather a cluster of beautiful star-like bodies of very definite and symmetrical structure. Each star is provided with six rays, set at an angle of thirty degrees to its neighbour. Search as we may, we shall never find two precisely alike in detail, since these rays may be simple rods of greater or less length in different flakes, or they may be furnished with lateral projections, making them more or less feathery in appearance, or the interstices between the rays may be entirely filled up, so that the flake becomes a perfectly six-sided disc, losing its star shape entirely. Between these extremes are all grades, but all through the thirty degree principle prevails, and, barring damages, all the parts will agree exactly in dimensions, and perfect symmetry will prevail. A large flake, usually indicative of thawing conditions, is produced by fortuitous meeting of a number of the constituent stars or discs in falling, and a dozen or more of these may be thus adherent, but each one will have its own individuality. Such fine snow as we have in a blizzard is no less artistically constructed, but on much finer and less obvious lines. The snowflake thus shows us in the simpest possible form, the law of crystallisation as exemplified in water, and the same law governs the solidification of all liquefiable bodies, including the metals and the gases, though not always so easily seen. The same law also determines the forms which chemical bodies assume in super-saturated solutions. With alum, for instance, dissolved in hot water until no more can be taken up, as the solution cools, the molecules invisibly suspended in the water, arrange themselves either on the undissolved surplus crystals, or, failing those, on nuclei self-engendered here and there in the containing vessel, and gradually build up symmetrical and beautiful crystals of the particular make and shape peculiar to alum, and possibly to alum alone, since nearly every body has its peculiarities. Here the crystallisation occurs because heated water is capable of holding more of the salt in solution than cold water, and, as the temperature falls, the surplus is deposited as described. With the snow flake we see something similar. The amount of water invisibly suspended in the atmosphere depends entirely upon the aerial temperature. In warm weather a cold wind blowing into a warm region at once renders the surplus water, which the air is unable to carry at the lower temperature, visible as clouds, which may or may not condense further into rain. Here the molecules of water cling together and fall, gathering up more and more as they descend, and so forming drops. Under freezing conditions, the minute particles of suspended water in the clouds start descent as particles of ice, the nuclei of the subsequent stars and discs and agglomerated snow flakes, the said nuclei chilling the air as they fall, the aqueous molecules collect equally all over them, obeying the particular law alluded to of a thirty degrees angle of attachment, and so each ray becomes of equal length, and of equal breadth by the lateral additions on the same principle. It is also due to the action of this beautiful law that we see such exquisite designs on window-panes and other surfaces, where warm aerial moisture is brought into contact with cold surfaces below the freezing point. The curves of the fern or moss-like ramification here noted are probably due in inception to minute artificial scratches made by cleaning, but otherwise it will be seen that the law of the thirty degrees angle determines the designs generally. The consideration of the star or flower-like forms assumed by the snowflake and the wonderful imitations of ferns and mosses assumed in the frost pictures of the window-pane, invariably suggest to the intelligent observer that there may be some link between the law of crystalisation in inorganic life and that which in some subtle fashion governs growth of both flowers and foliar vegetation. Each plant may thus be a law unto itself as regards its structural arrangement, as is every organic body as regards its crystallisation, a similar polar or magnetic influence determining its form on laws at any rate analogous if not identical.

MR. C. S. FUIDGE.

---

**Mr. C. S. Fuidge** is at the present time a very interesting personality among the secretaries of the varous associations that have for their object the advancement of horticulture, for he completes the fortieth year of his secretaryship of the Southampton Royal Horticultural Society concurrently with the celebration of the society's jubilee. The society was founded in 1862, and in the following year a summer exhibition was held in Bannister Park under the patronage of the Lord Mayor of London; and in the following year spring shows were instituted, and continued until 1876. At the annual meeting held in January, 1873, Mr. C. S. Fudge was elected as secretary, and there can be no question as to the great service he has rendered the society during the long and eventful period that has elapsed since he assumed the responsibilities associated with the office. In the same year a new departure was made by the holding of a great flower show and floral fête at Westwood park. In 1879 the late Prince Leopold accepted the position of president, and within two or three months of the election of his Royal Highness, Queen Victoria was pleased to command that the society should in the future be known as the Southampton Royal Horticultural Society. About this time both Bannister Park and Westwood Park came into the market for building purposes; and the executive, appreciating the importance of obtaining an open space suitable for the holding of the society's exhibitions appointed a special committee to secure, if possible, a portion of Bannister Park as a permanent home for the society. This project having failed, a fourteen years' lease of ten acres of Westwood Park was secured in 1882, and in the following year the grounds were formally opened on June 28, when the National Rose Society held its provincial show therein. There was a large accession of new members in that year, and the series of floral fêtes that were held during the period of the occupancy by the society of Westwood Park were highly successful financially and otherwise; but the profit on them was more than absorbed by the expenses incidental to the maintenance of the grounds, and the society was faced with a heavy debt. The society has continued its work, since leaving Westwood Park, with unabated vigour, and some years ago succeeded in paying off the debt incurred. We mention these facts as of interest in connection with the jubilee of the Southampton Royal Horticultural Society, and as showing far better than mere platitudes could do, the remarkable ability and tact of its secretary, whose portrait we have the pleasure of giving herewith.

**Climbers Out of Place.**—We have persistently advocated the free use of climbing plants in clothing the walls of dwelling-houses and other buildings, but we have been careful to differentiate between buildings that are of so commonplace a style of architecture that they are improved by a covering of greenery and those of which the architectural features are so beautiful that they should not be hidden. On more than one occasion we have directed attention to the mistake that is made in allowing the more important, from an architecural point of view, of the buildings belonging to the colleges at Cambridge and Oxford to be so overgrown by Ampelopsis Veitchi and other free-growing creepers that their architecture cannot be readily seen and fully enjoyed. We are reminded of the extent to which the charm, and, indeed, the interest of a building of architectural importance is reduced by allowing climbers to spread over their walls by an illustration that is before us of the Common Room and Library of Oriel, Oxford. This is a massive building of two stories, the wall of the lower portion being of sufficient thickness to form recesses for the windows, and to carry a series of pillars that support the cornice of the roof. The lower part of the building is covered by ampelopsis, and had the growth been confined thereto no objection could well have been raised to the use of the climber, but it has been allowed to spread over the upper half and to cover the pillars, which project from the wall, and the intervening spaces with its green mantle. The distinctive design of the greater proportion of the windows is completely hidden, and the effect produced by the growths crossing the pillars at right angles is decidedly objectionable, apart altogether from the architectural lines being obscured.

**Royal Gardeners' Orphan Fund.**—The report presented by the committee of this charity to the members at the annual meeting on the 9th inst., contained much that is gratifying to those who fully appreciate the great value of the work it is doing in the maintenance of the orphans of gardeners. It stated, among other things, that at the beginning of the past year there were 118 children receiving the benefits of the funds, and that 17 were elected at the annual meeting, making a total of 125. During the year 18 children ceased to receive the benefits of the fund, 15 owing to their having reached the age limit, and three by retirement on leaving the country with their mothers. As 18 candidates were elected at the annual meeting the total is the same as that in the past year. The family to be provided for is therefore a large one. It is also a source of much satisfaction to have further proof of the generous manner in which the charity is supported by owners of gardens and by those engaged in the various branches of commercial horticulture. On the other hand, we regret to find that, while there was a remarkable advance in the proceeds of the annual festival, the annual subscriptions remain much below what they should be, and that the committee should, as regards the subscriptions, have to "appeal for a larger measure of support from gardeners especially." The total amount received as subscriptions was only £370, which is a very small sum considering that the annual sum required for the maintenance of the orphans is £1,788. We trust that during the present year gardeners will recognise their responsibilities in this matter more fully than is at present the case, and make a hearty response to the appeal made by the committee.

**The Liverpool Horticultural Association.**—The committee have decided to hold the following shows during this year at the Corn Exchange, Brunswick Street, Liverpool: Spring Show, Wednesday and Thursday, March 27 and 28; Sweet Pea Show, Wednesday, July 17; and Chrysanthemum Show, Wednesday and Thursday, November 13 and 14.

**Birmingham Flower Show.**—Under the chairmanship of Sir George Kenrick, an excellent meeting was recently held at the Birmingham Council House for the purpose of furthering the aims of the newly-formed Birmingham Horticultural Society. It appears that the Handsworth Horticultural Society has placed its balance of £237 9s. 7d. to the credit of the new society, in addition to properties valued at £100. The attempts to raise funds for the proposed Great Midland Show have resulted in donations of £59 2s. 6d., two silver cups valued at £11 11s., and trade prizes of £36 10s.—a total of £107 3s. 6d. The meeting referred to pledged itself "to do its best to raise a prize fund of at least £500, so that the committee of the Birmingham Horticultural Society may offer a prize schedule of £1,000." Sir George Kenrick gave £50, and Mr. W. G. Griffiths £25; these amounts, with others promised, brought the prize fund up to £193 0s. 6d. Local jealousies appear to be standing in the way of a thoroughly successful Birmingham show.

**Visitors to the Royal Gardens, Kew,** 1911.—According to the returns published in the current issue of the "Kew Bulletin," 3,704,606 visitors to the Royal Gardens, Kew, were recorded during 1911. These figures show an increase of 158,304 over those of the previous year, and are the largest on record. During the ten years 1901-10, 22,459,027 persons visited the gardens, giving an average of 2,245,902. The total number of visitors on Sundays, during 1911, was 1,517,650, and on week-days 2,186,956. The largely-increased number of visitors during the past year must be attributed mainly to the remarkable spell of brilliant summer weather and also to the large number of visitors to London in connection with the Coronation. As in 1910, there were five Bank Holidays, and the attendances on Easter Monday, Whit-Monday, and the August Bank Holiday were 144,084, 157,425, and 115,833 respectively. The total number of visitors for the five holidays was 446,644, as against 424,010 in 1910. Sunday visitors decreased by 96,435, while the number of visitors on week-days show an increase of 254,739. The greatest attendance on any one day was on Whit-Monday, when there were 4,971 more visitors recorded than for the corresponding day in the previous year, which previously held the record for a single day. The smallest number on any one day was 179 on December 20. The largest Sunday attendance was 88,005 on June 4, and the smallest 423. The former figures show a decrease of about 3,000 from those recorded in 1910.

**Mr. William Collins,** the veteran secretary of the United Horticultural Benefit and Provident Society, completed twenty-five years' service in that position on Monday last. The usual monthly meeting of the committee was held on that evening, and the chairman, Mr. C. H. Curtis, took advantage of the occasion to congratulate Mr. Collins, and to accord him the thanks and good wishes of all the officers, committee, and members of the society, adding a hope that he might be spared in health and strength to continue his good work for some time to come. The vice-chairman (Mr. F. Winter) and other members of the committee also added congratulations, and expressed their high appreciation of Mr. Collins, and the services he has rendered to horticulture through the U.H.B.P.S.

**Record Prices for Peas.**—That excellent and deservedly popular pea Senator, which was introduced by Messrs. E. Webb and Sons, Stourbridge, a few years since, fully justified during the past year the high estimation in which it is held by cultivators for market, as well as for home supplies. Writing on February 8, 1912, to Messrs. Webb and Sons, a customer of theirs, Mr. F. W. Gwilliam, of Milton, Cambs, states: "You will be pleased to hear that two acres of Webbs' Senator pea grown by me last year realised £98, or £49 per acre. This, I think, beats the 'record' in your catalogue. The peas were planted in rows, just the same as beans, and kept horse-hoed as long as possible." The "record" referred to was £44 and £41 per acre respectively, which prices were obtained in July last for fields of Webbs' Senator grown in the Stourport (Worcester) district.

LIEUT.-COLONEL D. PRAIN, V.M.H., ETC.

**New Victoria Medallists.**—It was with great pleasure that everyone present at the annual meeting of the Royal Horticultural Society heard Sir Trevor Lawrence announce that the vacancies on the roll of the Victoria Medal of Honour in Horticulture were to be filled by the appointment of Lieut.-Colonel D. Prain, director of the Royal Gardens, Kew, a famous botanist and splendid administrator; and Mr. E. H. Wilson, whose several journeys to Central and South-West China on behalf of Messrs. Jas. Veitch and Sons and the Harvard Arboretum have resulted in the enrichment of our gardens with large numbers of hardy flowers, trees, and shrubs. It was unfortunate that neither recipient was able to be present to receive this highest of all honours in horticulture and the congratulations of the Fellows present. Lieut.-Colonel Prain fills the vacancy caused by the death of Sir Joseph Hooker, and Mr. E. H. Wilson follows the late Mr. James Douglas.

**Index of Plant Diseases.**—The study of plant diseases is so important from the technical point of view, and presents so many problems of scientific interest, that any suggestions for advancing it deserve serious consideration. The Biology Committee of the Agricultural Education Association is, we learn from "Nature," organising a card index that shall form a systematic record of fungus, insect, and other diseases of plants, and invites the co-operation of those able and willing to help in order that the record shall be as complete as possible. The value of the work, of course, will depend entirely on the extent to which this invitation is taken up. The record thus compiled will be available for consultation by an investigator, either by application to the secretary of the committee, Professor J. H. Priestley, of the University of Leeds, or by the application to the Board of Agriculture, which will hold duplicates of all the entries. The committee hopes to receive the co-operation of all investigators of this subject in the British Isles, and to form a record that shall not only be useful to the economic biologist, but also to the mycologist and to other students of plant diseases. Full information about the scheme can be obtained from Professor Priestley.

**National Auricula Society.** — The thirty-fifth annual report of the Southern Section of the National Auricula Society has been published, and it is gratifying to have the evidence it affords of the continued prosperity of this section which has done so much excellent work in promoting the cultivation of auriculas in the southern parts of England. The schedule of the exhibition to be held on April 30, which accompanies the report, is on the same comprehensive scale as in previous years. Reference is made in the report to the loss the society has sustained by the death of Mr. James Douglas, V.M.H., who was one of its founders, and for many years its secretary, and the regret to which expression is given shows how high was the estimation in which he was held by those associated with him in the management of the society. To perpetuate the memory of the late Mr. Douglas, a silver challenge cup is offered for the best exhibit in the four more important classes for show and alpine auriculas. These classes are for twelve and six show varieties and twenty - four and twelve alpine varieties.

**Nesting Boxes in London Parks.**—Miss L. Gardiner, secretary of the Royal Society for the Protection of Birds, writes: "Your readers may be interested to know that, through the generosity of a member of this society, a large number of R.S.P.B. nesting boxes have been offered to the Public Works Department and to the London County Council for placing in the London parks, and that the offer has in each case been accepted. This spring, therefore, boxes will be placed in Richmond Park, Bushey Park, Hampton Court Gardens, Greenwich Park, Hyde Park, and Regent's Park, and other public resorts, and also in Kew Gardens. The experiment will be watched with pleasure, and it may be hoped that it will be imitated at Wimbledon Common and elsewhere, where the woodpeckers, nut-hatches, tree-creepers, and other hole-building birds greatly need some substitute for the old and rotten trees which once gave them lodging. It may likewise be of interest to bird-lovers to know that nesting-boxes will shortly be met with not only in Paris, Berlin, and London, but that some of the society's boxes have been sent out to Rome, and will be placed in the Vergilian Garden on the Palatine." This letter, we are informed, records the first systematic attempt to encourage the breeding of birds in artificial nesting-places in London.

**Royal International Horticultural Exhibition.**—At the request of Monsieur Louis Gentil, editor of the "Tribune Horticole," Brussels, the Belgian State Railway and the South-Eastern and Chatham Railway Companies have agreed to issue cheap tickets (50 per cent. under the usual price) to Belgian visitors to the London International Show in May next. These tickets will be issued from all the leading towns in Belgium direct to London, via Ostend or Calais, from May 18 up to May 26, and will be available for fourteen days.

MR. E. H. WILSON, V.M.H.

## ROYAL GARDENERS' ORPHAN FUND.

About twenty subscribers to the above-named useful and well-managed charity were present at three p.m. on February 9, at Simpson's, 100, Strand, on the occasion of the annual meeting and election of annuitants. Mr. H. B. May, V.M.H., chairman of committee, presided.

Notice of meeting having been read, and the minutes of the previous annual meeting confirmed, the committee's report was presented, as follows:

### REPORT OF COMMITTEE.

The committee, in presenting its report on the operations of the fund during the past year, has again great pleasure in congratulating the subscribers on its steadily increasing prosperity, and enhanced usefulness. The accounts presented herewith will be found to show an appreciable increase in general subscriptions and donations, a remarkable advance in the proceeds of the collection made in connection with the annual festival, and a still further increase in the total yearly amount disbursed among the beneficiaries. The total sum received in the form of annual contributions still, however, remains much below what it should be to enable your committee to meet the pressing claims for assistance constantly made upon the fund, and it again appeals for a larger measure of support, from gardeners especially, with the assurance that the smallest contribution will be most thankfully received.

At the commencement of the year the number of children receiving the full benefits of the fund was 118, and 27 candidates waiting for election were receiving temporary assistance. At the annual meeting 16 children were elected, 15 by the direct votes of the subscribers, and one by special resolution. This was the very sad case of a boy, 14 years of age (who, with five younger brothers and sisters), was left to the mercy of the world through the death of both parents within three days of each other, and at a time when such a lad most needs control and guidance. Your committee was able to provide a home for him in the School of Handicrafts at Chertsey, where he will be maintained and instructed in the rudiments of gardening until he is 16 years of age. Your committee thankfully acknowledges the readiness with which its action was confirmed.

During the year, 18 children ceased to receive the benefits of the fund, 15 under the operation of the age limit, and three by retirement on leaving the country with their mothers, two of whom have joined friends in the Colonies, and one in the United States. The committee has carefully selected a list of 23 candidates to appeal to the subscribers at the ensuing annual meeting, and much regrets its inability to prudently recommend the election of more than 18. The total amount disbursed in allowances during the year exceeded by over £50 the sum expended in 1910, and is the largest amount distributed in any one year since the fund was established. Since the first election, which took place in 1888, the total sum distributed in allowances amounts to over £24,746.

The annual festival, on May 4, presided over by Mr. Sherwood, one of the earliest of the vice-presidents, for several years the treasurer, and from its foundation one of the fund's most constant and most generous supporters, proved by far the most successful that has yet been held. the chairman's list exceeding all previous efforts by nearly £350. Your committee has in the past been constantly indebted to Mr. Sherwood for innumerable acts of kindness and generosity, and once more invites the supporters of the charity to unite with it in expressing to him its deep gratitude for the splendid services rendered in the sacred cause on this occasion. Most cordial thanks are also given to all who so enthusiastically helped Mr. Sherwood in making the festival such a splendid success.

One of the most gratifying contributions to the chairman's list was made by Mr. George E. Messer, Hyde Side Nursery, Lower Edmonton, who, in recognition of the warm interest taken in the charity by his late parents, and as a lasting memorial to their memory, gave £100 in Consols. Your committee the more keenly appreciate the filial affection which prompted this gift from the fact of both the late Mr. and Mrs. Messer having been personal and highly esteemed friends of most of its members. To their worthy son most grateful thanks are accorded.

Your committee again acknowledge with deep gratitude the valued contributions of Sir Frank Crisp and others who so kindly open their gardens to the public in aid of this and other charities. It also most heartily thanks the members of the Chislehurst Gardeners' Society, the Bradford Chrysanthemum Society, the Altrincham Gardeners' Society, the Leeds Professional Gardeners' Club, the Reading Gardeners' Society, the Spen Valley Gardeners' Society, and the Sevenoaks Gardeners' Society, etc., who, by means of concerts, flower shows, and the sale of flowers at their local exhibitions, have greatly benefited the fund. The honorary local secretaries are also specially thanked for their valued assistance and continued interest in the welfare of the fund.

Your committee with deep regret records its sense of the heavy losses which the fund has sustained during the year by the deaths of old and greatly valued supporters. In the late Mr. James Douglas and Mr. Alfred W. G. Weeks two most esteemed colleagues have passed away. Mr. Douglas was a member of the original committee, and Mr. Weeks joined the committee on the death of its first chairman, Mr. George Deal, both being ever earnest workers on the fund's behalf. The late Mr. A. J. Brown, of Chertsey, also for several years worked hard in the cause of a local secretary. The kindly efforts of one and all will long be remembered.

The retiring members of the committee are Mr. W. Bates, Mr. G. L. Caselton, Mr. C. Dixon, Mr. H. B. May, Mr. J. W. Moorman, Mr. W. Nutting, Mr. G. Reynolds, and Mr. J. H. Witty. All being eligible, offer themselves for re-election.

Through the much lamented death of Mr. M. Rowan, who had professionally audited the accounts of the fund for the past 18 years, it is essential that a new auditor should be elected, and the committee has much pleasure in recommending the election of Mr. Frank Reader to that office.

CASH STATEMENT FOR THE YEAR ENDING DECEMBER 30, 1911.

Receipts.

| | | £3,073 13 11 |

The Chairman, in moving the adoption of the report and statement of accounts, said that, as printed copies were in the hands of all present, it was hardly necessary to cover the ground there treated. The charity was thoroughly deserving of every support, and he was sorry to find that many names well-known in horticulture were still absent from the list of subscribers. The annual dinner of 1911, presided over by Mr. N. N. Sherwood, was the most successful ever held, the sum obtained being over £300 above anything previously received at the festival. The donation of £100 by Mr. Merser, the chairman referred to as a highly appreciated gift and memorial. Sympathetic reference was made to the losses sustained by death during the year. In conclusion, Mr. May paid a loyal tribute to the hard, regular, and conscientious work done by every member of the committee. Mr. May also referred to the kindness of Mr. Frank Reader, who assisted in the audit of the accounts, at short notice, on the death of Mr. Martin Rowan.

Mr. George Gordon seconded the motion, and emphasised the need of more support from gardeners generally, and held up the good example of several gardening societies which in various ways already regularly augmented the funds of the charity.

On the motion of Mr. R. H. Pearson, seconded by Mr. Alex. Dean, V.M.H., Mr. A. A. Sherwood, V.M.H., was heartily thanked for presiding at the annual festival dinner, and securing such a splendid success. Mr. E. Sherwood was thanked for past services, and re-elected as treasurer. Mr. Frank Reader was elected an auditor on the motion of the Chairman, and Mr. J. F. McLeod.

Messrs. Bates, G. L. Caselton, C. Dixon, H. B. May, J. W. Moorman, W. Nutting, G. Reynolds, and J. H. Witty, were thanked for past services, and all re-elected members of the committee. Mr. Bryan Winn was re-elected secretary, and in this connection the Chairman took the opportunity of referring to the new home of the fund at Bedford Chambers, Covent Garden, where the fund had a room in which the committee could conveniently meet.

Messrs. W. Bates, G. H. Cutbush, W. H. Cutbush, W. Howe, D. Ingamells, J. F. McLeod, and J. W. Moorman, were appointed scrutineers of the ballot, and the meeting was adjourned until the declaration of the poll.

The poll was declared soon after five o'clock, and it was then found that Gertrude A. Riley (461), Edward Dodd (376), Evelyn Stokoe (336), Annie Steptoe (295), John E. G. King (290), Thos. L. Rainey (278), Hugh Fraser (270), Alice Lee (260), Dorothy Edwards (258), Reg. A. Powlesland (257), Marjorie Billings (213), Wm. Sprackling (210), Ralph Deadman (206), Winifred Lockyer (205), Ernest Wright (199), Elsie Pretty (132), Winifred Potter (148), and Thos. Rudge (117), these eighteen were declared duly elected to the benefits of the fund.

A vote of thanks was passed to the scrutineers, and a similar compliment to the chairman closed the procedings.

**Chrysanthemum Kathleen May.**—Some of the rich crimson-coloured chrysanthemums lose their brightness when they open late in the season, but not so this charming kind. As the singles are by no means confined to flowers with one row of florets, Kathleen May can be described as a single with an anemone-like centre. Good examples may be had in flower throughout the month of January, or even later.—S. W.

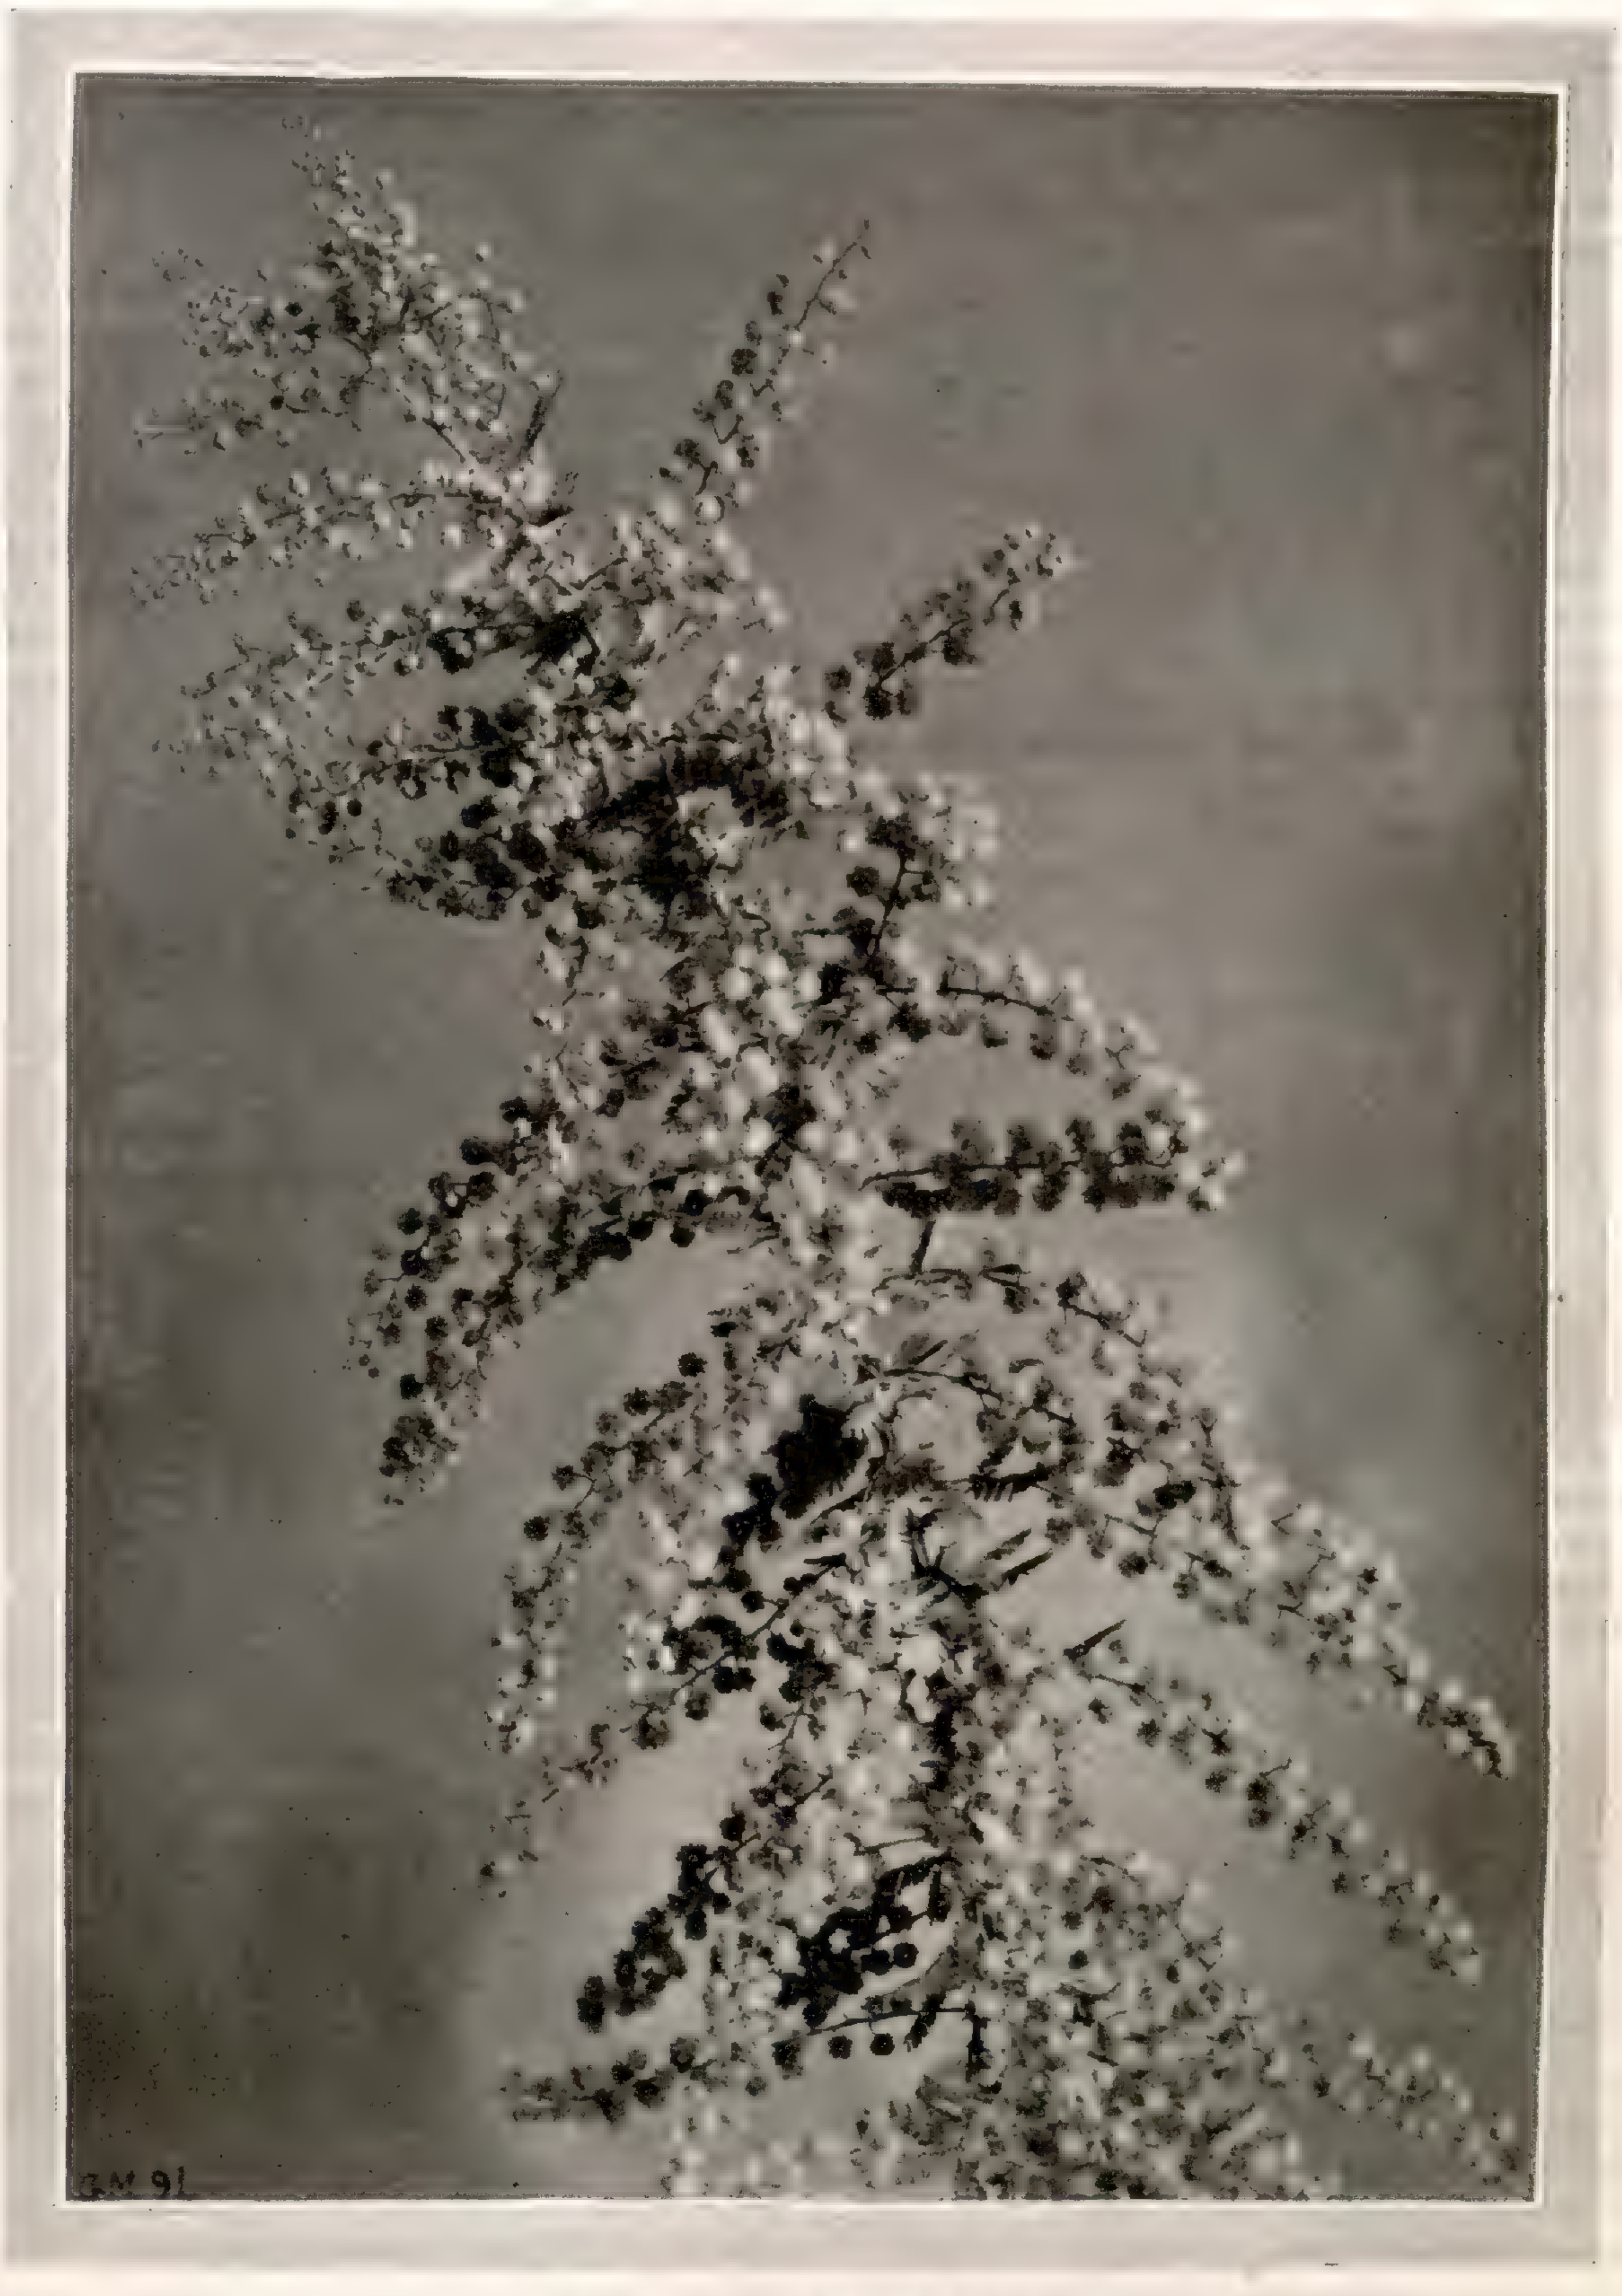
**Gesneras.**—We have had several opportunities at the Horticultural Hall during the autumn and winter of seeing the value of the garden varieties of gesneras for decorative purposes at that season. In colour the different forms vary a good deal, but the most effective during dull weather are those of a warm orange or orange-red tint. The foliage, too, of many of these gesneras is very handsome, being more or less of a velvety texture, and mottled or marbled in varying proportions with red and green.—S. W.

## ACACIA BAILEYANA.

To those who have had opportunities for becoming acquainted with the trade in cut flowers as conducted in the London markets, it is well known that immense quantities of acacia blossom are sent to this country from the South of France during the winter months. They will also be conversant with the fact that for many years past the flowers sold in the London markets have been chiefly those of the Silver Wattle (Acacia dealbata), which, under ordinarily favourable conditions, attains a large size, and in its native home reaches a height ranging from 30 to 100ft. This is, perhaps, one of the best known of the larger-growing kinds that are in cultivation in this country, and specimens are to be found in many gardens in which there is a conservatory or winter garden sufficiently lofty to afford a fair amount of head room. In some of the more favourably situated gardens in the West of England good specimens are found growing in sheltered positions in the open, where they bloom freely.

Within the past few years some of the flower growers in the district of which Nice is the centre have turned their attention to Acacia Baileyana, a species of singular beauty, and attaining the dimensions of a large shrub. They have been sending to the London markets for a year or two small quantities of the flowers of this species with their consignments of the blossom of A. dealbata, and this winter there has been a considerable increase in the supplies, a fact of interest as showing that they have found favour for decorative purposes. It would be somewhat surprising that A. Baileyana has not come into general cultivation in this country, were it not that hard-wooded plants have for some years past been at a discount. It is represented in the Kew collection, and the plant may be found among other acacias at the eastern end of the central part of the temperate house; but in the position it occupies it has no opportunities for the display of its distinctive characteristics, and affording some indication of its elegant habit and wondrous beauty when in bloom. In the case of a collection such as that at Kew, it is not, of course, possible to provide sufficient space for each specimen to attain its full development. It may also be met with in a few Cornish and Devonian gardens; but we have not been able to find it offered for sale in any of the trade catalogues that we have.

Acacia Baileyana is a native of New South Wales, where it forms a large shrub somewhat pyramidal in outline, and wholly free from formality. The shoots are slender, and well clothed with bluish-green leaves, which are bipinnate and about two inches in length and the same in breadth. The flowers are of medium size, and a rich golden colour; and, as shown in the accompanying illustration, are borne in gracefully-arching racemes that are produced in the axils of the leaves, and are about five inches in length. The spray illustrated was nearly 18in. in length; and, when we mention that there were nearly fifty racemes thereon, it will not be difficult to realise the fact that cut specimens are admirably adapted for the decoration of indoor apartments, and that well-grown bushes must, during the season of flowering, be immensely attractive. That A. Baileyana is free in blooming is evidenced by the large sprays the French growers are sending us, and the fact that they are growing it in increased quantities for the supply of cut flowers for the markets. For further evidence upon this point we turned to "Australian Plants," by Mr. W. R. Guilfoyle, late director of the Melbourne Botanic Gardens, and therein we found an illustration of a large, shapely bush, that was simply enveloped in the myriads of golden ball-like flowers. The species is so distinct and beautiful that it should have a place in every garden in which coolhouse plants are appreciated; and we have no doubt that, should a demand arise, there will be no difficulty in obtaining supplies from the nurseries. The spray illustrated is one of the many that have been sent to the London markets, and distributed therefrom in the usual course. G.



ACACIA BAILEYANA.

A free-flowering and handsome species, bearing elegant racemes of rich yellow flowers.

---

**Daphne indica.**—Though this daphne cannot be called showy, the blossoms are so deliciously fragrant as to be admired by everyone. What is more, they are borne during the winter and very early spring months. It is often met with in a far from satisfactory condition, and this is, I think, in some cases at least, owing to the plant being propagated by grafting on to the mezereon, a deciduous member of the genus. Though cuttings take some time to strike, young plants can be obtained in this way.—W. T.

## CORNUS MACROPHYLLA.

Several species of cornus have little to commend them except that their bark is conspicuous during winter by reason of its bright red colour. This, however, cannot be urged against the species under notice, for its commanding appearance warrants it receiving attention amongst other woody plants, whether in bloom or in leaf. Unlike many of the other kinds, which are conspicuous by reason of masses of stems which spring from a common root-stock, this usually assumes a tree-like habit, rising to a height of 18 or 20 feet, with a stout central stem from which a flattened head of branches is borne. The leaves are large, ovate, and accuminate, green above and glaucous beneath. Individually, the cream-coloured flowers are small, but as a large number are borne together to form flat heads, 3 to 5 inches across, they are very conspicuous when at their best about the middle of summer.

C. macrophylla is widely distributed in China and Japan, and is suitable for general cultivation in Great Britain, except in the very coldest places. It must, however, be so placed that it is sheltered from cold east winds, by which the young leaves are liable to be damaged. Loamy soil is suitable for its successful cultivation, and to keep the leading shoot vigorous it is necessary to check strong side branches occasionally. W. D.

## SUBURBAN FRUIT PRUNING.

Attached to the villa and semi-detached residences which collectively go a long way to make up the well-to-do suburbs found on the outskirts of every large town, there are gardens, and in most of these gardens there are fruit trees, chiefly such things as bush apples and pyramid pears, with here and there a plum, and occasionally a cherry, which looks very beautiful when in bloom in the spring, and now and then it produces a solitary cherry or two which makes a dainty morsel for the birds.

In a general way these suburban gardens, which house agents describe as being "well stocked with fruit trees," are arranged very much on the same plan, and the age of the fruit trees can be estimated by the time the house has been built. The trees, by the way, are generally planted by the first tenant or by the owner if he builds the house or purchases it brand new. In either case, the circumstances are very much the same, and the business or professional man in town, who has the ambition and the necessary means to enable him to live in the suburbs, surveys the plot of ground at the back of his newly-built residence—which the speculative builder has been good enough to allot to him under the title of a "spacious garden"—and he sees a vision of a future day when he can step out through his French window and pick his fruit for dessert direct from the trees. In his happy dream he sees himself picking baskets of apples and luscious pears to send as presents to those less fortunate, who have no garden, and he feels as enthusiastic about it all as an Australian settler when he first begins to clear the scrub from his claim.

The garden is bounded on three sides by the orthodox paled fence, and on this side and that there are gardens just like it. Whether there is anything infectious about the arrangement of them, I do not know, but the gardens are all laid out very much the same, which may be due to the fact that the initial work is mostly done by the local expert, who has a sign over his premises which informs the inhabitants of suburbia in general that he is a landscape gardener.

Parallel with the fence there is a walk, and beyond this a border, along which the fruit trees are planted, mostly, as I said before, bushes and pyramids, though in some gardens horizontal espaliers skirt the sides of the walks. The ambition of the owner is to see these trees grow about as high as the paled fence, and, in many cases, being a business man and not knowing much about it himself, he places the whole matter in the hands of the individual who comes one or two days a week to "do" the garden, and leaves it to him, just as he would entrust his personal health to the local practitioner if he happened to get influenza. It is with some pride, however, that our friend watches his trees growing into bearing, and when they produce their first few apples or pears, his cup of happiness is full. No hands but his own are privileged to pick those precious fruits, which are placed in positions of honour on the sideboard, where every caller is expected to admire them, while the fruiterer round the corner provides apples for the family consumption. When at last, however, these first fruits of the "fruitful" garden are beginning to show signs of wear, the owner reluctantly cuts them up, divides them between the members of his family, who in turn protest that they have never tasted such apples or pears in their lives, and our friend feels that he has not lived and planted and grown fruit in vain.

So the small trees get bigger, the young specimens grow older, they are operated on every year by the local expert already referred to, and you will imagine them now as fairly matured specimens, with thickened stems and furnished with a fair complement of main branches. There are hundreds of trees of this kind in suburban gardens, and every spring they go through the annual process of amputation, which is called pruning. If you peep into the garden a day or two before the event you will see each tree covered with scores, yea, hundreds, of young shoots, anything from a foot to a yard long, but after the pruning they present a different appearance. The fixed idea of the local expert is to cut, and he sets about it with the air of a man who is entrusted with a task about which his client knows nothing, and it would be presumption on the part of the latter to offer any suggestions. There is one thing, however, the annual pruning is done systematically. The branches are taken one by one, every young shoot is cut back close to its base; by the time the work is completed the ground beneath is strewn with twigs that are admirable for flower stakes, and as the pruner gets down from his steps he seems to say to the tree, "There now, I've stopped you; don't grow like that again, or I'll treat you more severely the next time."

For a while, the trimmed in, artificial-looking tree present quite a stiff, not to say, neat, appearance; it has been professionally pruned, of course, and to ask any questions would be presumptious, but when the warm days come it takes its revenge by pushing up a forest of young vigorous shoots like willow growths, and before the end of the summer the tree is so thick that it is impossible to see through it. In other words, the tree is producing its annual crop of flower stakes, and hidden away amongst the leaves on the lower parts of the branches there are a few fruits, which collectively are honoured by the name of the crop.

Sometimes the owner nervously suggests something about the trees being very thick and making a lot of wood, and his professional adviser at once points to the necessity of root pruning to counteract the exuberance, but root pruning means labour, which in turn means expense, and the business man in town, with his "fruitful" garden in the suburbs, concludes that there is no help for it; his neighbour, at any rate, is in the same fix as himself, so he leaves the local expert to continue his annual process of amputation.

If only someone could take the man on one side, and advise him to give the local expert a holiday just one season, even if he paid him his wages, and then instructed him to be content with thinning out superfluous shoots, but let the tree grow for a year, he would see the next season fruit buds form on the young wood, the vigour of growth reduced, and he would get an ocular demonstration that this annual butchering which so many suburban fruit trees undergo is excellent if the object of the apple trees is to produce flower stakes, but not if they are wanted to grow fruit.

Day after day at this season one sees trees that are undergoing their annual "cropping," just as a shepherd shears his sheep by a process of rule, all varieties treated alike; a few months hence they will be furnished again with a forest of summer shoots, and a year hence the whole routine will be gone through again. I do not hesitate to say that a large proportion of the fruit trees in suburban gardens are growing a superabundance of wood, but not half the fruit they might through being brutally over-pruned. When will the individuals who are responsible for this unnatural treatment depart from rule-of-thumb methods, bring common sense to bear upon the work, and realise that pruning is a multiplication sum: the closer you cut back the stronger the tree will grow? H.

## ROSE NOTES.

The end of January and early in February reminded us of the advantage of having some protective material to hand, as recommended in my last notes, and I trust readers were not so unprepared as many undoubtedly were. The severe weather that was experienced came on so suddenly, and was all the more noticeable because of the soft growth generally, which had felt no appreciable frost previously.

Some of our own plants are caught rather severely; more especially the wichuraianas, which had hardly ceased growing all through the winter. The heads of tender varieties as standards probably suffered the most; but, in our case, this appears to have been mostly from the keen frost-laden wind. However, it is much too early yet to talk of how our roses have come through the winter. In due season I may give a few notes upon their condition in this district.

Roses in pots are moving satisfactorily and coming on apace with the greater sun influence. Naturally, the many insect foes have done likewise, and they should be kept well under. Constant attention, so that they cannot gain a start is much better than neglect to take prompt measures; for only a couple of days makes a vast difference in their number. I have found changes of liquid manure, given freely but weak, most useful.

Dwarf stocks for the purpose of budding in summer may be planted out by the end of the month. But I would not be in any hurry if the ground does not appear in good condition, and a little soil is not able to run among the roots. Planting dwarfs late is quite distinct from the case of those intended for standards; the latter having no roots to speak of, while the dwarfs should have a fair amount. Indeed, I prefer later planting with the dwarfs in the case of cuttings, because the stems of these are more soft and tender than the crowns of seedlings. The cuttings having been deep in the ground all one summer, and almost a couple of winters, while the seedlings have been exposed the whole time of their existence.

Always earth up cutting stocks as soon as they are planted. It helps to stay them against wind, and, with the aid of soil drawn against them, we can put them in a little less deeply; a great help when the budding season returns. By removing the soil in summer we can get the rose bud close down upon the root, and, needless to say, this is a great factor in the avoidance of suckers.

Rosarian.

## NEW PLANTS.

### ODONTOGLOSSUM MERLIN.

This beautiful odontoglossum was figured in our issue of February 10. It is of hybrid origin, but of unrecorded parentage; it closely resembles an O. crispum, but is probably a form of O. eximium. The shapely flowers with broad, substantial white segments, are very attractive, and rendered the more so by the red-brown markings on the sepals, and the crimson spottings on the petals. A fine spike, carrying thirteen beautiful blooms, was exhibited. F.C.C., R.H.S., February 6. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

### ODONTOGLOSSUM MEMORIA LILY NEUMANN.

A very handsome hybrid of unrecorded parentage, with large, shapely flowers, tipped with rose, and with a white ground. Very showy are the heavy red-purple blotches and spottings on the sepals and petals, and the smaller markings of a similar colour on the golden-crested lip. A.M., R.H.S., February 6. J. Gurney Fowler, Esq. (Gardener, Mr. J. Davis), Glebelands, South Woodford.

### CARNATION TRIUMPH.

A good perpetual variety, the flowers of fair size and good substance. The colour is deep glowing crimson, and the petals are fringed. To its other good qualities must be added the merit of fragrance, as it is distinctly clove-scented. A.M., R.H.S., February 6. Mr. C. Engelmann, Saffron Walden.

### LISSOCHILUS STYLITES.

An erect, strong-growing terrestrial orchid from tropical Africa, it has been found in Angola and in Southern Nigeria, and appears to delight in hot, moist conditions while growing, but drier conditions while resting. L. stylites carries a spike 3ft. to 5ft. high, bearing six to nine flowers each, two or three inches across, pale rose-purple, the large, pouched lip being purple, yellow, white, and spotted with brown. A specimen was flowered in this country at Packham, Fordingbridge, in the Hon. Mrs. Foley's garden, in June, 1909. Bot. Mag. t. 8397.

### APHELANDRA FASCINATOR.

This very handsome acanthad from Columbia was introduced by M. J. Linden, of Brussels, in 1873, but it appears to have been also discovered by Bowmann, about 1866-68, when he was collecting in South America for the Royal Horticultural Society. It is a good garden plant if grown under somewhat similar conditions to that afforded the tropical begonias, and raised from cuttings each spring. The dense terminal spikes carry large numbers of brilliant scarlet flowers, and these are well set off by the green, silver-banded leaves. Bot. Mag., t. 8398.

### SPIRÆA WILSONI.

A beautiful shrubby spiræa from Central China, and closely allied to S. Veitchi and S. Henryi. It is of graceful habit, and grows to 8ft. high, is deciduous, and produces its clusters of white flowers, on lateral branchlets, during June. A useful hardy flowering shrub. Bot. Mag., t. 8399.

### RHODODENDRON AMBIGUUM.

Yellow rhododendrons are none too common, hence R. ambiguum, found in Western China by Mr. E. H. Wilson, is the more welcome. It makes a closely branched shrub, and promises to be quite hardy in British gardens. The flowers are widely bell-shaped, two inches across the mouth, and light yellow. Bot. Mag., t. 8400.

### BUDDLEIA OFFICINALIS.

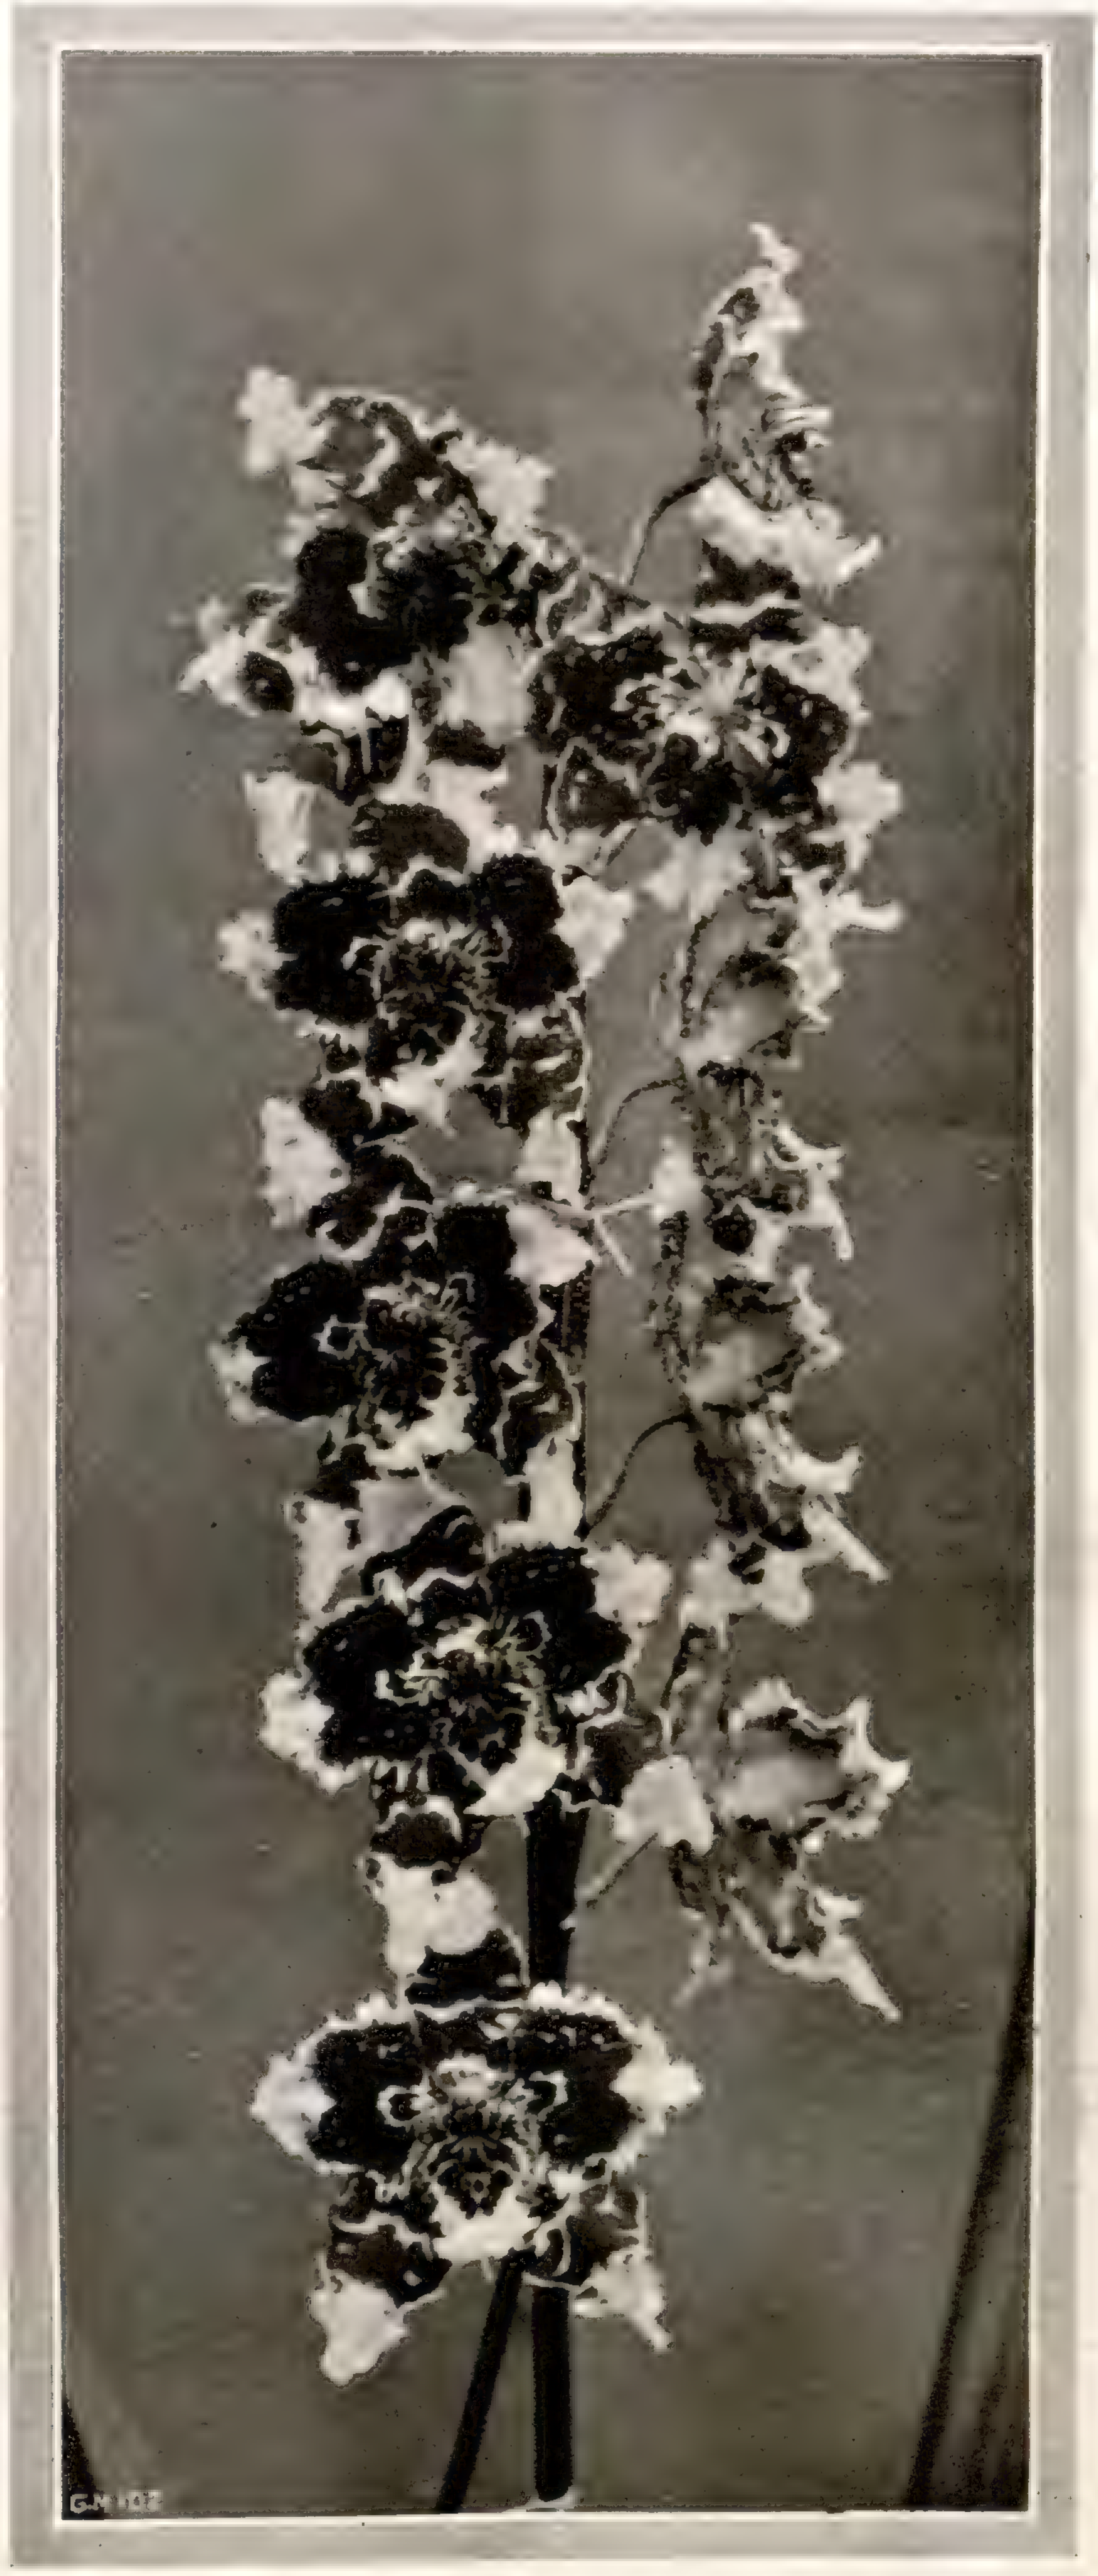
This may be useful for greenhouse decoration, as it flowers during the winter, and is then sweetly fragrant. Stems and leaves are pubescent, and the small flowers, borne in small clusters on a terminal spike or thyrse, are pale lilac. The species is hardly so attractive as B. asiatica, and falls far short of B. variabilis in beauty. Bot. Mag., t. 8401.

## GESNERAS.

These lovely plants may be regarded as companions to gloxinias, and their treatment may follow that generally given in the case of the last-named. One of the finest batches of gesneras I ever saw were growing and flowering profusely on the floor of a conservatory in partial shade. Although the flowers were lovely, and there were so many of them, the leaves seemed to me equally attractive.

Seeds should be sown on the moist surface of sandy compost in pots or pans, in preference to boxes. A very slight sprinkling of silver sand will suffice, and if the pans are kept in a warm moist atmosphere, the seedlings will soon appear. A suitable compost is one of fibrous loam and leaf-soil in equal proportions, with sand to ensure porosity; for the first potting the compost should be finer than for subsequent ones, and for the final potting a small quantity of old mortar rubble may be mixed with the soil. While growing the plants should have a summer temperature, but not as close an atmosphere after the flowers develop.

When the flowers have faded, place the plants under glass lights in the open air, or in a cold frame, with lights well tilted, so as to secure gradual but complete ma-



ODONTOGLOSSUM MEMORIA LILY NEUMANN.

Flowers white, tipped with rose, and heavily blotched and spotted with deep red purple. A.M., R.H.S., February 6. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

turity of the tubers. Store the latter in their pots during the winter in the same way that gloxinias are.

If a few old tubers are started very early in spring in two batches, the flowering period will be considerably prolonged. Red, yellow, and orange are the prevailing colours. The flowers are borne on stout stems, well above the leaves, and do not look at all stiff or formal. A light syringing will be beneficial occasionally up to the flowering stage. As the roots are fine—very fibrous—do not give strong stimulants. GEO. GARNER.

---

## FINELY-FLAVOURED PEARS.

We grow over seventy varieties of pears, and most of these are useful in their season, though, of course, some are better than others, and in some seasons certain varieties do better than others.

One of the earliest and best is Beurre Gifford, a pear of medium size, melting, and very juicy, and in a good season it has a beautiful colour; this does well on pear or quince stock, and either as a bush, cordon, or horizontal trained tree. Clapp's Favourite is a very large and handsome pear, and when taken from the tree in the proper condition is decidedly an acquisition. It is highly coloured and a fine fruit for exhibition. To ripen it on the tree it must be secured with ties, when it will develop a splendid flavour, but it will not keep long after being gathered, while, if gathered before it is ready, it never develops its true flavour. This is an August pear.

The two earliest pears are Doyenne d'Ete and Citron des Carmes, but both are small, round fruits, and not of much value. Targonelle and Williams' Bon Chretien are two remarkable pears, both very old, and both unsurpassed in their season. The former is best when eaten as gathered from the tree on a west or south-west wall. If gathered about twenty-four hours before ripe this pear will ripen well, and the flavour be good. If required for packing, it will stand gathering two days ahead, and still be passable. Williams' Bon Chretien, if the true type is secured, is a really first-rate pear, and I daresay the most popular, as the familiar "William" is amongst us from France long before our own fruits are ready. The English type is by far the best, and I have gathered fruits of it over a pound in weight from a west wall. The end of August and the first half of September is the time for these pears, and they are of the finest flavour, but the "William" may be gathered and ripened quite easily by artificial means, and thus give a longer season. It should be grown in several positions to doubly ensure a long supply. The tree bears well as a cordon, bush, espalier, or fan-trained. There are two varieties; one is much smaller and earlier than the other, and striped.

In September and October there is rather a glut of pears, and for general use many are not really necessary. Yet where one variety fails, another one does well. One will do probably better on a light soil and another on a heavy soil; so it really takes some time for one to discover which varieties are likely to do well, and vice versa. The best method would be to have a look around the district, and see what varieties do well under normal conditions, plant accordingly, and then compare notes.

Marguerite Marrillat is one of the very best pears in the month of September; it is a strong grower, and has very large fruit, juicy, and of good flavour. It is fine for home use and exhibition, grows extra large on walls, and does well as a bush or pyramid. Souvenir du Congrès is another good pear, very large and highly perfumed; splendid on a south-west wall, does fairly well as a pyramid or bush, and is a very consistent cropper. The fruits require to be heavily thinned. Fondante d'Automme is a fine old pear; large and deliciously flavoured; does well in any form, and is most useful for orchard culture. Dr. Jules Guyot is a large fruit, much resembling a Williams', but with more colour. It is of good flavour, and the tree is a rare cropper. Triomphe de Vienne has very large and handsome fruits of fine flavour, and is quite one of the finest pears for all purposes, but does not last long in good condition.

Beurre Hardy is, I consider, one of the best of October pears when well grown and the fruit well developed. It is both large and handsome, and of very rich flavour. Beurre Superfin is of a similar character and an excellent bearer in all forms. Comte de Lamy is small, but of excellent flavour, and requires a wall to do it justice. It does well as a cordon, fan, or horizontal trained tree. Great care must be taken in pruning, as it fruits on the ends of the branches. This tree is not a strong grower, but, nevertheless, Comte de Lamy is one of the best dessert pears. Emile d'Heyst is a finely-flavoured, moderately sized fruit, quite in the front rank, and after the style of Marie Louise. It often fruits when the latter fails, and should always be planted, as it is very free; the fruits require severe thinning. Marie Louise is now considered by many to be the best pears of its season. Unfortunately, it is rather tender, and not a very robust grower on some soils.

Louise Bonne of Jersey is both large and very handsome, quite hardy, and is first rate on walls. The best of all autumn pears, it keeps a long time in perfect condition, and the tree is an abundant bearer. This variety does well in most places as a standard, and is usually so grown in Wiltshire, and at Compton Basset there are the largest and best trees of the variety I have ever seen.

Coming to November pears, Doyenne du Comice, when grown well and from walls, is second to none, being large, of good shape, sweet, juicy, and very handsome when the fruits are exposed to the sun. I have grown this up to 1¼lb., but the best fruits for general purposes are those that weigh about half a pound. The variety does well as a single cordon or a trained tree, but it should be grown in several positions and aspects to secure as long a season as possible, because the fruits are always in demand. Fondante de Thirriot is a very fine pear of the finest flavour, a real good grower, and abundantly prolific. Charles Ernest is a fine large yellow fruit, with faint red colouring next the sun. It forms a good pyramid, but is best on walls, bears freely and quickly on the quince stock. Thompson's is small to medium sized, sweet, aromatic, of excellent flavour, and considered by some to be the best of pears. It requires a wall to do it justice. Beurre Alexandre Lucas has large golden fruits, melting, and of rich flavour, something like Louise Bonne, keeps well, and is very prolific.

Among December pears Glou Morceau is an old favourite, and generally crops well, especially near the sea coast. The fruits should be thinned, and not gathered until really ripe, or they will shrivel. I have left them on the trees until November has well advanced, netting them over to give shelter from frost. Winter Nelis is a rather small pear, but of most delicious flavour, being quite of the front rank, and probably the very best in its season for private use; a rather shy grower until well established, and should be grown against a warm wall, as it is not so hardy as some pears. Santa Claus is a new introduction, and regarded as the Doyenne du Comice of its season. This pear is destined to have a great future.

Easter Beurre, on light, well-drained soils, is an ideal pear for use from January to March; it crops well, and is of most refreshing flavour; requires a warm wall and plenty of water during the growing season. On clay soils I have not found it do very well. Beurre de Naghin is a large pear of the highest excellence for January and February, and makes a fine addition to late pears. It bears freely, and requires thinning to allow the fruits to properly develop. Josephine de Malines is a first-class dessert pear when well ripened, and its season extends from February to April. It takes a long time to ripen, and should not be gathered until it comes away easily, or it will not keep well. Olivier des Serres is an old variety, but a good grower and cropper, and often succeeds when others fail; an excellent pear of the finest flavour; February to March.

Le Lectier is a fine late pear, and a real good grower and cropper, and is quite one of the best introductions of recent years. Ne Plus Meuris is rather small, but one of the best pears for April use. It bears freely and in large clusters which should be severely thinned. This pear also should be left on the tree to the last possible moment; it requires a wall, but in warm localities will grow well as a bush. Doyenne d'Alencon gives good-sized fruits for use in January; a good bearer, requires high culture to bring out its merits, and a warm wall to grow against. Bergamotte Esperen is a good pear after a hot season, small, but of nice dessert size; requires severe thinning, is a good grower, and a very dependable cropper. Duchess de Bordeaux is a good bearer, and when well developed is a very fine late pear; requires high culture and attention during the growing season; good in March and April. Knight's Monarch, a rather small, round pear, is a very hardy and a great bearer; must be thinned early, or it casts a lot of its fruits; should be allowed to hang on the tree as long as possible, when, if properly matured, it lasts to May and June. This variety should be more generally grown; must be very carefully pruned, as it bears on the extremities of the shoots. Blickling is an old pear that has recently come to the front; of very fine and rich flavour, and most valuable in January.

The best-flavoured stewing pears are Cattillac, Grosse Calabasse, and Uvedale's St. Germain.

Most pears, more especially those on the quince stock, require a good deal of feeding when the fruits are swelling, and especially is this necessary during July and August. Against walls the roots are liable to become very dry, and therefore the crop fails. Pears on the pear stock should be root pruned or the roots will push down into the cold subsoil and suffer in that way. A good mulching is very beneficial, and a liberal watering with liquid manure several times during the growing season is valuable, and if soot, bone-meal, and kainit are pricked into the soil during the growing season, or just as the roots are moving, it will work wonders, and in a very short space of time. All pears require to be most carefully gathered; in fact, one cannot be too careful that the fruits do not become bruised. Many failures with pears are bruised by incorrect harvesting, or they are not sent into table at the proper time.

Leonardslee Gardens. W. A. COOK.

# SOME OF THE NEWER HYBRID TEA ROSES.

Of the many types of roses none are more popular or useful than hybrid teas, and any deserving new variety that blossoms freely and continuously is sure of a welcome. Roses are so much employed nowadays for garden decoration and for supplying cut flowers that many of them which are not suitable for exhibition find a place in even a limited collection where they would have had no chance a few years ago.

Duchess of Westminster (A. Dickson and Sons, 1911) should be much grown, both as an exhibition and as a garden rose. It is a dainty clear rose-madder, with full-sized blooms of splendid shape. In growth it is vigorous, erect, and free-flowering.

Melody (A. Dickson and Sons, 1911) is deep saffron-yellow, with lighter edges, strongly perfumed, and very free; the deep purple wood and rich glossy deep green foliage make a harmonious setting for its blossoms; it is said to be mildew-proof, which, if correct, will be a distinct gain, especially as it is purely a garden rose.

Dorothy Ratcliffe (McGredy 1911) is coral red, shaded with yellow and fawn, becoming paler as the flowers expand; a decorative variety of much value.

Lady Katherine Rose (S. Bide and Sons, 1911) is a delicate pink, with richer markings in the petals, very shapely, free and vigorous in growth, with a strong perfume.

Mrs. Amy Hammond (McGredy, 1911) has a colour blend of ivory, amber, and apricot, and is of good shape, with long-pointed petals; likely to become a good exhibition rose.

Lady Downe (W. Paul, 1911) produces large shapely flowers quite late in the autumn; it is buff, with a deeper centre of yellow, paling with expansion; it is of strong growth, and carries its flowers on stiff stems.

Leslie Holland (H. Dickson, 1911), I consider to be the finest exhibition variety introduced for many years; it is a deep scarlet-crimson, heavily shaded with deep velvety crimson. The large blooms have shell-like petals, and are quite sweetly perfumed.

Lady Reay (B. R. Cant, 1911) should prove to be a really good garden rose; the colour is a deep rich pink in the centre, shading off to a mother-of-pearl white.

Countess of Shaftesbury (Hugh Dickson, 1911) should become a popular exhibition rose, as it has good lasting properties. In colour it is silvery-carmine, mottled and flushed with pale pink.

Edward Mawley (McGredy, 1911) made a deep impression when first seen because of the marvellous substance of its petals. The colour, deep crimson, with a rich velvety shade, is most attractive. Whether it will prove valuable for garden use remains to be seen.

Jonkheer J. L. Moct (Leenders, 1910) I regard as a magnified La France, which it resembles in colour and form very much, but is more massive; it should be added to every collection.

Claudius (B. R. Cant, 1910) is one of the best roses of recent introduction, and, though classed as a H.T., it favours the hybrid perpetual section, both in shape of bloom, habit of growth, and remarkable perfume. It is bright rose.

Ethel Malcolm (McGredy, 1911), ivory-white, shaded peach, has shapely, full-sized blooms, and is in every way desirable.

Lieut. Chaure (Pernet-Ducher, 1910) is of remarkable colour, standing quite alone for its velvety crimson-red shade; it has large, full, shapely blossoms, and should become a popular exhibition variety.

Lady Pirrie (Hugh Dickson, 1910) should become very popular in the garden for massing. The colour is deep coppery, reddish-salmon, with a flush of apricot-yellow inside.

Portia (W. Paul and Son, 1910) is sure to become a good exhibition flower; pale rose, with a flush of yellow when unfolding.

Margaret (W. Paul and Son, 1909) has thick fleshy petals, which build up a full-sized bloom, soft pink, with the centre a trifle deeper in colour.

Carine (A. Dickson and Sons, 1911) should become a favourite as a garden rose; the growth is vigorous and erect, carrying the blossoms on rigid stems; the colour is orange-carmine, flushed fawn.

Mrs. Amy Hammond (McGredy, 1911) I should describe as an improved Madame Abel Chatenay in size and form, but with a flush of yellow in the centre; quite free in growth and flower.

Mrs. Cornwallis West (A. Dickson and Sons, 1911) shows a mixture of shell-pink and rose-pink on a white base; in growth it is very satisfactory.

Elaine (W. Paul and Son, 1908) opens pale lemon-white, and when fully developed is pure white; it has massive petals that build up a handsome bloom.

Mrs. E. J. Holland (McGredy, 1909) is pale rose on the outer portion of the flower, with a deeper centre; shapely and good.

Arthur R. Goodwin (Pernet-Ducher, 1909) is coppery orange, red in the bud, passing to salmon-pink as the flowers expand; it flowers well into the autumn, and is quite one of the best of garden varieties of a dwarf habit.

Sunburst (Pernet-Ducher, 1911) is undoubtedly very like a combination of Prince de Bulgarie and Gustave Regis in formation of the flowers. In colour yellow-carmine, deepening to orange-yellow in the centre. For culture under glass this must be a good rose.

E. Molyneux.

CARNATION TRIUMPH.

A deep crimson perpetual variety, with fringed petals and clove-like fragrance. A.M., R.H.S., February 6. Mr. C. Engelmann, Saffron Walden.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of Chrysanthemums for Garden and Greenhouse, by D. B. Crane, price 2s. 6d. net; or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## WENNINGTON HALL.

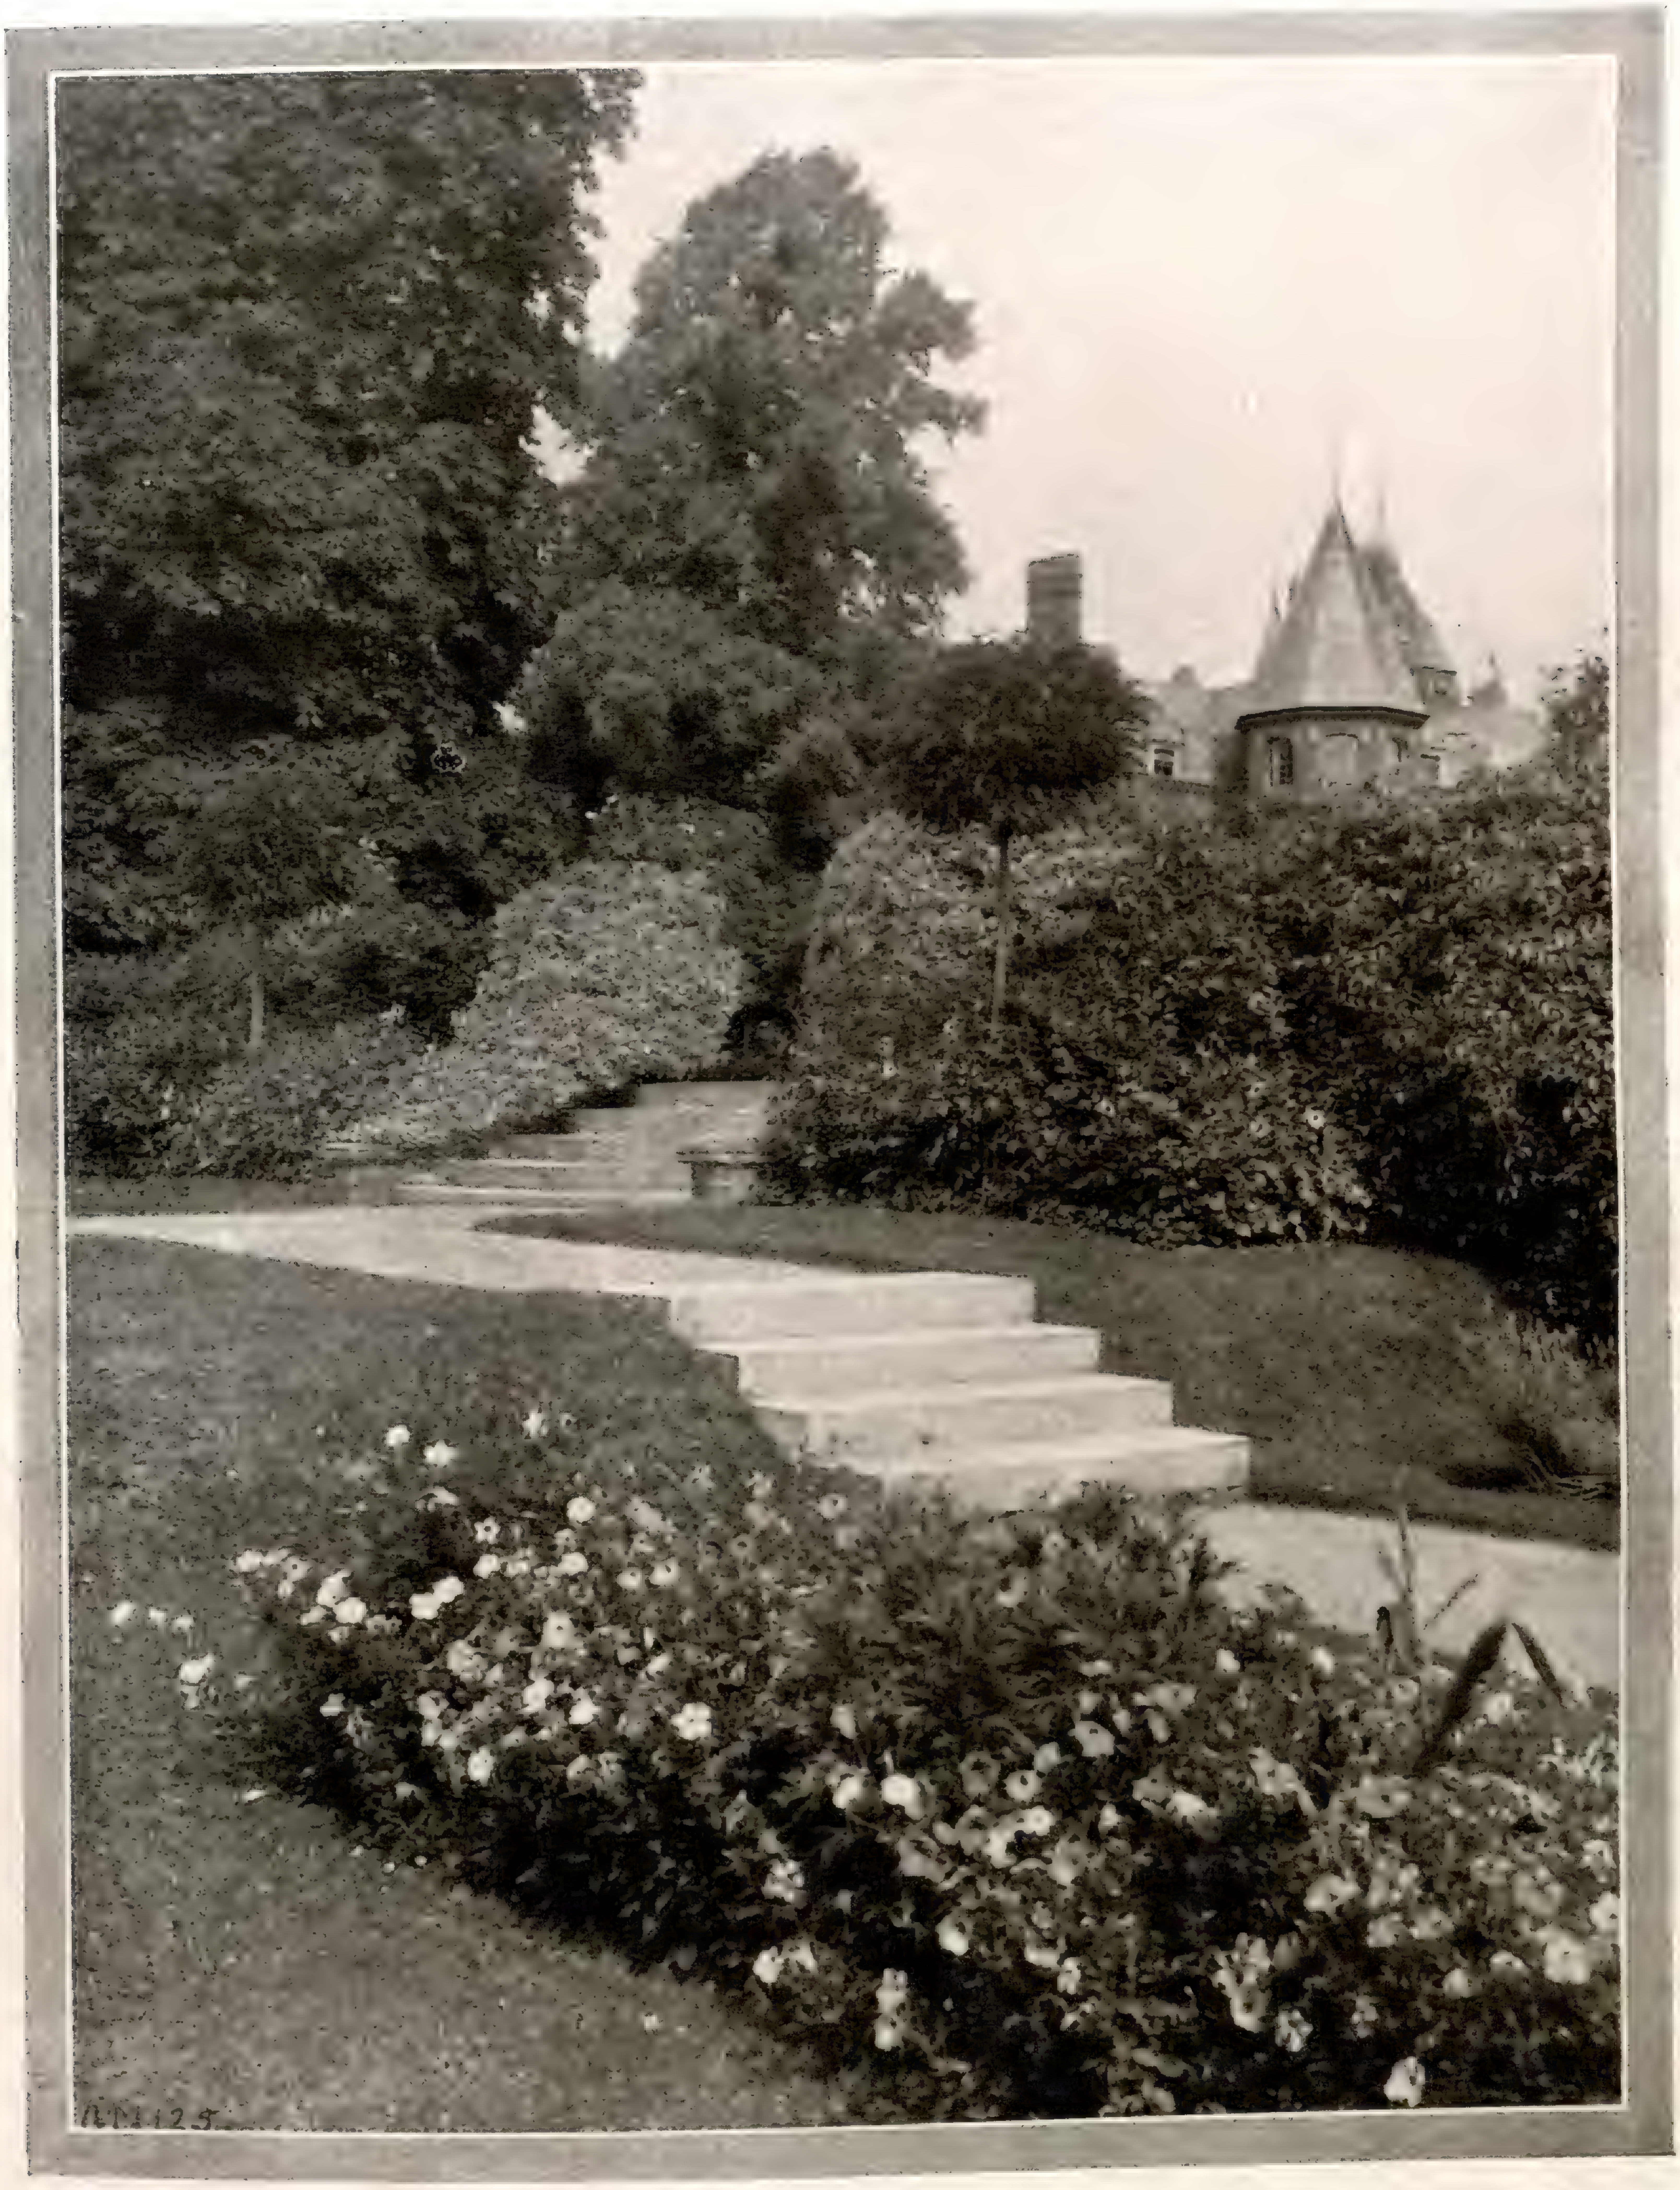
Wennington Hall, the seat of Colonel Saunders, is prettily situated near the picturesque village of Wennington, on the railway between Carnforth and Hellifield. The mansion itself is a fine one, and is surrounded by noble trees and spacious grounds. From the house to the garden entrance there stretches a long, broad border of hardy flowers of great variety and excellently grown. Backed by a wall covered with good climbers this border looks extremely well, especially as it is planted with due regard to a succession of bloom, from early spring until late autumn. The best genera and species, together with excellent varieties, in the most valuable classes of herbaceous flowers, are here represented, although Mrs. Saunders, who is the presiding spirit of the garden, does not lay claim to owning any special collection of border flowers.

ENTRANCE GATEWAY, WENNINGTON HALL.

It is mainly to alpine flowers that Mrs. Saunders is devoted, and when we enter the garden we are at once confronted by evidences of her taste and skill in the direction of these charming subjects. Mrs. Saunders spends a good deal of time in the Alps, and, while staying at Pontresina and other places, has been an earnest student and collector of the best of the plants to be found there. She has selected her finds with keen critical taste, with the result that there is hardly a poor form, and there are many of special beauty among the alpines brought home to Wennington. Not only, however, are the plants well chosen, but they are cultivated in a manner, which, possibly too artificial for many, yet by its results fully justifies Mrs. Saunders' departure from the conventional way of cultivating alpines. This is neither by growing them on natural-looking or formal rock gardens, although there is one small rockery, where, by the way, are a number of the easiest subjects doing as well as they can be seen anywhere, but by a method intended to secure that the flowers will have their requirements fully met. It may at once be said that this is done in a manner far surpassing the writer's anticipations, although his companion—a keen grower and experienced cultivator of alpines—had held out high expectations. These were more than fulfilled, for there are few places where one can see these flowers so well grown, looking healthy, happy, and flowering with freedom.

The arrangement for the cultivation of the alpines at Wennington is by means of a series of raised beds, built up with low, dry stone walls, about two feet high in some, but in others a little more lofty, and raised higher at the back than in the front, so that the compost slopes gradually. The crevices of these walls are left open and unplastered, so that there is the freest possible drainage. The space is then filled so far up with drainage; then rough material, such as stones, grit, and sand, and the whole finished off with a good layer of free soil, such as loam, peat, or leaf-soil, sand, grit, and small stones, with a surfacing of an inch or two of small stones, the general idea being to form what might be called a moraine on artificial lines, the leading consideration being the welfare of the plants. These are kept well supplied with water, and the treatment produces the happiest possible results. The garden was visited a year ago by M. H. Correvon, who was delighted with the condition of the plants, many of which were in better condition than they can be seen at home in the Alps.

Looking through these flowers one was struck with the fine representation of the charming gentians, some of which are seldom seen, and those which are seen are seldom in as good condition. Thus we saw Gentiana brachyphylla doing well, G. verna, a pattern for other growers, G. acaulis, G. acaulis var. dinarica, G. cruciata, G. ciliata, G. Allioni, and several others. Androsaces are also wonderfully grown, among those observed being A. glacialis, A. carnea, A. foliosa, very finely grown; A. arachnoidea, A. Chumbyi, A. lanuginosa, and a good representation of other species. The hardy primulas are excellently, and some superbly grown. For example, P. marginata was simply wonderful, making enormous rosettes of its handsome leaves for this species, and a picture of beauty in itself. Primula farinosa alba is a special plant here, as it may well be, for this white variety of our native Bird's Eye primrose was originally found by Mrs. Saunders in a meadow on Colonel Saunders' own estate of Wennington. This pretty form was just over, but it is an excellent one. Of course, the typical P. farinosa is also grown, and we observed among others P. Clusiana, P. graveolens, and a wide selection of the best of the European and other species. It was a pleasure to see the campanulas so well done with this treatment, and a wonderful feature was the manner in which the lovely little C. excisa is growing in the artificial moraines here. It is spreading freely, and is very beautiful with its little blue bells, deeply cut so as to be appropriately named excisa. C. G. F. Wilson, C. pumila in



THE GARDEN STEPS AT ELVETHAM PARK, LORD CALTHORPE'S SEAT, NEAR WINCHFIELD.

(See Page 138.)

variety, C. nitida, C. waldsteiniana, C. Raineri, C. barbata, and C. b. alba, a very fine form of C. Hosti, C. pulloides, and many more of this charming race of alpine flowers. A good feature were the daphnes, which thrive well under the same conditions, among them being D. fioniana, D. alpina, D. cneorum, very fine, D. Blagayana, and others. We naturally expect to find the dianthuses well represented, and we see such good species as D. neglectus, D. alpinus, D. glacialis, with a good many more. Anemones are in considerable variety, and, with the alpine ranunculi, are of much beauty. A. alpina and A. sulphurea are doing extremely well, and we see the pretty ranunculus crenata and R. glacialis among the ranunculi.

Quite a host of good saxifrages of different sections flourish, but the tale is too long to permit of detail of these favourite flowers as seen here. There is also an unusually good collection of sempervivums, while sedums are cultivated in the neatest and finest forms. New Zealand and other veronicas are in goodly numbers, and among other plants seen were Geum reptans, Œnothera cæspitosa, Viola calaarata in variety, Nigritella angustifolia, Mertensia lanceolata, Potentilla nitida, Mitellas diphylla and pentranda, edelweiss, Cherleria sedeoides, several phyteumas, Linnea borealis, silenes in variety, Pædorota Bonaroti, Shortia uniflora and galacifolia, Galax aphylla, Dryas octopetala, Iris gracillipes, Aquilegias alpina and glandulosa, Heliopsis breviscapa (doing extremely well), Anemonopsis macrophylla, and a magnificent plant of Onosma taurica, with O. alba-rosea. Many other plants were noted, but cannot be now detailed.

Among other good features in this garden is the rose borders and beds. Mrs. Saunders shares her love for her alpines with that for the rose, and the best of the new varieties are added in the hybrid teas and others.

There are also good herbaceous borders in this garden, and the other departments are excellently cared for by Mr. Moffat, Colonel Saunders's gardener. He evidently takes a thorough interest in the garden under his charge, and has a great pride in the alpines which Mrs. Saunders herself cultivates with such sedulous and successful care. Few collections of alpines are more deserving of a visit than this at Wennington Hall. S. Arnott.

---

**Hardy Fuchsias.**—Are the value of these in the garden realised to the extent that they might be? I think not; for when summer is on the wane they are most beautiful. This refers even in districts where they are cut down to the ground during the winter, as with a little protection from leaves or something in that way they will push up again vigorously in the spring, and bloom as the season advances. As is well known, in many parts of the country they are little, if at all, injured by frosts, and are then consequently regarded as permanent shrubs. In a selection of hardy fuchsias the two commonest forms, namely, Fuchsia gracilis and F. Riccartoni, must on no account be omitted, as they are so beautiful and trustworthy in every way. Of those with white corollas, Madame Comellison is the only one to be considered as hardy. An autumn exhabit of these fuchsias at the Horticultural Hall contained, among others, Elysée, a plant of upright growth with fair sized dark coloured flowers; Enfant Prodigue, of looser growth, with semi-double blossoms; Thompsoni, like a small gracilis; Brightoniensis, a little globular bush with dark coloured flowers, the corolla being crinoline-shaped; Globosa, remarkable for its globular buds; and pumila, a bushy grower.—W. T.

## GARDEN STEPS.

It is a curious and hardly recognised fact that amid the wealth of advice on adornments of gardens and pleasure grounds, large and small, contained in the literature devoted to these subjects in the present day, useful or artistic suggestions on garden steps have been either totally ignored or dismissed with scant courtesy.

Prominence is given to the designing of terraces, lawns, pergolas, wall, rock, and water gardens, but few of the present-day landscape gardeners give any help on the idea suggested by our illustration.

Yet, when we come to consider the matter seriously we realise that much of our pleasure in a country house or villa residence is bound up in its "stair and stepways." Whether it be the grand sweep of some marble approach to one of the stately homes of England, from the rose garden, or the severe stone or brick ascent, leading from the yew-tree walk to the peacock-haunted balustrade, verging the paved alley under the southern windows of some ancient manorial mansion, that affords delight, or the moss-grown flight of steps in a more secluded woodland paradise, or hidden garden way, that thrills us with pleasure as we near the breadth of still water or old-time well to which they conduct us, the fact of enjoyment remains, and we sometimes realise that in former days garden steps evoked a keener interest than is the case in our prosaic twentieth century life.

"The long, low grass stairs that led me from the allée verte to my lady's fantasie, and following through her rose pleasaunce, I do find myself above the mossy steps that bring her little feet down to her dipping well," is a fitting appreciation from an old-world lover, and we see in fancy the lichens and the ferns that lovingly clothe the steps to-day.

Bacon, in his "Essay on Gardens," advises "for a fountaine that there be also some steps up to it and some fine pavement about it." In the work just completed on the Sussex home of the Master of English flower-gardening, there is an interesting entry. "Formed in the spring of the year 19—, the steps laid in earth with rock plovers beneath them and the pathway," and no one who has had the privilege of visiting Gravetye Manor at any season can forget the enchantments of all Mr. Rominson's stairways.

In our ever-abused climate we cannot expect to attain to the glorious effects of the Italian garden steps so aptly described by Sir George Sitwell in his book on "Making of Gardens," or to adapt the "broad, stately steps and open-air staircases of cold-blooded marble leading to sombre conclaves of silent cypresses in tragic gardens," ever present at the water approaches to villas and chateaux in warmer climes, but in every country and on every estate, even in the humblest suburban garden, ways may be beautified by the artistic arrangement of ascent and descent where practical and artistic help is desired.

As with entrances and gates, the primary object to be considered is the meaning of the steps with regard to their situation and practical use. The material to be employed rests with the owner or occupier of the property, and should be decided by local surroundings and quarries, though there can be no veto on the employment of foreign stone and marbles. Yellow and red sandstone are picturesque in their own localities, and of Ham Hill and Bath stone, grey granite and red brick, the same may be said. Grass stairs are eminently adapted to roseries in some situations, but climatic influence has always to be taken into consideration and sodden conditions of turf in damp places and the pathetic brown in very dry sites may prevent its use in either.

In many terrace gardens no vegetation is allowed to grow on the walls and steps, but the older and more beautiful way is to garland all such surfaces with living plants. With the large number of subjects that we have it should be easy to find some handsome and really effective climbers to drape our walls and steps with. Stone steps are often an ugly blot in the garden, not always owing to their position, but their bald aspect, but they may be made attractive to look at if the surroundings are carefully planted. Steps without a margin of fern and flower are by no means pleasing to the eye, but, with a setting of hardy plants, they have a very changed aspect. To obtain such an effect is very simple, as, if the steps are in the shade, it is easy to grow ferns by the side or shade-loving plants. Cotoneaster microphylla is a delightful plant for such a position. It sends its wiry, crimson-berried shoots over the facings, and produces a charming picture. Primroses, saxifrages, sedums, and the little sandwort, Arenaria balearica, may be grown in a simple way against steps and in the crevices and chinks.

Much care and taste is needed in building rustic steps in gardens. The mason's art should be concealed, and the work made to look as if it grew out of the ground. Any necessary cement joints should be kept out of sight, and the stones laid in natural-looking courses, much as they occur in the quarry. In building a chink should be left here and there for some tiny plant to grow in, the better to connect the steps with the masses of plants hard by, and the stones of the wall.

Flights of steps, always beautiful if easy and well-proportioned, are of the greatest value in terraces. There is no reason or excuse for the steep, ugly and often dangerous steps one so often sees. Every step in the garden should be nearly two feet broad, and never more than five inches high, no matter how steep the incline. Where the stairway cuts through the bank and is lined on both sides by dry-walling, the whole stonework may become a garden of delightful small things. Little ferns may be planted in the joints on the shadier side as the wall ascends, as well as numbers of small plants. Then there will be drooping veils of arabis and aubrietia, iberis and cerastium that will find a happy home in the cool shelter of the rocky pocket. Wallflowers, thrift, and antirrhinums may often be established, and, as they ripen their seed, it lodges in the crevices of the wall and forms plants of robust vigour that are longer-lived than the softer-grown plants in the rich flower borders.

In making steps to go with dry-walling it is not necessary that they should be entirely paved. If the front edge is formed of carefully-fitted stone, the rest can be levelled up with earth, and the sides and angles furnished with small plants. The steps themselves will then become flower gardens, and if the stones are large and heavy enough to be quite firm there need be no cement.

Wyndham Fitzherbert.

GRAPE CULTURE.—An illustrated guide to the culture and management of vines in greenhouses and in the open air is published at Gardeners' Magazine Office, 148, Aldersgate Street, London, price 1s. net (by post 1s. 2d.), or bound in cloth 1s. 6d. (by post 1s. 8d.). Full particulars are also given as to renovating old vines, and the best varieties to grow.

## CYDONIAS.

When visiting Oxford early in the spring of last year, I was greatly impressed by a striking example of Cydonia trained on a wall in the Botanic Gardens there. The plant was fan-trained, each stem being carried straight from the centre and with all the side shoots spurred in. The wood was thickly clustered with flower buds, on the point of breaking into bloom. Such a specimen reveals great latent beauty, and suggests how much our gardens lose by neglecting some of our commonest shrubs. One could not readily conceive a more admirable shrub for garden decoration. Yet how frequently do we find Cydonias relegated to some obscure corner of the garden, where the cultural attention bestowed upon them is of most indifferent character.

Cydonias succeed in ordinary garden soil, and flower best in positions where they obtain a reasonable amount of direct sunlight; pruning is generally necessary, as some varieties have a tendency to overcrowd their branches, and these should be thinned out, allowing ample space to each, so that sun and air may have access to the centre of the bush. At the same time, the lateral branches may be spurred in, as this assists the formation of buds.

Cydonia, or Pyrus japonica—the Japanese quince—is the oldest species known to gardens, and it forms a rounded, spreading bush, which when growing in the open, attains a height of 6 to 8ft. The type produces bright scarlet flowers; Simoni, rich deep crimson flowers; Cardinalis, scarlet-crimson; alba, white tinted flowers; and nivalis, snow-white flowers.

Cydonia Maulei is not so vigorous in growth as C. japonica, and forms low, rounded bushes, with slender branches, on the laterals of which the flowers are freely produced, even in a young state; in this the flowers are succeeded by orange-yellow fruits that remain on the plants right into the winter months. Cydonia Maulei produces scarlet flowers; the variety alba is a very beautiful form, with pure white flowers; atrosanguina has rich deep blood-red flowers, and produce a most telling effect; superba is an improved form of the type, with large deep scarlet-crimson flowers, and the variety Sargenti produces bright red flowers on plants that are particularly dwarf in habit.

It may also be noted in passing that all the cydonias are admirably adapted for house and conservatory decoration. So readily does this genus respond to forcing that plants potted up from the open ground and placed in a temperature of 50 to 55 degrees will open their flowers in from six to seven days, and these retain their beauty for a period of three weeks; the rich colour and quaint character of the plants make them most acceptable additions to the ordinary run of flowering plants at this season.

Thomas Smith.

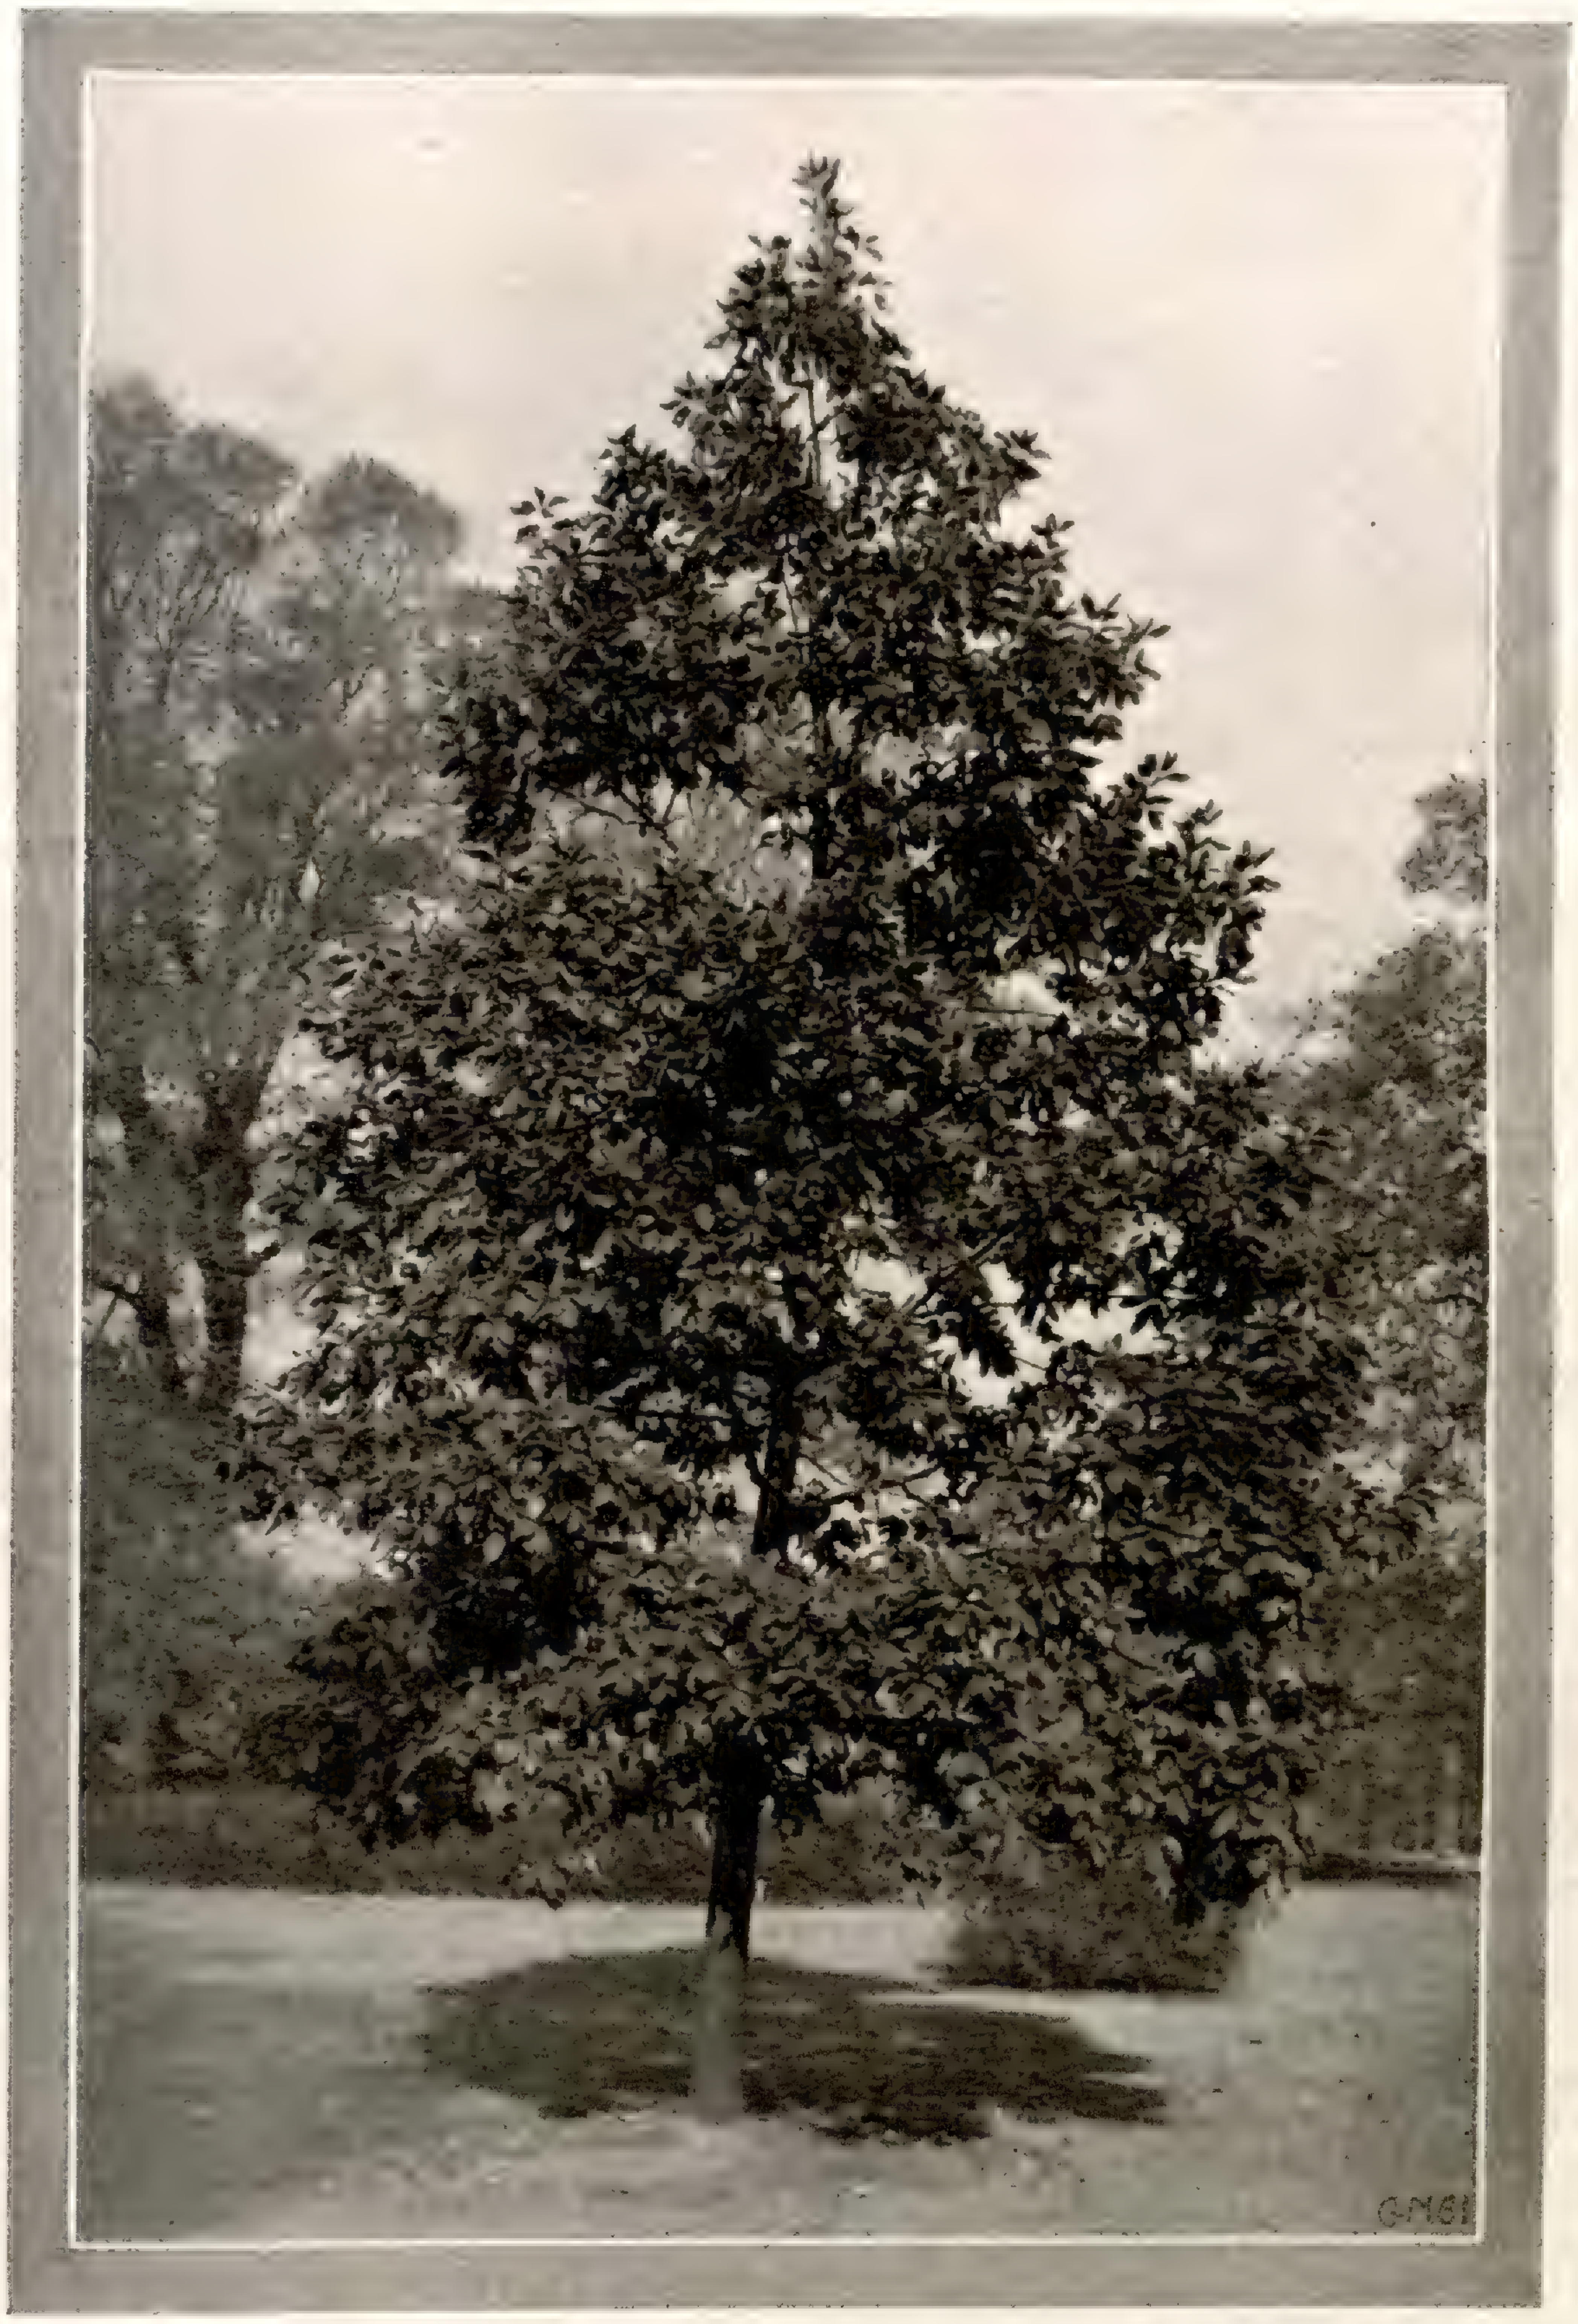
Coombe Court Gardens.

**Eranthemum pulchellum.**—This plant does not necessarily require stove treatment all the year round. Cuttings rooted in March and April, with due attention to potting, watering, and stopping, will by the beginning of August be nice bushy plants. After that date remove them to any cool, airy house, such as an early vinery cleared of its fruit, with full sunlight, where, with liberal feeding, they will develop strong dark leaves, and each branch will by the end of October be bristling with flower buds. Such plants introduced into heat in batches from November onwards will keep up a supply of rich blue flowers, a colour rather scarce during the winter months, till late in spring; and, being so treated, will retain their beauty for some time.—R. J.

## MIRBECK'S OAK.

The number of oaks that are now available for planting in parks and pleasure grounds is considerable, and planters have therefore full scope for the exercise of taste in the making of a selection for a special purpose. There are, for example, the Scarlet Oak, so well known and highly appreciated for the brilliant colouring assumed by its leaves when "touched by the breath of autumn"; the Lucombe Oak, a handsome sub-evergreen tree, which was raised by Lucombe at Exeter one hundred and fifty years ago; the Hungarian Oak, a medium-sized round-headed tree, remarkable for its distinctness and attractive appearance; the Glabrous Oak, an evergreen species that possesses much beauty in all stages of development; and Mirbeck's Oak, a sub-evergreen tree, distinct in character and handsome in appearance.

All the oaks mentioned are deserving of a place in parks and pleasure grounds, where suitable positions can be found for them, but at the present time we are only concerned with the last-named, which has strong claims upon planters who are specially interested in trees that can be used with good effect in the creation of garden and park scenery. Quercus Mirbecki is a native of Spain, Portugal, and North Africa, and in its native habitat forms a tree of considerable proportions, and its general character is admirably shown in the accompanying illustration of a specimen growing in the Royal Gardens, Kew, not far distant from the Wood Museum at the northern end of the Broad Walk. The leaves are six or more inches in length, about three inches in width, and regularly dentate; they are stout and leathery in texture, and retain their rich green colour until such time as they are subjected to a severe frost, when, as was the case a fortnight since, they are browned at the margin; but this change in the colour is not sufficient to greatly detract from the appearance of the trees when seen from even a short distance. Mirbeck's Oak is evidently well adapted for planting alongside carriage drives, for with but little aid from the pruning knife a pyramidal outline can be maintained. It has several synonyms, and in some English catalogues will be found under the name of Quercus Zang.



QUERCUS MIRBECKI.
A handsome sub-evergreen oak, of much value for gardens of moderate size.

## BOUVARDIAS.

During the early winter months bouvardias are always useful, as their neat, compact clusters of flowers can be used in a variety of ways, where those of a larger and heavier type would be out of place or could not be employed to advantage.

### Propagation.

In order to have good sturdy plants that are capable of sending up fine trusses on long stems, it will be necessary to commence propagating as early in the spring as possible. When the old plants have ceased flowering they should be cut back and placed in a brisk heat to induce them to make young growths, and when these are about an inch long they will be large enough for cuttings. Prepare some small pots, such as 72's, and fill them with light sandy soil well-warmed. Take off the cuttings with the heel of the old wood attached, and insert them near the edge of the pots; then place in a propagating case where a temperature of about 75 degrees can be maintained, and shade from bright sunshine until rooted.

As it is not always possible to get sufficient cuttings in one batch to supply the requisite number of plants, a second lot may be taken and treated in like manner. When these small pots are filled with roots stand them out of the propagating case for a few days to harden off a little, previous to potting them. Those who are desirous of obtaining large specimens may shift the plants as they are into larger pots, but where only moderate-sized ones are required then the small plants may be shaken out of the soil and potted up singly, using a light rich compost and ample drainage. After being potted they should be returned to the hotbed, where a temperature of from 70 to 75 degrees can be maintained.

Propagation may also be effected in the following manner. After the cuttings have been removed, shake the old plants out of the soil and take off all the roots, and cut the strongest and most fleshy of these into pieces about an inch in length. Fill some pans with light sandy soil, then place these pieces of roots evenly over the surface, sprinkle a little sand over them, give a gentle watering to settle the soil, and place the pans in the propagating case, giving shade from the sun. In the course of a few days young growths will appear all along the roots, and when this occurs more air should be admitted to strengthen them. When the growths are about an inch long the plants should be potted off singly, using small pots, and returned to the hotbed until established.

### Frame Culture.

Bouvardias grow best in a light rich soil, and if ample root room can be afforded them will make large plants in a very short period, as may be seen by those raised from cuttings in the spring and used for planting in the flower beds during the summer months. If bouvardias are specially needed for cut bloom they should be planted out in pits, about eighteen inches apart. If such structures have a couple of hot-water pipes running round them, so much the better, as the requisite temperature can be maintained during the autumn and early winter months to keep the plants blooming. If it is intended to bed them out there will be no need to give the plants a shift after the middle of April, as by the time those pots are filled with roots, which should be towards the end of the second week in May, it will be safe to transplant them to the pits. The lights should be kept on, and if the nights are cold, a little heat should be given to maintain a genial temperature, but they should be gradually hardened off, so that by the middle of June they may be fully exposed to the weather both day and night. We have had plants so treated that made growths three feet in length and as thick as a lead pencil, carrying trusses of bloom from three to four inches across, which we found most useful during the dull months. When grown in this manner bouvardias do not require half the usual attention, either in the way of watering or keeping them clean; it may, however, be necessary to stake some of the growths to prevent their being broken by rough winds in the early autumn.

### Culture in Pots.

If grown in pots the final shift should be given about the first week in June, after which, if the plants are stood in a cold frame for a week or two, and shaded from the bright sun until new roots have formed, they may then be plunged in a bed of ashes in a sheltered position, where, if duly looked after, they will make good material by the autumn, when they should be housed for the winter. Treatment through the summer is very simple; all growths made should be pinched at the third or fourth joint, and on no account should they be allowed to bloom, as this would weaken them. When they have their final shift, it is a good plant to peg all growths down level with the soil, as the young growths that spring up from the centre will then have ample room to develop. If the plants are healthy and in a flourishing condition, they will send up a quantity of such growths from buds underneath the soil, and as these will be much stronger than those made from the axils of the leaves above ground, they should be encouraged, especially those made during the latter part of July and August; some of these shoots will grow eighteen inches high or more, if liberal supplies of liquid manure are given to keep them growing.

### Varieties.

Bouvardias, like all other plants, are subject to the attack of insect pests, but these are easily kept under if the plants are in a healthy condition, but once allow them to suffer for want of nourishment, and there is sure to be difficulty. Varieties are not numerous, and there is no need to grow many. Three or four of the best singles, and the same number of doubles, are enough. The following are all good, and may be relied on as free-flowering. Singles—Jasminiflora, white; Mrs. Robert Green, pink; President Cleveland, scarlet; and Humboldti corymbiflora. Doubles—Bridesmaid, pink; Alfred Neuner, white; and Hogarth flore pleno, scarlet. There are others, such as Scarlet King, President Garfield, Sang Lorraine, The Bride, etc., which are good, and should be grown where a collection is required.

When bouvardias are housed in the autumn, no attempt should be made to force them into bloom, as plants grown in strong heat are quite useless. A free circulation of air is necessary to keep the plants sturdy, but the temperature should not be allowed to fall below 50 degrees or the flowers will not expand properly or be of fine colour.

## PERENNIALS GROWN AS ANNUALS.

The cult of annual plants for decorative summer display in English gardens has reached amazing proportions, and doubtless 1912 will see even greater progress made. The special attention which is now given to annuals is very different to the starved conditions which used to be accorded them in many gardens. Thorough cultivation in well-prepared beds and borders has resulted in a high degree of excellence, and this, combined with the raising and selection of new and improved varieties by the florists, have given annual plants a very exalted place in the horticultural world.

In these few notes I wish to briefly discuss the merits of certain perennial subjects from an "annual" point of view; that is, the growing and flowering of perennial plants effectively, within the limits of a single season. It is noteworthy that many of the ordinary annuals have a very short flowering season, consequent upon the rapid maturing of seeds, and it is to obviate this, and to gain the greater effect, that I have had recourse to perennials in their place.

The first point in this direction is to sow early, choosing just those subjects which will give one the greatest pleasure and the most effective display. Secondly, one must resort to frame culture for a short period to ensure unchecked growth, and follow this up, if possible, by early planting, putting all the young plants out before "bedding out" commences. From this point, growth becomes both quick and vigorous, and many subjects will be coming into blossom in June or early in July, when, if proper selection has been given, and good cultivation maintained, will go on in beauty until autumn.

One of my most-favoured subjects is Delphinium Belladonna, which gives such a delightful display, with its dainty spikes of soft blue blossoms, and raised from seed each season, one is able to secure a long, continuous display good alike for cutting or for garden decoration. Chrysanthemums, particularly the single forms, are now so generally grown as annuals that any remarks of mine may seem superfluous, though a good bed, or, better still, a sloping bank, planted up with an array of seedling singles, provides a feast of colour for quite two months before the frosts come.

Chrysanthemums of the C. maximum group and those C. leucanthemum forms, known as the Shasta daisies, can be well grown as annuals. A series of seedlings of Mrs. Lowthian Bell were grown by us last year with marked results, giving plenty of long-stemmed, large-sized flowers during the latter half of summer and early autumn. Lupines were treated in the same way; both L. polyphyllus and L. arboreus sections were grown, though the greatest success was gained from hybrid forms between the two groups mentioned. These formed neat bushes, well-flowered, and of considerable decorative value.

Gauras, as may be well imagined, come grandly as annuals, these being almost indispensable for giving waving misty masses of snowy blossoms in the more informal spaces. Montbretias may not be regarded as annuals, nor are they, but I have been struck with their utility when treated as such. Few summer flowers are more charming or more valued for cutting than these, and I say with all sincerity that I believe the montbretia has a great future treated as an annual subject. Campanulas, particularly those of the C. carpatica and kindred sections, came well as annuals last season. But the taller forms, especially those of the C. persicifolia type, are useless in this direction.

Hybrid pyrethrums can be treated so as to have an early autumn display from a spring sowing, and the value of Gaillardia grandiflora, and, in a lesser degree, Coreopsis grandiflora is sufficiently notable to be taken into account, especially where large quantities of cut flowers are required. Then again, Michaelmas daisies make fine bushy plants from spring-sown seeds, and furnish a grand display of blossom, without attaining the weedy, over-grown appearance of plants which remain year in and year out in the same situation. Other subjects (perhaps equally good) might be mentioned, but the foregoing will prove the possibility of treating "perennials as annuals."

P. S. Hayward.

## CYMBIDIUM LOWIANUM AT DUNORLAN.

Few orchids are so useful as Cymbidium Lowianum, and certainly no member of the cymbidium family is so easily or so widely cultivated. We make no pretence to be orchid growers at Dunorlan; that is to say, we have not a collection of orchids, but grow batches of some of the commoner kinds, because of their value for cutting. We find Cymbidium Lowianum extremely useful. The flower spikes usually begin to open their flowers in February, and remain fresh for fully two months, but it is not wise to leave them so long on the plants. This year, owing possibly to keeping the flowers on the plants longer than usual in 1911, our specimens are neither flowering so well or so strongly as usual.

Once established in a good compost of fibrous loam, peat, and sand, and given plenty of drainage and ample root room, this cymbidium grows and flowers freely in a cool house, and is a capital orchid for an amateur to cultivate. Potting should be performed only when really necessary, as the thick fleshy roots are sure to be damaged somewhat during the process, with the result that flowering is deferred or is poor for a season. Plenty of water is needed when the plants are growing freely, and a little weak liquid manure is beneficial at this stage if the pots are well filled with roots. Under no consideration must Cymbidium Lowianum be allowed to become dry at the roots.

Some of the plants shown in the accompanying illustration I secured at a sale many years ago, and for some years previously they had been freely exhibited as specimens, and had always flowered finely and regularly. It will thus be seen that Cymbidium Lowianum is long lived, an easy plant to manage, and a very useful subject.

E. H. Caterer.

Dunorlan Gardens, Tunbridge Wells.

**Self-clinging Vines.**—A great deal of the popularity of Ampelopsis Veitchi, or Vitis inconstans, as it is also called, is owing to the fact that, once planted it takes care of itself, and mounts upwards without further attention. A fact, however, not so generally recognised is that there are several forms of this popular climber. The strong-growing kind, known sometimes as robusta, does not colour so well in the autumn as the more slender one. Beside these there is a form (purpurea), whose freshly-expanded leaves are of a pretty bronzy hue, and the distinct Lowi, whose small leaves are deeply cut. There is a variety of the common Virginian creeper known as muralis or Englemanni, which supports itself almost to the same extent as the Japanese kind. It might with advantage be more often grown than it is.—T.

## MAGNESIA.

We always used to be told in books, lectures, and papers, that the four essential plant foods we need concern ourselves with were nitrogen, phosphorus, potash, and lime, and that, although iron, soda, magnesia, sulphur, etc., were almost always present in the ash of plants, it was never necessary to consider them or apply them as a manure, because all ordinary soils contained enough of them for plant nutrition.

The last few years, however, we have been hearing a good deal from certain quarters about the necessity of applying magnesia to the soil. One pamphlet which is distributed freely says that the use of carbonate of magnesia is of great importance in potato and fruit culture, while a recent booklet on garden manuring says that in exceptional cases its application has proved beneficial, and that where there is an insufficient supply of it in the soil the leaves will be of a pale yellowish-green, and consequently the manufacture of food in the leaves will go on slowly. It seems to be a fact that vines do best in soils which are rich in magnesia, while it is stated that roses have been found to grow weakly in a soil which is deficient in this substance, and in such circumstances have derived great benefit from its application. If it is a fact that any soils or plants need the application of magnesia to ensure the best results, it is a little curious that, notwithstanding the fine produce displayed on the exhibition tables, we have until recently heard little or nothing about it.

It is doubtless true that good results have followed from an application of magnesium salt, such as carbonate of magnesia, but it seems that it was not because that particular salt was necessary, but because it, like the salts of soda, potash, and lime, has the effect of setting free stores of potash which are locked up in the soil in an insoluble condition. Experiments at Rothamsted prove this pretty clearly, and Mr. A. D. Hall, in his recent book on "Fertilisers and Manures," says that, while magnesia would render "available some potash in the soil, common salt would do the same thing more cheaply. Carbonate of magnesia has from time to time been suggested and even put upon the market as a manure, but there is no evidence to show that its action is in any way different from that of calcium carbonate; that is, it behaves as a base, and is not of any further value as supplying magnesia to the plant."

[Photo: J. Richards.

CYMBIDIUM LOWIANUM AT DUNORLAN, TUNBRIDGE WELLS.

That seems pretty conclusive, but those who think magnesia is necessary in their gardens should try it in comparison with, say, salt and lime, one of each of the three on a given plot carrying the same crop. The results would certainly be interesting, not only to the experimenter; but to a wider circle as well.

Alger Petts.

**Epacris onosmiæflora flore plena.**—This is interesting in being, as far as I know, the only double-flowered member of the genus, and withal a pretty flowering plant for the greenhouse. This species, which is, by the way, also known as Epacris purpurascens, is a stouter grower than most of them, and branches but sparingly. The long shoots are, when at their best, wreathed for the greater part of their length with white rosette-like blossoms.—T.

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

THE MEXICAN HOUSE.—In this house Odontoglossum citrosmum is starting into growth, but the plants must not be disturbed by repotting, nor unduly excited by watering, or they will produce no flower spikes. They should be kept at the cool end of the house, and receive no water until the spikes are seen to be pushing up through the centre of the young growths. When this occurs they may receive abundance of water both at the roots and in the atmosphere. Those plants which show no signs of flowering within the next few weeks, should not be rested longer, for no further amount of resting will induce them to bloom.

LÆLIA ANCEPS.—In the same house Lælia anceps, and its numerous varieties, will have passed out of bloom, and after they have enjoyed a short rest, and new roots are seen to be pushing from the rhizome, no time should be lost in supplying fresh rooting material, or larger receptacles to those requiring them. I prefer pans to pots, and these must be well drained. Do not disturb the plants more than is necessary, but any that have overgrown their receptacles, or that are unsightly, should be made up again into compact specimens. All useless backbulbs should be cut away, as it is not necessary to have more than three or four behind the leading growth. Should these backbulbs come from any variety which it is deemed necessary to increase the stock, they may be placed in a box or pan, upon a layer of sphagnum moss, and sprayed from time to time, when those which have good buds will push forth new growths; they may then be potted up. The compost I find them succeed in consists of equal parts peat, polypodium and osmunda fibre, and clean sphagnum moss, with a fair sprinkling of half-decayed oak leaves, which have been rubbed through a half-inch sieve. All the earthy particles must be taken from the fibres. The newly-potted plants must be watered cautiously until new roots are moving in the compost. They may be sprayed overhead occasionally on bright days, and they delight in the lightest and brightest position in the house. For the present the night temperature should range from 58 to 60 degrees, increasing gradually as the days lengthen. It matters little how high the temperature rises by sun-heat, providing plenty of fresh air is admitted. When young roots push from the rhizome, they must be carefully protected from woodlice and cockroaches, which do considerable damage, even in a single night. The above conditions answer the requirements of all the Mexican lælias.

SHADING.—Although up to the present it has not been necessary to use any shading, it will become a necessity at any time now; therefore all blinds should be thoroughly overhauled and put into working order, so that whenever the sun puts forth its power everything may be ready. We find lath rolled blinds answer our requirements in all cases, but during the abnormal summer of last year it was found necessary to use additional shading of thin canvas. The usual kind of shading for the ends or sides of the various houses must soon be brought into use; either stippling, or frames covered by canvas, or the foliage of the plants may easily be scorched.—J. T. BARKER, The West Hill Gardens.

## STOVE PLANTS.

TEMPERATURE. — As the days are now lengthening, and the sun's power appreciably increasing, a temperature a few degrees higher should be maintained both day and night; but the rise must be gradual, and in accordance with the conditions prevailing outdoors. Utilise the sun heat as much as possible by closing early in the afternoon, thus saving excessive fire heat at night.

INSECT PESTS.—Wage constant war with these at this season, when the conditions favour an increase of insect life. In these days there are numerous preparations on the market for the extirpation of pests, thus making it easy to keep the plants clean by timely applications.

BEGONIAS.—Begonias of the Lorraine type that have passed out of flower should be cut down to within four inches of their base, and kept rather dry for a time, then placed in heat and supplied with water to induce them to produce cuttings. These should be taken off with a heel when two or three inches long, inserted in sandy soil, and placed in the propagating frame. If potted on friable soil, used as soon as rooted, these will provide good specimens for the earliest batch of flowering plants next winter. Where extra large specimens are desired it is good practice to strike three cuttings in a thumb pot, and shift them on into larger pots when rooted without any disturbance. Excellent plants may be grown by selecting mature leaves at this time, and after passing the knife lightly over the ribs of the leaves, peg them on to sandy soil in pans. Plants raised by this method will bear comparison with those raised from cuttings. The Rex varieties are also particularly amenable to leaf propagation, and the present is a good time to raise the required number of plants.

ACHIMENES.—These are not so frequently cultivated as their merits deserve. The tubers should now be shaken from the old soil and restarted into growth. In gardens where these plants are grown in quantity it is good practice to start them in batches to form a succession. Grand specimens may be grown in ordinary round seed-pans, or the tubers may be started in a seed box, and when the young growth is two or three inches high, be transplanted into hanging baskets. The soil most suitable for achimenes is one consisting of two parts peat to one each of loam, and flaky leaf-soil, plenty of sharp sand, and a sprinkling of bone-meal and dried cow or sheep manure. The pans, or pots, should be three parts filled with the compost, the tubers laid flat on the surface, and then covered with half an inch of soil.—H. T. MARTIN, Warren Wood Gardens.

## FRUITS UNDER GLASS.

EARLY VINES IN FLOWER.—The sharp frost and snow, which we have recently experienced, accompanied by dull, sunless days, has had a deterrent effect upon early forcing. During the flowering period of vines the atmosphere of the house should be kept fairly dry, and we like to leave a crack of ventilation on the top ventilators night and day, but this has been almost impossible during the severe weather we have experienced, and at the same time maintain a steady minimum temperature of 60 to 65 deg., without overheating the hot-water pipes. We discontinued syringing and reduced the damping-down to a minimum for a few days during the flowering period to allow the flowers to set, but immediately a "set" has been obtained, syringing and damping-down will be commenced again, or red-spider will probably make its appearance. Pollinate the bunches with a camel's hair brush, or rabbit's tail, every day, when the pollen is dry, and easily dispersed. We find this is the safest plan to adopt at this early season of the year to ensure a good set. Later on in the season it is not necessary to adopt these means with free-setting varieties, but with Muscats and several shy-setting grapes it is imperative that it should be done.

THINNING GRAPES.—It is a great mistake to allow the berries to grow to the size of small peas, before commencing to thin them. A commencement should be made immediately they are set. The small berries grow with remarkable rapidity, and constant attention should be given; use a good sharp pair of thinning scissors, and exercise great care not to rub the berries in any way. Maintain a night temperature of 65 degrees, with a day temperature of 70 to 75 degrees, allowing a rise of 10 degrees with sun heat. Applications of weak liquid manure, and some approved chemical fertiliser should be given, and well watered in occasionally to accelerate the swelling of the berries, and to promote good healthy foilage. Continue to damp down the house late in the afternoon with weak liquid cow manure.

PEACHES AND NECTARINES.—Endeavour to finally disbud the earliest trees, and exercise due care to thin them sufficiently, and allow plenty of room to develop, so that later on no confusion will follow; commence to tie in the shoots as they advance in growth. The fruits will now be set, and a start should be made to partially thin them; proceed with due caution, first removing all badly-formed fruits, and also those that are too close to the wires. Administer some liquid or chemical stimulant to the roots, to assist the young fruits to grow away freely. Close the house, and syringe the trees thoroughly early in the afternoon, and maintain a night temperature of from 60 to 65 degrees. Close the second early house for successional fruits; give the borders a good soaking with clean water, and proceed on exactly the same lines as that recommended for forcing the early house.

MELONS.—Plants raised from seeds sown as recommended, early last month, will be ready to plant out into firm mounds of soil; give the plants a good watering to settle the soil around the roots after planting, and place a strong stake to each, to which it should be carefully tied.—HENRY R. FARMER, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

LAWNS.—These should be kept in good condition by frequently sweeping and rolling them during favourable weather, otherwise worm-casts render them unsightly. It often happens that lawns become impoverished from various causes, and where this is the case a good dressing of bone-meal, or some approved lawn manure, should be given at the present time. Weeds like dandelions and plantains must be taken out, and the holes be filled with some fine soil. Towards the end of March these places, and other bare parts of the lawn, can be sown over with some good grass seed, which should be well rolled in; but means must be taken to guard it against birds.

SWEET PEAS.—Autumn-sown plants that have been wintered in cold frames must be well supplied with air on favourable occasions to promote sturdy growth. For ordinary garden adornment seeds can be sown at the present time in 60-sized pots, three seeds in each pot, and placed in a house with a temperature of 55 degrees to germinate. When the seedlings are above the soil, give them a position near the glass, and finally remove them to a cold frame where they can be hardened off, to plant out early in April. When they need support, place a few twiggy sticks around them to keep the plants erect.

BORDER CHRYSANTHEMUMS.—Those boxed up in the autumn are now producing an abundant supply of cuttings, which should be taken off with a sharp knife and inserted in small pots filled with a light sandy compost. If placed in a brick pot with a temperature of about 50 degrees, and kept near the glass, they will soon take root, and can then be potted separately. They should be given a good watering, and kept close for a few days until they take root in the new soil, when more air can be given with advantage.

DELPHINIUMS AND PHLOXES.—These are both handsome border plants worthy of extensive cultivation, and they delight in a rich and deep rooting medium. When it is desired to increase choice varieties, this can readily be done at the present time by detaching small side shoots with some roots attached. Pot them up separately in small pots, and place in a cool house or frame, which should be kept fairly close for a time until growth commences. Later on they can be planted out where required, in bold groups for preference, or, if it is desired to still further increase any of the phloxes, they should be grown on in pots, and have cuttings taken from them.—J. GARDNER, Batsford Park Gardens.

NATIONAL SWEET PEA SOCIETY. Great Exhibition at Royal Horticultural Hall, Westminster, July 9 and 10. Join now. Minimum Annual Subscription, 5s. Schedule on Application. "Sweet Pea Annual," free to members; 2s., post free, to non-members. "List of Sweet Pea Names," free to new members. CHARLES H. CURTIS, Hon. Sec., Adelaide Road, Brentford, Middlesex.

# EXHIBITIONS AND MEETINGS.

## Royal Horticultural Society.

The blackness of darkness overshadowed Westminster on Tuesday afternoon last, when, at three o'clock, Sir Trevor Lawrence, Bart., took the chair at the society's annual general meeting. Sir Trevor was supported by Sir Albert Rollitt, Lord Balfour of Burleigh, Sir J. T. D. Lewellyn, Bart., Lieut.-Colonel Sir George Holford, Mr. J. Gurney Fowler, Mr. Harry J. Veitch, Mr. H. B. May, Mr. E. A. Bowles, Mr. Jas. Hudson, Mr. W. A. Bilney, etc., and among those present at the meeting we noticed the Rev. G. H. Engleheart, Messrs. H. J. Cutbush, W. Howe, J. F. McLeod, G. Gordon, R. H. Pearson, J. T. Bennett-Poe, Alexander, R. Pinches, J. Green, G. J. Ingram, J. Cheal, Thos. Bevan, E. F. Hawes, C. H. Curtis, J. H. Dick, and A. Bartlett.

The usual formalities having been disposed of, the President expressed the regret all felt at the absence of the Rev. W. Wilks, owing to indisposition.

The report of the Council, of which we give an abstract, having been circulated, was taken as read.

### EXTRACTS FROM ANNUAL REPORT.

WISLEY GARDENS. — In common with most gardens having sandy soils in the South of England, the Society's Garden at Wisley suffered from the exceptionally hot and dry summer. The heavy rains of October, November, and December have been most welcome. A large rock garden, including a small bog garden and a miniature moraine, has been constructed by Messrs. Pulham. It covers what was formerly a rough grass-grown hill above the water lily pools in the south-west corner of the old garden, to which it will, when fully planted, make a most attractive addition. The planting has been begun, but is necessarily a somewhat lengthy proceeding, and the full effect of the new work will hardly be apparent until the plants have had some years growth. It should be remembered that the garden is not designed to afford the most artistic arrangement of stonework, so much as a suitable home for rock and alpine plants. The Council gratefully acknowledge the gifts of rock plants from Sir Frank Crisp and Mr. E. A. Bowles, and of ferns from Mr. W. Marshall, V.M.H. A special foreman, Mr. D. Sarsons, lately rock gardener at Wretham Hall, Norfolk, has been placed in charge of this department, and the Council have full confidence that under his superintendence it will soon be an object of interest and instruction to the Fellows.

SCHOOL OF HORTICULTURE AND LABORATORY.—The valuable practical and scientific educational work being conducted at Wisley, is becoming more and more widely recognised. Its position is in some respects unique, there being in many places too great a tendency to look upon information about gardening as the one thing to acquire, instead of a knowledge of gardening. The Council are convinced that the young horticulturist to be started on the right lines for his future development should both be equipped with (1) a sound knowledge of the scientific principles underlying his craft, and also have acquired (2) a considerable degree of and appreciation for technical skill, which can only be derived from the actual and continual performance of the various operations. The more closely these two are connected with one another in time and place, the more capable each is of aiding the other, and this is the aim of the students' course inaugurated at Wisley in 1907.

During the past year Sir Albert Rollit, as a member of the Senate of the University of London, and also a member of the Council of our society, has been endeavouring to secure the University's recognition of our School of Horticulture at Wisley. The matter has made considerable progress and hopes are entertained of its reaching a successful issue, though as yet it is too soon to speak at all confidently.

The increased demands upon the time of the director, and the necessity for his constant presence at the gardens to watch experimental work, has necessitated both the appointment of an assistant lecturer—Mr. Arthur S. Horne, B.Sc., F.G.S.; and also the building of a house on the spot for the director.

THE CORONATION CUP.—In celebration of the Coronation of their Majesties King George and Queen Mary, patrons of the society, the Council caused a special silver-gilt challenge cup to be designed at a cost of sixty guineas. It will generally be offered for competition at the summer show, and will be adjudged directly by the Council to whatever in their opinion is the best exhibit in the show. A small replica of the cup will each year be given to the winner, together with the custody of the larger cup for twelve months.

LIBRARY.—The annual report for 1910 recounted the steps which had been taken by the Council and trustees to secure a closer identification of the Lindley Library with the society, whilst at the same time preserving it as a perpetual trust. This action paved the way for the appointment of a Special Library Committee, which now consists of Messrs. J. T. Bennett-Poë, E. A. Bowles, E. A. Bunyard, J. Gurney Fowler, Dr. Daydon Jackson, J. R. Lowe, Arthur Paul, C. H. Payne, H. J. Veitch, and Rev. W. Wilks The committee meets fortnightly and recommends to the Council the acquisition of desirable new or rare old books which may happen to be obtainable at the moment, together with those suggested by any of the Fellows. About 300 volumes have been purchased this year, amongst them being Redouté's "Les Liliacées," Dr. M. C. Cooke's "Original notes and drawings of Parasites of Cultivated Plants," Sibthorp's "Flora Graeca," Mas' "Pomologie; Pomologie de la France," Mas' "Le Verger," Besler's "Hortus Eystettensis," Bury's "Hexandrian Plants," Trew's "Plantæ Selectæ," Descourtilz's "Flore des Antilles," Maund's "Botanic Garden," Andrews' "Heathery," and many others. The amount expended on books has been between £800 and £900. The whole library is being rearranged, classified, indexed, and catalogued, under the supervision of Messrs. Wesley.

The necessity of putting up additional book cases having come to the knowledge of Baron Bruno Schröder, nephew of the late Baron who so generously fitted up the library at his own expense, Baron Bruno offered to take upon himself the provision of the new oak cases, in order that the whole of the furnishing of the library might continue to be identified with his family's name. The total cost exceeded £100. The Council greatly appreciate this most kind generosity.

PLANT COLLECTOR.—The appointment of a Plant Collector will be considered by the Council at an early date.

TRANSACTIONS.—At the last annual meeting it was suggested that, in addition to the present "Journal," "Transactions" should be issued from time to time, devoted exclusively to scientific matter, and sent to those only of the Fellows who would like to subscribe an additional £1 1s. a year for the purpose. A communication was therefore sent to all the Fellows of the society setting forth the proposal, but as less than sixty favourable replies were received out of 12,000 Fellows, the Council have decided to allow the proposal to stand over at least for the present.

PRESENTS.—Many gifts have been made to the society during the year. Baron Bruno Schröder's munificent gift to the library has already been mentioned; as have also the plants from Sir Frank Crisp, Mr. Bowles, and Mr. Marshall. 220 books for the library have been received under the bequest of the late Mr. Gumbleton; 150 volumes from the late Colonel Beddome's library, presented by his widow; a collection of dried specimens of British plants from Miss F. M. Hudson; a fine old steel engraving of Linnaeus from Mr. Christopher J. Sandberg; an original autograph engraving of William McNab, of Edinburgh, from Mr. Chas. Ross, V.M.H., and two silver cups, one from Mr. A. L. Wigan as an annual prize for roses at the summer show, the other for Alpines presented by Mr. Reginald Farrer. The Council take this oppotunity of expressing their cordial thanks to the donors.

Sir Trevor Lawrence referred briefly to a few points in the report, and said that a rock garden at Wisley was now in being, and was being steadily furnished, thanks to the generosity of many members. The School of Horticulture at Wisley was progressing, as would be gathered from the report, in the most satisfactory manner. The society's exhibitions had, with one exception, Olympia, been a success, but the intensely hot weather had a trying effect upon both flowers and visitors at Addison Road. The library was progressing, nearly £1,000 had been expended upon rare books during the year, and the Council was prepared to do all it could to make the library one of the finest of its kind in the world. Baron Bruno Schröder had generously given new shelves for the library. The President expressed regret that in the report, in connection with library matters, the name of Mr. C. Harman Payne, who had rendered able service, had been accidentally omitted. Sir Trevor had nothing further to say about the appointment of a plant collector than is contained in the report. In the present year, he said, a new departure would be a two days' orchid show in the autumn. The society had sustained a great loss by the death of Sir Joseph Hooker, a great botanist and a foremost scientist. The passing of M. Lemoine, of Nancy, who had done so much to improve garden plants, such as syringas and begonias, was sympathetically adverted to. The President pointed out that the financial position of the society was excellent; he remembered the time when the society could not pay its tradesmen's bills; but in the past year they had finished up with a surplus of £8000. Sir Trevor concluded with a very hearty appreciation of the services of the staff at Westminster and Wisley, paying special compliments to the Rev. W. Wilks, Mr. S. T. Wright, and Mr. F. Reader. The motion for the adoption of the report and balance-sheet was then moved by the President.

Mr. J. Gurney Fowler, the treasurer, seconded the adoption of the report and balance-sheet, and referred to the building of a new house for the director at Wisley, and the investment of £6,000. At present the society was putting on one side about £500 a year as a depreciation fund, so that when the lease of the hall, etc., fell in there would be a large capital sum to provide new premises. Income from subscriptions and the Government Educational Grant had increased considerably in the year, but the takings at the hall were lower than usual, because the hall was closed for redecoration for some time. General expenditure had increased somewhat owing to the increase of Fellows, and the "Journal" had cost about £400 more than in previous years.

One gentleman tendered congratulations to the Council, and spoke very highly of the kindly services always rendered to Fellows by the society's librarian, Mr. Hutchins.

The Rev. G. H. Engelheart made reference to the granting of awards. In past years, he said, the Council had suggested that awards were being made rather freely, and therefore their value was likely to be reduced as a consequence. He thought the society should be very jealous of its awards, and he urged that the award of a gold medal should never be cheapened. He referred to a large group of Chinese plants, collected and brought home at great risk and cost; to this a gold medal was rightly awarded. At a meeting shortly after a similar award was granted to a fine group of ornamental gourds, which, he thought, was not of equal value to the Chinese plants. To meet the case he suggested a small gold medal and a large gold medal. Again, there were anomalies in the awards of First-class Certificates. He understood that this higher award had sometimes been given to a florist's flower, and he asked, Are orchids florists' flowers now? During the year forty-five First-class Certificates were awarded, and thirty-seven of these, he believed, were granted to orchids. He did not depreciate orchids, but thought the awards of so many F.C.C.'s was apt to confuse the mind of the public. Surely a rose or a hardy plant available for every garden was deserving of as high an award as an orchid that could be grown only in a hothouse. He considered the Council's monition regarding awards should be repeated, and, if necessary, enforced.

The President said they could only leave the awards of plants, groups, etc., to the judgment of the members of the various committees, and, referring to the exhibit of gourds, he said it was a quite unique display of its kind.

The motion was then put, and the report and balance-sheet were adopted unanimously by sixty or so of Fellows present.

The members of Council elected were: Baron Bruno Schröder. Mr. Harry J. Veitch, and Mr. W. A. Bilney. Sir Trevor was re-elected president, Mr. J. Gurney Fowler re-elected treasurer, and the Rev. W. Wilks secretary.

On the motion of Sir John T. D. Llewelyn, Bart., and the Rev. J. H. Engleheart, a very hearty vote of thanks was accorded the president for his services. Sir Trevor suitably responded, and said he had just celebrated his 80th birthday.

---

## Royal Scottish Arboricultural Society.

The fifty-ninth annual business meeting of this society was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 9th inst. The President, Sir John Stirling Maxwell, Bart., occupied the chair, and there was a fair attendance. According to the report by the council, 115 new members were admitted during the year, the net increase being 42, and the number on the roll was 1,411. The abstract of the accounts showed that, after providing for the ordinary, and about £470 of extra expenditure, the balance of income over expenditure was £51 3s. 1d. The extra expenditure had been heavy, the cost of publishing the report of the Glen Mar survey being £319 15s. 1d., and the expenses of the society's exhibit at the Scottish National Exhibition being £149 7s. 5d. The funds at December 31 last stood at £1,822 18s. 4d.

In moving the adoption of the reports, the President made some reference to the report of the Aberdeen branch, and expressed the opinion that it would be a good thing to have more of these branches. He thought that, although the Glen Mar Forest Survey had cost a good deal of money, it was nevertheless money well spent, and when, in the next half-century our Highland hills were covered with woods, as they no doubt would be, it would be a matter of much satisfaction to the society that they had taken the lead. Referring to Lord Pentland's announcement that there was to be a Forestry Department attached to the Board of Agriculture in Scotland, Sir John thought that Lord Pentland was right in doing this, but forestry could not be run by people who were ignorant of it, and it was very necessary, as Lord Pentland had recognised, that this department should be in the hands of skilled persons.

Sir John Stirling Maxwell was re-elected president; Lord Lovat and Mr. Charles Buchanan, Penicuik, were elected vice-presidents; and the following were elected to the council: Messrs. A. T. Gillanders, F.E.S., Alnwick; Jas. Whitton, Glasgow; Wm. Davidson, Panmure; and W. H. Massie, Edinburgh; Lord Balcarries, M.P., Captain Archd. Stirling, of Keir, and Mr. A. D. Richardson, Edinburgh. The Right Hon. R. C. Munro Ferguson, M.P., was re-elected hon. secretary, and Mr. R. Galloway, S.S.C., was re-elected secretary and treasurer. The other honorary officials were re-elected.

At the conclusion of the business part of the meeting, an address (illustrated by lantern slides), was delivered by Mr. John F. use of the students attending the Armstrong College, Newcastle-on-Tyne, and acting agent and manager for the Crown Woods at Chopwell, Co. Durham, on "Some Uses of Demonstration Forest in Forestry Education." The lecturer dealt with what Mr. Annand was doing in order to bring these woods into the condition of a demonstration area for the use of the student attending the Armstrog College, and it was of great interest. On the motion of the President, Mr. Annand was very cordially thanked.

---

## Manchester and North of England Orchid Society.

At the meeting held on Thursday, February 8, the members of committee present were: Rev. J. Crombleholme (in the chair), Messrs. R. Ashworth, W. R. Lee, C. Parker, H. Thorp, Z. A. Ward, J. C. Cowan, J. Cypher, J. Evans, W. Holmes, A. J. Keeling, D. McLeod, W. Stevens, and H. Arthur (secretary). The contributions were numerous and of much interest.

Z. A. Ward, Esq., Northenden (gardener, Mr. Weatherby), was awarded a Silver-gilt Medal for a group composed principally of odontoglossums in variety. The plants were well grown, and the most noteworthy were O. Wilkieanum Jasper (A.M.), O. Adrianæ var Vulcan (A.M.), O. Jasper (A.M.), O. amabile Mrs. Buckley, O. Rolfæ Ward's var., O. Northenden Beauty, O. Wardi, O. ardentissimum Ward's var., O. crispum Luciani, with Cypripediums Beechense, aureum Virginale, Leeanum Avalanche, Minos Youngi, Berryanum, and a pretty variety of Lycaste Skinneri.

W. R. Lee, Esq., Heywood (gardener, Mr. Branch), staged a nice group of choice plants, to which a Silver-gilt Medal was awarded. Among the odontoglossums were O. percultum purpurescens (F.C.C.), Euterpe, Lucianni, Lindeni, and Mirandum, Miltonia Blueana, Dendrobiums Leechianum and nobile Hardy's var., Brasso-cattleya Mendeli-Digbyana, with cypripediums in variety, C. Trollius Craveniianum being very fine, the dorsal sepal measuring three inches Cybridium Holfordianum were also of much merit.

R. Ashworth, Esq., Newchurch (gardener, Mr. Gilden), was awarded a Silver Medal for a nice mixed group, the odontoglossums in variety, crispums, and hybrids being very fine, one in particular, named Orphanum (A.M.), of unknown parentage, and the pretty O. Cervantesi decorum. Dendrobiums Ainsworthi and Burberryanum superbum, cattleyas of the Trianæ section, Miltonia Blueana, Lycaste aromatica, and the choice Cymbidium Holfordianum.

Colonel J. Rutherford, M.P., Blackburn (gardener, Mr. Lupton), staged a miscellaneous group to which a Silver Medal was awarded, odontoglossums being well represented, some very nice blotched crispums and hybrids, including Luci Masereel, together with some nice plants of O. Rossi majus, Cypripediums Merlin magnificum, Harefield Hall, and aureum Ædippe, with varieties of the Leeanum section were also remarkable.

A. Warburton, Esq., Haslingden (gardener, Mr. Dalgleish), was awarded a Silver Medal for a choice group, in which were fine examples of Odontioda Bradshawæ Warburton var. (F.C.C.), Odontoglossums Victoria Regina, Emperor Rex, King Emperor, Her Majesty, Albert Warburton, The Lady, and Lambeouianum, with Cypripediums Lucernale (A.M.), and Leeanum varieties making a fine display.

Rev. J. Crombleholme, Clayton-le-Moors (gardener, Mr. Marshall), was awarded a Bronze Medal for a small group of cypripediums, comprising such fine forms as Mrs. W. Mostyn, G. F. Moore, Mons. de Curte, Mortoni, Lord Ossulton, and Statterianum.

J. McCartney, Esq., Bolton (gardener, Mr. Holmes), was also awarded a Bronze Medal for a group comprising Cattleyas Holmesi and Trianæ (in variety, Lælies anceps Sanderiana and Schroderiana, Dendrobium nobile Balliæ, Calanthe Wm. Murray, Cypripedium Leeanum Clinkaberryanum and seedlings.

W. J. Hargreaves, Esq., Burnley, contributed a small group of cypripediums, to which a Bronze Medal was awarded, the best being Harbourni, Grovesianum, Rossetti, Maudiæ, Evelyn Ames, Fowlerianum, Minos Youngi, Thalia, aureum Virginale, and other hybrids.

Wm. Thompson, Esq., Stone (gardener, Mr. Stevens), staged Cypripediums Hercules (A.M.), Draco (A.M.), and Nubia (A.M.).

From J. J. Holden, Esq., Southport (gardener, Mr. Johnson), came Cypripedium Birkdalense (A.M.) and a fine, well-flowered plant of Lycaste x Mary Gratrix.

G. H. Pearce, Esq., Monton Grange (gardener ,Mr. Mace), submitted Odontoglossum Phœbe Monton Grange var., a well-grown plant with a fine branched spike.

Messrs. J. Cypher and Sons, Cheltenham, were awarded a silver medal for a remarkably fine group, in which L. anceps Barkeri and Sanderiana, Brassovola Digbyana, Brasso-cattleya Maroni, cattleyas in variety, Lælio-cattleyas calistoglossa and Welleysiana, Cypripediums Curtmani, Alcibiades superbum, Vandyke, Gigas Corndean Hall var., Beechense, and Calanthes William Murray and Bella were, with others, splendidly represented.

Messrs. Sander and Sons, St. Albans, contributed a fine group, to which a silver medal was awarded. Especially noteworthy were Cattleyas Gaskelliana, Exquisita, Trianæs Vivicans and Corona, Brasso-cattleyas Fourneri picturatum and Sirens, and Cypripediums Stephanos, aureum Surprise, Pyramus, Flamingo, Goldfinch, and Helen Pulchrissima.

Messrs. Hassall and Co., Southgate, sent Odontoglossums Endresi majus, percultum. Solon, Lawrenceanum, Cypripedium aureum The Pearl, and Lycaste Skinneri alba.

Messrs. A. J. Keeling and Sons, Bradford, staged Odontoglossums Lambeauianum and Virginale, and two seedlings; and Mr. W. Shackleton, Great Horton, showed three plants of Odontoglossum crispum, one very fine variety with large white flowers.

### AWARDS.

First-class Certificate. — Odontoglossum percultum var. purpurescens, from W. R.

Lee, Esq., distinct variety with fine round flowers, bronze-purple, the segments edged with white.

Awards of Merit.—Odontoglossum crispum Euterpe, from W. R. Lee, Esq., a nice variety with well-formed and brightly-coloured flowers; Odontoglossum Wilkieanum Jasper, a fine large flower, O. Adrianæ Vulcan, nice dark spotted variety, and O. Jasper, parentage unknown, all from Z. A. Ward, Esq.; O. Orphanum, a brilliantly-coloured form, from R. Ashworth, Esq.; Cypripedium Birkdalense, a distinct variety with finely-formed flowers, from J. J. Holden, Esq.; C. Hercules, C. Draco, and C. Nubia, all fine varieties, from Wm. Thompson, Esq.; and C. Lucernale, a very fine form, well spotted, from A. Warburton, Esq.

## Scottish Horticultural Association.

The first monthly meeting of this association for session 1912 was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 6th inst., when Mr. Massie, the president, delivered his opening address to a large audience, taking as his subject "Garden City Problems." The address was highly interesting and of much practical importance, and we hope to publish it in our next issue.

The after discussion was taken part in by Mr. Fife, Mr. Todd, and Mr. Whytock; and, on the motion of Mr. D. W. Thomson, the president was very cordially thanked for his address.

At the meeting on March 5, Dr. J. H. Wilson, of St. Andrew's University, will deliver a lecture on "Fruit Growing in Australia" (with lantern illustrations).

## Croydon Gardeners' Association.

The members of the Croydon and District Horticultural Mutual Improvement Society attended in good numbers to hear the lecture on "Water and the Wild Gardens," given by Mr. A. Smith from the Royal Horticultural Society's Gardens, Wisley, at the last fortnightly meeting of the society.

The cultivation of the various subjects suitable for water and wild gardening was well expounded by Mr. Smith, and he was able with lantern views to show his audience many of the beauty spots contained in Wisley Gardens.

To the casual observer these spots might appear a part of Nature's garden, and that each flower, plant, or tree, had been deposited in its position during years of natural growth without attention from the hand of man; but this is not so. True that was the ideal arrived at, and it is a compliment to the cultivator when he gives this impression, but in doing this the art of landscape gardening is brought into requisition, and in Mr. Smith's lecture one was carried through a complete transformation of a waste tract of land into a beautiful picture.

Mr. Smith explained that Nature must be the one copy in laying out the garden. In choosing the site the lower levels of the landscape must be used; building a water garden on a high elevation may be accomplished, but the natural effect is missing, and the beauty is lost. If one has the advantage of a natural stream then by all means make use of it, but where artificial means of water supply are used this must be taken into account. Clearing the space around the intended water course must be done thoroughly and all roots removed. Levels and gradients must be observed and the bed of the water course must be irregular in shape. For a big pond puddling with clay may be done, but in smaller gardens it will be found of great advantage to cement the bed of the stream as well as the sides. This will prevent some of the plant enemies like water rats, moles, etc., getting through the sides, and facilitate the work of clearing out the water area. The surrounding ground on either side of the stream should be well dug and manured ready for the plants intended to grow. To build rockeries with huge boulders on either side of the water course was deprecated, for from a natural view the effect is spoilt. Far better to plant down to the water's edge such subjects as will grow, and there are plenty to choose from.

Generally one finds in a water garden a rustic wooden bridge standing high above the stream; but, in the lecturer's opinion, this is an eyesore, for, as he remarked, one can see on approaching it everything up to the bridge; but the full picture is hidden, and a view has to be taken from the bridge itself to obtain the remainder of the picture. A few stepping-stones would provide the means of crossing, and at the same time the complete picture could be seen. Planting the pond or stream can be done from early in the spring till autumn, and when the pond is full of water. Shallow baskets filled with prepared soil will give the plants their food supply, and the building up of these baskets was a detail not missed by the lecturer.

A long list of suitable plants for the stream was given by Mr. Smith. From the water garden on either side of the stream a gradual rise should be aimed at by planting specimens in bold groups of flowering and foliage subjects, and the ground previously prepared will soon be covered with a collection of plants giving form and colour through all seasons of the year.

At the close of the lecture Mr. Smith was accorded a hearty vote of thanks. A few exhibits were staged by members. Mr. T. Butcher put up a collection of miscellaneous plants. Mr. West brought a dish of Ailsa Craig onions, and two dishes of apples and one of pears were staged by Mr. M. E. Mills, the hearty thanks of the meeting being given to each exhibitor.

## Bournemouth Gardeners' Association.

The annual meeting of this society was held at the Town Hall Avenue Assemply Rooms, on the 6th inst. The President, J. H. Ralph Smythe, Esq., J.P., presided, and there was a good attendance of members.

The report showed a very satisfactory state of accounts, a better balance being in hand than was the case last year. There is an increased membership, and much more interest taken by members generally, in the doings of the society. The librarian, Mr. Barge, has charge of a very good collection of books, which are well studied, especially by the new members.

During the past year some very fine plants and garden produce generally have been staged at the fortnightly meetings, and special mention should be made of the grand collection of orchids, which nearly filled one side of the large room, staged by Mr. Jones, gardener to J. H. Rolls, Esq., J.P.; and the collection of miscellaneous stove and greenhouse plants brought at the same time—in November—by Mr. Welch. Certificates of Merit were awarded in both cases. The cypripediums in Mr. Roll's group were magnificent.

In one special class prizes were awarded to exhibitors who gained the highest number of points for produce staged in it during the whole year. This is called the "points" prize class. Certificates of Merit and other prizes are awarded for other exhibits quite distinct from it. Mr. Nippard, gardener to J. J. Norton, Esq., J.P., Ashton Court, Bournemouth, won the "Points" first prizes, namely, an "Abol" syringe, and a beautiful framed water-colour painting by Miss Roper, who presented it. Mr. Tompkins, head gardener to the Dowager Lady Miller, Ladywell House, won second honours, a lovely water-colour painting, by Miss Roper, who was again the donor. Mr. Charles Pearce, gardener to Mrs. Ormond, Astney Firs, Bournemouth, won the third prize, a book on sweet pea culture, presented by the hon. secretary and hon. treasurer.

A list of papers on very interesting subjects is arranged for the first session of the year, and in July the committee intend holding a sweet pea and rose show in the Central Hall, Bournemouth; and, although entries will be confined to the members only, a fine show is looked forward to. Special prizes are to be devoted to the classes provided. The fortnightly exhibitions will be held as usual. The "Points" prizes class is being considerably extended; more prizes are to be offered, and classes are so arranged that the majority of the members can enter in them.

The president, vice-presidents, hon. and assistant secretaries, trustee, treasurer, and librarian were all re elected, and to the committee some new members were added. Altogether, the future prospects of this old and important society are very encouraging, as much influential support by noted horticulturists is being given.

A cordial vote of thanks was voted the president at the close of the meeting.

## Reading Gardeners' Association.

The fortnightly meeting of the association took place in the Abbey Hall on Monday. Owing to the inclement weather the attendance suffered from the absence of members residing at a distance from the town, but the paper for the evening was most attractive. Mr. F. B. Parfitt presided over what must be regarded as a fairly good muster of members.

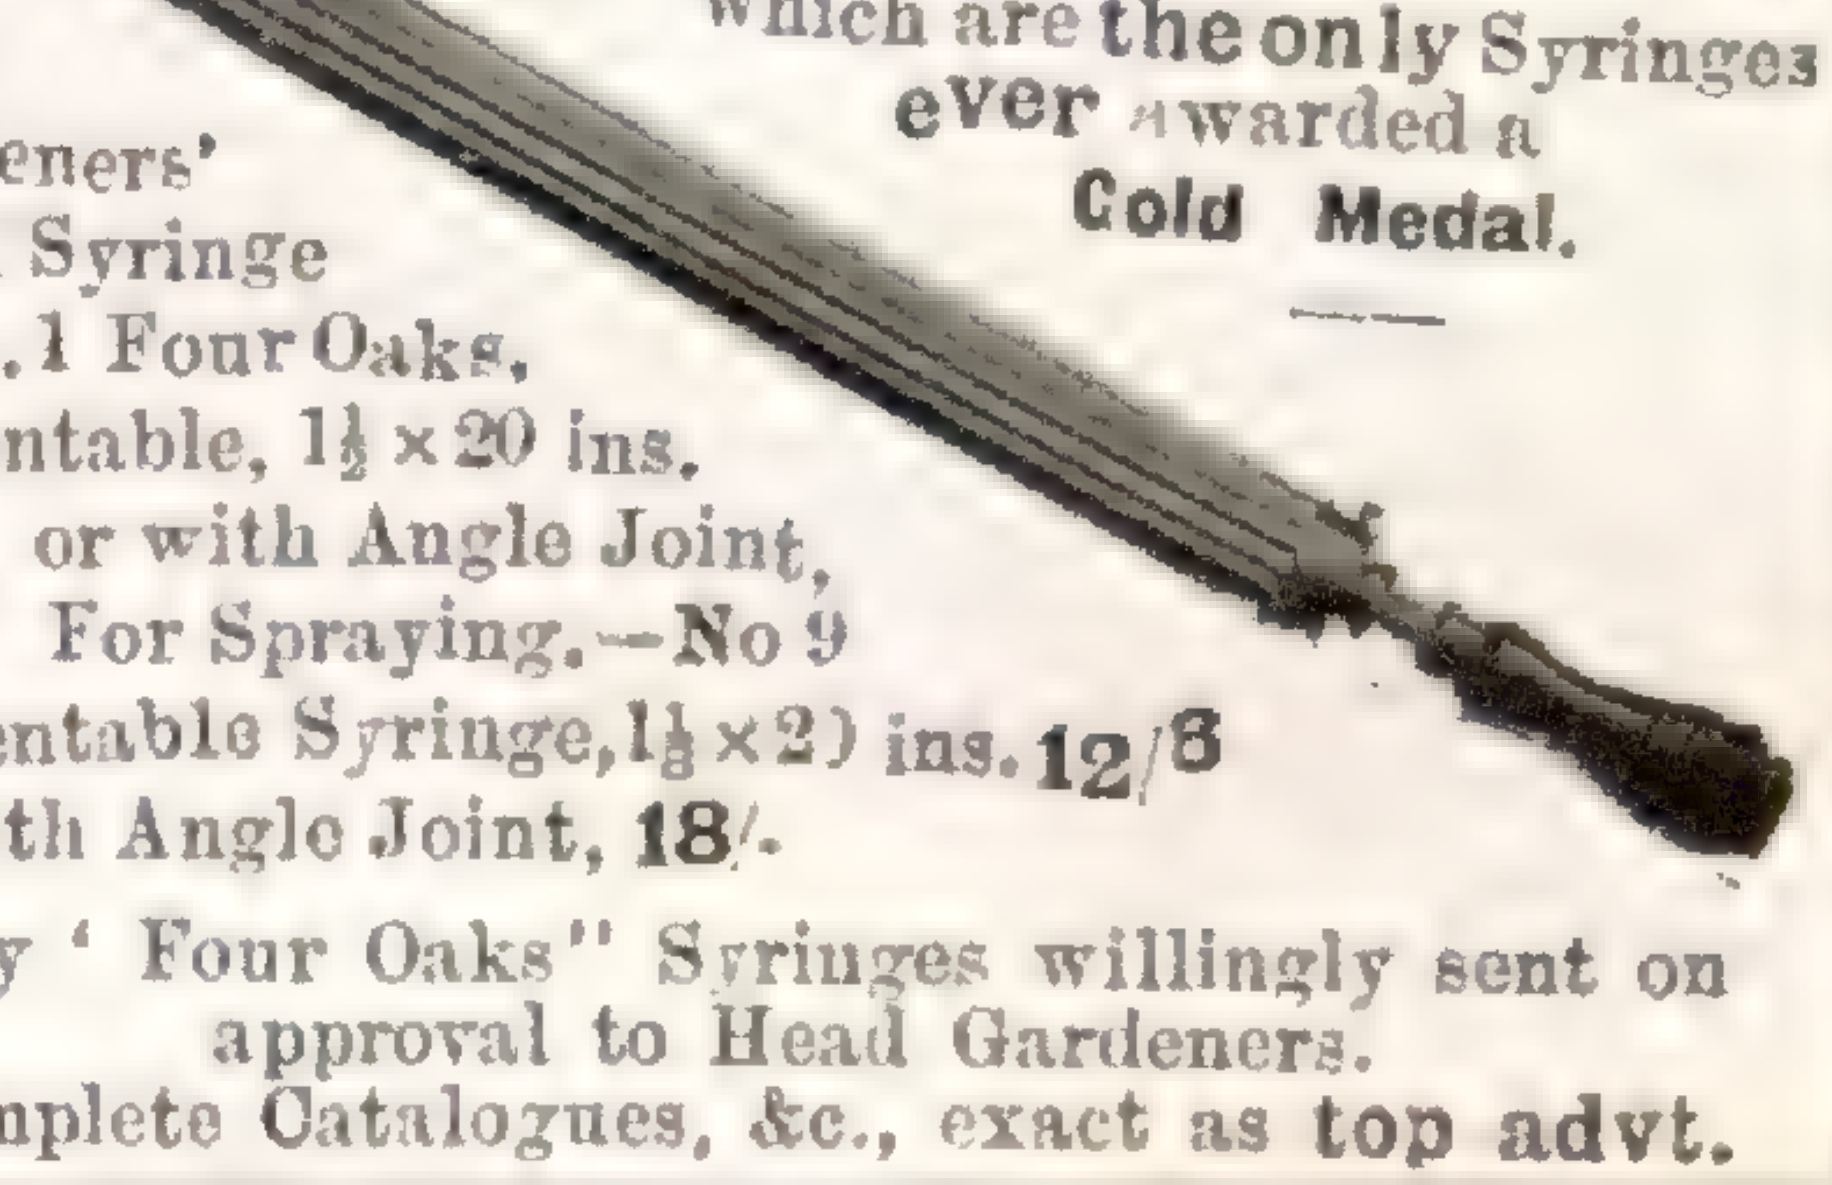
The lecturer was Mr. J. O. White, one of Messrs. Sutton's experts in floriculture, and his subject was "A Chat on Sweet Peas." Mr. White is an authority on the culture of sweet peas, and he was followed with close attention throughout his remarks. The lecture was illustrated by a fine collection of beautiful slides, many of them faithfully depicting the better-known and favourite varieties of the ',Queen of Annuals," as well as pictures of many fine exhibits staged by prominent growers, and the appearance of these on the screen evoked frequent applause. The lecturer, however, did not confine his slides to beautiful flowers only; a large number were altogether of the utilitarian order, and included object lessons with regard to preparing the ground, sowing in pots, sowing in the open, in borders and in trenches, the transplanting of seedlings, and the various distances they may be set apart in order to secure the desired result. Staking, too, in different forms also came in for illustration. Apart from the instruction which the slides conveyed, Mr. White also gave those present the benefit of his experience as to the preparation of the ground for sweet pea culture, trenching, manuring, watering, feeding, all being most fully and carefully dealt with.

At the conclusion of the paper an excellent discussion took place and the many questions put to him were answered by the lecturer in the most lucid fashion. On the proposition of the President, Mr. White was accorded a hearty vote of thanks.

## GARDENING ENGAGEMENTS.

Mr. Fred Francis, of Isleworth, has been appointed head gardener at the Royal Naval School, Twickenham.

Mr. F. Russell, foreman at Coombe Court Gardens, Kingston, Surrey, has been appointed head gardener to Major Renton, Naseby Hall, Warwickshire.



SYRINGES.

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the
"FOUR OAKS,"
which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No. 1 Four Oaks, Undentable, 1½ × 20 ins. 21/-; or with Angle Joint, 27/-. For Spraying.—No 9 Undentable Syringe, 1½ × 20 ins. 12/6 or with Angle Joint, 18/-.

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners.
Complete Catalogues, &c., exact as top advt.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

WHAT IS A GLAZED FROST?—M. J., Streatham: Kindly give me an explanation of the term "Glazed Frost."—In further answer to the above question, appearing in our issue of February 3, Mr. W. Gardiner, Horsham, writes: In addition to the answer already published, it may be interesting to your correspondent and other readers to know that on January 18 a glazed frost was very much in evidence at Horsham and the neighbouring districts of Sussex, and upon enquiries I cannot ascertain that a similar occurrence had been noticed during the last seventeen years. Seventeen years ago the lake at Warnham Court was sufficiently frozen over for skating, but never again since until this year. The last glazed frost was, I have been informed, so sharp and general in this part of Sussex that the very highways afforded excellent skating, but, so far as I can gather, no material damage was done to vegetation by it.

FILLING A LONG FLOWER BED.—Strathmore, Cambs.: I have in my garden a bed about 18 or 20 yards long, backed by a hedge, ornamental trees, and some herbaceous plants. The front of the bed, which comes down to a lawn, I thought of planting something as follows, and shall be pleased to have your opinion of the correctness of it, or any suggestion for improvements: First row, echeverias; second row, lobelias; third row, yellow violas; fourth row, Cineraria maritima or Dactylis glomerata variegata; fifth row, Pentstemon Newbury Gem; sixth row, Yellow Queen antirrhinums; seventh row, Zonal Pelargonium King of Denmark. I have all these plants by me, and hence would like to use them, but would gladly consider your suggestions for addition or substitution.—Although it is no uncommon thing to find hardy and very tender subjects associated in beds and borders for a summer display, it is much better to keep the two distinct, if possible; hence the echeverias, lobelias, Cineraria maritima, and Pelargoniums King of Denmark should be associated in beds or borders near the house, while the bed referred to could be devoted to the hardier subjects. Use an edging of sweet alyssum, and cover the ground behind it with the yellow violas. In this groundwork set the pentstemons and antirrhinums in groups, each group about a yard across, adding groups of pink, white, and yellow early-flowering chrysanthemums of various heights, some annual chrysanthemums (sown now under glass), and some chamois and pink antirrhinums. These additions would not add very materially to the expense. Each group might have an encircling ring of the variegated Cocksfoot grass.

PINK EARLY-FLOWERING CHRYSANTHEMUMS.—H. P., Gamlingay: You will greatly oblige me by giving a short list of pink or pink shaded chrysanthemums of the early-flowering section in your "Answers to Correspondents" column.—The following are all excellent varieties in various shades of pink: Ada, Dainty, Dolly Reeves, Dora Blick, Dorothy Humphery, Elenore, Goacher's Pink, Glory of Merstham, Hector, Jas. Bateman, L'Aube, Lillie, Nellie Hemsley, Normandie, O. J. Quintus, Provence, Patricia Rabbie Burns, Ryecroft Beauty, Satin Rose, and September Belle.

LENTEN ROSES.—H. E. B., Berkhampstead: Having greatly admired the improved forms of Lenten roses exhibited during late years, I am anxious to secure some of the best varieties. I fancy some are named, and should therefore be glad if you will give a selection of these, and some suggestions for planting, in an early issue.—Hellebores do well in rich loamy soil, inclining to heaviness, and are usually best managed in a semi-shaded position where their roots will be constantly moist. To produce a good effect, the plants should be grouped in considerable numbers. When new growth is being made, a top-dressing of decayed manure and leaf-mould will add strength to the plants, and result in a finer crop of flowers. The true Lenten roses are varieties of Helleborus orientalis, but this latter has been crossed with other species for the production of new colours. Excellent varieties of this section are Abel Carriere, dark purple; Albin Otto, white, spotted with deep purple; Apotheker Bogrin, purple, spotted with crimson, very fine; Councillor Benary, white, with purple spots; Diadem, rose, spotted with purple; Duchess of Cleveland, rosy-lilac; Gretchen Heinmann, rosy-purple, with crimson spots; Norma, white, faintly spotted; and W. E. Gladstone, rose, shaded pink.

BIGENERIC ORCHIDS.—S. C., Chippenham: Kindly tell me the chief bigeneric combinations that have been effected by hybridists among orchids. The names of individual results I do not need at present, but simply the generic combination.—The following combinations have been effected successfully among orchids: Ada and Cocklioda, Brassavola and Cattleya, Brassavola and Lælia, Cattleya and Lælia, Cochlioda and Odontoglossum, Cochlioda and Oncidium, Cochlioda and Miltonia, Odontoglossum and Oncidium, Odontoglossum and Miltonia, Diacrium and Cattleya, Diacrium and Lælia, Epidendrum and Cattleya, Epidendrum and Lælia, Epidendrum and Sophronitis ,Epidendrum and Brassavola, Sophronitis and Cattleya, Sophronitis and Lælia, Phaius and Calanthe, Phaius and Cymbidium, Schromburgkia and Cattleya, Zygopetalum and Batemannia, Zygopetalum and Colax, and Zygopetalum and Aganisia.

TUBEROUS BEGONIAS. — A. E. C., Chislehurst: In the course of the next week or so I propose to place my begonia tubers in sandy leaf-mould, in boxes, over gentle bottom-heat, to start them into growth. Is this right? So far, I have not been so successful in the general cultivation of these handsome flowers, and should, therefore, be glad if you could give an article on this matter in an early issue, as doubtless other readers are interested in begonia culture as well as I.—Your proposed method of starting the tubers into growth is a good one, but there is a little danger lest they are left too long in the boxes, and the roots become entangled, and consequently become damaged when potting becomes necessary. In our issue of March 2 we shall publish an article on tuberous begonias, which we are sure, will prove very helpful to you.

LOPPING AN ELM.—J. D., Atherstone.—Two large elms, each with huge branches, occupy a position near a cottage, and I am told that such trees are dangerous as big limbs are apt to fall during summer-time without warning. Please say whether I am rightly informed; and, if so, what do you suggest I should do?—Old elm trees with large limbs are undoubtedly dangerous, and should be lopped. To properly lop a big elm is itself a dangerous proceeding to any but those used to such work; moreover, without seeing the trees it is not possible to advise you as to how much of the tree should be cut back. Your best plan will be to place the matter in the hands of a woodman, forester, or nurseryman after obtaining from either an estimate of the cost.

DIMORPHOTHECAS.—P. R. D., Bishopstoke: Last year I grew a number of plants of the beautiful Dimorphotheca aurantiaca, and have purchased seeds this year of that species and also of dimorphotheca hybrids. But, athough the plants I was successful in raising during the spring of 1911 proved most delightful subjects for positions on a low piece of rockwork, I was not able to raise more than about 30 per cent. of the seedlings that appear. When transferred to the open air, they failed unaccountably and in considerable numbers, but the few that pulled through all right were, as I have said, splendid. Can you give me any cultural hint that would enable me to secure a larger number of the plants after germination —We had a similar experience two years ago with one pan of seedlings. From some cause or other, the plants were not pricked out promptly while quite tiny, and so they never did any good, while seedlings from another pan, transferred singly into small pots as early as possible, made capital plants, and did not suffer in the least when transferred to their flowering quarters. We noticed that the seedlings were inclined to make top roots and very few fibrous branching roots, and so, instead of pricking them out into other pans and boxes, we gave each one a large thumb pot, and in due course a large 60-sized pot, and by this means every plant so treated was a success. We imagine the new hybrids will prove successful under similar conditions.

### NAMES OF PLANTS.

E. M. H., Ulverston.—Odontoglossum excellens.

P. P., Hayward's Heath.—1, Acacia Drummondi; 2, Helleborus colchicus; 3, Erica carnea.

M. T. L., Hornchurch.—1, Saintpaulia ionantha; 2, a garden form of the achimeneflora section of streptocarpus.

M. C. G., Hitchin.—1, Pleroma macrantha; 2, Peristrophe speciosa; 3, a fairly good form of Cypripedium Actæus; 4, Nephrolepis Duffi.

F. J. C., Chelmsford.—1, Euphorbia splendens; 2, appears to be a piece of Æschynanthus, send when in flower; 3, Debregæcia velutina; 4, Virburnum Tinus; 5, Cydonia japonica; 6, Ruscus aculeatus.

VINES.

VINES.

We can still offer extra fine canes of GRAPE VINES, up to our usual well-known quality for present planting

*Orders dispatched same day as received.*

**Geo. Bunyard & CO., LTD., Royal Nurseries, MAIDSTONE.**

# OBITUARY.

◆

### MR. GEORGE MAW, F.L.S.

We regret to record the death of Mr. George Maw, F.L.S., which occurred on the 7th inst at his residence, Benthall, Kenley, Surrey, in his 79th year. Mr. Maw was a member of many scientific societies at home and abroad, and was elected a Fellow of both the Linnean and Society of Antiquaries in 1860. He was for upwards of fifty years a frequent contributor on botany, geology, and allied subjects to the transactions of the societies to which he belonged and to technical journals. Mr. Maw is best known to horticulturists as the author of "A Monograph of the Genus Crocus," to the preparation of which he devoted upwards of ten years. In studying the several species and their varietal forms, he travelled in Asia Minor, the Levant, Greece, Italy, Spain, the Swiss Alps, and the Pyrenees. He also formed a comprehensive collection of croci, the major portion of the species and varieties being collected in the course of his travels. His great work was published in 1886, and contained 81 hand-coloured plates, the drawings for the majority of both flowers and fruit being made by himself. Some years previously Mr. Maw, in company with the late Sir Joseph Hooker and Mr. John Ball, made a tour in Morocco and the ascent of the Great Atlas, and the results of the tour were given in a work published in 1878, the geological sketch of the country visited contained therein being contributed by Mr. Maw. Sir Joseph Hooker dedicated the 30th volume of the "Botanical Magazine" (3rd series) to Mr. Maw as a tribute to the value of his exertions in introducing unknown plants to English gardens. Mr. Maw, who for a long period resided at Benthall, Broseley, Shropshire, came to Kenley in 1886.

### MR. THOMAS SWIFT.

We regret to learn of the death of Mr. Thomas Swift, who for so many years was principal book-keeper at Messrs. Hurst and Son's establishment at Houndsditch. Mr. Swift was also one of the auditors of the Gardeners' Royal Benevolent Institution for many years. On his retirement from business in 1909, a staff dinner was given in his honour, and he was presented with a silver centre-piece, and two silver vases by his fellow-members of the staff. Mr. Swift entered service at Houndsditch in 1869. He died at the age of 65.

# FORTHCOMING ENGAGEMENTS.

TUESDAY, February 20.—Royal Horticultural Society. Fruit, Floral, and Orchid Committees, 12 noon. Lecture at 3 p.m. on "New Sweet Peas," by Mr. Wm. Cuthbertson, J.P. Scientific Committee, 4 p.m.

North of England Horticultural Society. Meeting Queen's Midland Hotel, Leeds. Council Meeting, 2 p.m. Lecture on the Wisley Rock Garden, by Mr. Pulham, jun., 3.30 p.m.

THURSDAY, February 22.—Manchester and North of England Orchid Society. Meeting, Manchester Coal Exchange, 12 noon.

North of England Horticultural Society's Orchid Show, in conjunction with the Manchester Orchid Society.

TUESDAY, March 5.—Royal Horticultural Society. Narcissus Committee meets at 11.30. Fruit, Floral, and Orchid Committees meet at 12 o'clock. Lecture at 3 p.m. on "The Stimulation of Plant Growth," by Professor H. E. Armstrong. Scientific Committee at 4 o'clock.

Royal Horticultural Society's Spring Bulb Show; two days.

THURSDAY, March 7.—Linnean Society Meeting.

Manchester and North of England Orchid Society.

MONDAY, March 11.—United Horticultural Benefit and Provident Society, Annual Meeting at Royal Horticultural Hall, at 8 p.m.

THURSDAY, March 14.—North of England Horticultural Society meets at Bradford.

TUESDAY, March 19.—Royal Horticultural Society. Narcissus Committee meets at 11.30. Fruit, Floral, and Orchid Committees meet at 12 o'clock. Lecture at 3 p.m. on "Ferns," by Mr. H. B. May, V.M.H. Scientific Committee at 4 o'clock.

THURSDAY, March 31.—Perpetual Flowering Carnation Society, at Royal Horticultural Hall, Westminster; two days.

Linnean Society Meeting.

Manchester and North of England Horticultural Society.

TUESDAY, March 26.—Bournemouth Spring Flower Show; two days.

WEDNESDAY, March 27.—Liverpool Spring Show; two days.

Royal Horticultural Society's General Examination in Horticulture.

Royal Botanic Society Meeting.

THURSDAY, March 28.—Torquay Spring Show.

# METEOROLOGICAL OBSERVATIONS.

TAKEN IN THE ROYAL HORTICULTURAL SOCIETY'S GARDENS AT WISLEY, SURREY.

Height above Sea-level, 150 feet.

# CATALOGUES RECEIVED.

HALLAMS, MOSELEY, BIRMINGHAM.—In a gay cover, abloom with sweet peas, this enterprising Moseley firm issues a pocketable list of seeds and plants, the former occupying chief place, and sweet peas are a special feature.

WILLIAM DEAL, BROOKLANDS, KELVEDON.—A capital catalogue of sweet peas, including many novelties raised by Mr. Deal. A pathetic interest attaches to the list as it contains a portrait of Mr. W. Deal, who so lately passed away, but it also contains a portrait of Mr. Bertrand Deal, Mr. Wm. Deal's elder son, who is continuing the business.

H. E. WARD, CARTREF, VICARS CROSS, CHESTER.—A very modest sweet pea list, containing descriptions of only four varieties.

W. E. SANDS, HILLSBOROUGH, IRELAND.—A small and useful catalogue of Irish-grown seed potatoes, including some new varieties.

J. JEFFERIES AND SON, LIM., CIRENCESTER.—Novelties of merit, both among vegetables and flowers are included, and mostly illustrated, in the seed catalogue issued by this long-established Cirencester firm.

**Robinsons' Guaranteed Gardenalities**

are known all over the world, and the keenest gardeners are never without them, for their value covers the price over and over again.

Till and tend as you will, your unaided efforts will not produce the best results.

Fertilisation is Nature's law, but feed your soil with the best. Don't waste time and money on useless fertilisers, when the real and right fertilizer is obtainable.

**"CARMONA" FERTILIZERS**

are a grand soil food, and will more than fulfil your expectations.

Make a success of your garden by adopting the best principles, and the best preparations—use "Carmona" Fertilizers.

There are specal fertilizers for many varieties of flowers—for Robinson's particularise. Note the prices: 1cwt., 20s.; ½cwt., 12s. 6d.; 28lbs., 7s. 6d.; 14lbs., 4s. 6d.; 7lbs., 2s. 6d.; 1s. and 6d. tins. Of all Seedsmen and Agents; or write direct.

**ROBINSON'S GREAT £350 SHOW**

will be held at the Botanical Gardens, Edgbaston, Birmingham, on August 28th and 29th, 1912, not September 5th and 6th, as previously announced.

Free entries to purchasers of "Carmona" Fertilizers, for each packet contains an entry "free" coupon.

Don't miss this splendid opportunity of gaining a cash prize, and a Championship Medal.

Remember, £350 to be given away, and you are open to your share. Send to-day for Show Schedule.

**CLIFT'S FLUID INSECTICIDE**

Exterminate Insect Pests. Take the sure and easy way—one that is a proven success, for Clift's Fluid Insecticide absolutely safeguards against all insect attacks.

Easy to apply and entirely efficacious. It makes all the difference, and your plants thrive and flourish because they are free from enemies.

Prices and quantities to suit everybody. 40 galls., 4s. 6d. per gall.; 20 galls., 5s. per gall.; 10 galls., 5s. 3d. per gall.; 5 galls., 5s. 6d. per gall.; 1 gall., 6s. ½ gall., 3/6; 1 pint, 1s. Of all Seedsmen and Agents; or write direct.

**MORE VALUABLE GARDEN ADVICE.**

The two following Gardenalities are the best of their kind:
1. "Eradiweed," guaranteed cent. per cent. weed killer.
2. "Velvas" Lawn Sand.

**FREE.** Robinson's offer you complimentary copies of their two well-known issues:—

Guaranteed Gardenalities booklet (24 pages) and Garden Enemies booklet (32 pages). Show Schedule included upon request. Posted free to any address in the Kingdom. Fullest details of all you need by writing to

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Streak Disease of Sweet Peas.

The disease of sweet peas, commonly known as streak, has within the past few years been so destructive in its effects in many gardens, and thereby caused much disappointment to cultivators of these fragrant flowers, that any information likely to prove useful to growers in their endeavours to avert its attacks should have the careful attention of those who are concerned with the sweet pea and its culture. Holding this view, we take an early opportunity of directing attention thus prominently to the important contribution to the literature of the subject that has been made by Mr. G. Massee, V.M.H., an abstract of which we shall give in an early issue. We need not refer to Mr. Massee's eminence as an authority on plant diseases, for that is widely known and generally acknowledged; but it may be mentioned as a matter of importance that his investigations possess additional value from the fact that in making them he does not at any stage lose sight of the practical side of the question involved. The views to which Mr. Chittenden, the Director of the Wisley Laboratory, gave expression in his address at the conference held by the National Sweet Pea Society in December last, on the cause of the disease and the value of soil sterilisation as a preventive, have been amply confirmed by Mr. Massee's investigations. This is exactly what would be expected by those who are acquainted with the work of these two scientists. They, of course, deal with the subject in a quite different manner, and necessarily so. Mr. Chittenden, when giving particulars of the results he had obtained in the course of his investigations, was addressing an audience consisting almost exclusively of those who are engaged in the cultivation of sweet peas, and dealt with the subject in a popular manner. On the other hand, Mr. Massee so records the results he has obtained as to render them of the greatest possible value for purpose of reference, but there is nothing of the dry-as-dust character about his description of the disease and the cause thereof. Those cultivators who are anxious to obtain the best possible results from their strenuous endeavours, whether engaged in the production of flowers for market, for exhibition, or for the decoration of the garden and home, should take the two papers and study them together. They should be closely studied, for while necessarily they do not contain a panacea for the restoration to health of a disease-stricken crop, they afford information of immense value on the prevention of the attacks of the fungus by which the disease is caused. This information is hardly of less value to cultivators of culinary peas, for these, under certain conditions, are equally as liable to infection as the sweet pea; and the Rev. J. M. Berkeley, who was the first to observe the fungus in this country, found it on the nemophila and also on the peas that belong to the kitchen garden. The readiness with which the scientists have come to the aid of cultivators in this matter is of interest, as evidence of a fuller appreciation than was for a long time the case of the value of the co-operation of cultivators and scientists in the solution of difficult problems. This association of science with practice is useful in another way. It assists the cultivator to understand how necessary it is that important questions should be fully considered from all points of view before an answer is attempted. The difficulties that beset investigators, more especially of diseases of fungoid origin, is very clearly shown by Mr. Massee, who states at the commencement of his report that in his earlier investigations of Thielavia basicola, the fungus causing the streak disease, he found the fungus in what is known as the Milowia stage, and, regarding the delicate white mould at the base of a dying plant as an entity, and worthy of generic rank, he published it as Milowia nivea. We mention this as an illustration of the necessity for not readily accepting a statement that a disease of which little is known is due to this or that cause, unless made by a well-known authority. It is not less necessary that care should be shown in accepting statements to the effect that injury to vegetation has been caused by a certain set of circumstances, and of this we had a remarkable proof at the conference referred to in the great diversity of opinion expressed by those who took part in the discussion. Cultivators have now the most conclusive proofs that the cause of "streak" is Thielavia basicola, and sufficient information with regard to its life cycle to enable them to adopt methods of culture that will not favour the development of the fungus. The point that it is both saprophytic and parasitic, and that it can pass through its complete course of development as a pure

MR. JAMES VERT.

saprophyte, feeding on the humus present in the soil, is of great practical importance. With a full knowledge of this fact it is not difficult to understand that when large quantities of animal manure are buried in the soil, in layers or otherwise, the fungus rapidly spreads through the rich material, and soon makes its way into the tissues of the plants. The entrance of the mycelia is greatly facilitated when the roots have the run of a rich medium, because of the greater softness of their outer covering. Humus is, of course, essential to the healthy growth of the plants, but there can hardly be any doubt that a reduction in the quantity of animal manure that is sometimes employed might with advantage be effected. It should be remembered that sweet peas, in common with other leguminous plants, can, with the aid of nitrifying organisms, obtain the greater part of the nitrogen they require from the atmosphere, and also that when this is given in excess it encourages a soft sappy growth and coarseness both in the flowers and flower stems. It is of importance also to avoid, where practicable, growing sweet peas on the same ground for several consecutive years, and to utilise as far as possible the aid soil sterilisation is able to give. To sterilise beds and borders may not be practicable, but there should be no great difficulty in providing a sufficient quantity of sterilised soil for raising stocks under glass, and thus enable the plants to pass through a vulnerable stage with at least some degree of immunity.

---

**Mr. James Vert** is well known to our readers because of his great success as a cultivator of perpetual carnations and plums—widely differing subjects. Mr. Vert has charge of a famous garden, that of Audley End, Saffron Walden, but ere he reached his present position there were many years of working and waiting. In 1871 he left his father, who was then head gardener and land steward to the Hon. Arthur Lascelles, to serve an apprenticeship of four years under the late Mr. James Fowler, head gardener to the Earl of Harewood, Harewood Hall, near Leeds. His apprenticeship served, Mr. Vert went to Knowsley, under Mr. Harrison, to take charge of the fruit houses, and from Knowsley he entered service with Messrs. Fisher, Son, and Sibray, of Sheffield, where he had charge of the stove and greenhouse plants. Wishing to extend his experience, he then served under Mr. Hudson, gardener to Godfrey Wentworth, Esq., at Woolley Park. His next move was to the celebrated gardens at Burghley, the Marquis of Exeter's seat, where, under the famous Mr. Richard Gilbert, he stayed four years, and rose to be general foreman. In 1880 Mr. Vert was appointed head gardener to Lord Braybrooke, at Audley End, and occupied that position for twenty-four years. On the death of Lord Braybrooke, in 1904, Audley End was taken by Lord Howard de Walden, whose marriage this week was one of the great events in society. Lord Howard de Walden is a great lover of gardens and gardening, and is president of the Perpetual Carnation Society; so that, with the encouragement he gives and the great interest he takes in them, the gardens at Audley End are now occupying a higher position than ever under the skilful management of Mr. James Vert, who, we might add, has for many years been a member of the R.H.S. Fruit Committee.

**"The Gardeners' Magazine" Spring Number.**—Our annual issue that is specially associated with the season of spring in its relation to the garden will be published on March 2, and will not be less interesting and useful than corresponding issues of previous years. The subjects that will be dealt with have been selected with special reference to the requirements of the season, and the needs of readers. Chief among the contents will be articles on the finely-flavoured peas, maincrop potatoes, summer lettuces, a valuable dry weather vegetable, melons and melon culture, tuberous begonias, greenhouse flowers from seeds, annuals for beds and borders, the usefulness of asters, fine foliage plants from seed, and seasonable notes on sweet peas. The number will be profusely illustrated.

**The Botanical Magazine** for the current month contains illustrations of several remarkable plants. The first of these is Stanhopea peruviana, a yellow-flowered species allied to S. Wardi. Then come Stranvæsia undulata, a Chinese tree, found by Mr. E. H. Wilson; this is an evergreen species that bears a profusion of orange-coloured fruits, after the fashion of the popular Cratægus Lelandi; Leptospermum scoparium Nicholli, a New Zealand plant, and an elegant greenhouse subject, with deep carmine-coloured flowers; Olearia Chathamica, a rare half-hardy species, bearing white, violet-tinted flower heads two inches broad, the disc being violet-purple; and Crassula Barkleyi, a curious little succulent plant with imbricating leaves clustering round the two-inch high stem so as to form a little column; the small white flowers are produced in a little cluster at the apex of growth.

**Botanical Research at South Kensington.**—The building of the Botanical Institute in Prince Consort Road, South Kensington, has been commenced, and has the promise of being an important addition to the Imperial College of Science and Technology. The architect is Sir Aston Webb, R.A., and the four-storey building has a length of 120 feet and a depth of 50 feet. The two lower floors will be devoted to the general botanical work of the college, which is now carried on at the Royal College of Science in Exhibition Road. On the two upper floors will be located the new Department of Plant Physiology and Pathology, and these, it need hardly be said, have been designed with special reference to the work that will be carried on by those engaged in botanical research. The greenhouse-laboratory on the top floor will be a distinct feature; it will have a length of 25 feet and a width of 20 feet, and is the first of its kind that has been erected in the United Kingdom. With a cement floor and a glass roof, it will combine the advantages of a greenhouse and a laboratory. A physiological laboratory and a research laboratory for the professor will be located on the same floor, and also a professor's room. In addition there will be a research laboratory for his assistant, and five research rooms. A bio-chemical laboratory, a pathological laboratory, a bacteriological laboratory, a constant-temperature room, and two more research rooms will occupy the third floor. The estimated cost of the building is £14,000. As our readers have been informed, the Professorship of Plant Physiology and Pathology was established last year, and Professor V. H. Blackman, of the Leeds University, was appointed. There are at the present time seven students at work, namely, a graduate of Aberdeen, a graduate of Edinburgh, a student who has been a chemist and bacteriologist in Jamaica for three years, two students of the Imperial College in their fourth year, two students working under the John Innes Trust at Merton, one of whom holds the Cambridge Diploma in Agriculture, and is a Development Commission scholar in plant physiology, and a lady who has taken the London B.Sc. degree. The aim is to make the department a centre for research of scientific and economic importance in relation to plant life as well as to qualify students for appointments throughout the British Empire.

**Horticultural and Agricultural Research.**—In reply to a question in the House of Commons on Tuesday Mr. Runciman, the President of the Board of Agriculture, stated that a grant of £30,000 per annum will be made from the Development Fund for work at research institutes in the following subjects, viz.: Plant physiology, plant pathology (Mycological side), plant breeding, fruit growing, plant nutrition, and soil problems, animal nutrition, animal breeding, animal pathology, dairy investigation, agricultural zoology, and the economics of agriculture. Negotiations are proceeding as to the places at which the work will be carried on. It is proposed to allocate an additional sum of £5,000 for investigations of a special character during the ensuing financial year, and Mr. Runciman hopes shortly to be in a position to announce the purposes for which this sum will be expended.

**Gardeners' Royal Benevolent Institution.**—The committee of the Liverpool Auxiliary, in notifying their eleventh annual concert and social gathering, have the pleasure of announcing that the Right Hon. the Earl of Derby, G.C.V.O., C.B., etc., Lord Mayor of Liverpool, has kindly consented to preside. This function takes place at the Bear's Paw, on Tuesday, the 27th inst., and the committee is straining every effort so that the high character of these re-unions may be fully sustained. It is hoped that the meeting will be a record one, and that increased patronage may indicate appreciation of his Lordship's valued assistance. Mr. R. G. Waterman, Woolton, is the hon. secretary, and he will be glad to answer any inquiries and acknowledge donations.

**The Journal of the Kew Guild.**—The nineteenth issue of the ever popular and interesting "Journal" of the Kew Guild is a double number, and serves for the year 1911 and 1912. It is edited by the new secretary-editor, Mr. H. Cowley, who has provided material that cannot fail to find favour with Kewites the world over. Even to a man who is not a Kewite the contents are so interesting that the issue will not be placed on one side until read right through. Mr. R. Allen Rolfe, the orchid expert, figures on the frontispiece, and the accompanying appreciation shows that Mr. Rolfe commenced his working life as a young gardener at Welbeck Abbey, thirty-two years ago. Mr. A. S. Galt tells some amusing experiences in connection with county lecturing; Mr. E. J. Thomas discourses on the pronunciation of plant names, and Mr. J. R. Jackson, formerly curator of the museums, gives his recollections of forty-three years' service at Kew. The notes from Old Kewites are always of special interest, and in these Mr. W. H. Paine's description of a hunt after alpine plants in the Pyrenees; Mr. W. H. Etterley's account of life in Shanghai; Mr. J. D. Snowden's impressions of Uganda; Mr. C. E. F. Allen's experiences with his coloured men in Portuguese East Africa, and Mr. A. E. P. Griesson's story of the Delhi Durbar and its gardens, with the latter of which he had a great deal to do, are all excellent reading. Kindly references to Kewites who have died during the year, a list of appointments and retirements, a half-page of weddings, accounts of annual meeting and annual dinner, cricket news, and a list of names and addresses and positions of Old Kewites, all go to make the "Journal" that cementing power so essential in a guild with members spread over the whole world.

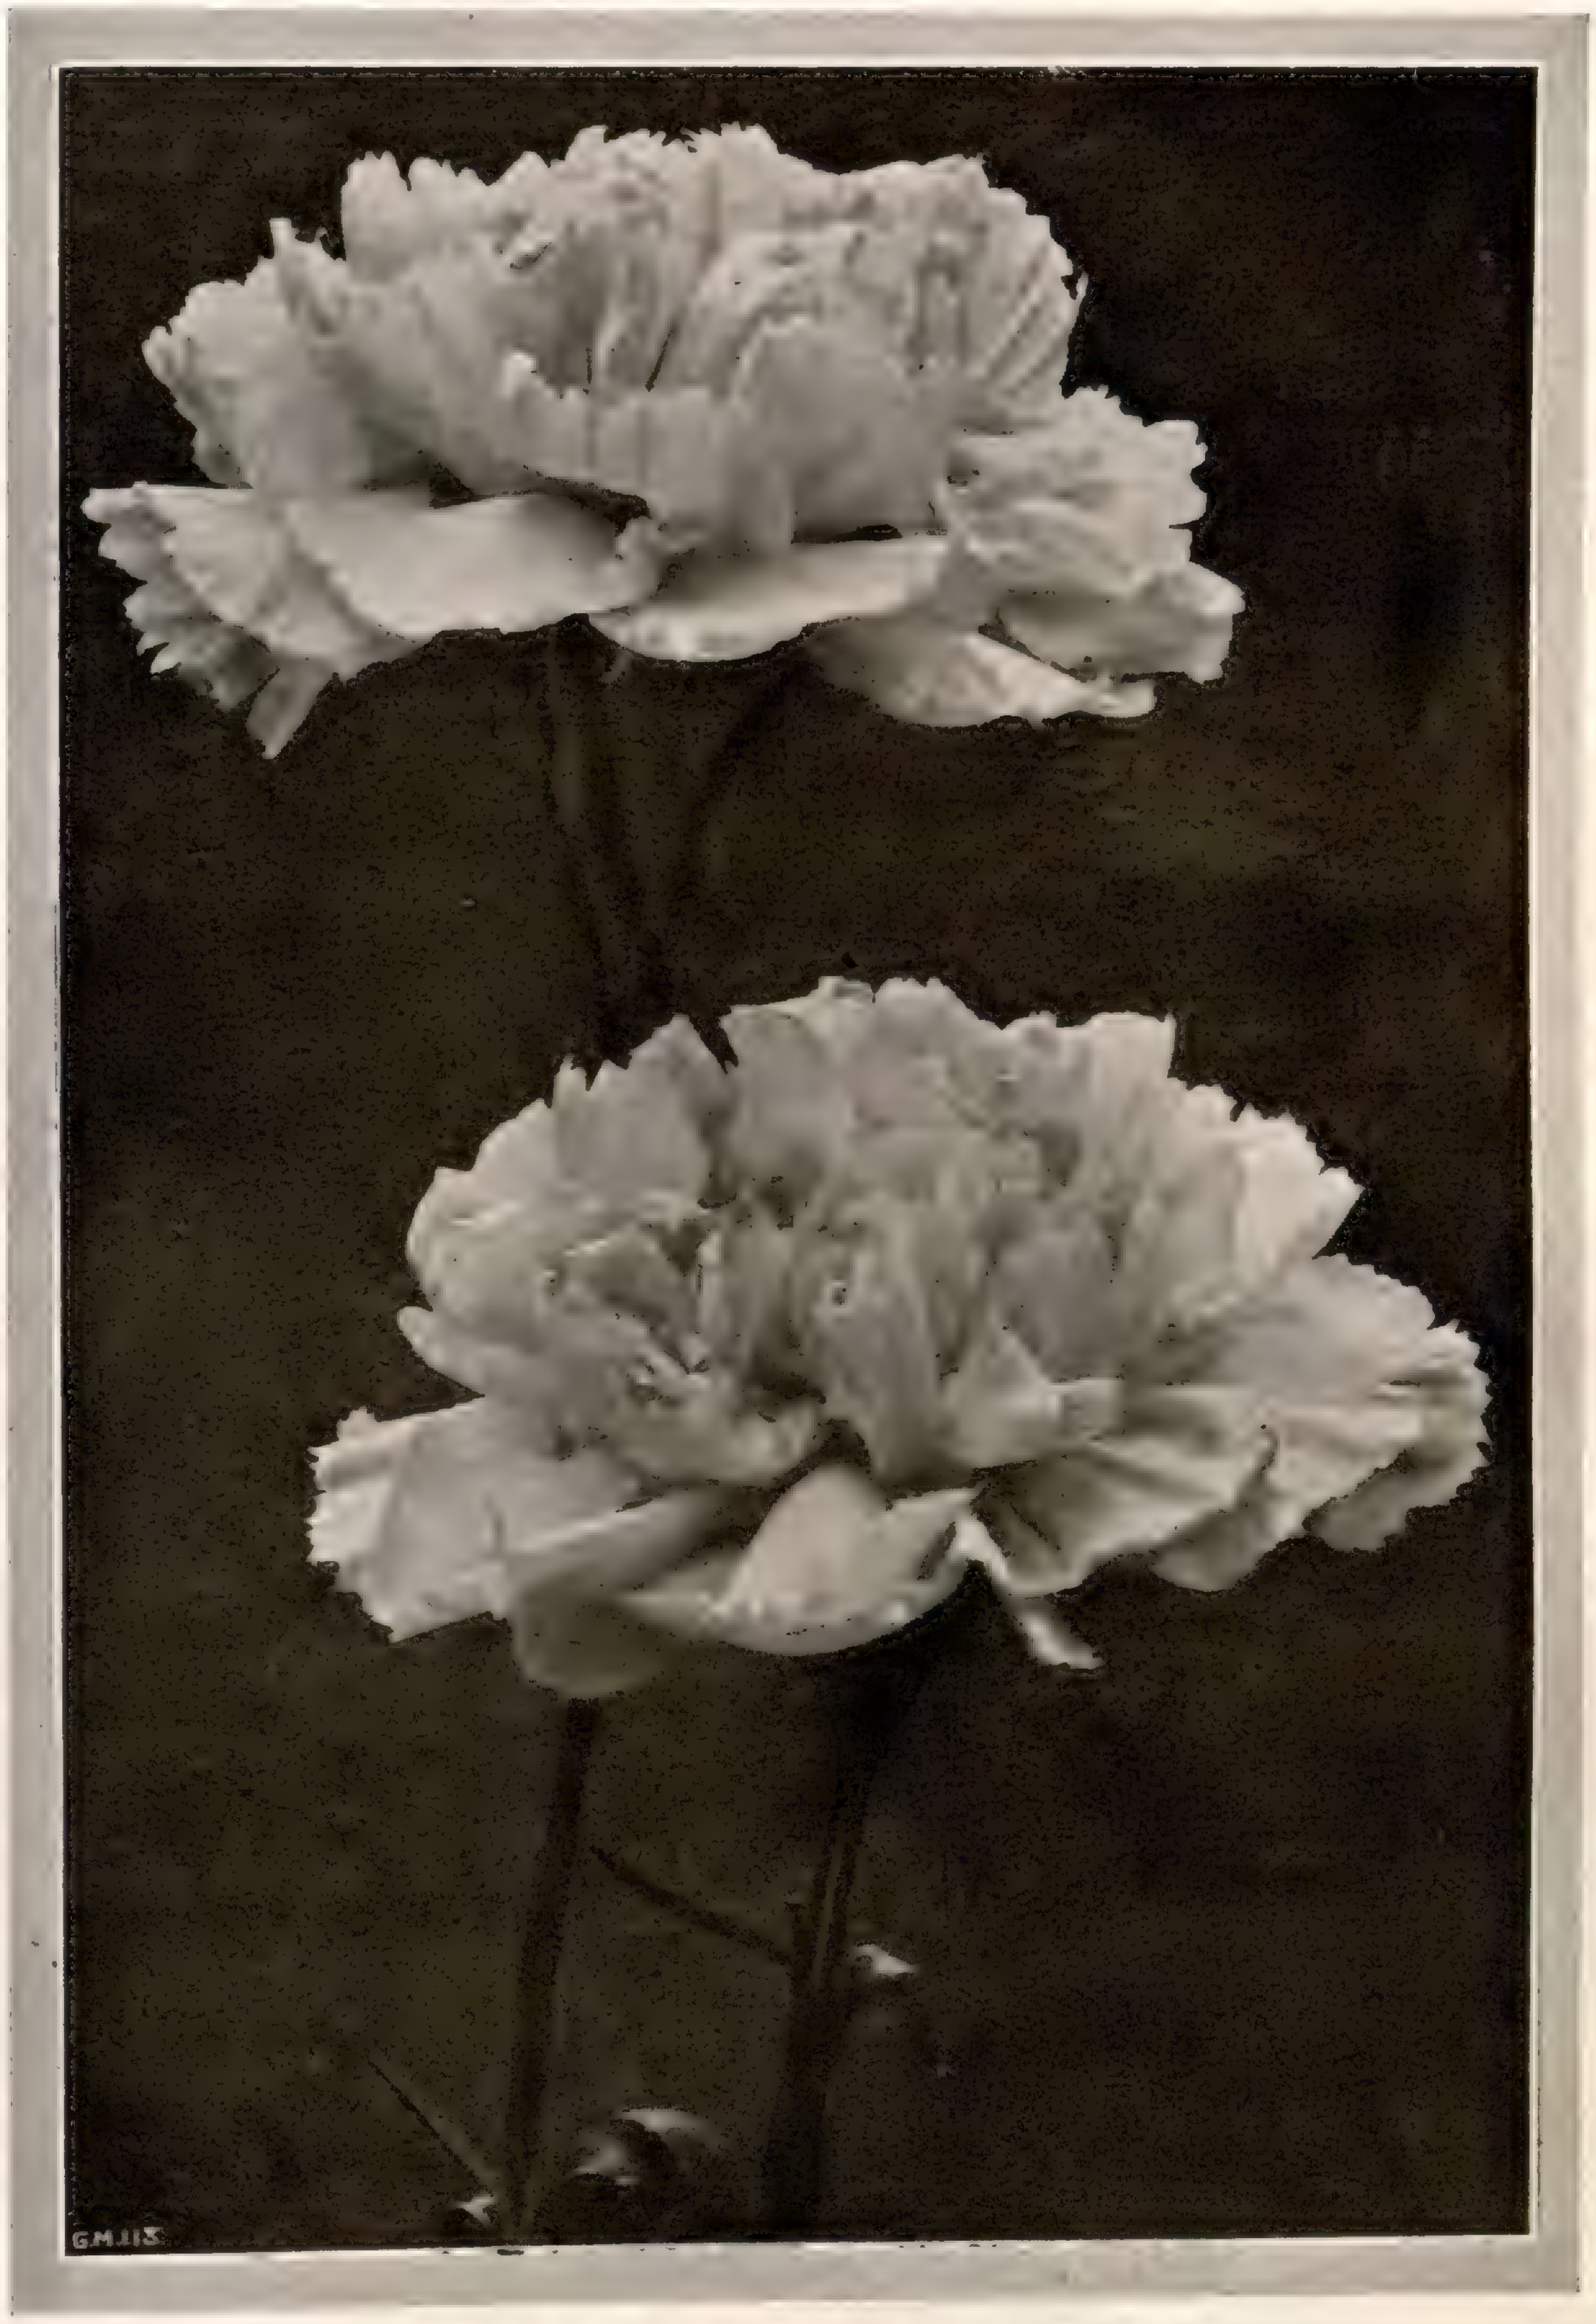
**Gilbert White Relics.**—The exhibition of relics of Gilbert White, the naturalist, and of objects associated with his writings, organised by the Selborne Society at the offices of the Civil Service Commission, Burlington Gardens, was of quite exceptional interest. The exhibition was opened on the 15th inst., and extended over several days, and among the more important of the contributions were the MSS. of "The Natural History of Selborne" and of the "Nature Calendar" for 1766, which has recently been published in facsimile by the Selborne Society. Of much interest was the natural history notebook, kept by his future brother-in-law, Barker, which is probably the earliest existing record of Gilbert White's taste for natural history. The initials "G. W." are appended to some of the entries, and these, it is assumed, record observations of his own, some early in 1736, when he was in his sixteenth year. Leaves were also exhibited of the "Garden Kalendars," in which, from the year 1751, he recorded his gardening operations and events of interest in the garden, interspersed with natural history notes. There was also exhibited his copy of Hudson's "Flora Anglica," which led him in later life to take great interest in botany, and induced him to expand the garden calendars into the "Nature Calendar" for 1766, which at one time he intended to make the groundwork of his "Natural History of Selborne." Of this work there was a large collection of editions, of which upwards of 100 have appeared since his death, and many illustrations of Selborne.

**Testimonial to Mr. Silas Cole.**—Mr. Silas Cole, the raiser of Countess Spencer Sweet Pea, has left the service of Lord Northcliffe, and intends to commence business for himself in a small way. It is considered by many that the present would be an opportune time to do Mr. Cole a good turn. Although Mr. Cole has helped, by his introduction, many sweet pea growers and dealers to enlarge their trade profitably, he has not reaped much of the golden harvest himself. Mr. Mackereth, with whom the idea originated, approached a few friends in America and at home, and received promises of support. Any of the signatories will be glad to hear of promises of help, but it will be most convenient to communicate with Mr. Mackereth. Mr. W. Atlee Burpee, Mr. R. Bolton, Mr. C. H. Curtis, Mr. W. Cuthbertson, Mr. Hugh Dickson, Mr. Alex. Malcolm, Mr. R. Sydenham, and Mr. G. H. Mackereth, Market Place, Ulverston, are the signatories. About £123 has already been paid or promised.

**Presentations at Beverley.**—A few evenings since Mr. Hodgson, the chairman of the Beverley Chrysanthemum Society, entertained the officials and members at dinner, and advantage was taken of the opportunity for acknowledging the services rendered by the secretary and treasurer. Following the dinner the Chairman, on behalf of the members, presented Mr. F. Pape, the hon. secretary, and Mr. R. Smith, the hon. treasurer, with gold and silver mounted umbrellas respectively. Mr. Pape has held the position of secretary for eighteen years, and Mr. Smith that of treasurer sixteen years, and have discharged their duties with so much ability as to have obtained the respect of all concerned with the society.

## ROYAL HORTICULTURAL SOCIETY.

There was a crowded meeting on Tuesday, February 20; the exhibits were numerous and good, and the attendance large. One end of the hall was occupied by the stage used in connection with a pageant dealing with the History of Nonconformity, and there were many expressions of dissatisfaction with its presence, chiefly because it curtailed the exhibition space, and because the dull red curtain was the worst possible colour for the flowering plants on view. It appears that the pageant should have finished on the previous Saturday, but the attendance was so good that the pageant authorities wished to retain the use of the hall for another week; this not being possible, owing to the Tuesday meeting, the pageant was held over until Wednesday, February 21, and, we understand, the financial result of this arrangement was excellent. If such a curtailment as this were a matter of common, or even frequent, occurrence, we should add our protest, but the grumbling on this occasion was scarcely to the point, unless, maybe, it prevents a similar happening in the future.



PERPETUAL CARNATION LADY MEYER.

Flowers bright pink. A.M., R.H.S., February 20. Mr. E. Guile, Newport.

### FLORAL COMMITTEE.

A superb exhibit of carnations, from Mr. W. S. Wallace, Eaton Bray, Dunstable, was a great attraction. It was a grand display of fine flowers, all splendidly arranged in vases of various sizes, in baskets and tall stands, the whole associated with Asparagus Sprengeri, A. plumosus, and smilax. There were dozens upon dozens of such varieties as Gloriosa, Marmion, Lady Audley Nield, Carola, Mrs. H. Burnett, Pink Delight, Winsor, Enchantress, Una Wallace, May Day, Bonfire, Beacon, and White Wonder. A few baskets and vases of lovely Richmond roses completed this fine exhibit, which was a centre of attraction all day long.

Indian azaleas, charming flowering plants of the double rose-coloured peach, and of the popular wistarias, were pleasingly grouped by Messrs. James Veitch and Sons, Chelsea; this firm also arranged a bank of Azalea amœna Hexe, the fragrant Boronia megastigma, Tillandsia Lindeni, with vivid blue flowers, Coleus thyrsoideus, Libonia floribunda, cyclamens, etc.

Messrs. H. B. May and Sons, Edmonton, contributed a most interesting group of ferns, many of them trained over small tree stems. Polypodiums were very much in evidence, notably P. piloselloides, P. vaccinifolium, P. repens, P. nitida, and P. squamulosum.

Messrs. Allwood Brothers, Hayward's Heath, presented large vases of Lady Alington, La Rayonnante, Marmion, R. F. Felton, and other good varieties of perpetual-flowering carnations.

Many dainty early spring flowers were exhibited by Mr. Maurice Prichard, Christchurch, such as Saxifraga Elizabethæ, Anemone blanda, Iris Krelagei, Gentiana acaulis, Adonis amurensis plena, Primula cashmenana Lavender Gem, Daphne Genkwa, and Orobus vernus.

Mr. A. F. Dutton, Iver, Bucks, made a good show of carnations, setting these up in large bouquets in tall vases; Enchantress, Mrs. C. W. Ward, White Enchantress, Niagara, Mikado, Rose Pink Enchantress, May Day, and Scarlet Glow were all capitally represented.

Messrs. Sutton and Sons, Reading, filled a long table with well-arranged grouplets of their fine strains of Chinese primulas, well grown, and of splendid colour, and freely-flowered cyclamens, the whole making an effective and fragrant exhibit.

The spring flowers from Messrs. Barr and Sons, Covent Garden, included a delightful set of crocus species, little saxifragas, snowdrops, miniature daffodils, and freesias.

The bright pink Coronation carnation, a free perpetual variety, was again shown well by Mr. Bertie Bell, Guernsey.

An interesting exhibit of cyclamens, Acacia Baileyana, A. ovata, Daphne indica, and carnations came from Messrs. Stuart Low and Co., Enfield.

Some lovely Richmond roses from Messrs. George Mount and Sons, Canterbury, were a centre of admiring visitors.

Mr. G. Reuthe, Keston, had a quite big exhibit of crocuses, anemones, snowflakes, hepaticas, lovely little irises, heaths, etc. Messrs. Pulham's, Elsenham, Essex, also contributed alpine plants. Mr. Clarence Elliott, Six Hills Nursery, Stevenage, showed a small rock garden, with colonies of Saxifraga Burseriana, Hepatica triloba, Draba aizoides.

A glorious group of carnations was staged by Mr. H. Burnett, Guernsey, who, as usual, put up grand flowers of Britannia, Fortuna, Mikado, R. F. Felton, Mr. C. F. Raphael, May Day, Mrs. H. B. Clode (finely clove-scented), Marmion, Mandarin, and White Wonder.

Messrs. Whitelegge and Page, Chislehurst, made a speciality of Primula malacoides, and staged these with saxifragas, etc.

A bright exhibit was one of cyclamens, cinerarias, and zonal pelargoniums, from Messrs. H. Cannell and Sons, the latter being particularly effective, and representative of the finest varieties.

Crocuses, anemones, Narcissus cyclamineus, hellebores, heaths, and Japanese maples made up a pretty exhibit from Mr. James Box, Lindfield.

The little rock garden arranged by Messrs. J. Cheal and Son, Crawley, was bright with irises and primulas; models of garden furniture proved very attractive.

Messrs. Young and Co., Hatherley, Cheltenham, put up a capital lot of carnations, their Royal Purple, Mrs. Greswolde Williams, and Lady Audley Nield, being especially good.

Messrs. W. Wells and Co., Merstham, showed some new perpetual carnations; Wodenethe, white; Merstham Beauty, rose-pink; Princess Charming, pink; and Bonfire, red, were among the best.

A very fine exhibit of flowering shrubs, forced into flower, was set up by Mr. L. R. Russell, Richmond, and herein the lilacs, Mollis azaleas, and Prunus triloba were especially beautiful.

Messrs. R. and G. Cuthbert, Southgate, filled a corner with forced azaleas, lilacs, wistarias, and magnolias.

Messrs. C. Brooks and Son, Worting, Basingstoke, showed single flowers of primulas, set out in blocks of a variety on black velvet; the colours showed up finely in this way, and Giant Salmon, Giant Pink, King George V., Orange King, and Ruby Queen were especially effective.

Messrs. Thos. S. Ware, Feltham, brought up anemones, saxifragas, Adonis amurensis plena, Iris stylosa, I. reticulata, and Bletia hyacinthium.

Crocus species, notably C. versicolor, C. Sieberi, and C. aureus were delightfully shown by Messrs. R. Wallace and Co., Colchester, together with Fritillaria chitralensis—quite strong and bright, Iris reticulata, Tulipa Kaufmanniana, and T. Fosteriana.

Messrs. W. Cutbush and Son had a beautiful lot of carnations, spring bulbous flowers, and a great variety of forced flowering shrubs; the colonies of Iris reticulata, hepaticas, Iris sindjarensis, and I. histrioides were greatly admired.

Freesia Chapmani aurantiaca was capitally shown by Messrs. Walter T. Ware, Inglescombe, Bath; this was much stronger and finer than we have seen it before.

Mr. C. Engelmann, Saffron Walden, was represented by a group of perpetual carnations that included Carola, Triumph, and Lady Northcliffe.

Mr. A. Hemsley, Crawley, had a rock garden exhibit, with alpine shrubs, primulas, heaths, and saxifragas much in evidence.

Messrs. G. and A. Clark, Dover, had several good things in their little rock garden exhibit; especially notable were Juniperus pachyphlœa elegantissima and J. p. conspicua, each of a bright bluish-green or rich glaucous green leaves and branchlets; they are said to retain their striking colour up to 4ft. high, and if this is so the plants have a distinct garden value; for the rock garden they should be in great request. Anemones, crocuses, and Iris stylosa were other good things on view.

Ribes laurifolium (A.M.), shown by the Hon. Vicary Gibbs (gardener, Mr. E. Beckett), was more interesting than beautiful; it has broad dark leaves, and little drooping axillary spikes of small light green flowers and bracts.

Some charming floral studies by Miss Gundry, Foots Cray, attracted a great deal of attention, especially the rock garden, flower border, and wild garden scenes.

## ORCHID COMMITTEE.

A superb exhibit of orchids, finely arranged by Mr. H. Alexander, orchid grower to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester, was the great feature of the meeting. It occupied the whole space next the wall, betwen the entrance and the orchid annexe, and, as usual, the arrangement was such that every plant stood clear of its neighbour. The display was a splendid one, the long spikes of Lælia anceps, in variety, adding elegance and lightness to it. Lælia anceps Dawsoni carried eight spikes and twenty-four flowers; L. a. Alba, nine spikes and twenty-one flowers; L. a. Ashworthæ, seven spikes and sixteen flowers; L. a. Williamsi, five spikes and twenty-three flowers; and L. a. Sanderiana, six spikes and twenty-five flowers. Lælia-cattleya Cappei and L.-c. Tigris, with their tall spikes of bright flowers, were very conspicuous, while the graceful spikes of Odontoglossum crispum Egret, O. c. Peacock, O. c. Miraud—very beautiful—and O.c. Rosemary were very fine. Cattleya Percivaliana, Charlesworth's var., with four lovely blush flowers; C. Trianæ Hydra, C. Maggie Raphael, Sophro-lælio-cattleya Danæ, Holford's var., Brasso-cattleya Pluto, B. c. Thorntoni, B. c. gigas-Digbyana, Miltonia Bleuana, and Vanda Watsoni were other fine things. Among cypripediums a few of outstanding merit in a grand set were C. Rosetti magnificum, C. Œdippe, C. Alabaster, C. Alcibiades magnificum, C. Mandiæ, C. Minos Youngi, and C. Helen II., Holford's var.

From Messrs. Sander and Sons, St. Albans, came a bright group of orchids, wherein graceful spikes of Phalænopsis Schilleriana were conspicuously beautiful. Some dendrobiums, cypripediums, Brasso-cattleya Vilmoriana magnifica, Renanthera Imschootiana, and the handsome Cattleya Trianæ Ralph Sander were also included in the display.

Angræcum sesquipedale, with seven flowers, Trichosma suavis, Angræcum citratum, Cymbidium insigne, and Masdevallia triangularis, smothered with flowers, were associated with dendrobiums and cypripediums by Messrs. Stuart Low and Co., Enfield.

Messrs. J. and A. McBean, Cooksbridge, showed some fine white forms of Lælia anceps, the old Dendrobium speciosum, Cymbidium eburneum, C. eburneo-Lowianum, and some well-grown odontoglossums.

A position in the orchid annexe was filled by Messrs. Armstrong and Brown, Tunbridge Wells, with some finely-grown cypripediums, such varieties as C. Cupid, C. Baron Schroder, and C. Euryades, C. Venus Orchidhurst var., being conspicuous. Other good things were Cattleya Maggie Raphael hybrid odontoglossums, Lælio-cattleya Ernesti, and Odontioda Bradshawiæ.

The little display set up by Messrs. Mansell and Hatcher, Rawdon, Leeds, included the graceful Ionopsis paniculata, some good forms of Odontoglossum crispum, Vanda Moorei—a rare plant, and Phalænopis Schilleriana.

The contribution from Messrs. J. Cypher and Sons, Cheltenham, was composed largely of cypripediums, such as C. Van Dyke, C. Alcibiades, C. Morganiæ, and C. Minos Youngi. With those were Calanthe Bella, of lovely blush colour, some fine forms of Lycaste Skinneri, including L. S. alba, and the graceful Angræcum citratum.

Lycaste Balliæ, with no fewer than thirty flowers, was brought up by Mr. Thorne, gardener to Mrs. W. J. Joicey, Sunningdale Park, Sunningdale, and was greatly admired.

Some white forms of Cattleya Trianæ were submitted by Mr. W. A. Manda, St. Albans.

Mr. C. J. Salter, gardener to W. Cobb, Esq., Rusper, Horsham, showed Cypripedium Euryades, New Hall Hey var., one flower having two well-developed dorsal sepals; Odontioda Bradshawiæ, Odontoglossum blendum, and the brilliant crimson-scarlet Sophrolælia Psyche were also sent from Mr. Cobb's collection.

Mr. E. V. Low, Hayward's Heath, presented a number of spikes of Cymbidium insigne, white forms of Lycaste Skinneri, Cypripedium Œdippe, a fine form of C. Harefield Hall, and Odontoglossum Rolfeæ.

Calanthe Baron Schroder was shown by Mr. Metcalfe, gardener to Sir Julius Wernher, Bart., Luton Hoo, who staged thirty-three spikes. Calanthes Baron Schroder var. albiflora (A.M.), a variety with fine white sepals and petals, and carrying two splendid spikes, came from Baron Bruno Schroder (grower, Mr. Shill), The Dell, Egham.

Messrs. Charlesworth and Co., Hayward's Heath, presented a delightful display composed chiefly of odontoglossums and odontiodas. Of the former, the most prominent were O. Lambeauianum, O. Wilckeanum, O. armainvilliersense xantholes, and O. Phoebe. The odontiodas were O. Cooksoniæ, O. Bradshawiæ, O. Keighleyense, O. Charlesworthi, O. Lutetia, and O. Craveniana. Miltonioda Ajax and Brasso-cattleya Maroni were also very well shown.

## FRUIT AND VEGETABLE COMMITTEE.

Messrs. Sutton and Sons, Reading, exhibited an interesting collection of hardy winter vegetables, the set including salsify, turnips, Stachys tuberifera, artichokes, Kohl rabi, leeks, broccoli, savoys, Brussels sprouts, kale, scorzonera, carrots, and winter radish.

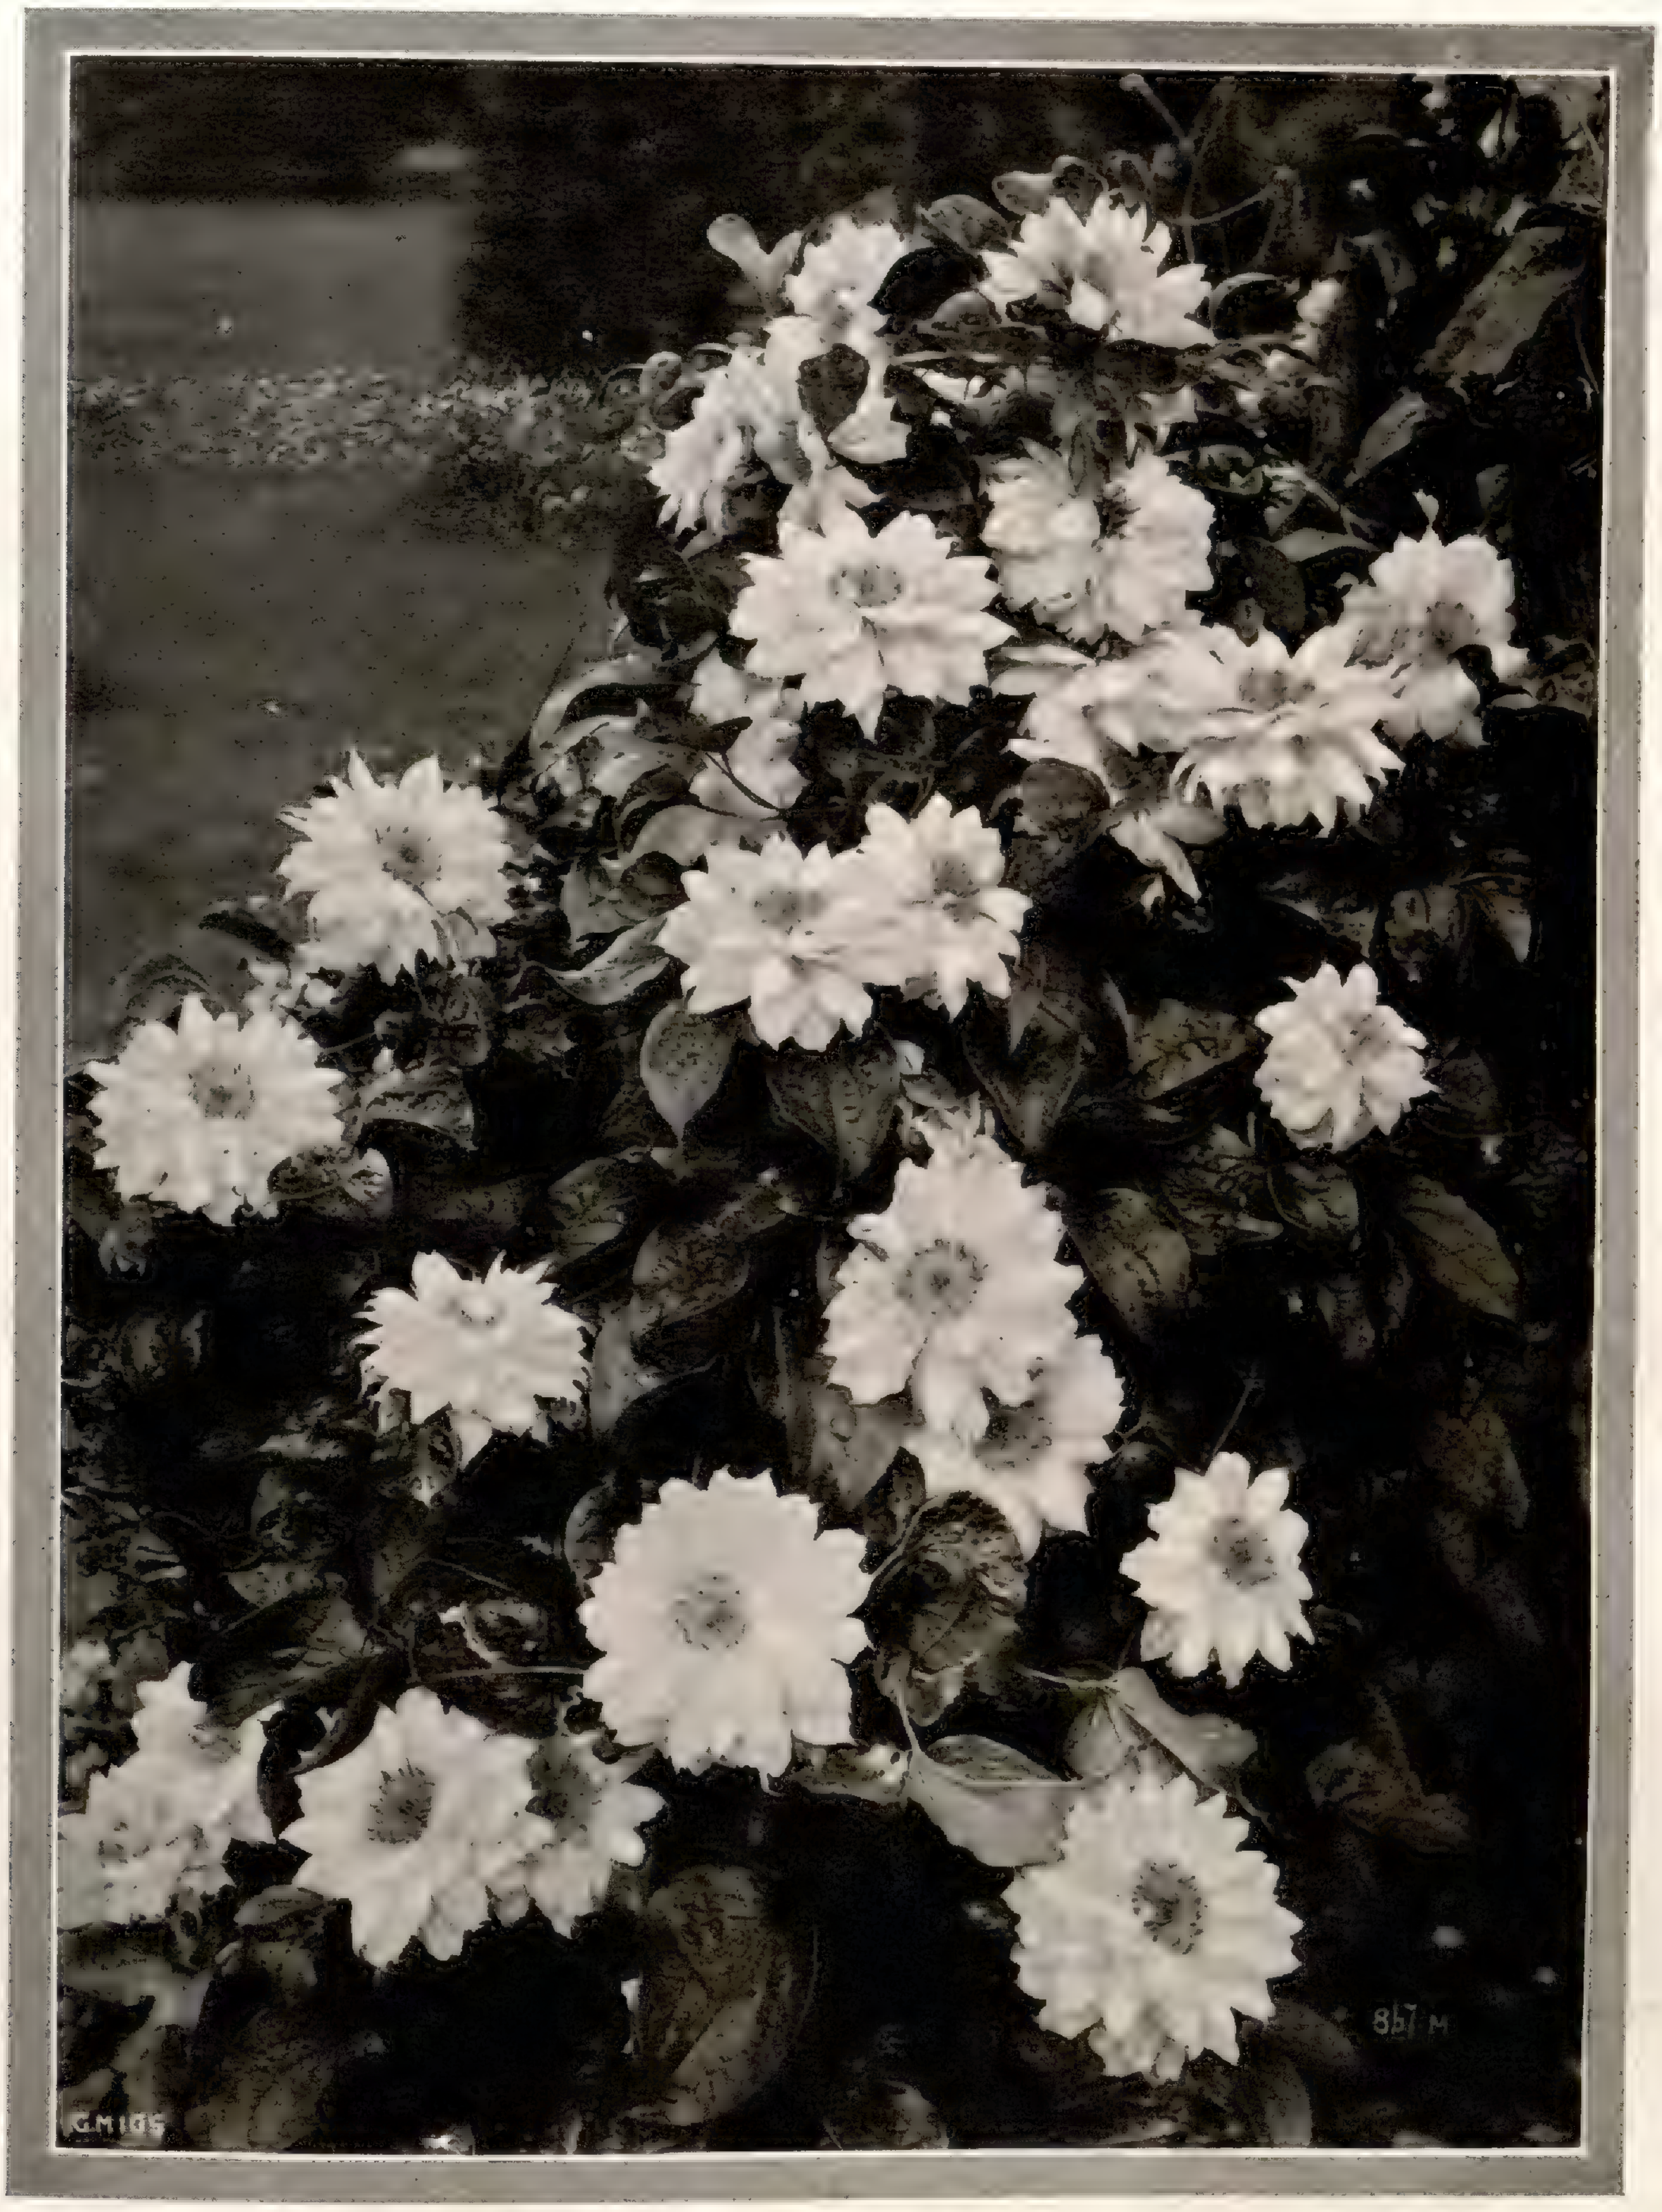
Mr. Hogbin, gardener to Lord Falmouth, Castle Mereworth, set up two dozen dishes of apples; Smart's Prince Arthur, Annie Elizabeth, Newton Wonder, and Shephard's Pomona were the best examples.

Some excellent apples, fine in colour and size, were exhibited by Mr. A. W. Metcalfe, gardener to Sir Julius Wernher, Bart., Luton Hoo, Luton; the varieties were Annie Elizabeth and Lane's Prince Albert, preserved in the new fruit room erected at Luton Hoo last year.

For Awards and Medals see page 165.

## GARDEN CLEMATISES.

The various kinds of garden clematises are amongst the most showy of hardy climbers, and the only point that can be urged against their general cultivation is that they sometimes die suddenly without any apparent reason when in full growth, and, to all appearances, in first-rate condition. In some gardens this has occurred repeatedly, and it is difficult to assign a reason. It may be that high breeding and intensive propagation have weakened the plants, thereby making them peculiarly susceptible to disease, or, what is quite likely, they may be liable to sunstroke. Whatever is the cause, species and botanical varieties, planted under exactly similar conditions, grow freely, and it is rarely that one dies in the same manner.



CLEMATIS DUCHESS OF EDINBURGH.

A beautiful garden hybrid with large white, sweetly scented double flowers.

The most satisfactory results appear to be obtained from planting these clematises in positions where the soil is cool, and where the lower parts of the stems are not exposed to bright sun, for it has been observed that plants which are planted against the shady side of a trellis or wall, but have their upper parts exposed to full sun, thrive well; thus it would appear desirable to shade the roots and lower parts of the stems, but let the upper parts have as much sunlight as possible. Suitable positions for clematises may be found in most gardens, for they may be grown against walls, on trellises, pergolas, fences, arbours, on old bushes, or over rough posts. Wherever they are grown it is necessary to provide fairly good loamy soil; the addition of chalk, if the soil does not naturally contain much lime, is attended by good results.

The annual pruning of many clematises is a necessary business, for the best results are only obtained when there are plenty of strong, vigorous young growths. As the pruning of the several groups requires to be done somewhat differently, attention is directed to the work under each group as it is described. The propagation of the various garden clematises is usually carried out in one of two ways, either by grafting upon pieces of root of the common C. vitalba in spring, or by means of cuttings. They are grown in pots until ready to place in permanent positions, which is usually within twelve months of the time of propagation.

In addition to their being grown out of doors, a large number of young plants are flowered in pots for greenhouse decoration in spring, while now and then one finds large pot plants, trained on wire balloon-shaped trellises, which blossom very freely. In the northern parts of the country, it not infrequently happens that the latter varieties are used as cool greenhouse climbers, and as such they give excellent results.

The garden varieties of clematis are divided into the following groups: Patens, florida, lanuginosa, Jackmani, viticella, and coccinea.

C. patens, the type of one of the earlier-flowering groups, is a native of China and Japan, from whence, according to Loudon, it was introduced in 1836. Its large blue flowers are freely produced during May and June. Any pruning which may be necessary must be left until after the flowers have fallen. Of the numerous varieties the following is a selection: Albert Victor, lavender; Edith Jackman, white, with a mauve tinge; Fair Rosamond, white; Lady Londesborough, silver-grey, with a reddish bar to each sepal; Mdlle. Torriana, rose, flushed purple; Mrs. George Jackman, white; Mrs. Quilter, white; and The Queen, mauve.

C. florida differs from the last-named by flowering two or three weeks later, and by having more formal-shaped, and sometimes double, flowers. It, like C. patens, flowers on the old wood, hence it must not be pruned until the flowers are over, and even then neither kind needs severe pruning, a little thinning being usually all that is required. It is a native of Japan, and has been in cultivation for more than a century. The flowers may be white or blue. Good varieties are: Belle of Woking, silvery-grey, double; Countess of Lovelace, bluish-lilac, double; Duchess of Edinburgh, white, double; and John Gould Veitch, lavender.

C. lanuginosa, a native of China, is the type of a group which is characterised by bearing very large flowers. These, in some instances, are from six to eight inches across, and the colour may be white, mauve, blue, or white, with stripes of other colours. As it blossoms in July and August from the current season's wood, pruning may be done in February. This must be fairly hard, for the previous year's shoots require cutting back to within a few buds of the older wood. There is a wide selection of varieties, and of these the following will be found worthy representatives: Alba magna, white, with a faint blue tinge; Anderson Henryi, creamy-white; Beauty of Worcester, bluish-violet, sometimes double; Duchess of Teck, white; Fairy Queen, flesh; Gloire de St. Julien, lavender-blue; Lady Caroline Neville, pale lavender; La France, violet; Louis Van Houtte, violet-purple; Madame Van Houtte, white; Marcel Moser, pale lavender, with reddish bars; and Nellie Moser, white, with red bar on each sepal.

C. viticella is a European species, which gives its name to a group that is rendered conspicuous by reason of its large quantities of elegant purple flowers, which are smaller than those of the other groups. The flowering time is from late in July until October, and the flowers are borne from young wood, therefore the branches may be pruned back to within a few buds of the base in February. There are varieties with red, white, and double flowers. Good ones are: Bicolor graveolens, yellowish-white; La Nancienne, violet, double; alba, white; rubra, red; Lady Bovill, blue; Madame Grange, crimson-violet; grandiflora, red; and Thomas Moore, violet.

C. Jackmani, the type of one of the most extensive groups, is a hybrid between C. lanuginosa and C. viticella. It blooms freely from July to October, the flowers being of a rich purple colour. It requires hard pruning in February, for the flowers are produced on the current year's wood. Among the many varieties, red, white, and purple-flowered kinds may be obtained. The following is a selection: Alexandra, purple; Earl of Beaconsfield, purple; Gipsy Queen, purple; Jackmani alba, white; J. rubra, red; J. superba, deep purple; Madame Edouard Andre, red; Othello, purple; Snow White, white; and velutina purpurea, purple.

C. coccinea differs from the other kinds by dying to the ground annually, and by its scarlet flowers being urn-shaped. Crossed with other varieties several showy hybrids have been obtained. Of these Countess of Onslow, purple, with red bands; Duchess of York, blush-pink; Duchess of Albany, pink; and Sir Trevor Lawrence, crimson, are showy kinds.

W. Dallimore.

## EARLY-FLOWERING CHRYSANTHEMUMS.

It is impossible to over-estimate the importance of early-flowering chrysanthemums. They are of immense value for beds and mixed borders, and for providing an abundance of flowers for cutting during the late summer and autumn months, they are indispensable. For this latter purpose a good number of plants should be put out in the reserve garden, which will prevent the necessity of cutting flowers from those in the beds. It is also advisable to retain a good stock of plants for refilling spaces which occur in the borders through the removal of plants that have ceased flowering. Occasionally failures happen with other subjects after being bedded out, and it is at such a time that the value of these early-flowering chrysanthemums is appreciated. They are very accommodating, and lift well if dull, showery weather can be chosen for the operation, and even in bright weather they stand the ordeal wonderfully well, providing a slight shading is afforded, and the plants are syringed for a few days.

### Propagation.

The most suitable time to take the cuttings is from the middle to the end of February. The stock roots, which have been in cold frames since being lifted and boxed, are placed in a newly-started fruit house in January, where abundance of material for propagating purposes will be in readiness by the time mentioned above. The cuttings are dibbled into seed boxes, which have been previously filled with light soil, having a layer of sand on the top. After being inserted, the cuttings are given a good watering, and allowed to remain in a little warmth to root. When top growth commences the tops are pinched out to induce side growths, the idea being to form bushy plants. As soon as the side shoots are in evidence, remove the boxes to cold frames, keeping them fairly close until they become accustomed to the change of temperature. After being in the frames for about a fortnight the young plants should be planted out in frames. Place about six inches of good soil in the frames, and plant at least six inches apart. A good watering should be given when planting is completed, and it is necessary to keep the frames shaded and fairly close until the plants are established. After this the shading can be dispensed with, and air gradually given until the weather allows full exposure. The extra trouble caused by the frame culture is well repaid, and splendid plants will be in readiness for putting out.

### Planting.

The most suitable time for putting the plants into their outside quarters depends a great deal on locality. In the southern counties, the end of April is generally safe, but in the colder districts the planting must necessarily be delayed until later. If possible, a fresh site should be selected annually, for there is nothing more conducive to the welfare of these chrysanthemums than new ground. The distance they are to be put apart must be governed by the habit of the varieties grown, generally speaking, from two feet to two feet six inches between the plants will be found ample space.

One stake is quite sufficient for supporting the plants, and, as growth advances, the shoots must be looped to it. It is very beneficial to the welfare of chrysanthemums to stir the surface of the soil frequently, and a slight dressing of some approved artificial manure given occasionally will prove of great assistance.

### Varieties to Grow.

The list of early-flowering chrysanthemums now on the market is an extensive one, and those varieties mentioned below are only a few of the many obtainable: Bronze Goacher, bronze; Carrie, yellow; Crimson Marie Masse, crimson-bronze; Crimson Queen, crimson; Goacher's Crimson, bright crimson; Goacher's Pink, fine pink; Harrie, orange; Harvest Home, orange and crimson; Horace Martin, yellow; Improved Masse, lilac; Le Cygne, white; Market White, good white; Mrs. W. Sydenham, dark crimson; Norbet Puvrez, salmon; Ralph Curtis, creamy-white; Robbie Burns, rose; Roi des Blancs, white; Roi des Precoces, bright crimson; and Wells' Scarlet, scarlet terra-cotta.

Gnaton Gardens. E. C. Pooley.

## REVIVAL OF THE HULL CHRYSANTHEMUM SHOW.

It is pleasing to hear that this show is to be revived after a lapse of eight years; it would be better news to hear of more revivals, but I fear the opposite is rather the tendency. The Hull show is to extend over two days, and I am sure all will wish it a long term of prosperity.

There were four outstanding features in the late shows that are worthy of special mention. Firstly, the extraordinary punctuality and readiness for the judges; at two minutes to 10 a.m., Mr. Dixon could be found in front of the clock with bell in hand to give the signal to clear. If some other societies would copy this system, it would be the better for exhibitors and judges alike. Secondly, this society was the pioneer of showing how effectively large-flowered chrysanthemums could be disposed along with foliage plants to produce a bold, yet artistic and harmonious effect. Thirdly, it initiated the idea of table decoration by artificial light, thus thoroughly representing what a dinner-table design should be, and how effective chrysanthemums could be employed in conjunction with any natural foliage. This is all too often a source of argument and dissatisfaction at autumn shows, as exhibitors are at a loss to know how to arrange their tables, whether for daylight effect or for artificial light. With good prizes and stringent regulations, there was no room for argument at the Hull displays. Fourthly, the extreme courtesy and consideration that was shown to all concerned was especially noticeable.

Many persons may wonder how, with all these good qualities, the Hull Society ceased to progress, and indeed closed down. I may or may not be right in my answer to such an enquiry, but, having acted as one of the judges for many years, I saw exhibitors gradually dropping off, and this undoubtedly was the principal cause of decline in the receipts. Fifteen years ago there was a strong tendency all over the country to offer extra large and tempting prizes for cut blooms; these were naturally sought after by the leading exhibitors, and as Hull is geographically situated out of the direct line from one large centre to another, the society suffered, as exhibitors found it easier to get to York, Sheffield, Bradford, Leeds, etc., than to Hull; hence the show lacked the support of exhibitors, and this had an adverse effect upon the attendance.

E. Molyneux.

## CARNATION MAY DAY.

During the past two or three years a considerable number of perpetual carnations of quite exceptional merit have been introduced to cultivation, and prominent among them is the charming variety, May Day, which at once obtained attention, and is regarded with much favour by cultivators. This excellent carnation is of American origin, and was introduced to this country in 1909, and made its appearance at the English exhibitions in the year following, when it was recognised as possessing merit of a high order. At the exhibition held by the Perpetual Carnation Society, on June 9, 1910, it received the award of a First-class Certificate, and was one of the three varieties with which Mr. W. Wallace, of Eaton Bray, won the American Carnation Society's silver cup, offered as the premier award for three vases of American novelties.

The flowers of May Day are large in size and of fine form, with shell-like petals and borne on long, stiff stems. The colour is salmon-pink, with satin-like finish. Its free growth and abundant and continuous flower production render the variety equally valuable in private gardens and commercial establishments.

## COLOUR.

The question of which of the two organic worlds, the vegetable or the animal, presents the wider range and greater brilliancy of colour, is a very open one. The flower lover would, at first sight, be fully justified in claiming pre-eminence in that respect for his pets, but both the ornithologist and the entomologist could cite plenty of ground for, at any rate, an equality, and when we come to the sea anemones, many seaweeds, and also many fish, especially tropical ones, we shall certainly find that even our richest rainbows of the floral world find worthy rivals in many sections of the other realm of life. How colour is produced is, in many instances, somewhat of a mystery. Actual pigments are by no means necessary, as the very rainbow itself proves. The most brilliant and the purest tints can be produced by mere molecular conditions which tend to break up the pure white light of the sun into its constituents and convey them to the wonderful nerve system of our eyes in such a way as to produce the most diverse effects. Thus it is with the beautiful tints displayed by the opal, mother of pearl, etc., in the inorganic world, and many of the tints of feathers of birds, and scales of butterflies, are doubtless due to light refraction more than actual pigmentation or presence of actual colouring matter. Whether, however, the colours we perceive are due to refraction or pigments is rather a distinction without a real difference, since even in the pigments their colour is only due to decomposition of the white light rays, part of whose component colours they absorb and reject the rest to act upon the optic nerves and so convey a special colour impression to the brain.

Therefore it is obvious that the colour we perceive is not really an innate quality of the object seen, but a quality which it refuses to retain. In the plant world the prevailing colour is green due to the general presence of those tiny grains of chlorophyll which practically do all the vital work of the world by utilising the vital forces inherent to the sunbeam, and by its aid working up gas and inorganic material into assimilable nutrition for the animal world which cannot do such work for itself. It is mostly in the flowers that other colours are displayed, generally in their petals and corollas, but sometimes, as in poinsettias and hydrangeas, associated leaves are so modified as to display brilliant colours instead of chlorophyllic green, and thus indirectly produce the same effect as brilliant petals by attracting the insect world to act as fertilising intermediaries. The infinite delicacy of the evolution of colour in flowers is seen in the fact that their tints often pass through various grades of change during the transient life of the blossom. Each of these changes means some subtle alteration in the power of selection of the light rays to be absorbed or rejected as explained above. As a result of selective cultivation, flowers have often been induced to assume quite other tints than the normal wild ones, and occasionally, and not rarely, we find one and the same plant suddenly producing "sports" quite distinct in hue from the type.

CARNATION MAY DAY.
A distinct American perpetual-flowering variety, with finely-formed flowers of a bright salmon-pink hue.

Mr. E. A. Bunyard, in a very interesting lecture at the Horticultural Club, demonstrated that such changes may not be due to the actual introduction, as it were, of differently coloured pigments, but that colours were often due to varied pigments arranged in superposed cell layers. These pigments consisted of coloured grains, with interstices between them, and a very slight change in the position of the containing cells sufficed to show one layer through the other or to hide one entirely beneath the other, as the case might be, and thus produce a quite different colour effect upon the eye, though the actual materials present were identical. From this we can see that very slight constitutional changes in a plant may produce very marked differences. It is a curious and interesting fact that, although, as we have said, chlorophyll in its normal green state is the prevalent tint of vegetation during the active period of growth, it is yet capable when that period ends, and its work is finished, of displaying in its decay in the autumn such a brilliant and varied garment of colour as then clothes our landscapes in a myriad other tints, as if it almost seems tired of its unassuming working vestments.

C. T. D.

## FOLIAGE BEGONIAS.

Though many of the begonias that are grown for the sake of their beautiful flowers have very ornamental foliage, the section to which the term "foliage begonias" is generally applied consists of the numerous garden forms of Begonia Rex and hybrids obtained between it and a few other species.

Begonia Rex itself is a native of Assam, and was introduced by M. J. Linden, of Brussels. In an interesting catalogue now before me, namely, that of Messrs. William Rollinson and Sons, of Tooting, containing the new and rare plants for distribution during the spring of 1858, Begonia Rex is there offered for the first time at a price of two guineas each. Accompanying the description is a notice to the effect that the above-named firm had purchased the above plant for distribution throughout Great Britain and Ireland from that eminent botanist, M. J. Linden, of Brussels. Despite the fact that Begonia Rex was at the time of its introduction so much admired for the beauty of its foliage, it was not until 1884 that it was given a First Class Certificate by the Royal Horticultural Society.

Now it has proved so variable in itself, and has been crossed and intercrossed in such a manner that these "foliage begonias" form an extensive class in which the markings of the leaves, the size thereof, and the rate of growth differs considerably. Among the more delicate, yet at the same time exquisitely coloured, forms, are some varieties raised on the Continent between the members of the Rex section and the pretty little Begonia decora, which was introduced from Penang by Messrs. J. Veitch and Sons, and sent out in 1893. Messrs. Sander, of St. Albans, also raised and distributed, about ten years later, some fine varieties, the result, I believe, of crossing B. Rex and B. Bowringeana. Noteworthy among these last are His Majesty, Fearnley Sander, and Mrs. H. G. Moon.

These foliage begonias are of considerable value for various decorative purposes. In the first place, where there is an arrangement of rockwork in a warm house, they are seen to considerable advantage thereon, while for furnishing a back wall they are equally useful. The fact that they will thrive in a somewhat heavily shaded position stands them in good stead for this purpose. In order to clothe a wall it should be faced with wire netting, standing out a little distance therefrom, and the intervening space filled with a mixture of fibrous peat and sphagnum moss. In this small plants should be inserted as the rooting material is gradually built up, this method being preferable to sticking in the plants after the soil is placed in position.

Grown in pots five inches or six inches in diameter these begonias are available for the edging of groups or for decorative purposes in different ways, while in small pots the bronzy tinted varieties have an extremely pretty effect when dropped into some of the small metallic jardinières now so much in vogue. Although they will not stand a great deal of exposure, yet the plants quickly recover from any injury when they are returned to more favourable quarters.

As is well known, their propagation by means of leaf-cuttings is a very simple matter, and if the mature leaves are laid on a pan of sandy soil, held in position by a peg or two, and the midrib and principal veins divided in a few places, young plants will be quickly pushed up from the surface of the cuts, and when large enough they can be potted singly. Where a bed of cocoanut-fibre refuse, with a supply of bottom-heat, is used, in which to plunge plants of different kinds, the leaves may be laid on the surface of the bed without any covering, and under these conditions a stock of young plants can be readily obtained.

I was particularly interested last autumn in a house of these begonias at Chelsea, the plants being neat, well furnished examples in 5in. pots. With such a number of beautiful forms, it was difficult to make a selection, but the following were recorded in my note-book: Adolphe Pollock, bronzy-green, with silver markings; Brian Boru, bright green and purple, with silvery band; Catherine Schmitt, bronzy-green, dark margin, blotched white; Chicago, silver ground, green edge, dotted silver; Etoile d'Argent, silvery-pink; Finette, curiously freckled; Gaspard Crayer, dark green, heavily spotted white; His Majesty, carmine-rose; Lecontre, silver ground, spotted green; Isabella Bellon, silvery-red, purple shading; Masterpiece, silver ground, dark purple centre; Mrs. H. G. Moon, silver ground, carmine centre; President Carnot, bronzy-green, spotted silver; Remily, silver ground, rose margin, green centre; and The Queen, bronzy-purple, margin and centre edged green, with silver dots. W. T.

## GRASS ORCHARDS.

Recently the oft-recurring subject, whether or not a verdant covering of grass over the roots of fruit trees, but more particularly apple trees, is a disadvantage, has again been discussed in the horticultural Press. Much has been advanced, both for and against the system of grass culture, and the whole question would have, in all probability, again relapsed in the same indecisive state as before had not the results of the Woburn experiments been made known. These experiments, which, by the way, are far more conclusive and reliable than any that could be conducted in a private establishment, go to prove that a thick covering of grass is detrimental to the health and fruitfulness, as well as to the longevity of fruit trees. That rank herbage covering the entire surface of the soil should have an adverse effect upon the health and fruitfulness of the trees is easily conceived, but that this should cause their untimely death seems a more dubious point, especially when it is considered that there are great numbers of old trees in all parts of the country, in health and vigour, whose roots have been covered by grass, close cropped by animals, it may be, for the greater part of a century. Many of these, of course, may be survivals of extensive plantations, their companions having succumbed to untoward circumstances; still it would not be difficult to discover regularly planted plots of thriving trees, with, to all appearance, soil enveloping their roots, that had remained untouched by any implement since the time of planting many years ago.

A grass-covered orchard of fruit trees has a great fascination for most persons, and, to my view, a no more fitting adjunct to a farm house could be imagined, as, apart from its value for fruit producing, it only requires surrounding by a substantial hedge to make it an ideal nursery for young stock in the early and most trying months of the year.

Allowing that a long-continued covering of grass-turf is injurious to the trees, still it is not difficult to compromise the matter by cultivating a portion of a given area each year, or, if little or no value is set, as stated, upon the grass in early spring, the whole plot may be done at one time. This at first sight suggests a complete change from grass to fallow, but, except for a short time, it really is not so. Turf turned with a spade at any time through the winter months, or even as late as April, completely hiding from view all trace of verdure, will by midsummer have regained all its wonted greenery, and, if not fed off by animals, will require the aid of the scythe to render it comfortable to traverse.

There are here two plots or orchards adjoining, each about an acre in extent. One of these was planted about thirty-five years ago, the other scarcely twenty years. The former was cultivated upon the surface for about ten years, when the task that keeping down weeds implied led to its being sown out with grass seeds. The latter has always been cultivated—that is, the hoe and rake are used during the summer and autumn, and in spring, when pruning and cleansing of the trees is accomplished, the whole surface is pointed over with a fork, this latter process being done to facilitate the summer work rather than from any good results supposed to arise through disturbing the soil more deeply. Upon the first-named plot the turf is turned at intervals, sometimes two or three years intervene, but, other work permitting, every alternate year is favoured. Last winter the whole orchard was thus turned, and at present, except for a slight roughness of surface, no one would suspect that it had been disturbed. As hinted, time cannot be found annually for this, though the work can be proceeded with when most other garden operations are at a standstill. Where any fear exists of grass being injurious to fruit trees, a space from four to six feet around the bole of the tree treated in this way will, I think, set all fears at rest. In carrying out the work the workman should be instructed to insert the spade in a sloping direction, whereby a turf about two inches in thickness throughout is raised, and is then turned into the space it was taken from, but the reverse side uppermost. A good workman will do this in such a way that an almost level surface is presented when all is finished.

The greatest advantage gained, so far as I have been able to observe, is that of moisture to the tree roots, for a thick mass of grass and its fibrous roots absorbs so much of the rainfall, especially after seasons like last that the trees suffer accordingly, and have no chance to recuperate their energies until the winter is far advanced. With upturned turf, however, this is reversed, and the decaying herbage must be very helpful as a manurial agent.

In conclusion, I may add that, between the trees and the crops produced in the two plots mentioned, little or no difference is manifested, when the disparity between their age is allowed for; while the grass-covered area takes considerably less time and labour to keep in order compared with the other. James Day.

Galloway House, Wigtownshire.

**Fruit Trees** of all kinds intended for walls or wires should, where space permits, be bought in as maidens and trained according to one's own ideas. Peaches, plums, apricots, and cherries may be built up to fair sized trees, and by moving them every two years the roots are in a splendid condition when required to fill a vacancy on the walls, and if transplanted early in the autumn there is a reasonable prospect of a light crop the following year. The future well-being of the tree depends upon the stock; the union of stock and graft must be clean and without blemish; failing this the tree may as well be consigned to the garden fire.—W. Messenger.

## FAIR BLOSSOMS OF SPRING.

First comes the almond, wild-rose pink against the skies of blue, though the ground beneath may be snow covered, for the tree remains true to its Hebrew name of "shakad," which means "wake early." On the reverse of every petal lies a metallic sheen, that caused the poet Moore's description in the lines:

> "The dream of a future happier hour
>   That alights on Misery's brow
> Springs out of the silvery almond flower
>   That blooms on a leafless bough."

There is a classic legend about this tree, well meriting remembrance. After the siege of Troy, Demophoon, the son of the famed Theseus, was shipwrecked on the coast of Thrace, and there fell in love with the beautiful Thracian queen, Phyllis, whom he wedded. The royal consort went back to Athens on his father's death, promising to return to his wife within a month. On his failing to appear, the young bride died of grief, and was transformed into an almond tree. The husband, when at last he revisited Thrace, petitioned the gods, and offered sacrifices, but the only consolation vouchsafed to him was that the almond immediately blossomed in midwinter, and continues to do so to this day.

A more practical fancy is that when the tree has an unusual amount of bloom it presages a very good season for all fruits of the earth.

The poetic symbol of the snowdrop is generally supposed to be Hope, but most ancient writers on the language of flowers give it as "a friend in need," or "consolations of friendship." There is a tradition that snowdrops are always to be found in bloom on Candlemas Day, the second of February; that they represent the white doves offered by the Virgin Mary in the Temple. The Latin name, Galanthus, merely signifies milk-flower.

Who does not love the daphne, which, like the almond, blooms in February along boughs devoid of foliage, but afterwards becomes clothed in splendid green garments embroidered with scarlet berries? The scent is indescribably sweet, one little bush making its presence known half across a garden. Mezereon is its old-world name, and, alas! it is the emblem of coquetry. It is a dangerous beauty to grow where children play, for the fruits are poisonous, though a valuable medicinal drug is manufactured from its bark. There is a wonderful variety known as the "lace-wood" of Jamaica, the inner bark of which can be pulled out in lengths until it resembles lace of finest kind. Charles II. used to wear a cravat of this, which had been sent to him by a Governor of Jamaica.

How strangely pathetic is the record of the Laconian festival of Hyacinthus, the beautiful youth who was killed by the throwing of a quoit by Apollo, but directed out of its proper course by the jealous blowing of the breath of his rival, Zephrus. We are bade believe that the familiar flower sprang up out of his blood. The festival was an annual one of grief, lasting three days, during which time prevailed the peculiar custom of eating sweetmeats instead of bread, while the wearing of garlands was strictly forbidden.

Then there is the beloved "polyanthus of unnumbered dyes," believed by the Greeks to have sprung from the ashes of Paralisas, a youth who pined to death for love; the nodding daffodil, containing the tears of vain Narcissus; and the primrose, known to the Swedish villagers as "the Key of May."

We may note, too, in our gardens the wallflower, "faithful in misfortune"; the tear-decked Crown Imperial, or "mourning widow"; while later blossoms the lilac, the beauty of which caused the Dutch painter, Van Spaendoul, to throw down his brush and nearly die of melancholy.

M. H.

## SAINTPAULIA IONANTHA.

This beautiful and useful little plant is of comparatively easy culture, and, grown in successional batches, will make an equally fine display at any season. Having selected a finely-coloured form from a batch of seedlings raised some time ago, I now prefer to raise the plants from leaves. On a small space under the stove staging and towards the light, covered with about an inch of loam, leaf-mould, and sand in equal parts, the petioles of the leaves are inserted fairly firmly, after being broken from the plant. I find that cutting seems to induce damping.

The damping down of the stove provides sufficient moisture, and in a month plants have formed sufficiently large to pot into small 60's. The compost used consists of two parts good loam, one of peat, one of leaf-mould, and one of sand and burnt earth or wood ashes in equal proportions. If the soil is in good condition they will not require watering for a few days, nor should they be watered at any time unless they are approaching dryness. The stove shelf will provide a good place for them. While in the small pots keep them to a single crown, for probably many crowns will form. When well rooted, pot rather firmly into 54 or 48-sized pots, using the same kind of compost as before; still water carefully until the pots are well filled with roots, when an occasional watering with water containing a little fertiliser will materially assist them.

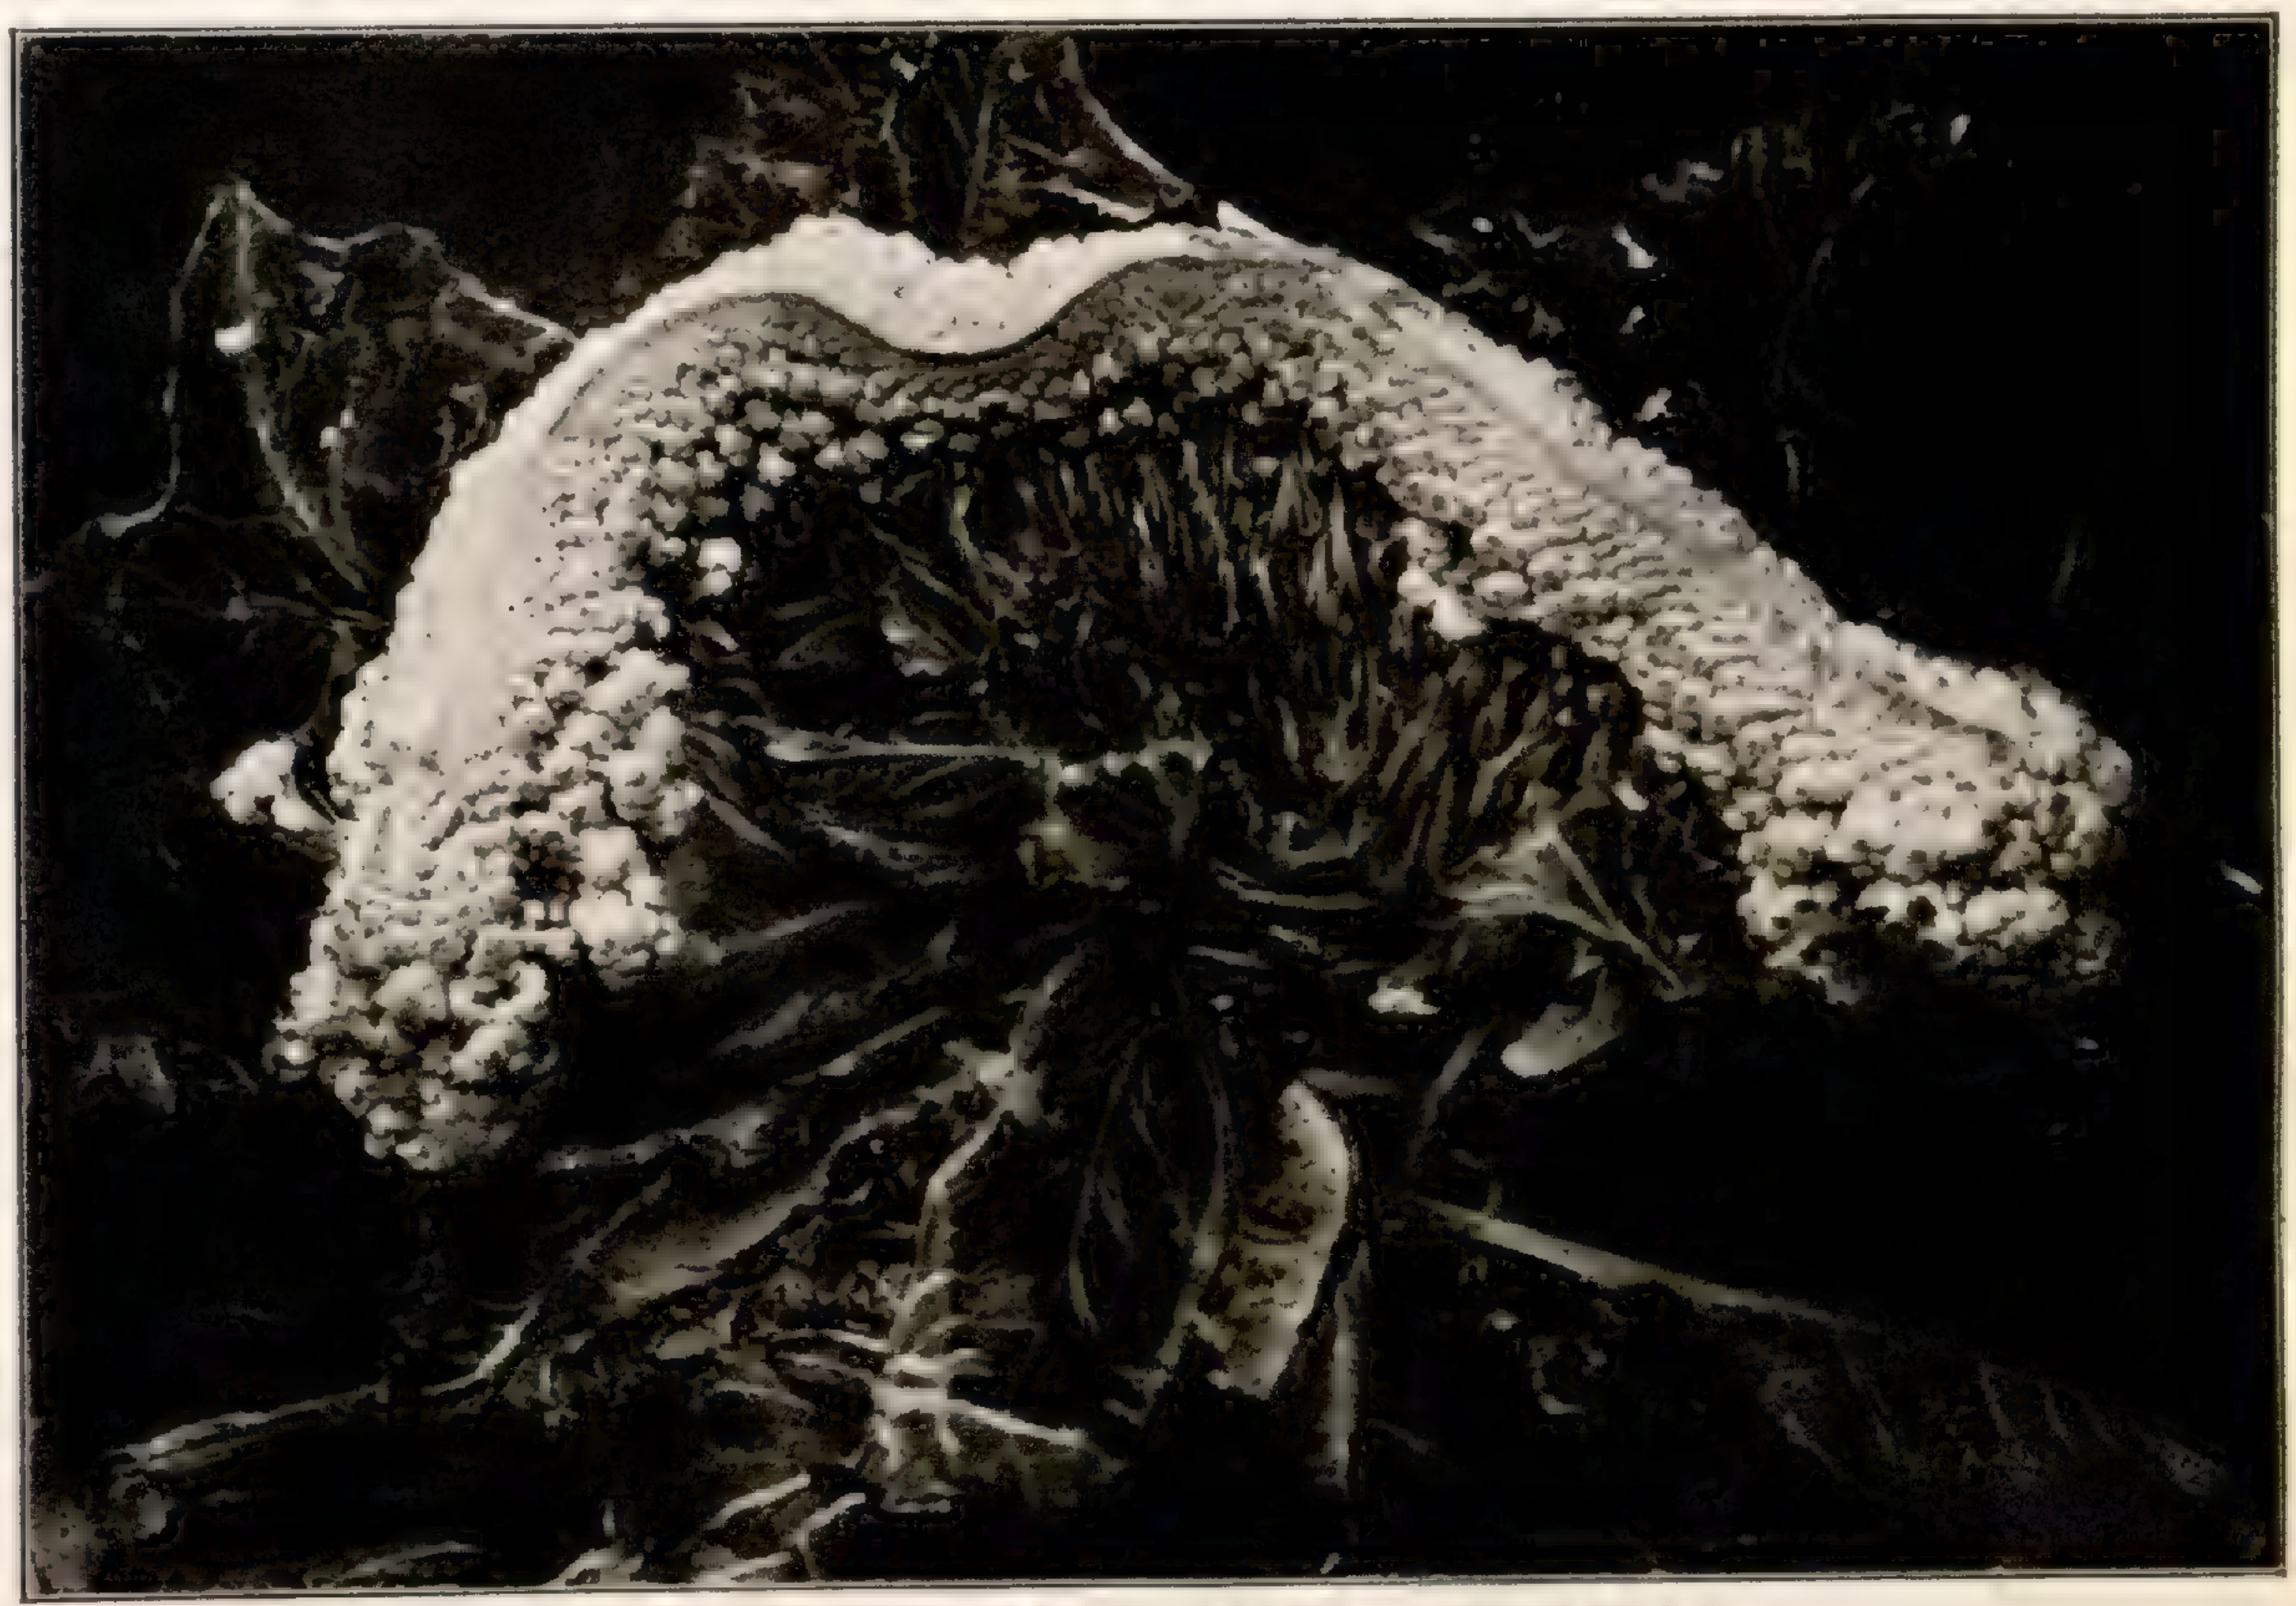
Keep the flower spikes picked off until the plants have well developed, and they will be in full flower within a month of the time picking out ceases, and will last good for fully two months if fallen blooms are not allowed to remain on the plant to cause damping. Propagate in January or February for autumn flowering; in May for winter-flowering; and for flowering in April and May propagate in September.

H. Prime.

Hatfield House Gardens.

## A QUAINT COCKSCOMB BROCCOLI.

Nature performs some quaint tricks, and not seldom takes advantage of man's most careful developments and improvements to carry them out. Fasciation is one of the commonest of these tricks. Members of the cabbage family often seem to go out of their way to be funny, and most of us have seen cabbages producing funnel-shaped leaves instead of the ordinary ones. A short time ago Mr. S. B. Dicks, of Messrs. Cooper, Faber, and Co., Southwark Street, kindly sent us a photograph of a Cockscomb Broccoli that appeared in the garden of Mr. C. Knight, of Cranley. In this instance the head, instead of growing in a cockscomb fashion, as illustrated, and at a little distance was remarkably suggestive of some weird antediluvian reptile.



A CURIOUS COCKSCOMB BROCCOLI.

## LONICERA FRAGRANTISSIMA

This is one of the earliest honeysuckles to blossom, for its flowers appear with the earliest days of the year when the weather is favourable. It is a Chinese shrub growing to a height of 5ft. or 6ft., suitable for planting in a sheltered position in a shrubbery. Although in mild winters it may assume a semi-evergreen character, the leaves usually fall before mid-winter, consequently the flowers are seen to greater advantage if an evergreen background is afforded. The flowers are usually borne in pairs from the leaf axils, and they are white in colour and fragrant.

A second species, L. Standishi, blossoms about the same time. It is also a Chinese plant, and the two are sometimes placed under the same name, although they are distinct in every way, except that they bloom at the same time. L. Standishi bears much larger leaves, which are hairy, whilst those of the other species are almost glabrous. The leaves of L. Standishi fall at the normal time, about October, while those of the other species are retained much later. The flowers of L. Standishi are cream-coloured, but, like those of L. fragrantissima, are sweet scented. Both plants thrive in loamy soil, and are suitable for lifting and placing in pots for greenhouse decoration in winter. Sprays of flowers are useful for arranging with more showy subjects, on account of their fragrance.

W. D.

## THE KAMTSCHATKA STONECROP.

The stonecrops are so numerous and diversified in character and colour as to form a large and highly interesting group of plants, and a selection of the more distinct and beautiful kinds would, if placed under the conditions favourable to their full development, constitute an attractive feature. Stonecrops are of much value in gardens that are naturally warm and dry, and they are especially adapted for the furnishing of hot, dry corners, in which it is difficult to successfully cultivate plants otherwise than those of a succulent nature.

THE KAMTSCHATKA STONECROP (SEDUM KAMTSCHATICUM).
A handsome free-growing species, bearing a profusion of yellow flowers.

Some of the stonecrops grow freely and appear to the greatest advantage when growing on the ledges of the rock garden, while others thrive in the hardy flower border, provided the soil is well drained and they are not allowed to be overrun by strong-growing kinds belonging to other classes of hardy plants. The Kamtschatka Stonecrop (Sedum Kamtschaticum), of which a fine group is herewith illustrated, belongs to the second of the two sections, and when growing under suitable conditions is so attractive as to fully justify the high estimation in which it is held by those who are acquainted with its merits. This species grows from six to eight inches in height, the stems purple-green, and the ovate leaves with which they are furnished are green and dentate towards the apex. It blooms in September, and the comparatively large flowers are bright yellow, and borne on flower stems four or five inches in length.

There is no difficulty in growing this stonecrop to a high degree of perfection. The bed or border should be sufficiently drained to allow the surplus water to pass away readily, and, if the soil is close and tenacious, a liberal dressing of leaf-mould and coarse grit, such as the sweepings of gravel walks, will be beneficial. In common with other stonecrops, this species is readily propagated by division, in the spring, when new growth is commencing.

---

## RANUNCULUS RUTÆFOLIUS.

A graphic writer of works on alpine plants has gone into ecstacies about the Rue-leaved Crowfoot, and has been impelled by his admiration for it to bestow upon it the name of the Rue-leaved "Beauty Flower." One is not disposed to deny its beauty, but, on the other hand, one has met with many more delightful alpines of its class. Yet this Rue-leaved Ranunculus, Buttercup, or Crowfoot, has a charm which appeals to all who take pleasure in such plants as this, and when it is growing happily in the garden, its flowers are incontestably pretty enough, especially when we associate with them the dainty, rue-like foliage, to command and deserve a place in the garden.

This is a pleasing, rather prostrate, little plant from the high Alps, with neat, very finely cut, glaucous leaves, and wonderfully large flowers of white, with golden anthers, and reminding one of a glorified daisy at the distance, yet with all the character of the Crowfoots when seen near.

It is a slow-growing plant, especially if not supplied with all it prefers in the way of moisture. Planted on a bog, by the side of a stream, in shingly soil, or by a pond, it thrives much better than when in a drier position. Yet it can be cultivated quite well in a low part of the rockery, provided that it receives frequent soakings of pure water in dry weather in spring, summer, and even early autumn.

For its cultivation in such a place it should have a well-drained position, and preferably one which can be flooded at times, but will soon allow the water to percolate through the soil, and be carried away by the drainage. This appears somewhat paradoxical, but R. rutæfolius does not like stagnant moisture. It is a slow grower, and is a long time increasing much in size, so that division is not always possible, nor is it advisable. Where seeds can be obtained these may be sown as soon as they are ripe. The roots look as if they would lend themselves to propagation by root cuttings, but the writer has tried this unsuccessfully, and prefers raising from seeds to attempting this experiment again.

Growing only a few inches high, and having wonderfully large and pleasing flowers and foliage, Ranunculus rutæfolius deserves the consideration of alpine growers.

S. ARNOTT.

---

**Perennial Asters.** — Michaelmas daisies can advantageously be planted now, and, if space permits, a border should be set apart entirely for them. A partially shaded position suits them well, and the ground should be deeply cultivated and well enriched for their reception. Roots that are capable of producing five or six strong stems are large enough to plant at each station, and it is well to allow from three to four feet between each plant. Many of the varieties introduced during recent years are very charming, as in numerous cases they produce flowers from almost the whole length of their stems, and they will well repay the grower for any pains taken with them.—J. GARDNER, Batsford Park Gardens.

## CATTLEYA LABIATA.

There is no cattleya more serviceable for decorative purposes than Cattleya labiata autumnalis, as it flowers principally through the months of November and December, when house and shooting parties are plentiful. The flowers are most acceptable for dinner tables and other decorations, and the cut flower growers in this country, on the Continent, and in America grow C. labiata more extensively than any other orchid, which alone is sufficient to justify its merits as being one of the most serviceable orchids in cultivation.

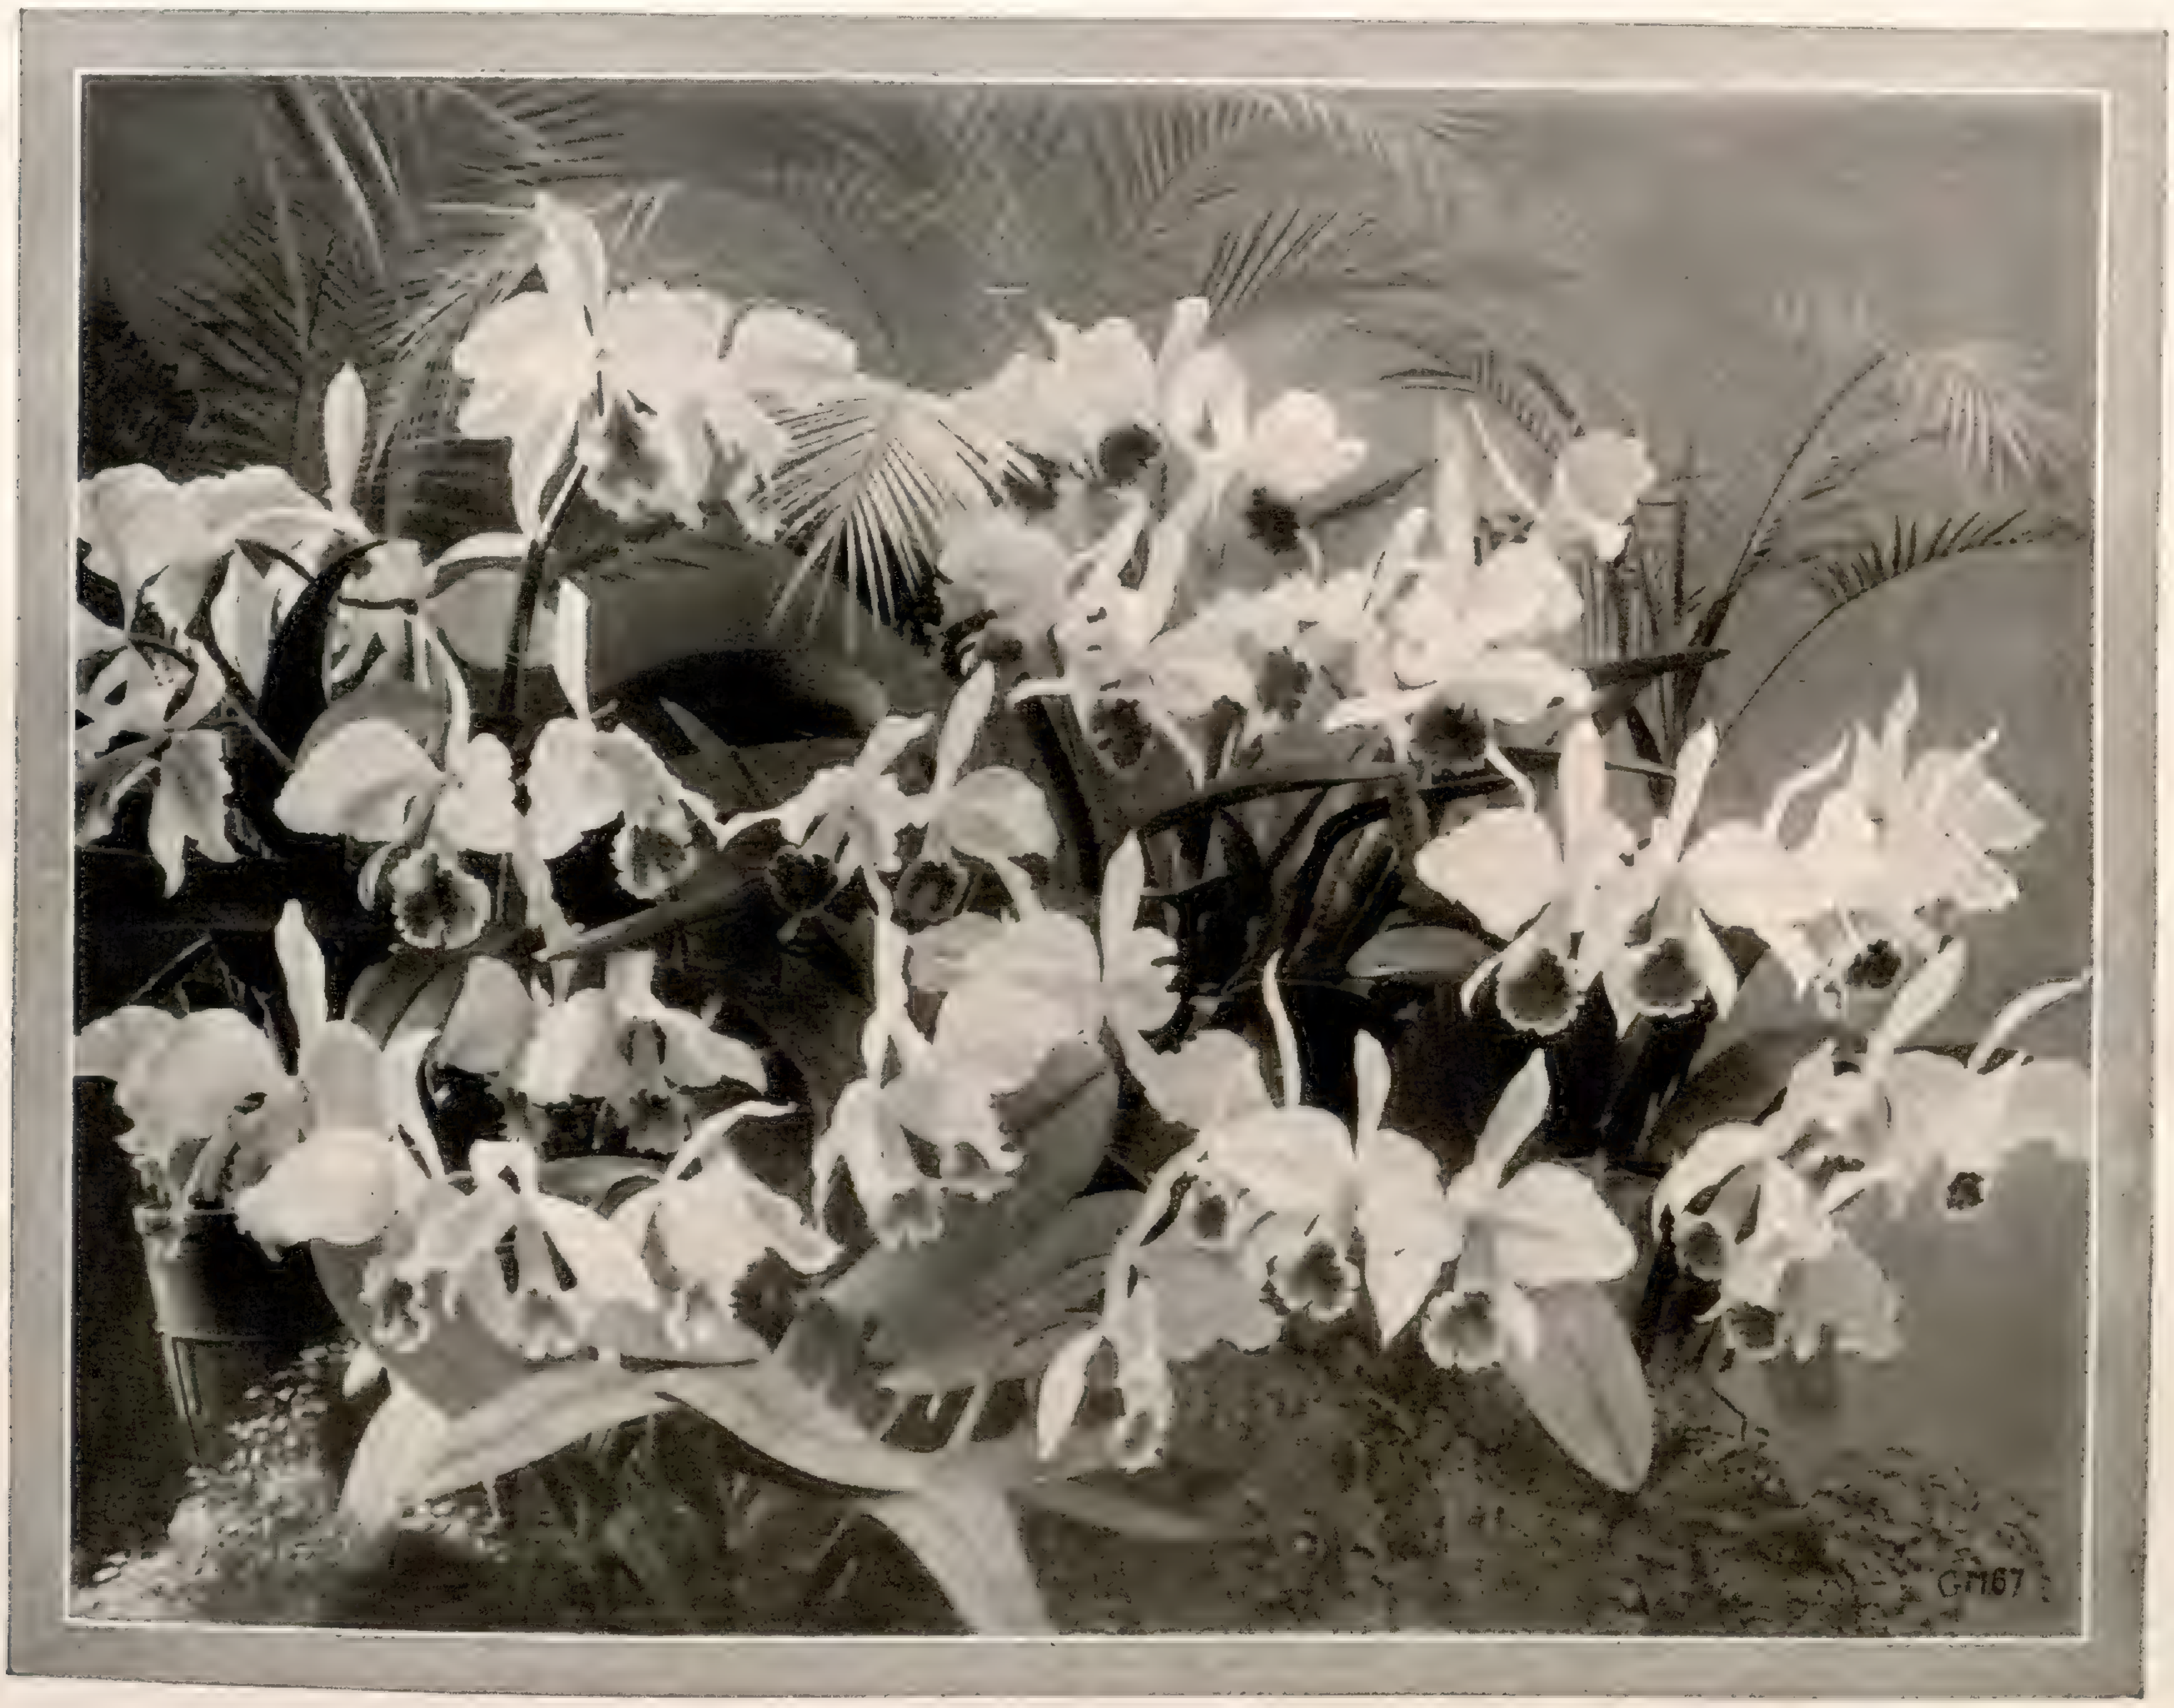
Since its re-introduction some twenty years ago, annual importations have arrived in this country at different seasons of the year, and it is really remarkable where the thousands of plants that have been imported have disappeared, and, what is still more wonderful, is the ready way in which the plants find purchasers annually, especially when the plants arrive in good condition and at a suitable season of the year. There can be no doubt but that the tractability of the plants when newly imported has had a considerable effect on the popularity of C. labiata. One finds plants growing satisfactorily for a season or more under the extremely diverse conditions and most unorthodox methods of cultivation. On one occasion, I remember seeing a number of plants suspended from the roof of a vinery, where they flowered most satisfactorily for the one season only, the cold resting conditions proving fatal to further experiments.

I have mentioned the ease with which the plants are managed when first imported for the special purpose of pointing out that after a few years' growth, under artificial conditions, as provided in our best equipped orchid houses, the coloured forms lose the vigour displayed when first imported, and this may, to some extent, be attributed to the free-flowering character of the species. We are not content with reasonable flowering and taking precautions to relieve the plants of their flowers within a reasonable time after they have become expanded. This does not apply to C. labiata alone, but to other cattleyas, etc., which are subject to deterioration after a few years' cultivation.

With the possibility of such deterioration it is advisable to procure a few imported plants annually. The plants are procurable for a modest outlay, well within the reach of the most humble amateur, and this offers opportunities of securing different varieties, as the range of colour, form, and substance in the flowers is very considerable. The extremely dark forms are almost as rare as the varieties with pure white flowers, or with white sepals and petals and a crimson front lobe to the lip, as seen in C. l. Cooksoniæ, etc. This expectation of good things gives added charm to cultivation. It creates a living interest that can scarcely be described, and it is this interest which has so greatly popularised orchid cultivation during the last few years.

The accompanying illustration is reproduced from a photograph by the writer, taken a little while ago in an amateur's collection. H. J. CHAPMAN.

Oakwood Gardens.



A GROUP OF VARIETIES OF CATTLEYA LABIATA.

## JAVANESE RHODODENDRONS.

No hard-and-fast line can be assigned for the flowering period of this group of rhododendrons, as, providing their requirements are understood, they will bloom more or less continuously throughout the year. In the first place, it must be borne in mind that, though frequently referred to as greenhouse rhododendrons, yet for their successful culture a temperature above that of an ordinary greenhouse is necessary. During the winter the thermometer should, if possible, not fall below 50 degrees, and this may rise 10 to 15 degrees in the daytime.

In summer no fire-heat will be required. It should also be borne in mind that the original species, from which the present-day garden varieties have sprung, are in a state of nature mostly epiphytes. Owing to this, it will be at once understood that dense masses of soil around the roots will be decidedly injurious; in fact, the pots should be efficiently drained, and the compost must consist chiefly of fibrous peat and sand. It should in potting be pressed down firmly.

Another point to bear in mind is that on the mountains of the Malayan Archæpelago, where the original species grow, there is a liberal amount of atmospheric moisture; hence, under cultivation this should, as far as possible, be maintained. Among the varieties there is now a wide range in the colour of their blossoms, from white to deep crimson, while in habit the plants vary greatly. W. T.

## SPRING TREATMENT OF LAWNS.

With the advent of springlike weather the grass on our lawns will show signs of returning life, and its encouragement will demand attention and care. During the autumn and winter months some lawns will have been top-dressed with horse-droppings and sand, to increase the fertility of the soil, some surfaced with other materials, and not a few left to the lowly worms to enrich with the earthy matter they have passed through their bodies. In all cases, advantage should be taken of a dry spell to brush harrow the lawn, and by this means spread the materials and work them in amongst the grasses. The usual method of brushing is to fasten a number of birch brooms on a gate-like contrivance, and draw this lengthways and crossways over the ground. Small depressions will be brought up to the level in the process, and strawy matter left in rolls ready to be raked off when the brushing is finished.

At this early stage of the grasses' growth it is not advisable to roll the ground, unless it is of a sandy nature. In this case solidity is wanted, and rolling is beneficial to that end. With soils of a tenacious nature, rolling, especially when the surface is at all moist, is most detrimental to the well-being of the finer grasses, as it seals up the air pores in the soil, and prevents either air or water passing through them. In this condition soil quickly becomes soured, the finer grasses die out, and coarse herbage, moss, and weeds, are the resulting survivors, making the lawn unsightly and unsuitable for games. I have frequently found that the unsatisfactory state of a lawn was due more to excessive rolling, or rolling when the soil was too soft, than to exhaustion of plant food. It is therefore advisable, when dealing with a lawn on a heavy formation, to exercise some judgment in rolling it.

Lawns in good condition, and those that have been surfaced with a rich organic material, will benefit from a top-dressing of 4oz. of slaked lime to the square yard in March. This should be passed through a fine sieve before it is applied, to secure evenness in its distribution. Where the herbage is thin, or the finer grasses scarce, a decided improvement can be effected by sowing seeds between the middle and end of April. For this purpose, the lawns that have been surfaced in autumn or winter, with rich manurial materials and brush-harrowed in the spring, will be in a condition to receive the seeds. The quantity of seeds to employ should, to a certain extent, be determined by the amount of herbage on the lawn, but, in any case, not less than 1lb. to 50 square yards (in sowing down a new lawn allow 1lb. of seeds to 30 square yards). Where seeds are to be used, the lime dressing should not be applied until the seeds are sown and rolled in. Lawns that have not been top-dressed should be scratched with a sharp-toothed rake to secure a bed for the seed, then sown, rolled, and dressed with lime.

Lime is advantageous to the seed in two ways, and sometimes three. It breaks up the plant food constituents in the soil, and makes them ready for the roots of the young seedlings; it tends to neutralise any acid formation in the soil, and is an excellent protection against the depredations of birds. Besides converting soil constituents into an available form of plant food, lime is itself a very essential grass food, and should be supplied annually where the soil formation is deficient in calcareous matter.

Pedestrian.

## CROAKERS.

What has produced the pessimistic tone pervading the horticultural world just now? Goodness only knows. But, read where you may, there is always someone bewailing the so-called fact, that things are not so well grown or exhibited now as they were when the writers themselves were in the arena; and deploring that there is nobody to take the exalted positions they occupied in their day.

Sometimes, Mr. Editor, I put it down to pessimism; at others, to failing eyesight and the need of new spectacles; while at other times I think they must have a fit of the "blues," and not content with themselves, and so sit down and write a tirade against modern things in general, and some subjects in particular.

Take a few recent instances—"the decline of the big chrysanthemum" will do for a start. We have had this bogey hustling around now for the past ten years, but the only result I can see is that exhibition Japanese blooms are grown and exhibited better than ever they were. No doubt the varieties have improved greatly during this period, but the cultivation has improved, at least I think so, and I have attended most of the Metropolitan shows for the last thirty years, besides a fair number farther afield. I do not say we have so many "giants" carting their flowers about from show to show as we used to have, but if we take each district we shall find just as many exhibitors in their respective places as formerly, but they do not travel so much about doing the National, Birmingham, Liverpool, Sheffield, Southampton, and Belfast shows all in one season, a tour one would describe as fashionable a decade or so ago. But because this class of exhibitor is a little out of date, it does not prove the decline in the big Japanese chrysanthemum.

Then take the dahlia world. Here we are constantly being told by the "croakers" that the introduction of the garden cactus varieties, the pæony-flowered form, and the collarette type, is going to ruin the prospects of the dahlia shows; and that, if it is persisted in we shall lose the exhibition cactus varieties altogether. But there is not the slightest prospect of this calamity in view, so far as I can see, for the popularity of the newcomers will only tend to still further efforts on the part of raisers and introducers to raise the standard of their exhibition forms.

Now we come to the fruits. If we only believed what we read, and not what we see, one would come to the conclusion that the art of grape growing was lost in the early seventies, and has never been found since. It is all very well to quote the huge bunches of those days, but when we remember they were mostly Gros Guillaume with their 23lb. weight, or Trebbiano, somewhat approaching 26lb., we ought to be thankful that such varieties are so rarely seen now. In spite of the "croakers," however, we can see a pretty good competition any season at Shrewsbury Show, or at any other show, provided the prize money offered is sufficiently tempting. The fine grapes are growing in the kingdom just as gloriously nowadays as they were thirty years ago—perhaps better on the average.

Now the poor old Primula sinensis comes under the ban. Why are primulas not grown so well as they were twenty years ago? This is becoming one of those hardy-annual questions we hear so much about. I maintain they were never better grown than at the present time; but times have altered, and instead of the large plants we used to grow in eight-inch pots, they are now mostly cultivated in the five-inch size. True the plants are not so large, but in these days of so much house decoration the old specimens would be too cumbersome to move about; and the handy plants in forty-eights, well grown, will give quite as good an effect. One might just as well argue that we do not grow ericas so well now as we did in the giant specimen days. But I maintain that those we cultivate to-day are far more difficult to manage, and grow satisfactorily, than were their gigantic forefathers, while they are far more suited to present-day requirements than were the specimen plants.

It is to be hoped, Mr. Editor, that with the coming spring these croakers will see matters more clearly and in a brighter light.

R.

## ROCK BORDERS.

The making of rock borders as a garden attraction is by no means to be despised, especially in gardens where no main rock garden exists. A border, set with small rocks, where one can grow many alpine plants within easy reach of hand and eye, and where one can utilise a background of bolder subjects, possesses many possibilities to the garden-maker.

For small gardens, or for edgings to herbaceous borders, there is nothing that gives more interest than low rock work of this description, and one may grow a wide and varied collection of plants, or specialise in just a few particular species and varieties. I have only to ask readers to recall the beauty of violas, of arabis, of saxifrages, cerastiums, rock pinks, thymes, and a hundred and one other subjects, to assure them that an effective display of beauty is readily possible. Indeed, it is often a very simple combination that produces the most pleasing effects. For instance, a combination of Iberis superba and I. corræfolia, with Alyssum saxatile is wonderfully pleasing in drifts of white and gold. Or equally charming would be masses of white mossy saxifrages, with the violet hue of Viola gracilis as a contrast.

The simple masses of floral beauty creeping over the grey stones to the pathway has much to commend it, and to those who tire of tiled edgings and box edgings I commend an edging of low rocks, laid informally on their natural bed, as being in all ways a pleasing change.

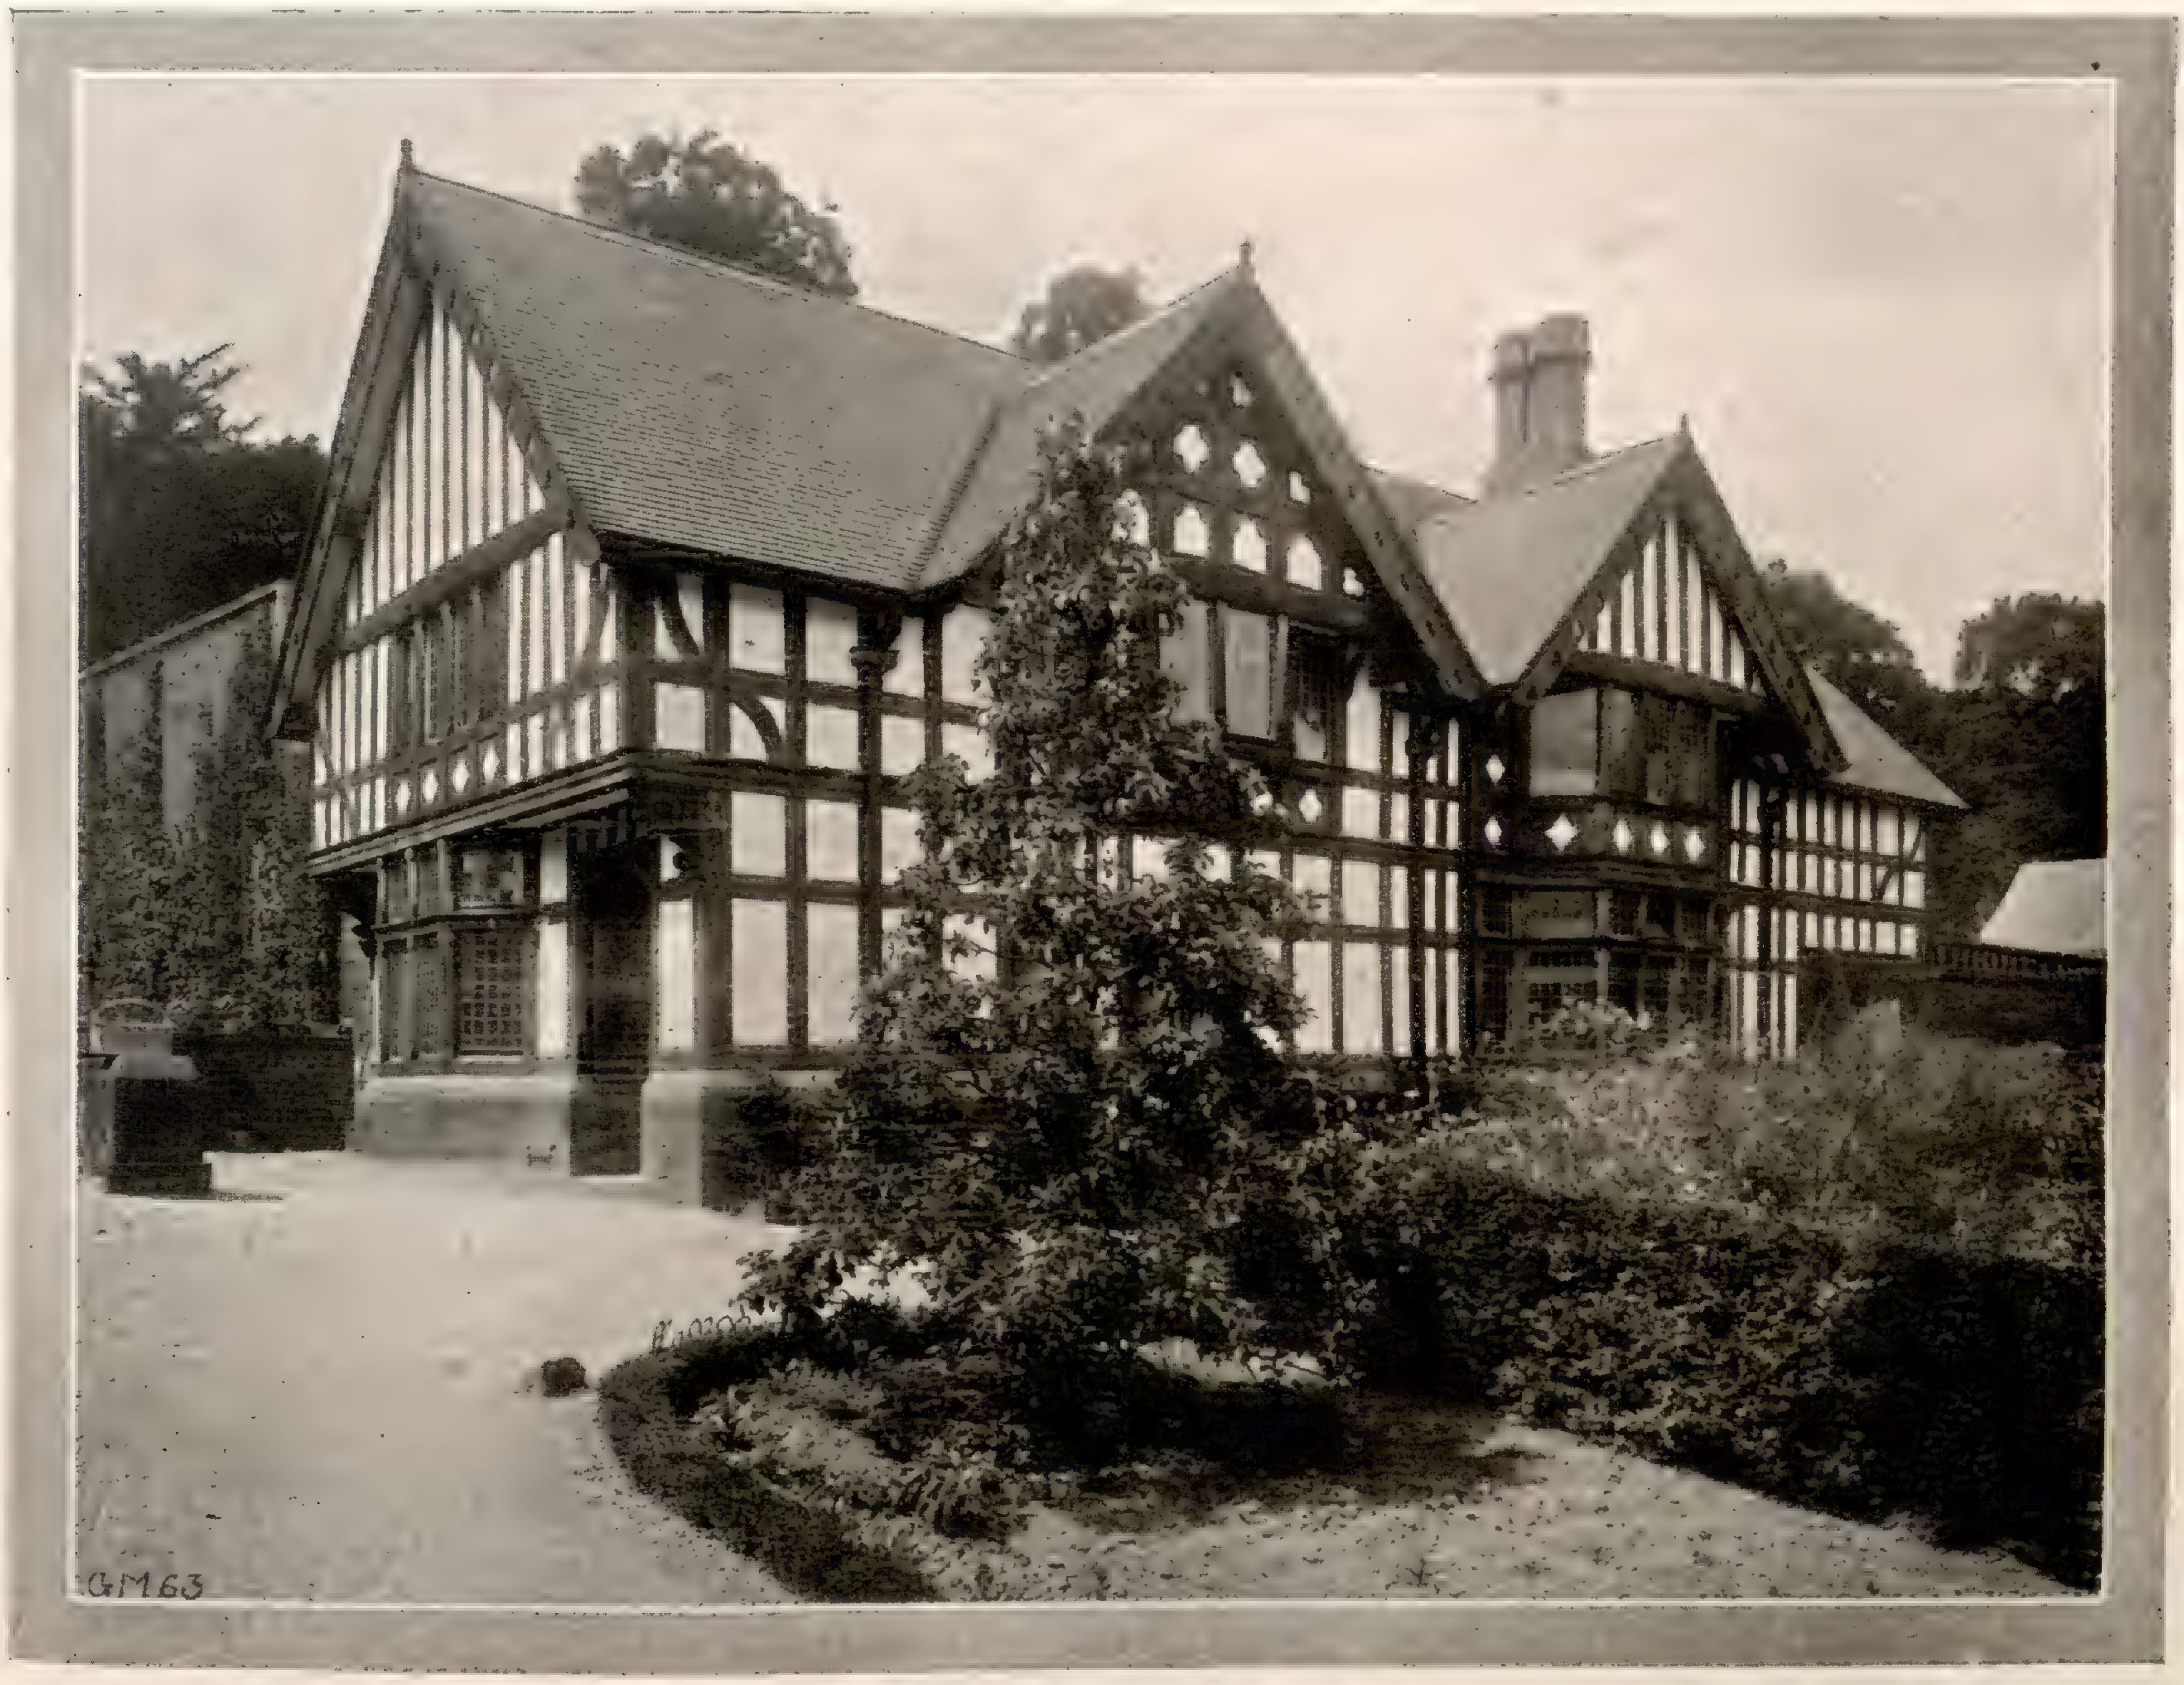
Another point, and this is illustrative of our own mode of working, is to utilise the rock border as a testing or trial ground for the rock garden. We raise so many plants to secure improved varieties that it has become impossible to give them full trial in the rock garden itself, so we have recourse to the border to give the novelties a fair trial and to enable us to make a selection of the best forms. A main feature this season will be a trial of violas and aubrietias, of which the plantings are fairly large; a run of 150ft. will be covered, and the effect should be distinctly pleasing. We hope to secure a few novelties in aubrietias which will be in advance of our last season's varieties, and in violas we hope to secure other improvements which shall be as pleasing and original as the yellow varieties of Viola gracilis were last year. It may be of interest to note that the whole of the violas we are testing will be of the V. gracilis type.

P. S. Hayward.

**Jasminium primulinum under Glass.**—In most parts of the country this comparatively new Chinese jasmine is of more value for flowering in the greenhouse than for out of doors. Generally speaking, it has not proved to be quite as hardy as it was thought likely to be, but at the same time it is very beautiful when the blossoms develop under glass. When grown in pots it needs a good sunny position during the summer, and in autumn when frosts appear it should be removed under cover. In a structure kept at 50 to 60 degrees it will commence to bloom by Christmas or thereabouts, and continue to be an object of attraction for some time. This jasmine can be readily struck from cuttings, and the young plants so obtained soon reach flowering size.—W. T.

# THE BOTHY AT POWIS CASTLE.

No doubt there are bothies in existence which are a menace to the health of those young gardeners who are compelled to live in them, and not a credit to the gardens in which they are situated. But, fortunately, there are garden lovers who believe that it is their duty to properly house their garden employees; and, we are glad to add, there are those who go beyond the strict line of duty, and add comforts to the mere necessities of the case.



THE BOTHY AT POWIS CASTLE.

In the accompanying illustration is shown the bothy at Powis Castle, Welshpool, the seat of the Earl of Powis. Mr. Lambert, who has recently retired from the management of the gardens at Powis, writes: “The bothy was built about twelve years ago, taking the place of a structure that provided very poor accommodation. The plans for the building were prepared by Messrs. Ethcote, of Manchester, but the bothy was built by the workmen on the Powis Castle estate. The oak used in its construction was grown on the estate, which is, and always has been, noted for its fine timber. On the ground floor there is a large dining-room or mess-room for the outside garden men, with the usual and necessary conveniences. Adjoining this is a large and commodious dining-room for the young men living in the bothy, with a scullery, pantry, and usual offices conveniently attached. Upstairs there are five large cubicles, with a separate room capable of holding two beds, which is used in case of sickness. A bathroom, which is greatly appreciated by the men, completes this floor.

“The bothy is not enclosed or hidden away, nor is it erected in an unhappy position. It has a southern aspect, commands fine and extensive views, and no reasonable expense has been spared to make its occupants comfortable.”

---

# BRIDGESIA SPICATA.

Some people do not favour ivy as a covering for walls, because it is so commonly used for the purpose. They require a close-growing, self-clinging plant, and try several kinds, often enough without success —unless they have selected the one above-named. This is, undoubtedly, a grand substitute for ivy.

Some years ago, I had occasion to plant many evergreen and other climbers to cover a very long wall, facing north and north-east. The portion facing north was overshadowed by large oak trees, the branches, in a few instances, crossing the top of the wall. I put in a number of kinds of climbing plants, among them the Bridgesia. It made splendid growth, and its glossy, thick leathery leaves, growing close together, made a capital covering which looked very neat, as much so as the ampelopsis does in this respect. A great point in its favour was the fact that the growth was so clean and healthy under the branches of the oak trees. I found that a little old mortar rubble mixed with ordinary soil suited the plant very well.

G. B.

# GARDEN CITY PROBLEMS.

The following is the presidential address by Mr. W. H. Massie, on the occasion of the annual meeting of the Scottish Horticultural Association:

Twelve months ago I selected as my subject, “Looking Forward, or the Future of Our Association”; and, on that occasion, I took the opportunity of laying before you some proposals regarding the future management of the association which I considered necessary in order to enhance its usefulness, and to make it more secure financially. These proposals you received most cordially, and now that they have become incorporated in our constitution, I trust they will, with your hearty co-operation, bring that success to the association which I feel it so well merits.

On this occasion I have taken as my subject, “Garden City Problems.” I have selected that subject not only on account of its grave national importance, but also because I consider it is one about which an association such as ours ought to have something to say.

The subject is one in which we are all more or less deeply interested, for the social welfare of the dwellers in our cities and towns, as well as in country districts, is a matter which affects us all either directly or indirectly. If the slums in our cities were wiped out, and the dwellers therein placed in a suitable environment, it would have such a marked influence in the diminution of poverty and crime, and probably also in the diminution of the burden of taxation, and on the improvement of the physical and moral condition of the people generally, that we ourselves would be astonished at the result; and, further, I believe it is a subject in which we, as horticulturists, must take the deepest interest, for it is largely to horticulture that we must look as the great ameliorating and refining agent which will raise to a higher moral plane the masses of our fellow mortals who are, perforce, compelled at present to live under conditions which are not only a menace to public health, but a disgrace to our civilisation, and which is rapidly causing the deterioration of the race.

### Town Planning Act.

But all this may in time be changed, for with the passing three years ago of the Housing and Town Planning Act, there has now been placed in the hands of local authorities a system of administrative machinery which can wipe out slums. It now only rests with those who elect these bodies to see that the right men are placed upon them to carry out the work. If the powers with which these bodies are now armed are fearlessly administered, slums are bound to disappear, for under the Town Planning part of the Act, their reproduction has become impossible. The first part of this Act (which consolidates former Housing Acts) deals with the housing of the working classes, and under clause 17 very drastic powers are placed in the hands of local authorities to deal with slum properties.

The second part of the Act deals with town planning, and it is to this that I wish more particularly to draw attention here. The object of this part of the Act is to prevent a recurrence of the conditions which have done so much in the past to disfigure our cities and towns, more especially our manufacturing towns. Under this part of the Act municipalities may have the power conferred upon them to prevent haphazard building, and to control the widths of streets and roads, the number of houses to the acre, the height of houses, and the provision of open spaces, gardens, etc. All that is necessary by way of procedure is for the local authority to place before the Local Government Board a prima facie case for the preparation of a town plan, after which a preliminary enquiry is held regarding the need for action, followed by the authorisation of the local authority to prepare a detailed plan; the issue of provisions relating to co-operation on the part of the local authority with the owners and other persons interested in the land, and the formation, if necessary, of a joint body of local authorities, where the land to be planned is in the area of more than one local authority; the holding of a local and public enquiry to fully consider the plan when prepared; and, finally, the placing of the plan as approved by the Local Government Board on the table of both Houses of Parliament for thirty days, and its formal authorisation and publication. Hitherto the only control exercised over the planning of new areas has been by means of local bye-laws, and, excepting in areas where the well-to-do have made demands for garden space, the "jerry" planner has taken good care to give the minimum of street width, and the minimum of open space, with the maximum of height for his buildings.

In the event of the plan being adopted, the Local Government Board may suspend the ordinary bye-laws, and replace them by regulations providing for the limitation of the number of houses to the acre, etc., as I have already mentioned. There is no reason, therefore, why municipalities should not now build garden cities like Port Sunlight, Bournville, Letchworth, or New Barswick under any new town planning scheme which they may promote.

### The Garden City Movement.

Though the Garden City idea is by no means new, the "movement" is of comparatively recent date. In England the commencement of the movement was due to the success which had attended the formation of model industrial villages, more particularly those of Messrs. Cadbury at Bournville, near Birmingham; of Messrs. Lever Brothers, at Port Sunlight, near Birkenhead; and, later, of the Joseph Rowntree Village Trust at New Earswick, near York.

Attention was first directed to the question of forming garden cities in connection with industrial towns by Ebenezer Howard in his book "To-morrow," published in 1898, and in the following year (1899) the Garden City Association was founded, its object being to establish industrial towns on Garden City lines, as advocated in Howard's book. In 1903, a pioneer company was formed under the title, "First Garden City, Limited," with a capital of £300,000 to acquire and develop an estate which had been selected at Letchworth, near Hitchin. This estate consisted of 3,818 acres, and the purchase price was £40 per acre. When the ground was purchased, the population was approximately 450, and a population of 35,000 is ultimately aimed at. It is an industrial town, with factories, railway sidings, water works, gas works, etc., but all laid out on Garden City lines. Each house has a separate garden, and there are parks and open spaces, recreation grounds (cricket, golf, etc.), schools, churches, halls, etc., while the outlying parts of the estate, comprising about 2,500 acres, are devoted to small holdings for agriculture. The land will ultimately be transferred to the community, or to a trust on its behalf, and the rents, which will increase with the city's progress, are expected to provide interest on the purchase money and the cost of all necessary municipal undertakings, so that there will be no rates. In France a Garden City Association (Association des Cities-Jardin de France) was formed in 1905, its object being "to provide healthy homes for working men, encourage agriculture, check migration to towns, secure for communities unearned increment on building land, and cheapen industrial production," and, under the recent Town Planning Act before referred to, quite a number of town planning schemes on Garden City lines are being prepared under the direction of local authorities in various parts of the United Kingdom.

### Cheap Land and Cheap Houses.

In Garden City schemes in connection with existing industrial towns, the most important factors are therefore cheap dwellings, cheap, easy, and rapids means of carrying the workers to and from the scene of their daily toil, and, above all, cheap land, for on the last factor the whole thing hangs. Cheap dwellings and cheap means of transit present no insuperable difficulties, but the question of building sites is a more serious one, for under a Garden City plan the number of houses to the acre will not exceed from eight to twelve, whereas under some of the existing bye-laws as many as fifty-six may be erected. The difference in the rental and rateable values of the two systems is obvious; therefore, to begin with, the land must be cheap enough to justify the scheme as a financial undertaking. This means, of course, that Garden Cities in connection with already existing towns must be removed some considerable distance out into the country, but this very necessity will in many ways benefit the dwellers, for it will ensure to them more healthy conditions, as well as more healthy conditions for plant life, without which the term "Garden City" would be meaningless.

### The Ideal Garden City.

It goes without saying, I think, that the ideal Garden City must have all the attributes of a garden. I doubt if the ideal Garden City is yet in existence. It certainly cannot come into being all at once, for where plants come into the plan, as they must do in this case, Nature requires time to finish the work. Even the plainest of brick buildings—the "little brick boxes with slate lids," as Mr. Burns, the author of the Town Planning Act, once called the brick-and-slate roofed houses we see so often in mining villages—may sometimes be made to look prettier objects in the hands of an enthusiastic gardener than the more substantial dressed stone buildings with which we are familiar, and this is one of the most cogent reasons why money should not be wasted on mere outward show in the construction of houses of this sort.

At New Earswick, the property of the Joseph Rowntree Village Trust, the most rigid economy had to be studied. The founder desired that, while they should be kept as low as possible in order to bring them within the means of ordinary working people, the rents should yield a net return on the capital of from 3 to 3½ per cent., so that the tenants should not be placed in the position of being recipients of a bounty. Many of the designs submitted by the architect were rejected solely on the ground of cost. The problem, too, was rendered more difficult and costly owing to the want of a sewerage system, and to the flatness of the ground adding to the difficulty of its disposal. Notwithstanding this, the desire of the founder, Mr. Joseph Rowntree "to make a practical contribution to the housing question" has been successfully realised, for here we have cottages of substantial construction, each with a garden of 350 square yards (which is the size the experience of the trustees has shown to be what a man can properly cultivate by spade labour in his leisure time), the cheapest of which are rented at 4s. 6d. per week, or with rates (including water) 5s. 6d. per week (£14 1s. 8d. per year). A house of this sort contains a living-room 14ft. 6in. by 10ft. 9in by 8ft. high; a scullery 10ft. 6in. by 6ft. 9in.; three bedrooms (1) 11ft. 6in. by 10ft. 9in.; (2) 11ft. 6in. by 6ft. 9in.; and (3) 10ft. 9in. by 6ft. 3in., all 8ft. high; and larder, coalhouse, and w.c.; with, of course, a garden of 350 square yards. The cost of building a house of this sort, inclusive of cost of land (£10), share of sewerage and roads (£28), and architects and clerk of works' and other expenses (£19 6s. 9d.), is £240 14s. 5d., and there are 12 to the acre. The highest rented of these houses is 7s. 6d. per week, or with rates 9s. 3d. (£24 1s. per year). A house of this sort contains a living-room, 15ft. by 12ft. by 8ft. high; a parlour, 11ft. by 10ft. 9in.; a scullery, 8ft. 9in. by 8ft. 9in., and three bed-rooms (1), 12ft. by 15ft.; (2) 11ft. by 10ft. 9in.; and (3) 13ft. 6in. by 8ft. 9in., all 8ft. high; bath-room, 9ft. by 5ft. 6in. (with hot and cold supply); larder, coal house, and w.c.

### The Gardening Aspect.

Having said this much about the houses, let us now turn to their surroundings. I do not hold out to you such Utopian ideas as were put before you by one of my predecessors in this chair six years ago, when, in referring to the changes of climate which he imagined were then in progress, he stated that he might live to see the day "when Princes Street may be turned into a tropical boulevard, planted with exotic palms, and the air scented with the sweet fragrance of the stephanotis, the allamanda, and the bougainvillea; when the Castle Rock would be covered with jasmine, the honeysuckle, and the wistaria; when Arthur's Seat would be covered with Eastern pagodas, and when the roof garden of the Waverley Market would be fragrant with the scent of the orange and the lemon," but I do think that horticulture has a very important part to play in the development of these garden cities, and it is to associations such as ours that people will naturally turn for light and leading in their development. This association has already made a move in this direction, for a proposal to offer a prize for villa gardening and one for window gardening in the city has been adopted by the committee which deals with these matters, and we are to have papers read on these subjects at our November meeting by our friends, Messrs. Eddington and Hay.

These are steps in the right direction, and by action of this sort, and in other ways stimulating a taste for floriculture among the citizens, this and other associations can do much to forward the Garden City movement. In a city like Edinburgh, or, in fact, any other large city, the Garden City must be largely of the character of a garden suburb surrounding the civic centre. As a matter of fact, Edinburgh does already possess some of these garden suburbs, but, alas! they are disappearing, and there seems to be no power to stay the hand of the despoiler.

(To be continued.)

## MANURES AND MANURING.

(Concluded from page 110.)

For plants requiring phosphatic manures, as, for example, tomatoes, chrysanthemums, and carnations, basic slag is undoubtedly one of the most serviceable manures. It is very well suited to the requirements of these particular plants, and should be applied to flower borders and vegetable plots at the rate of 4oz. per square yard; larger quantities than this are sometimes given with advantage. On chalky soils, containing a large percentage of lime, superphosphate is probably preferable to basic slag. The peculiar property of this fertiliser is that most of the phosphates in it are soluble in water; thus it soon dissolves, and becomes thoroughly mixed with the soil particles. Very soon after application to the soil it reverts to a condition no longer soluble in water, and is then precipitated and fixed in the soil beyond risk of loss.

It may be assumed that the rate of action of superphosphate is quicker than that of any other form of phosphatic manure, and for rapid work it is therefore to be preferred. On soils deficient in lime, or those which contain a too small percentage of lime to keep them alkaline, superphosphate has a tendency to increase the acidity; and for this reason basic slage is to be preferred. Superphosphate should be applied in conjunction with stable manure at the rate of 3oz. or 4oz. per square yard; it can be mixed quite well with sulphate of ammonia, Peruvian guano, potash salts, bone meal, fish guano, dried blood, or any substances which do not not contain nitric acid. Superphosphate and steamed bone flour are splendidly adapted for light soils, and are also beneficial to stiff soils where spring manuring is unavoidable. The latter substance, it may be remarked, has much to recommend it for garden purposes.

Potassic manures include kainit, sulphate of potash, muriate of potash, and wood ashes. The first two are most commonly used; they are all soluble in water, and are washed into the ground with the first shower of rain, and become at once available for the plant. On light, sandy, and chalky soils, kainit is to be preferred, and should be applied either early in autumn or winter. There should be at least 12 per cent. of pure potash, and, in addition to this, kainit will contain something like 33 per cent. of common salt, which property renders it peculiarly suitable for light sandy soils. Sulphate of potash, 90 per cent., should contain at least 50 per cent. of pure potash; it is the most suitable potash manure for clay lands and potatoes, and may be applied either in the autumn, winter, or spring, as may be most convenient.

For the guidance of the grower, it may be noted that potash salts, especially kainit and muriate of potash, make heavy inroads on the lime in the soil; hence it is important to see that there is no deficiency of this constituent. Further, it is recommended that superphosphate, basic slag, phosphatic guano, bone manure, or some other form of phosphate of lime, should be applied in conjunction with potash salts. Asparagus is a good example of a crop which responds to special dressing of potash, and gooseberries may be classed in the same category, about ½oz. per square yard sufficing for the latter crop. All root crops, including carrots, beet, parsnip, etc., are benefited by liberal applications of potash. Nitrate of potash, or common saltpetre, is used by some growers as a fertiliser for onions; in fact, those accustomed to grow onions for exhibition regard it as excellent manure for the production of first-class bulbs, because it supplies both nitrate and potash in the same manure. In addition to the ordinary manure, ½oz. of common saltpetre per square yard may be sprinkled on three different occasions; once soon after the plants are up, and lastly not later than the middle of June.

Of so-called "complete" fertilisers for garden crops there is no end; and, generally speaking, for pot plants and for use in small quantities, they may be recommended. At the same time, however, it is doubtful whether they can be regarded as economical for general use, and where the question of economy is an important one, it is better to mix one's own manures. The principal forms in which nitrogenous, phosphatic, and potassic manures can be obtained have been enumerated in the former part of these notes. If they are to be mixed together to form a "complete" manure, it is, of course, necessary to take into consideration the tendency of the soil and the nature of the crops to be grown therein.

When applied separately, the phosphates and potash should usually be given in the autumn or early spring, and the nitrates in two dressings, one after the seedlings push through the soil, and the other a few weeks later. Of course, in order to become well acquainted with the actual manurial requirements of the soil in any particular garden, it is well to conduct trials on small plots, giving a certain manurial treatment to one plot, and withholding it from another; the results will indicate fairly correctly what manures are required. Practical growers will have no difficulty in arranging suitable tests, and the knowledge so gained will be of exceeding value; far more useful, at any rate, than the knowledge of any results gained elsewhere.

The necessity arises in many gardens to supply an organic manure, and for this purpose fish guano is to be recommended. It is an economical fertiliser, and contains from 7 to 8 per cent. of nitrogen, 12 to 14 per cent. of phosphates, and 2 or 3 per cent. of potash. Market gardeners speak well of it, especially for vegetable crops, and it is now considered an excellent organic source of ammonia. But from the above figures it will be clear that the percentages of phosphates and potash are comparatively small, and to make it a complete manure these two ingredients must be added.

J. C. N.

---

**Cordylines or Dracænas.**—The present is the best time to overhaul this class of plants; the roots have now become active, consequently those wintered in small pots will need a shift into 48's—the most useful size for house and table decoration. It will be noticed that dracænas have fleshy roots, which always grow downwards, and in some cases protrude through the hole in the bottom of the pots; these roots may be shortened back without any injury to the growing plant, and used for propagating. Old plants which have become leggy may be used for stock. Old dracænas may be shaken clear of all potting compost, and the fleshy roots cut up into inch lengths; the whole stem of the plant may also be cut up and used for the same purpose. Prepare a pan, well crocked, by filling with sandy loam and peat, place the lengths evenly over the surface, and cover them with one inch of the compost; plunge the pan in a propagating frame. Growth will soon appear, and when the plantlets are large enough put them singly into small pots. Old plants having fine heads may be "rung," a pot which has been broken equally in two vertically being placed together again around the stem close up to the foliage, tied in position, and filled with sandy compost. If the compost is kept moist roots will soon be emitted from the ring or notch round the stem. When the pots are full of roots, the stem may be severed below the pot.—Lewis Smith.

## CLEMATIS JACKMANI.

This old purple clematis has been one of the most popular of all climbers, and by reason of its hardiness and freedom of flowering has suffered very little in competition with the multitudes of clematis species and varieties, which have been introduced during the last twenty years. It has given its name to a whole section, and there are two varieties of it which have finer flowers, and are almost as hardy and as free in flowering and growth as the type, and these are C. J. alba and C. J. superba, the white flowers of the former having an occasional tinge of mauve, but becoming whiter as the plant gets older, and the purple flowers of the latter differing from the type in their greater depth of colour and better quality. The former, too, often produces a few immense double flowers in the early summer before the main crop of buds is in sight.

This clematis will grow in any ordinary garden soil, and the richer it is the better. Like our native travellers' joy (C. vitalba) it is essentially a plant of the chalk, and if the soil is not rich in this constituent, chalk, slaked lime, or mortar rubbish should be mixed with the soil at the time of planting, and further dressings applied every year or two, the result being seen in sturdier and more vigorous growth and flowers of better substance. When young plants are received from the nursery they should always be put in the soil three or four inches deeper than in the pots at the time of purchase as they will then have some little protection from the frost, and will throw out roots along the buried portion of the stem as well as strong young growths. A mulch of manure before the winter comes is beneficial.

Clematis Jackmani would often be improved by more pruning than it commonly gets, many being afraid of sacrificing any length of stem. If it has an unlimited growth over trees it may be treated as a wilding, the effect produced in this way being very good, though the individual flowers will not be fine. When, however, the space is limited, as on walls, arches, pergolas, etc., it is best cut down to within three or four feet of the ground, when the young growths will be very strong, and will grow during May and June with marvellous rapidity, producing an abundance of bloom in July and August. Some recommend doing this pruning in November because of the earlier bloom obtained, but this means early spring shoots with the risk of having them cut off by the frost, as with roses. A better way is to cut back as far as is necessary for a certain amount of tidiness in November, and to defer the final cutting back till late March or early April, when a good deal of weak growth will be cut away, which is very likely to be destroyed by frost, the greater part of the flowering shoots for the year breaking out lower down. The morning sun in early spring shining on the frozen shoots will often cause their destruction, and this should be considered when planting. It will grow in almost any situation, but it objects to cutting winds.

C. Jackmani can be best propagated by taking young growths with a heel of old wood from below the surface of the soil, and such will sometimes have a piece of root to start with. The best time for this is early spring before growth is far advanced. Similar cuttings, however, may be taken from any part of the plant and struck in heat. Clematis should never be moved in the autumn, as this renders them very liable to succumb in a sharp winter, the best time being March or early in April.

Alger Petts.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

ANGULOAS are now becoming active after their long, dry rest, which they so much appreciate. They should be grown in a compost of one part osmunda fibre, one part peat, one part polypodium fibre, and one of sphagnum moss and fibrous loam, all used in a fairly rough condition. Should it be considered necessary to repot any of these plants, this is best done when the new growths are a few inches high, before the flower spikes appear; as, if left until the flowering period is over, the roots are often far advanced, and easily damaged. The flower buds will appear from the base of the new growths. Anguloas succeed either at the cool end of the intermediate, or the warm end of the cool house. When in full growth, and the pots are full of roots, they delight in an abundant supply of water, and an occasional watering with weak liquid manure or soot water.

LYCASTES.—The same remarks also apply to these, many of which will now be in bloom. They produce their flower buds in exactly the same manner, and therefore require repotting in the same way. They recover very quickly, as the new roots soon enter the new compost, and become firmly established. When potting, keep the plant well below the rim of the pot, so that in the growing season a plentiful supply of water can be given.

ZYGOPETALUMS.—Z. Mackayi and Z. crinitum, as they pass out of flower may be repotted should this be necessary. These plants resent being disturbed at the roots, and potting must be done with care. They will thrive in the same kind of compost as lycastes and anguloas, and the general treatment laid down for those species is also suitable for these. Such zygopetalums as Z. Perrenoudi, and others, that are pushing up their flower spikes, had better not be potted until the flowering period is over. They must not be potted too firmly, and they delight in abundance of water when in full growth. During the summer months they must be shaded from strong sunshine, and their proper place is at the warm end of an intermediate house.

CYMBIDIUM TRACYANUM, C. Hookerianum, etc., as they pass out of bloom and the young growths push up and begin to put forth roots, may be repotted, using the same sort of compost as for anguloas, etc. If the loam is of good quality, a little more can be used for this species, but I prefer a good free rooting medium in preference to a heavy compost, relying on frequent uses of liquid manure when well rooted and in full growth. These plants do not like disturbance at the roots, therefore it is not desirable to pot them unless it is an absolute necessity to do so. Do not use pots too large, as cymbidiums flower much more satisfactorily when their roots are restricted, and the pots are well-filled with roots. They delight in an airy position in the intermediate house, and must be shaded from strong sunshine.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

FERNS.—Adiantums, etc., should be examined forthwith. Plants in small pots will need a shift. Before repotting scratch the ball of soil around the sides with a pointed stick to free the roots somewhat. Old plants which are bare in the centre should be divided with a knife and potted, using smaller pots. Adiantum Farleyense will not remain in good health for many years unless treated in this way. Plants which do not need a shift should be tidied up by picking off old fronds, and encouraging the young fronds with applications of tepid soot water and liquid monure occasionally.

SCHIZANTHUSES.—These useful annuals are excellent subjects for the conservatory. Young plants raised in the autumn and grown in small pots will now be ready for potting on into 32's. Loam, leaf-soil, and coarse sand make an excellent compost. Schizanthuses must be grown cool to maintain sturdy, bushy plants; they resent coddling, and so long as the house or frame is frost-proof, with plenty of light, it will suit the plants admirably. When well rooted in their flowering pots the plants like plenty of liquid manure.

PRIMULAS.—The members of the primula family are favourites for conservatory decoration, and the cultivation of P. sinensis, P. stellata, P. Kewensis, P. obconica, etc., is well understood. It is of a later arrival I should like to add a note, namely, P. malacoides; I have now a batch of about 100 plants, and their dainty rosy-lilac flowers, produced on spikes one foot high, after the style of Primula japonica, present a charming appearance. The abundance of flower spikes in comparison to the size of the plants is extraordinary. It has been spoken of as being quite hardy, but I have not found it so. True, it will stand a great deal of cold, but it is liable to damp off at the collar in wet weather, and hard frost will kill the plants. It is a perennial, but the plants are best raised from seed each year. If seeds are sown at intervals of three months a succession may be kept up. The cultivation is also very simple. Seeds should be sown now, choosing pots or pans well crocked. The compost should be two parts loam, one part leaf-soil, and one part silver sand. The compost should be sifted finely, and the pos or pan filled to within one inch of the rim; sow the seed evenly, and sprinkle it over with silver sand. Put a piece of glass over the top, and place the pan in a structure with a temperature of about 50 degrees. When the seedlings are well up, prick off and place them in cold frames. As the plants grow shift them into larger pots, but they are not strong rooting subjects, and the largest specimens can be grown in a 48-size pot. Grow the plants cool and near the glass always.—Lewis Smith, Shotesham Park Gardens.

## HARDY FRUITS.

STRAWBERRIES.—Owing to the mild weather weeds have grown apace; with so much wet it has been practically impossible to keep them down. Old plantations will need manuring, but previous to applying the dressing remove all dead leaves and weeds from the plants, then spread the manure between the rows and point it in with a fork, working it well up to the collar of the plants, but the less the roots are disturbed the better. Spent mushroom bed material is the best for this purpose; failing this use well rotted manure. The addition of some old potting soil is an advantage where the soil is of a tenacious character. Where the above manures are not to be had, artificial fertilisers may be used. Soot is an excellent stimulant, and at the same time proves distasteful to slugs and other pests. Young plants put out last autumn should be examined, and faulty ones replaced from the reserve bed; a dressing of soot will be beneficial, and supply sufficient nutriment to the plants. New beds may be formed from runners which were set out in nursery rows, but I do not advocate this method of culture. Planting should only be carried out when the soil is in a suitable condition.

ESPALIER TREES.—The pruning of espalier apple and pear trees should be completed without delay. Where there is a superabundance of fruit spurs (this often occurs on espalier-trained trees) they should be boldly thinned out; long, unsightly spurs should be removed by degrees, and by sawing off each year those spurs which can be spared it is possible to recover the branches with a fresh set of healthy, plump fruit spurs in the course of a few years. Extension wood should be cut back according to the vigour of the tree, and young growths laid in where necessary to take the place of old or diseased growths. Tie in the branches with tar twine, and spray the trees. If growth is too vigorous, and the trees fail to form fruit spurs, attention must be directed to the roots; it is now getting late to completely lift the trees, but by doing one-half now and the remaining portion early next autumn, sufficient check will be administered to bring the trees into a fruitful condition. Apples on the paradise, and pears on the quince stock, seldom require attention to the roots unless the tree is in an unhealthy state, when it should be carefully lifted and the border renovated with fresh loam. Trees on these stocks should have their roots disturbed as little as possible. Fruitful trees may now have a dressing of artificials, lightly pointing it in; a dressing of bone-flour, 3 or 4 ounces to the square yard, will prove a great help, and if to this is added 2 ounces of sulphate of potash, better results may be anticipated. A mulch of good manure later on will supply the necessary amount of nitrogen to trees which have set a full crop.

Apricots should be protected against frost and cold winds. Choice plums are worthy of protection alike from birds and severe weather. Three thicknesses of one-inch mesh netting provides a fair cover, but it pays to have blinds made up of either No. 3 or No. 5 shading, stout hessian or cotton canvas; these with care will last for years. No. 3. shading I consider to be an excellent protective material, but whatever material may be used must be so fixed that strong winds cannot dash it against the trees.—W. Messenger, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

PARSNIPS.—Should the ground be in a suitable condition, the seed should now be sown. Parsnips delight in a deeply-dug soil, and may follow leeks or celery; beyond a dressing of burnt garden refuse, or soot, and the surface well raked and levelled up, very little else will be necessary previous to sowing the seeds. Draw drills eighteen inches apart, and one inch in depth, and sow two or three together at intervals of six inches to ensure an even crop; later on thin out every alternate station, and leave the plants one foot apart. To obtain fine roots, holes must be bored eighteen inches apart, and four feet deep, filling them in fairly firm with finely sifted soil; old potting soil forms capital material for this mode of culture.

ONIONS.—Those sown early in the year must be pricked off; nothing is gained by pricking off too early, but much is gained if the seedlings are left long enough to become strong, with three and four nice roots, as they then grow away sturdily and root more quickly. Use boxes of soil containing three parts loam, one part mushroom bed manure, and a little road grit; place the seedlings three inches apart, return to a temperature of 55 degrees, and well water them in. When the seedlings are established, gradually inure them to more airy surroundings, aiming at a strong plant by April.

LEEKS should be treated as advised for onions, giving them occasional light sprayings of tepid water on all favourable occasions.

PEAS.—Good sowings should be made on sheltered borders to succeed those now comfortably inside, in boxes. Draw drills not less than nine inches wide and four inches in depth, and cover the seed with one inch of fine soil. This trench-like drill, when completed, will make things snug, by warding off the cold wind when the little seedlings appear; and later on will hold the usual top-dressings and waterings. Should much rain occur after sowing, lay boards temporarily over the trenches; and, again, should the ground still remain wet and pasty (as it is at the time of writing), make another sowing in boxes and place in the greenhouse, or any fruit house, to germinate. Profitable varieties for this sowing are Early Giant, Edwin Beckett, and Duke of Albany.

GENERAL REMARKS.—Prick off early-sown parsley, when ready, in boxes of rich soil; make small sowings of maincrop cauliflowers, cabbage, lettuce, French beans, etc., in pots and boxes. Introduce more chives, mint, and tarragon into the forcing pit; blanch endive and chicory as required, and sow spinach on a south border.—Geo. Ellwood, Swanmore Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

## Royal Horticultural Society.

FEBRUARY 20, 1912.

### AWARDS.

No certificates were granted on this occasion.

Award of Merit.—To Ribes laurifolium, from the Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Aldenham House, Elstree; to Carnation Lady Meyer, from Mr. E. Guile, Newport Carnation Nursery, Newport; to Odontoglossum Vulcan, from De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks; to Cattleya Brenda, from Lt.-Col. Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester; and to Calanthe Baron Schroder alba, from Baron Bruno Schroder (gardener, Mr. Shill), Egham.

### MEDALS.

Gold.—To Lt.-Col. Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester, for orchids; to Mr. W. E. Wallace, Eaton Bray, Dunstable, for carnations.

Silver-gilt Flora.—To Messrs. Charlesworth and Co., Hayward's Heath, for orchids; to Miss Gundry, Foot's Cray, for paintings.

Silver-gilt Banksian.—To Mr. L. R. Russell, Richmond, for forced flowering shrubs; to Messrs. Sutton and Sons, Reading, for vegetables.

Silver Flora.—To Mr. H. Burnett, Guernsey, for carnations; to Messrs. W. Cutbush and Son, Highgate, for miscellaneous flowering plants; to Messrs. S. Low and Co., Enfield, for cyclamen and carnations; to Messrs. H. B. May and Sons, Edmonton, for epiphytal ferns; to Messrs. Sutton and Sons, Reading, for primulas and cyclamen; to Messrs. J. Veitch and Sons, Chelsea, for miscellaneous flowering plants; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. S. Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. J. and A. McBean, Cooksbridge, for orchids; and to Messrs. Armstrong and Brown, Tunbridge Wells, for orchids.

Silver Banksian.—To Sir Julius Wernher, Bart. (gardener, Mr. A. Metcalfe), Luton Hoo, Luton, for calanthes; to Messrs. Mansell and Hatcher, Rawdon, Leeds, for orchids; to Mr. E. V. Low, Hayward's Heath, for orchids; to Mr. A. F. Dutton, Iver, Bucks, for carnations; to Mr. G. Reuthe, Keston, for alpine and bulbous plants; to Messrs. R. Wallace and Co., Colchester, for alpines and bulbous plants; to Mr. Metcalfe, Luton Hoo Gardens, for apples; and to Mr. Honess, Dorking, for lettuces.

Silver Flora.—To Messrs. H. Cannell and Sons, Swanley, for cyclamens and pelargoniums.

## Horticultural Club.

The annual meeting was held in the Club Room, Hotel Windsor, under the presidency of Sir John T. D. Llewelyn, Bart. There was a fair number of members present.

After the opening proceedings, Mr. R. Hooper Pearson read the report of the committee.

The committee had the satisfaction of being able to point to a year in which the basis of the club has been broadened, and its influence strengthened by the election of forty-six new members. The losses by death and resignation number five, leaving a net gain of forty-one. The membership is now 161, this being the largest number the club has recorded since its establishment in 1875 by the late Rev. H. H. D'Ombrain, Dean Hole, Dr. Maxwell Masters, Mr. Harry J. Veitch, Sir Edward Lee, and others.

A separate report, prepared by Mr. Harry Veitch, the honorary treasurer, shows that the income of the club for the year amounted to £172 18s. 9d., and the excess of income over expenditure to £12 18s. 1d., notwithstanding the fact that considerable sums have been spent on printing (list of members, rules, etc.), and an honorarium of £25, presented to the late secretary on his leaving this country for Canada. The present funds amount to £450 in Consols, and £100 18s. 11d. bank balance.

Concerning the management of the club, the committee had to record the resignation of the hon. secretary, Mr. E. T. Cook, which took place at the last annual meeting. Following this resignation, the committee obtained the consent of Mr. R. Hooper Pearson to fill the position. Another change in the personnel of the club has now to be made. The committee regretted to state that the esteemed president, Sir John T. D. Llewelyn, has felt it necessary to resign the position which he has occupied since 1892, as he finds it no longer possible to attend evening meetings. Members will desire to offer Sir John Llewelyn their thanks for the services he has rendered the club for so long a period.

Following the resignation of the president, the committee asked the vice-president, Sir Frank Crisp, to allow them to nominate him for the office of president, and Sir Frank kindly acceded to that request.

Sir John Llewelyn moved the adoption of the report and accounts, and expressed the great pleasure and profit he had derived from his twenty years' connection with the club as its president. Advancing years made it increasingly difficult for him to be out at night, and so, to serve the best interests of the club, he thought a younger man should fill the post he had so long occupied. He himself would still hope to retain his membership, and come to the meetings whenever possible. Mr. C. T. Druery seconded the motion, and it was carried.

The Management Committee was re-elected, and a cordial vote of thanks to Sir John Llewelyn for past services was passed, on the motion of Mr. Harry Veitch, the treasurer. A similar vote to the secretary concluded the proceedings.

### ANNUAL DINNER.

An unusually large number of members and friends, including many ladies, gathered at the annual dinner under the chairmanship of the new president, Sir Frank Crisp, who kindly provided, a capital musical programme. The function was an unqualified success, and to this success the presence of ladies and the charming floral decorations by Messrs. James Veitch and Sons contributed materially.

After dinner and the honouring of loyal toasts, "The Horticultural Club" was proposed by Mr. W. A. Bilney, who referred to the excellent management of the club and the large accession of members since Mr. R. Hooper Pearson became secretary. He made a graceful reference to the resignation of Sir J. T. D. Llewelyn from the presidency of the club, and to the accession of Sir Frank Crisp to the position Sir John had held for a score of years. Success to the club was then heartily accorded. Sir Frank Crisp responded in humorous vein, and said the club was an unique one. He said he felt a president was to be made use of, and, as he understood, he had been elected president that afternoon.

Mr. R. Rudolph Barr gave "The Royal International Horticultural Exhibition," and said we were all looking forward to the great event, with great hopes, tempered by some fears. The managing body was composed of well-known horticulturists, and in their hands he hoped the great show would be an unqualified success. Mr. J. Gurney Fowler, chairman of the Board of Directors of the International Exhibition, responded.

Sir Frank Crisp then offered on behalf of the club a 25-guinea cup to the Council of the International Horticultural Exhibition, an offer promptly accepted by Mr. Fowler.

Mr. W. Cuthbertson very neatly proposed "The Visitors," and said that the ladies were the principal visitors on this occasion, and to them he extended a very hearty welcome on behalf of the club. Mrs. H. Nutting made a charming response.

Mr. H. J. Veitch, who had a warm reception, very ably proposed "The Chairman," a toast that was accorded with musical honours. When responding Sir Frank proposed the health of the secretary, Mr. R. H. Pearson, and this toast being honoured the proceedings were brought to a pleasant and early conclusion.

## National Chrysanthemum Society.

The meeting held on Monday, February 19, was well attended. The financial statement showed a balance of £73 18s. 9d. It was agreed to issue an annual publication, to be called "The Transactions of the National Chrysanthemum Society," and estimates for printing were accepted. It was decided that a conference should be held on the occasion of the exhibition at Essex Hall in November, and "Soil Sterilisation" and "What is a Spray of Chrysanthemums?" were suggested as subjects for consideration. The report of the Floral Committee concerning the new classification of chrysanthemums was presented, and it was agreed that the classification scheme be published in the "Transactions," and that the Floral Committee would base its awards in the coming season on this new scheme.

Messrs. P. A. Cragg, J. W. Moorman, W. Newton, J. B. Riding, A. W. Seabrook, and W. Wells were re-elected as members of the Floral Committee. Messrs. P. A. Cragg, D. Ingamells, and J. W. Moorman constitute the Finance Committee; and Messrs. C. H. Curtis, P. A. Cragg, D. B. Crane, W. Howe,

D. Ingamells, H. J. Jones, F. W. Ladds, J. W. Moorman, and G. Prickett form the Schedule Committee; while Messrs. C. H. Curtis, D. B. Crane, A. J. Foster, D. Ingamells, J. B. Riding, and F. W. Ladds form the Publication Committee.

The secretary, Mr. R. A. Witty, presented a budget for 1912, which showed an estimated balance of about £20. Outings and annual dinner were matters left for further consideration.

Following this meeting the members of the Floral Committee dined together at Carr's Restaurant, as is their annual custom, and, with a few friends, made up a party of about three dozen. Mr. D. B. Crane presided. After the loyal toasts the Chairman proposed "Success to the National Chrysanthemum Society," and to this Mr. T. Bevan responded. Mr. C. Harman Payne gave "The Exhibitors," to which Mr. H. J. Jones replied on behalf of the trade, and Mr. W. Howe on behalf of private growers. Mr. McKercher very ably proposed "The Floral Committee," and in response the Chairman reviewed the work of the committee during the year 1911, and remarked that he had just completed twenty-five years' connection with the committee, and had had the honour of being chairman for ten years. "The Market Growers," proposed by Mr. E. F. Howes, was very suitably replied to by Messrs. P. A. Cragg and F. W. Ladds. Mr. John Green gave "The Press," and the response was in the hands of Mr. C. H. Curtis, of the GARDENERS' MAGAZINE, and Mr. J. B. Riding.

## Bristol Gardeners' Association.

The usual fortnightly meeting was held the other evening at St. John's Parish Rooms, and Mr. A. Perry presided over a good attendance. Mr. Sydney Hills, of Newport, read a paper entitled, "Would they have been pests if left alone?" The lecturer took an unusual course in defending the birds which the ordinary gardeners generally look upon as enemies to be relentlessly destroyed. He said man only sees the evil in them, and does not take into account the great amount of good they do. In destroying owls, hawks, sparrows, starlings, and other birds, the lecturer said, the balance of Nature had been upset, and man had only made things more difficult through having to adjust that balance as best he could.

A lively discussion followed, and this was taken part in by Messrs. Perry, Ayres, House, Jennings, Young, Springham, Garnish, Binfield, Woodward, Lee, Hayball, and Zhoday. Mr. T. Clark was awarded a first prize for two bunches of violets.

## Dundee Horticultural Association.

The ordinary monthly meeting was held in the Technical College, Dundee, on the evening of 8th inst., when Mr. George Scott, Leathwood Gardens, was the essayist, his subject being, "Floral Decorations." As might be expected from so successful a competition, the essay contained admirable word-pictures of the decorative art in bouquets, wreaths, baskets, and table decoration set up by the essayist in competition at Edinburgh, Dundee, and Dunfermline flower shows. An ardent admirer of bronze and yellow shades in combination for baskets and bouquets, and table decoration, Mr. Scott practices what he preaches, and preaches what he practices, particularly during the chrysanthemum season, when these shades are perhaps more appreciated, and show to the greatest advantage.

The essay was exceedingly well read by the secretary, Mr. John Summers, while the only critics in discussion were Messrs. W. P. Lawes, Wm. Grant, J. C. Brown, and Alexander Macrea, the latter calling for a vote of thanks to essayist and president, Mr. Wm. Christison.

The annual social and dance came off on the 9th inst. The Hon. President, Bailie Melville, presided, and was supported on the platform by Messrs. William Christison, D. C. Hutcheson, William Grant, W. P. Laird, and James Bethel. After tea there was an excellent concert, which was enjoyed by the large company. Subsequently the young folk enjoyed the gaiety of the ballroom until the small hours of morning.

## The Leeds Professional Gardeners' Society.

The members of this society held their annual dinner at the Griffin Hotel on February 15. F. B. Hudson, Esq., presided, supported by Wm. Green, Esq., J.P., and the Rev. Bernard Hall, B.A., secretary of the North of England Horticultural Society.

There were about 50 members present, and after the usual loyal toasts were given, an enjoyable smoking concert was provided by Mr. J. R. Groundwell. During the course of the evening Mr. Carver, the secretary, appealed to gardeners, who, not being members of friendly societies, could with advantage fall into line with the above society, which would in due course become approved under the National Insurance Act, and thereby gain additional benefits which this society, being on a sound financial basis, would provide.

## East Anglian Horticultural Club.

This club still maintains its popularity. Over a dozen new members have been enrolled already this year. At the February meeting, before a very large audience, Mr. W. Messenger, The Gardens, Woolverstone Park, read a thoroughly practical paper upon "Chrysanthemums and their Culture." He said he thought that, even if the day of the large exhibition blooms was on the wane, the popularity of the chrysanthemum for decorative purposes was still as much alive as ever. That Mr. Messenger was a master of his subject was soon evidenced as the paper progressed. It is not difficult to note a practical man dealing with a subject he understands. All points of culture were ably treated, as were also pests, both insect and fungoid.

A capital discussion followed, in which Messrs. L. Smith, Frank Neave, H. Perry, C. Fox, J. C. Abel, T. Notley, J. Clayton, and others took part. The exhibits were good and in great profusion, special praise being due to Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., for his fine specimen of Cœlogyne cristata, Mr. F. Williams, for bulbs in pots, and to Mr. S. Hunt, gardener to Mrs. Willis, for bulbs in pots, especially his pot of Iris reticulata. Mr. J. H. Willis sent his monthly weather report and also a most interesting photograph of his grass thermometer, taken on the morning of February 3, showing the reading at half a point below zero.

## Warninglid and District Gardeners' Society.

At the recent meeting of this association the president, G. Favork, Esq., occupied the chair.

A lecture on "Hardy Shrubs" was delivered by Mr. W. A. Cook, F.R.H.S., Leonardslee. Mr. Cook, before delivering the lecture, strongly advised young gardeners to interest themselves in this branch of gardening, which, year by year, is growing in popularity. Mr. Cook showed that with such a selection of choice shrubs procurable at the present time no part of a garden throughout the year need lack beauty or interest. He enumerated some of the choicest kinds of shrubs that are suitable for open, sunny, shady nooks, and dry and moist positions. He also pointed out that any difficulty with the few subjects that will not grow in the ordinary garden soil could be overcome by forming beds of a suitable rooting medium.

Robinsons' Guaranteed Gardenalities

You make no mistake when you use and apply Robinson Gardenalities. Their reputation is known everywhere, and reputation is everything.

THE SHOW OF THE YEAR

for all gardeners and garden lovers will be held at the BOTANICAL GARDENS. EDGBASTON, BIRMINGHAM, on August 28th and 29th next. Book these dates for you must not miss this show.

Cash Prizes to the value of £350 will be awarded, and also Championship medals. You are eligible for entry—remember this. Robinson Bros. invite all users of their Gardenalities to compete, and every purchaser of a packet of

"CARMONA" FERTILIZERS,

the world's standard fertilizers, by taking advantage of the entry "fee" coupon contained therein, can do so.

The "Carmona" Fertilizers are absolutely the best on the market. Plants respond to their nutrition. Why deprive them of just what they need? Give them the best chance, and you will be well repaid.

Sweet Peas thrive on the special "Carmona" Sweet Pea Fertilizer. It should always be used. Whether you garden on a large or small scale, Robinson's cater for you. Bulk and prices below: 1 cwt., 20s.; ½ cwt., 12s. 6d.; 28 lbs., 7s. 6d.; 14 lbs., 4s. 6d.; 7 lbs., 2s. 6d.; 1s. and 6d. tins.

*Of all Seedsmen and Agents, or write direct.*

CLIFT'S FLUID INSECTICIDE.

What about the insects? They are bound to do damage unless you exterminate them. Follow the wisest plan and use Clift's Fluid Insecticide, the never-failing, easy-to-use, and economical insecticide. Powders are a thing of the past, but this fluid insecticide is a thing of the present. So protect your plants from insect invasion by using it. The prices are: 40 galls., per gall. 4s. 6d.; 20 galls., per gall., 5s.; 10 galls., per gall. 5s. 3d.; 5 galls., per gall. 5s. 6d.; 1 gall, 6s.; ½ gall,, 3s. 6d.; 1 pint, 1s.

*Of all Seedsmen and Agents, or write direct*

FURTHER USEFUL GARDENALITIES.

1. "VELVAS" LAWN SAND—a perfect sand.
2. "ERADIWEED"—guaranteed cent. per cent. Weed Killer.

FREE. Robinson's offer you complimentary copies of their two well-known issues:—

Guaranteed Gardenalities booklet (24 pages), and Garden Enemies booklet (32 pages). Show Schedule included upon request. Posted free to any address in the Kingdom. Fullest details of all you need by writing to

Guaranteed Gardenalities

FLORA ABUNDA

ROBINSON BROS., LTD., WEST BROMWICH, BIRMINGHAM.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

**Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.**

PERPETUAL CARNATIONS IN A MIXED COLLECTION.—F. H. C., Holmes' Chapel: We cannot devote a house entirely to perpetual-flowering carnations; but, nevertheless, we are anxious to grow a small collection, and should be glad to know how far we are likely to succeed with them in a mixed collection of greenhouse plants.—A cold frame, especially a span-roofed frame, will serve well to house the young stock during the summer months, and if a light, airy position can be provided at one end of the greenhouse when the time comes for housing the carnations, there is no good reason why you should not have flowers during the coming winter. The great trouble in a mixed collection is that the amount of water needed for many plants causes a moister atmosphere than is suitable for the carnations. Why not build a little carnation house? It would not be a costly business.

SULPHUR FUNGICIDE. — G. W., Horsham: The question is doubtless a common one, and has been answered many times, but even so, as I do not bind up the "G.M.," please tell me how to prepare the sulphur solution that is so useful as a preventive of fungus disease of many kinds.—Dissolve 1oz. of sulphide of potassium (liver of sulphur) in some hot water, and then add sufficient tepid soft water to make up three gallons of solution. The mixture will then be ready for use, and should be sprayed on to the plants.

SOWING SWEET PEAS.—H. H., Ascot: I should like to raise sweet peas, so that the plants will be strong and vigorous, by planting time in early April; and I should also like a handy book on sweet pea culture. Please give me your assistance.—Sow the seeds at once in a warm greenhouse, and as soon as the seedlings have pushed through the soil transfer the pots or boxes to a frame, keeping them close to the glass. Give air according to the conditions of the weather, but in any case do not coddle the plants in the belief that by keeping the frame close they will advance more rapidly. That way lies disappointment. "Sweet Peas and Their Cultivation," post free 1s. 2d., or 1s. 8d. (cloth boards), from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C., will prove a most useful book.

POTATOES CERTIFICATED IN 1911.—M. B. C., Kildare: Will you kindly tell me in your "Answers to Correspondents" column the names of the potatoes which gained certificates during 1911, and also the introducers of the varieties?—We presume you refer to awards made to potatoes during 1911 by the Vegetable Committee of the Royal Horticultural Society. An Award of Merit (not a First-class Certificate) was awarded to each of the following varieties, after cropping tests at Wisley, and cooking tests at Westminster: Balgowrie Seedling, Mr. J. Lyule, Aberdeen; Dobbie's Prolific, Messrs. Dobbie and Co., Edinburgh; Erin's Queen, Mr. W. E. Sands, Hillsborough, Ireland; Great Scot, Messrs. Robert Veitch and Son, Exeter; and Tremendous, Messrs. Toogood and Sons, Southampton.

PRUNING LAURELS.—F. A. G., Nottingham: I have a bank of laurels wherein all the plants have grown much too high. I wish to cut them down so as to form a comparatively low, thick bank of glossy green foliage, but am rather fearful as to results if I cut back so severely.—The common laurel will submit to a great deal of hard treatment, and, if the top growth has been vigorous, there need be no fear as to results if severe pruning is carried out now. Cut or saw down the shrubs to a point rather below the level at which you wish the bank to be, as allowance must be made for the new growth. Having removed the top growth in this way proceed to cut out any dead or dying stems; clear the ground of decayed leaves, twigs, or rubbish, and give a good dressing of old manure, burnt garden refuse, road scrapings, etc., as this will encourage root action and keep the soil from drying quickly under the influence of sun and wind. With a comparatively small amount of care, it should be possible to keep the bank at the desired height for many years to come by annually pruning with a knife—not with shears.

RETARDING PRIMULA OBCONICA. — G. P. S., Derby: Circumstances are such that we need as many flowers and flowering plants as possible six weeks or two months hence, instead of at present. A fine batch of Primula obconica is just in full bloom, and I am wondering whether anything could be done to keep them until the period named. Perhaps you can suggest a means to the end in view.—Pick off all the flower spikes and remove old and in any way damaged leaves; pot each plant afresh, giving it the smallest possible shift and using a compost of good loam, old cow manure, sand, and a little leaf-soil. A fortnight hence put the plants into a frame or pit, from which frost is excluded, and then let them come again into flower. If dull weather prevails it may be necessary to again return the plants to the greenhouse to induce the flowers to open by the desired time.

## NAMES OF PLANTS.

A. C., Hamble.—Veltheimia viridifolia.

J. S., Abbey Wood.—Cymbidium eburneum.

H. S., Bexley.—1, Tillandsia usneoides; 2, Nertera depressa.

J. W., Epsom.—1, Odontoglossum Lambeauianum; 2, Cattleya Trianæ.

S. L., Bodmin.—1, Polygonium clorinda; 2, Nephrolepis Whitmani; 3, Correa cardinalis.

C. T. F., Cambridge.—1, Calceolaria Burbidgei; 2, Dracæna Godseffiana; 3, D. congesta; 4, Ophiopogon jaburan.

W. R. J., Horstead.—1, Rhododendron præcox; 2, Skimmia japonica; 3, Diplopappus chrysophyllus; 4, Abies Nordmanniana; 5, Sequoia sempervirens.

# OBITUARY.

◆

## MR. HAYWARD MATHIAS.

We regret to learn that Mr. P. Hayward Mathias passed away suddenly on February 10, death being due to heart failure. Mr. Mathias was a retired civil servant, but many years ago he entered enthusiastically into the cultivation of perpetual carnations, as an amateur, at Thames Ditton, and, seeing the great future of the flower, he entered business as a grower and formed an establishment at Medstead, Hants. He was largely instrumental in forming the Perpetual-flowering Carnation Society, and was the first secretary and treasurer of that body. Failing health compelled him to resign these offices, and he went to live at Lucerne, Stubbington, Fareham, Hants. A quiet gentleman, with a steady, unquenchable enthusiasm, he had also a pleasant manner that endeared him to all his friends and acquaintances.

# GARDENING ENGAGEMENTS.

Mr. C. J. Cradwick, previously foreman at The Gardens, Middleton Hall, King's Lynn, Norfolk, has been appointed head gardener to Colonel Grant, Sherborne House, Sherborne, Dorset.

Mr. R. D. Greenham, foreman at Joyce Grove, Henley, has been appointed head gardener to A. R. Motion, Esq., Upton House, Banbury.

# TRADE NOTES.

Messrs. John K. King and Sons, Coggeshall, Essex, have been awarded a Diploma and Commendation Medal in connection with their exhibit in the recent seed competition held at the Brussels International Exhibition.

From Messrs. Robert Veitch and Son, Exeter, we have received a few unusually fine sprays of the graceful Buddleia asiatica. This is a capital shrub for greenhouse and conservatory decoration during the latter half of winter, and, though not particularly showy, it is elegant, and very sweetly scented. We are informed that the long spikes sent were grown in a cool greenhouse.

# FORTHCOMING ENGAGEMENTS.

TUESDAY, March 5.—Royal Horticultural Society. Narcissus Committee meets at 11.30. Fruit, Floral, and Orchid Committees meet at 12 o'clock. Lecture at 3 p.m. on "The Stimulation of Plant Growth," by Professor H. E. Armstrong. Scientific Committee at 4 o'clock.
Royal Horticultural Society's Spring Bulb Show; two days.
THURSDAY, March 7.—Linnean Society Meeting.
Manchester and North of England Orchid Society.
MONDAY, March 11.—United Horticultural Benefit and Provident Society, Annual Meeting at Royal Horticultural Hall, at 8 p.m.
THURSDAY, March 14.—North of England Horticultural Society meets at Bradford.
TUESDAY, March 19.—Royal Horticultural Society. Narcissus Committee meets at 11.30. Fruit, Floral, and Orchid Committees meet at 12 o'clock. Lecture at 3 p.m. on "Ferns," by Mr. H. B. May, V.M.H. Scientific Committee at 4 o'clock.
THURSDAY, March 21.—Perpetual Flowering Carnation Society, at Royal Horticultural Hall, Westminster; two days.
Linnean Society Meeting.
Manchester and North of England Horticultural Society.
TUESDAY, March 26.—Bournemouth Spring Flower Show; two days.
WEDNESDAY, March 27.—Liverpool Spring Show; two days.
Royal Horticultural Society's General Examination in Horticulture.
Royal Botanic Society Meeting.
THURSDAY, March 28.—Torquay Spring Show.
SATURDAY, March 30.—French Horticultural Society of London. Annual Dinner.

Eckford's Giant Sweet Peas

**SWEET PEA PERFECTION.**

When growing Sweet Peas, grow only the best. To obtain the very best, send direct to ECKFORD for your Seeds; but remember they are only genuine when obtained direct from Wem. Eckford's are the largest retailers of Sweet Peas in the world, and do not supply the trade.

**£1,000 in CASH PRIZES given away. Send a postcard for particulars.**

**SPECIAL COLLECTIONS FOR 1912.**

| | |
|---|---|
| **Exhibitors' (E) Collection.** 24 giant waved varieties, new and up-to-date fine for exhibition, 10 seeds of each, **5s. 6d.,** post free cash with order. | **Exhibitors' (D) Collection.** 12 giant waved varieties, new and up-to-date; fine for exhibition, 10 seeds of each, **2s 9d.** post free, cash with order. |
| **Villa (C) Collection.** 12 splendid varieties, suitable for exhibition, 50 seeds of each, **2s.9d.** post free, cash with order. | **Half-Villa (B) Collection.** 25 splendid varieties, suitable for exhibition, 25 seeds of each, **3s.** post free, cash with order. |
| **Villa (B) Collection.** 24 splendid varieties, suitable for exhibition, 50 seeds of each, **5s.6d.** post free, cash with order. | **Villa (E) Collection.** 12 splendid varieties, suitable for exhibition, 25 seeds of each, **1s.6d.** post free, cash with order. |

*A specially written booklet on Sweet Pea Growing given with every order. Send to WEM to ensure satisfaction.*

**FREE** Send a postcard to day for large illustrated and coloured Catalogue. It gives full particulars of all novelties in Sweet Peas for 1912, also complete particulars of the £1000 offered in Prizes for growers of Eckford's Sweet Peas, and contains full list of all Flower and Vegetable Seeds.

**HENRY ECKFORD, F.R.H.S.,**
**(Dept. 221) WEM, SHROPSHIRE.**

## A WELL-DESERVED HONOUR.

The trustees of the Massachusetts Horticultural Society, at a meeting on January 13, 1912, unanimously awarded another gold medal to Mr. E. H. Wilson, for a collection of photographs taken during his last and fourth trip to China for the Arnold Arboretum. The Massachusetts Horticultural Society is the most important, and one of the oldest, of its kind in the United States, and among its most ardent supporters is Professor C. S. Sargent, who is widely known in America and Europe for his important contributions to the literature relating to Dendrology, and also for the fact that the last two expeditions of Mr. Wilson to China were promoted by him. Mr. Wilson was also awarded a gold medal by this society for a collection of photographs taken during his third trip to China, but the collection which he obtained on his fourth expedition is perhaps of more importance, as it gives an excellent idea of the arborescent vegetation of Central and Western China, which was hitherto very obscure.

The photographs, about four hundred in number, adequately portray the trees of this part of the world in the adult stage, and when one considers that probably not more than a dozen members of the arborescent vegetation were known in gardens formerly, the importance of these photographs will be readily observed.

Owing to Mr. Wilson's indefatigable work in China, it is now known that more species of trees exist in that country than in the whole of North America, and more species of Picea have been collected there than exist in the remaining part of the world. These, and the majority of other trees found there, are now growing in the nurseries of the Arnold Arboretum and elsewhere, and will undoubtedly prove perfectly hardy and of great ornamental value to American and European planters.

The Massachusetts Horticultural Society has done well to confer its highest award upon Mr. Wilson, as his work is of world-wide importance; and, in honouring him, it fittingly honours the Arnold Arboretum, and the study of Dendrological science in general.

A. E. THATCHER.

## CATALOGUES RECEIVED.

H. J. JONES' NURSERIES, LIM., RYECROFT, LEWISHAM.—The chrysanthemum lover will find this hand list of chrysanthemum novelties of the greatest interest. There are no fewer than twenty-four illustrations of new varieties.

CHARLES TURNER, ROYAL NURSERIES, SLOUGH.—Garden tools and sundries, seed potatoes, and bulbs for spring planting are added, in this catalogue, to a large selection of flower and vegetable seeds.

CHRYSANTHEMUMS.

Best Novelties!

The Journal of Horticulture recently arranged for a vote in the Best Tuche New Japanese Varieties (introduced or shown this season or last).

All the principal and most expert growers took part in the audit.

Eighty-one Varieties were mentioned but

Godfreys "King George V."

was the only monthly of this season which found a place in the list. 212 Best the others were 1910 introduction.

Godfreys' "Vicar of Exmouth"

will probably prove to be larger than the above.

See Catalogue. Post Free.

W. J. GODFREY & SON, Exmouth, Devon.

RAFFIATAPE.—To pass off green corrugated tape (that rots and fades) for this is to sell old seed as new. Raffiatape is bound with strong unfadeable cotton, which gives it great strength, durability, and, being two colours, it is never unsightly. Plants are as quickly tied as parcels, as it expands with growth. 1d. coils (ties up 150 plants); 6d., 1s., and 1s. 6d. reels. Samples and catalogue of all garden sundries.—C. E. WEST, Higham Hill, London, N.E. Please ask your seedsman for West's Patent Garden Sundries.

"LILIUM AURATUM," THE GOLDEN RAYED LILY OF JAPAN.—Extra fine bulbs (10in. round), 2s. for 6, 3s. 6d. per doz., cash with order. Quantities quoted for.—MESSRS. JOHNSON, DYMOND & SON, 38/9, Gracechurch St., London, E.C.

LOUGHBOROUGH LEICESTERSHIRE
London Office 122 VICTORIA ST S. W.

**MODERN GLASSHOUSES**

as supplied by MESSENGER and CO., Ltd., are made of the best materials, and only capable and reliable workmen are employed in the erection thereof.

The following letter was recently received by us on the completion of a contract for a well-known Member of Parliament.

*February, 1911.*

"I should not be doing my duty to your workmen if I did not at once tell you, on the completion of your work, how pleased I have been with each and all of them.

"They have been most obliging throughout the whole job, and have endeavoured to do everything in an efficient and thoroughly workmanlike manner, and I must congratulate you upon having such capable employees."

Printed and Published by W. H. & L. Collingridge, City Press, 148 & 149, Aldersgate St., London, E.C., and sold by all Newsagents, and at all Railway Bookstalls.

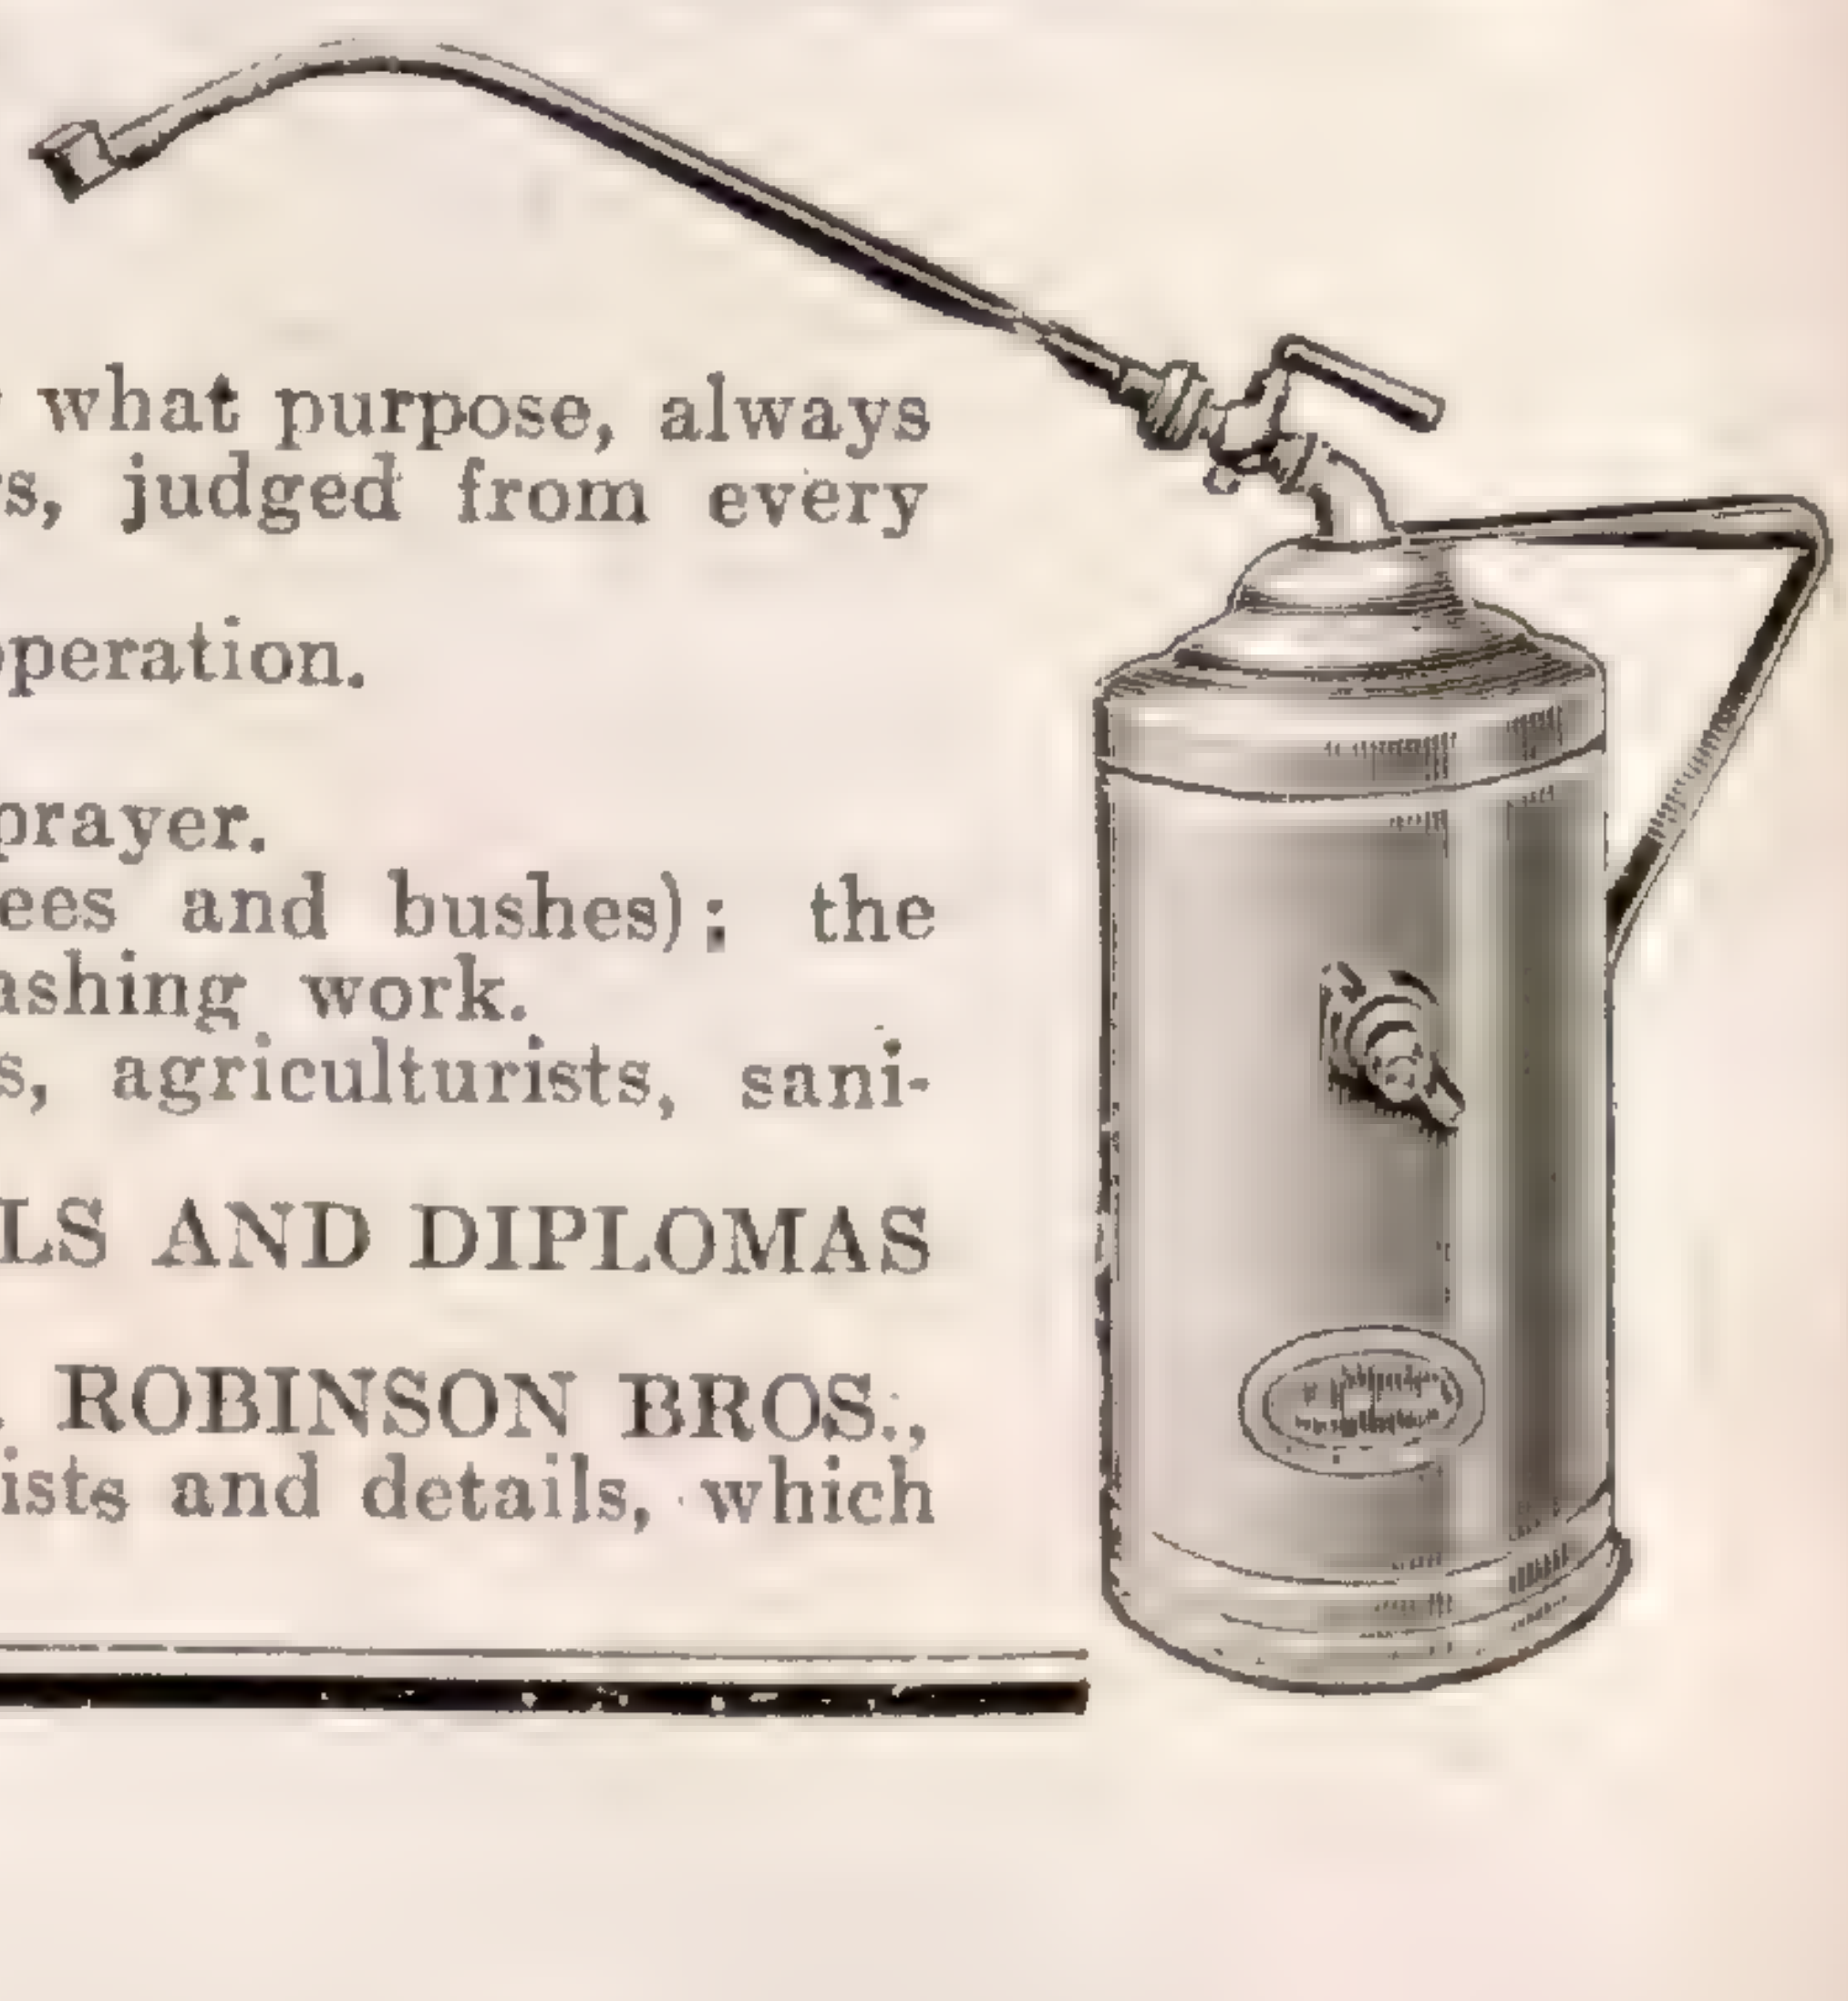
## ALPHA SPRAYERS.



Whenever you want a sprayer, for no matter what purpose, always order an "Alpha Sprayer"—the king of sprayers, judged from every standpoint.

It is simple in construction, but powerful in operation.
Easy to work, yet answers every purpose.
Carries further and fuller than any other sprayer.
Ideal for garden use (especially on fruit trees and bushes); the standard sprayer for all disinfecting and limewashing work.
Used by the biggest firms, railway companies, agriculturists, sanitary authorities, and gardeners.
Have won 18 GOLD AND SILVER MEDALS AND DIPLOMAS within the last two years.
Send to the Wholesale Selling Agents, Messrs. ROBINSON BROS., LTD., of WEST BROMWICH, STAFFS., for lists and details, which are sent free.

VOL. LV.—No. 3,044. SATURDAY, MARCH 2, 1912.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Sterilisation of Soil.

A short time since we called attention to the report by Dr. E. J. Russell and Mr. F. R. Pethridge on the investigations they have made at the Rothamsted Experiment Station in the partial sterilisation of soil used in the cultivation of various useful crops and ornamental plants grown under glass. In our reference to the work that had been accomplished, we gave a brief summary of the conclusions of the authors of the report, but in view of the importance of the subject, and the interest evinced by our readers, we again refer to it for the purpose of directing attention to a few of the more important points with greater fulness than was previously possible. The sterilisation of soil used for cultural purposes is not a new feature of garden practice, and horticulturists will remember that from their youth upwards they have been advised to sterilise soil required for filling pots in which choice seeds or fern spores are to be sown by subjecting it to a high temperature, pouring water as near the boiling point as possible over the soil when the pots have been filled being the procedure usually recommended. The advice may not have been acted upon very frequently, or so often as it should have been, for, as shown by Mr. G. Massee in his investigation of the "streak" disease of sweet peas, the sterilisation of the soil in which the seeds of these flowers are sown will enable the plants to pass through the most critical period of their life free from the attack of the fungus by which the disease is caused. In their investigations of the partial sterilisation of soil Dr. Russell and Mr. Pethridge have taken a much broader view of the questions involved than the destruction of germs of the various forms of life likely to be injurious to plants in the earlier stages of their development. As so admirably stated in the report, the grower of crops under glass, working against time and season, is compelled to make every condition as favourable as possible for his plants. He provides such soils and manures as are the best suited to his crops, carefully regulates the temperature, ventilation, and water supply, and then finds that the warmth, moisture, and food that he so liberally supplied also encourages a host of other things, including eelworms and fungi. Not infrequently he finds his own crop faring badly through the activity of these parasites, the roots being invaded by eelworms, the stems and leaves by parasitic fungi, and the fruits by various disease-producing organisms. "Before very long," we are told, "his soil may be so infested with the germs of all these undesirables that it is little better than a death-trap for his plants, and has, therefore, to be thrown out." The active agents in promoting a healthy growth of crops under glass, as elsewhere, are the food-producing bacteria which teem in countless millions in cultivated soil. But large as are their numbers, they do not, as Dr. Russell and Mr. Pethridge are careful to point out, work at their maximum efficiency under natural conditions. They have other bacteria that are more or less injurious to them to contend with, and thus it comes about that neither the crops nor the food-producing bacteria can attain to their full development under the competition ordinarily going on in a glasshouse soil. The investigations made by the two scientists here mentioned have shown that it is possible to appreciably simplify the population of a soil. The different inhabitants have been found to vary very considerably in their susceptibility to heat and poisons, and, fortunately for the cultivator, the least susceptible to the effects of these are the spores of the food-producing bacteria. Thus it has been proved to demonstration that it is possible, by the use of suitable poisons, or of varying degrees of heat, to kill off various groups of organisms in the soil. It has been found also that certain other effects are produced, for the poisons have some chemical or other action on the soil, and heat causes some decomposition, but, in the words of the investigators, "the net result of treatment with less violent poisons and degrees of heat, is that the food-making bacteria now have a clearer field, and can multiply and make much more food than before. Such heated soils are, therefore, well suited for glasshouse work, because they are free from harmful and competing organisms." The experiments have further shown that the food-making processes in the soil are increased, and the plants obtain a larger supply of food than before; but the food is not exactly the same as usual, and the plants grow somewhat differently; moreover, the disease germs are killed. The several classes of plants that were utilised in the course of the investigations included chrysanthemums, carnations, cinerarias, clarkias, verbenas, melons, tomatoes, cucumbers, and spinach, and all without exception gave better results in soil that had been partially sterilised than in that which had not been treated. In the case of the chrysanthemums the soil in which the cuttings were struck was divided into three parts, one being heated by steam to 200-210 degrees, one treated with toluol (½ per cent.), and the third untreated. During the earlier stages there was not much difference between the several sets of plants, but in the course of the summer the plants

MR. CHARLES WAKELY.

that were raised from cuttings rooted in the heated soil were the most robust, but were free from coarseness. Spinach grown under glass in soil that had been heated by steam to 200-210 degrees produced larger leaves, and showed less tendency to run to seed than did the plants in soil that had not been subjected to heat. The difference was most marked in the early spring crop, the relative weights of the produce in the untreated and treated soil being 100 and 447 respectively. The experiments with radishes are of special interest, and in these seven successive sowings were made under glass, but no manure was applied to the soil. The first three crops in the soil that had been heated to 200-210 degrees were much larger and earlier than the crops in the control bed, but the last three differed but little. After the seventh crop the soil was again heated and sown with radishes, and the weight of the resulting crop was nearly double that from the control sowing. The results obtained with tomatoes were of much interest because of the importance of the crop and the marked difference in the produce. Six sets of plants were grown for the purposes of the investigations, three in soil that had been heated, two in soil watered with chemicals in solution, and one in untreated soil. The relative weights of the crops, briefly stated, were: Untreated 100, soil heated to 200 degrees 342, heated to the same temperature plus an addition of basic slag 332, heated to 130 degrees 339, soil treated with toluol 336, and with carbon disulphide 346. The chemicals were used at the rate of ½ per cent., or one gallon per ton. The results obtained were throughout such as to show that the question involved is one deserving the most careful consideration of practical cultivators, more especially those engaged in market culture. It is hardly necessary to say that if such increases can be obtained in practice, the returns will more than repay the cost of treatment. It is even more important to know, from investigations conducted on strictly scientific lines, that tomato and other soils that have become "sick" can be restored to a healthy state. The investigations of Dr. Russell and Mr. Pethridge have proved to demonstration that "sickness" of such soils is due to a lowered efficiency of the food-makers, and an accumulation of disease organisms. Also that both these causes are removed by partial sterilisation, and most completely by heating to 200 degrees.

---

**Mr. Charles Wakely,** horticultural instructor under the Education Committee of the Essex County Council, is an exceedingly capable teacher of the gentle art of gardening, and his services are in great request for lectures and demonstrations throughout the county. Mr. C. Wakely is an Old Kewite, who, besides being an excellent cultivator, has always been studiously inclined, and so has added a wide theoretical knowledge to practical skill. Special attention has been given at Chelmsford to the training of young gardeners, and many of the young men so trained have passed local and R.H.S. examinations in horticulture, and are now occupying good posts in the horticultural world, and in their training Mr. Wakely has taken a very active part. When some local difficulty in connection with horticulture arises in Essex Mr. Wakely is the man usually sent to solve it. The Essex County Council long ago encouraged school gardening, with the result that quite a hundred schools now give instruction in this subject. This has naturally led to a need for classes for teachers, on Saturdays and during the summer vacation. This work, and also that of selecting plots for school gardens, and the superintendence of the plots under cultivation, occupy a good deal of Mr. Wakely's time. An experimental garden of three acres is also largely under his care, and this has been arranged and planted for the purpose of experiment, and also for practical instruction in connection with the various classes held at Chelmsford. Mr. Wakely is very happy in his work, and his quiet manner and readiness to help all and sundry make him very popular in the county of Essex.

**Dahlia Conference.**—A conference organised by the National Dahlia Society will be held at Carr's Restaurant on Friday, March 8, 1912, at 6.30 p.m. Mr. George Gordon, V.M.H., president of the society, will preside, and papers will be read by Mr. George Davidson on "The Cultivation of Dahlias in Suburban Gardens," and Mr. J. B. Riding on "Collarette, Pæony-flowered, and Decorative Dahlias." Members of the society and others interested in the dahlia are invited to send in questions relative to dahlia matters, and these will be answered by experts after the papers have been read. The questions should be written out and sent to Mr. E. F. Hawes, hon. sec., Ulysses, Fortune Green, N.W.

**Tree Pruning in the Mall.**—Towards the close of the winter of 1910-11 there was considerable criticism in the general Press of the manner in which the young plane trees in the Mall were being pruned, and much was written that indicated on the part of the writers an imperfect acquaintance with the pruning of such trees. Pruning operations have again commenced in the Mall, and with reference to the manner in which they are being carried out, a correspondent of "The Times" writes: "The authorities who have charge of the Processional Avenue in the Mall are again at their fell work lopping and hewing young trees into a kind of hedge. The work is being done by three apparently labouring men with no expert to advise them. They have nearly finished the south side of the avenue, on which they have, as far as they have gone, cut off the leading shoot of every tree, and generally stubbed them into the appearance of doll's-house trees. Now, no doubt trees in an avenue require some cutting for the prevention of surplus leads, the removal of surplus shoots, etc., but I am confident that no aboriculturist of experience in the Kingdom could be found who would permit the leading shoots of trees in a processional avenue to be cut off." This is the critic's statement with regard to the manner in which the pruning is being done, it is therefore of special interest that the facts of the case should be known. The work is being performed on exactly the same lines as last year. As already intimated, there was then considerable criticism of the manner in which the trees were pruned, and, in consequence thereof, Professor Bayley Balfour, F.R.S., Regius Keeper of the Royal Botanic Gardens, Edinburgh, was asked to inspect the trees and report upon them. He complied with the request, and the result of his investigation was published as a Parliamentary Paper, to which we referred at some length on its publication. Professor Bayley Balfour stated that he found nothing to justify the adverse criticism of the pruning, or of the result obtained from it. So far from this being the case, he was impressed by the evidence of the application of sound practical knowledge combined with scientific principle in the pruning of the trees in relation to their surroundings. The pruning operations that are now in progress are being conducted by expert workmen, under the supervision of those who are fully acquainted with both principles and practice of tree pruning.

**Proposed Gardeners' Dinner.**—Mr. Alex. Dean, V.M.H., informs us that hopes have been entertained that a big dinner and social gathering, similar to that which took place at the Holborn Restaurant in 1903, could be arranged in the interests of British gardeners in connection with the forthcoming International Horticultural Exhibition in May. The old Gardeners' Committee, considerably enlarged, met at Vincent Square on Tuesday, February 20, to give the matter full consideration. Ultimately, after considerable discussion, it was resolved to abandon the project for several and sufficient reasons, as the conditions which made for success in 1903 did not present themselves now. The committee came to the decision regretfully but realised that unless there was reasonable prospect of success it was useless to proceed further in the matter.

**The Yellow-flowered Cherry.**—Messrs. Paul and Son, Cheshunt, write us: "Your notes on page 114 of the GGARDENERS' MAGAZINE, and the accompanying illustration of Prunus pseudo-cerasus flore luteo pleno, interests us considerably, because our attention was drawn to it some ten years ago by the late Mr. George Nicholson. We have grown it ever since under the name of P. lutescens. The colour is, as you suggest, buff tinted or cream. This cherry has been very effective some seasons with us, but the remarkable thing is that customers so rarely enquire after the yellow-flowered cherry."

**Advisory Committee on Woods and Forests.**—The President of the Board of Agriculture has appointed a Committee to advise the Board on matters relating to the development of forestry. References will be made to the Committee from time to time as occasion arises. The Committee will be asked in the first instance: (1) To consider and advise upon proposals for a forestry survey; (2) to draw up plans for experiments in sylviculture, and to report upon questions relating to the selection and laying out of forestal demonstration areas; (3) to advise as to the provision required for the instruction of woodmen. The Committee is constituted as follows: Sir Stafford Howard, K.C.B. (chairman), Mr. F. D. Williams-Drummond, Sir S. Eardley-Wilmot, K.C.I.E., the Right Hon. R. C. Munro Ferguson, M.P., Lieut.-Colonel D. Prain, C.M.G., C.I.E., F.R.S., Mr. E. R. Pratt (President of the Royal English Arboricultural Society), Professor Sir W. Schlich, K.C.I.E., F.R.S., Professor William Somerville, D.Sc., and the Hon. Arthur L. Stanley. Mr. R. L. Robinson, of the Board of Agriculture, will act as secretary.

**Royal Gardeners' Orphan Fund.**—We have much pleasure in announcing that Sir Edwin Durning-Lawrence, Bart., has kindly consented to preside at the twenty-fourth annual dinner in aid of this fund, which has been arranged to take place at the Hotel Cecil on Wednesday, May 8.

**Northern Counties' Fruit Congress and Show.**—The four Northern Counties will hold a Fruit Show and Congress at Carlisle on September 4 and 5, in conjunction with the Carlisle and Cumberland Horticultural Association's exhibition. Mr. W. B. Little, Petteril Street, Carlisle, the hon. secretary of the Congress, writes: "The dates may appear early, but this could not be avoided as the Carlisle Society specialises in sweet peas, etc., and they afford us an opportunity of displaying early apples, which could not be shown at Newcastle in November, 1911, or at Hexham in October, 1910. The fruit section is classified according to the season of the varieties specified in the schedule, and, with one or two exceptions, only those varieties are specified which are known to do well in these Northern counties."

**The Gardeners' Royal Benevolent Institution.**—Sir Jeremiah Colman, Bart., has kindly consented to preside at the 73rd anniversary festival dinner in aid of the funds of the Gardeners' Royal Benevolent Institution, on June 25, at the Grocers' Hall, City, kindly lent by the Guild.

**Presentation at East Ham.**—At the annual meeting of the East Ham Amateur Chrysanthemum Society the hon. secretary, Mr. H. J. Kybert, was presented with a purse of gold in recognition of the ability with which he has discharged the duties of his office.

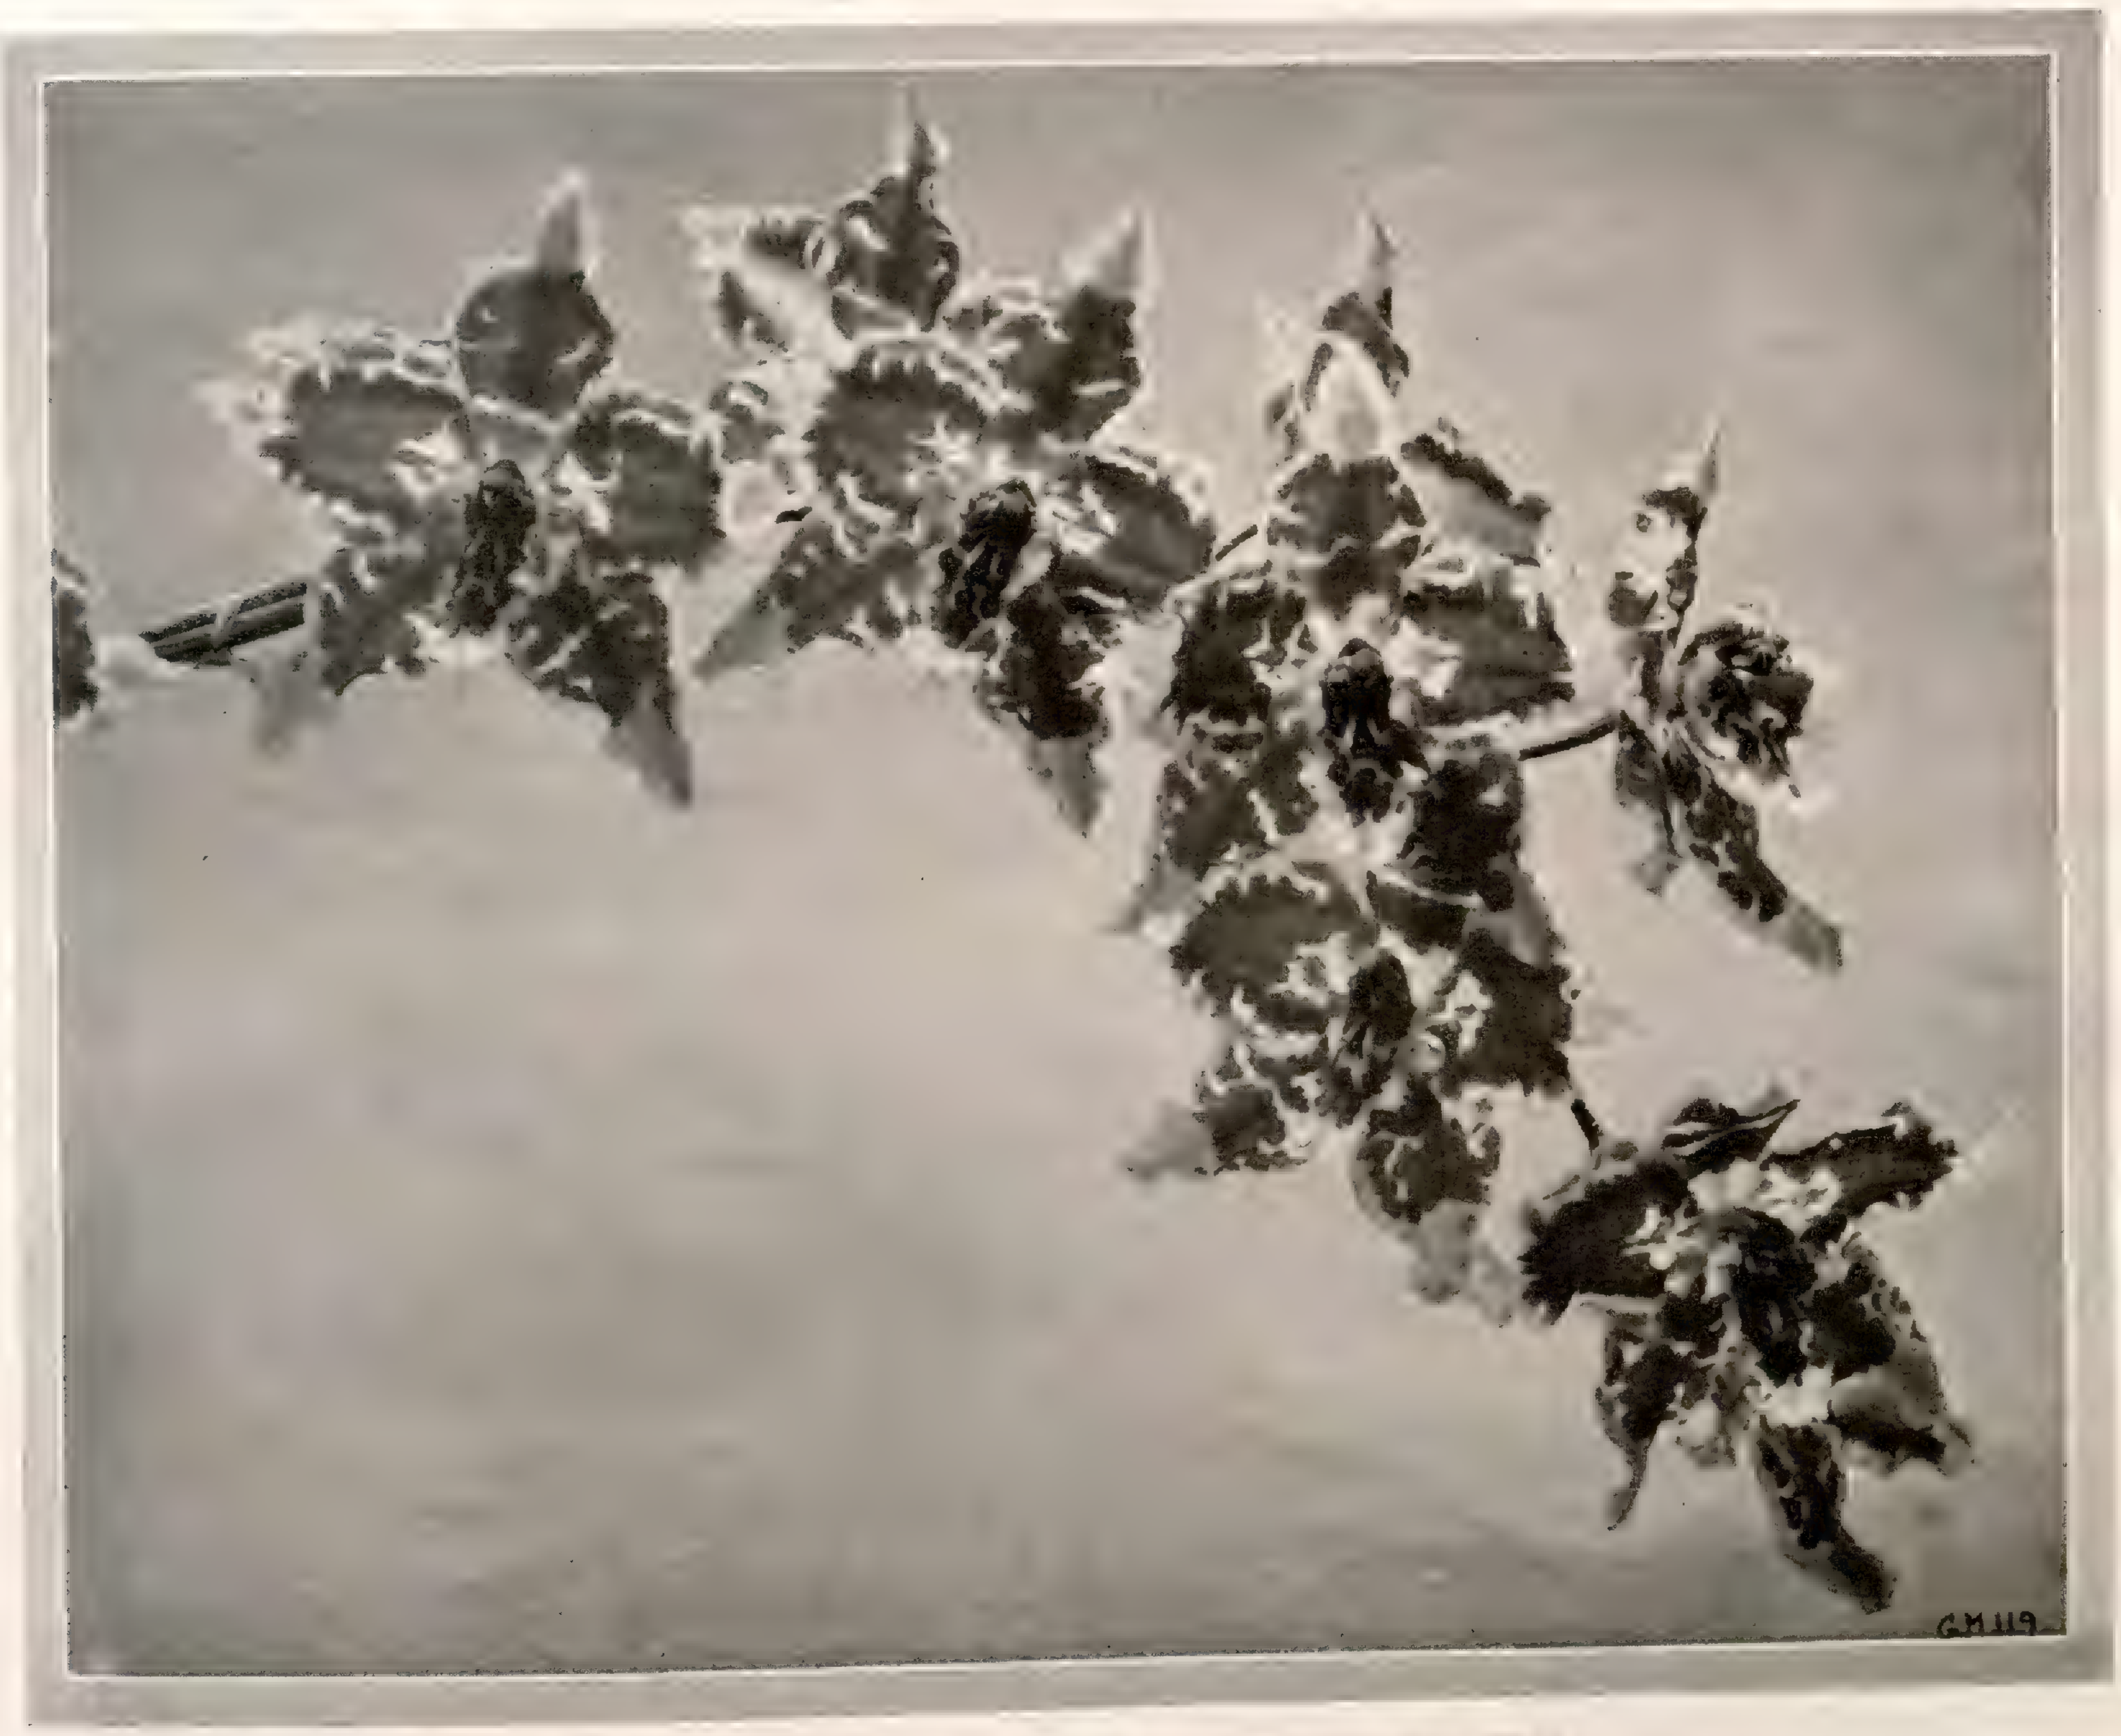
**Valentine's Park, Ilford.**—We have much satisfaction in learning that an attempt is being made to save for the public use a beautiful expanse of meadow and garden adjoining Valentine's Park, at Ilford. This is one of the most picturesque of London's suburban parks, but much of its charm will be lost if the adjoining land is sold for building purposes, and dwelling-houses brought close up to its boundaries. The owners of the land have made an offer that will enable this special area to be purchased for a price some £200 or £300 per acre less than was paid for the park land. To complete the purchase it will be necessary to raise about £3,000 by public subscription. Occupying a position on the land to be purchased is a vinery containing the stump of the Black Hamburgh grape which was the parent of the Hampton Court vine.

**Lady Doctor's Legacy to her Gardener.**—Dr. Sophia Jex-Blake, the first lady to qualify as an M.D. in England, left estate valued for probate at £14,196 gross. She resided at Windydene, Mark Cross, Sussex. Among various legacies was one of £100 to her gardener, Mr. David Beale.

## NEW PLANTS, ETC.

### ODONTOGLOSSUM VULCAN CRAWSHAYANUM.

A handsome and large-flowered hybrid between O. crispum and O. Vuylstekei. The shapely blooms are pale yellow, with a salmon sheen and numerous large bright red-brown blotches. A.M., R.H.S., February 20. De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks.



ODONTOGLOSSUM VULCAN CRAWSHAYANUM.
Flowers large and shapely, yellow, with a pink or salmon tinge, and with large blotches of bright red-brown. A.M., R.H.S., February 20. De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks.

### CARNATION LADY MEYER.

A beautiful large, perpetual-flowering carnation, of a charming shade of bright rose-pink. The flowers are very double, and are carried on stout stems. We understand the variety is very free-flowering. A.M., R.H.S., Mr. Guile, Newport Carnation Nursery, Newport.

### APPLE OATLANDS SEEDLING.

A very late-keeping dessert apple, of medium size, roundish, but flattened somewhat at top and base. The skin is green, russety, and but very slightly coloured; the flavour is excellent. Cox's Orange Pippin and Sturmer Pippin are said to be the parents. A.M., R.H.S., February 20. Mr. F. G. Gerrish, Pendley Manor Gardens, Tring.

### CALANTHE BARON SCHRODER ALBIFLORA.

A fine form of the late-flowering Calanthe Baron Schroder, and, as shown, it was in splendid condition, the plant carrying two large spikes. The sepals and petals are white, and throw into great relief the rich rosy-crimson lip. A.M., R.H.S., February 20. Baron Bruno Schroder (grower, Mr. J. Shill), The Dell, Egham.

### CATTLEYA BRENDA.

A white hybrid cattleya, with a very pale lemon-yellow tint in the throat of the lip. The flower is of fair size and shape. The parents are C. Dursuldorfi var. Undine and C. Gaskelliana alba, and the hybrid is most nearly like the first-named. A.M., R.H.S., February 20.

### RIBES LAURIFOLIUM.

This hardy Chinese shrub has been raised from seeds collected, we believe, by Mr. E. H. Wilson, in China. The three plants exhibited were small ones, with fairly broad dark green leaves that have suggested the specific name. From the axils of the leaves small drooping racemes, a couple of inches long, appear, and these are composed of very light green flowers, stems, and bracts. There is nothing bright or cheerful about the shrub as now seen, though doubtless a good bush would have a striking appearance when freely flowered. A.M., R.H.S., February 20. Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Aldenham House, Elstree.

### CALADIUM PUBESCENS.

A strong-growing species from Peru, with bright green ovate-cordate leaves about a foot long, pubescent on both sides; the rather large, white and green spathe is pubescent externally, and it is the presence of pubescence on the plant that makes it so distinct a species. "Bot. Mag.," t. 8,402.

## SUMMER LETTUCES.

It is generally admitted that the lettuce holds premier position for salading. Its blanched leaves alone are also very refreshing, and especially so during the summer months, when they are found on almost every tea table throughout the country. Each year seems to bring a greater demand for lettuces, and much skill and forethought are required from the gardener, especially in such a summer as we experienced last year, to keep up a liberal and constant supply of first-class produce. Lettuces grown on poor, light, shallow soils, and insufficiently supplied with moisture, are not worth eating, and stand as a great contrast to the properly cultivated plant; therefore it is of the utmost importance that good culture is given to attain success.

### Preparation of the Soil.

Although it cannot be said that the lettuce is particularly fastidious with regard to soil, it grows away most freely in a deeply-trenched, rich, and moderately open and warm soil. Fortunately, the freely-stirred, average kitchen garden soil is mostly within a small margin of meeting the requirements, and can be treated accordingly. Where it is found too stiff and cold, a thorough dressing of soil from the rubbish heap, first run through a sieve, is of prime value; while, where the land is too light, a desired medium can be brought about by adding marl or loam dressings, and forking these in lightly in such quantity as the case requires. Wood-ashes, if at hand, are a valuable addition to any soil.

### The First Sowings.

For the earliest summer cutting a sowing should be made in a bed of soil in a cold frame in early March. The frame should be kept close until germination has taken place; but as soon as the young plants are established, plenty of air, when the weather is suitable, should be given them, until the lights can be entirely removed, and the plants hardened off for planting out. The site selected to secure an early cutting in June must be a warm south border.

About the same date as the above sowing, and when the ground is found in a suitable condition, make a sowing on an outside south border in drills about 12 to 15in. apart. The germination and early growth will naturally be slower than in the case of frame-sown ones. The aim should be to select varieties for these sowings that turn in as early as possible, and the cabbage form is, without doubt, the most valuable in this respect. Golden Yellow, Early Paris Market, All the Year Round, and Buttercup—more especially the two first-named—are varieties that will give satisfaction.

### Mid-season and Later Sowings.

At mid-season extremes of temperature and drought have to be reckoned with, and the cooler and more open quarters of the garden are to be preferred for these sowings, and during the hottest part of the year north borders are very valuable for the crops. With the daily supply that is required for a private establishment, comparatively small and frequent sowings of seeds are better than few and larger ones. Every second week or ten days will serve, and then, whatever weather is experienced, there will be safety against broken supplies.

The lettuce seedlings are very amenable to transplantation. Yet in midsummer, when the weather is often very unsuitable, it is as well to err on the side of sowing where the plants are to remain, and thin them out to their proper distance apart. Top-dressings of old mushroom-bed manure or other decayed material which conserves the moisture to their roots is of great benefit. This, with deep cultivation, and ample supplies of water when the rainfall is light, cannot fail to produce succulent and satisfactory lettuces.

The question of which kinds to grow at this season, cos or cabbage, is, of course, a matter of individual taste; yet I think the majority would be on the side of the cos varieties. Dickson and Robinson's Little Gem turns in quickly, is nearly self-blanching, and is in every way a desirable lettuce; while other good kinds are London White, Mammoth White, Giant Market, and Webbs' Monstrous White. All these are well tried, and known to give solid and crisp leaves. A mistake that is often made by beginners is that of growing the cos varieties too thickly together. They should be allowed from 12 to 15in. from plant to plant, to permit full development. A detail with lettuces is that of blanching, for, however well grown, they are far from perfect if this has been omitted. Judgment should be used, as far as can be, so that the heads are tied up at least eight days before using them. Good varieties of cabbage lettuces for late summer use are Standwell, Continuity, All the Year Round, Summerhill, and Verdant Green.

C. Flack.

Cholmondeley Castle Gardens.

## MORE ABOUT SWEET PEAS.

The recent severe weather, coming as it did after such a generally mild spell, will, I am afraid, have played sad havoc with many autumn outdoor-sown sweet peas. The very moist state of the soil at the time of the frost has no doubt accentuated the evil effects. Many that I have seen in this neighbourhood are badly hurt, and the stems appeared quite bleached a day or two after the frost.

As autumn-sown peas are generally put in pretty thickly, some few may have survived, and as it takes very few plants to make a row, many that now look entirely done for may soon, under suitable weather, quite fill up the ground. Many that are cut down may even break up again, and make better plants than spring-sown ones. Given a few fine drying days a good hoeing between the rows will materially help the plants to make a fresh start, this being particularly necessary on the damp, cold soil, but it must not be done where there is danger of sharp frosts at night, as I have found plants damaged badly on freshly moved ground, whilst those that have not been hoed or disturbed in any way have not been touched. Where there is any fear of an insufficiency of plants, a sowing may be made at once, in boxes; the seeds will soon germinate in a little warmth, and, after careful hardening off, the seedlings may be pricked off into the rows to fill up gaps. The foregoing remarks apply chiefly to sweet peas being grown either for ordinary cutting purposes or for seeds.

The plants wintered in frames would, in many instances, also be frozen, but these being drier and partially sheltered should not be any the worse, though it sometimes happens that when the pots are not plunged the young roots are apt to suffer, but as this is easily preventable by plunging, when they have suffered it is the fault of the individual and not the system. With the lengthening days, and a little more power in the sunshine, these plants should now be growing freely, and if they are very close together they should be spaced out a little, and, where necessary, a few twigs put to the plants to keep them upright. Every opportunity of fine weather must be taken to remove the lights, not only during the daytime, but at night also, and there are not many weeks left in which to get them into a thoroughly hardy condition, as planting out should be commenced as early in April as the condition of the soil and weather will allow.

In the paper recently read by Mr. Chittenden, at the National Sweet Pea Society's Conference, he strongly urged the necessity of having the plants as strong as possible in the early stages, as the streak disease (Thielavia basicola) did not appear to attack the plants until they were in a generally debilitated condition through some other cause; with this in mind, it might be an advantage to give the plants in pots or boxes just one watering with sulphate of potash, 1oz. to two gallons of water.

Plants either planted out or growing in pots in the houses are now commencing to grow in real earnest, and careful watering and ventilating must be employed to keep them as steady as possible; it is not desirable to have them about six feet high before they commence to flower. The absence of sunshine during the early part of February has been all against sweet peas, but as we hope to see more of his majesty now, we shall expect a proportionate improvement in the plants; those of our friends who are growing sweet peas for the great International Exhibition, will be wanting all the sun possible to have their plants in the best possible condition for the month of May; it must be remembered that sweet peas will not stand forcing at the finish, as is the case with many other plants.

In warm districts and dry soils preparation should be made for sowing out of doors. There are many people who rely on this method of sowing for their main batch of flowers, therefore it is as well to do everything possible to ensure a good germination. Presuming the ground has been thoroughly well dug or trenched during the winter, a few drying days should be all that are necessary to bring it into good working condition. Where the soil is heavy a sprinkling of dry wood ashes over the surface should help to break it down finely, and this is essential, not only to allow of the free growth of the young seedlings through the soil, but to do away with the harbourage for slugs, which are probably the worst enemies of outdoor-sown sweet peas. With the soil in a fairly dry condition, and thoroughly well broken up, from two to three inches is none too deep to sow the seeds, varying it, of course, according to the texture of the soil, deeper in the case of light soil, and vice versa; this is deeper than many people recommend, and the late plants are longer in pushing through the ground, but I have proved they do better afterwards, and do not dry out so quickly in hot weather as those sown quite shallow.

Where birds are troublesome it is a wise plan to strain four or five rows of black thread about four inches above the soil, and this should be done at the time of sowing.

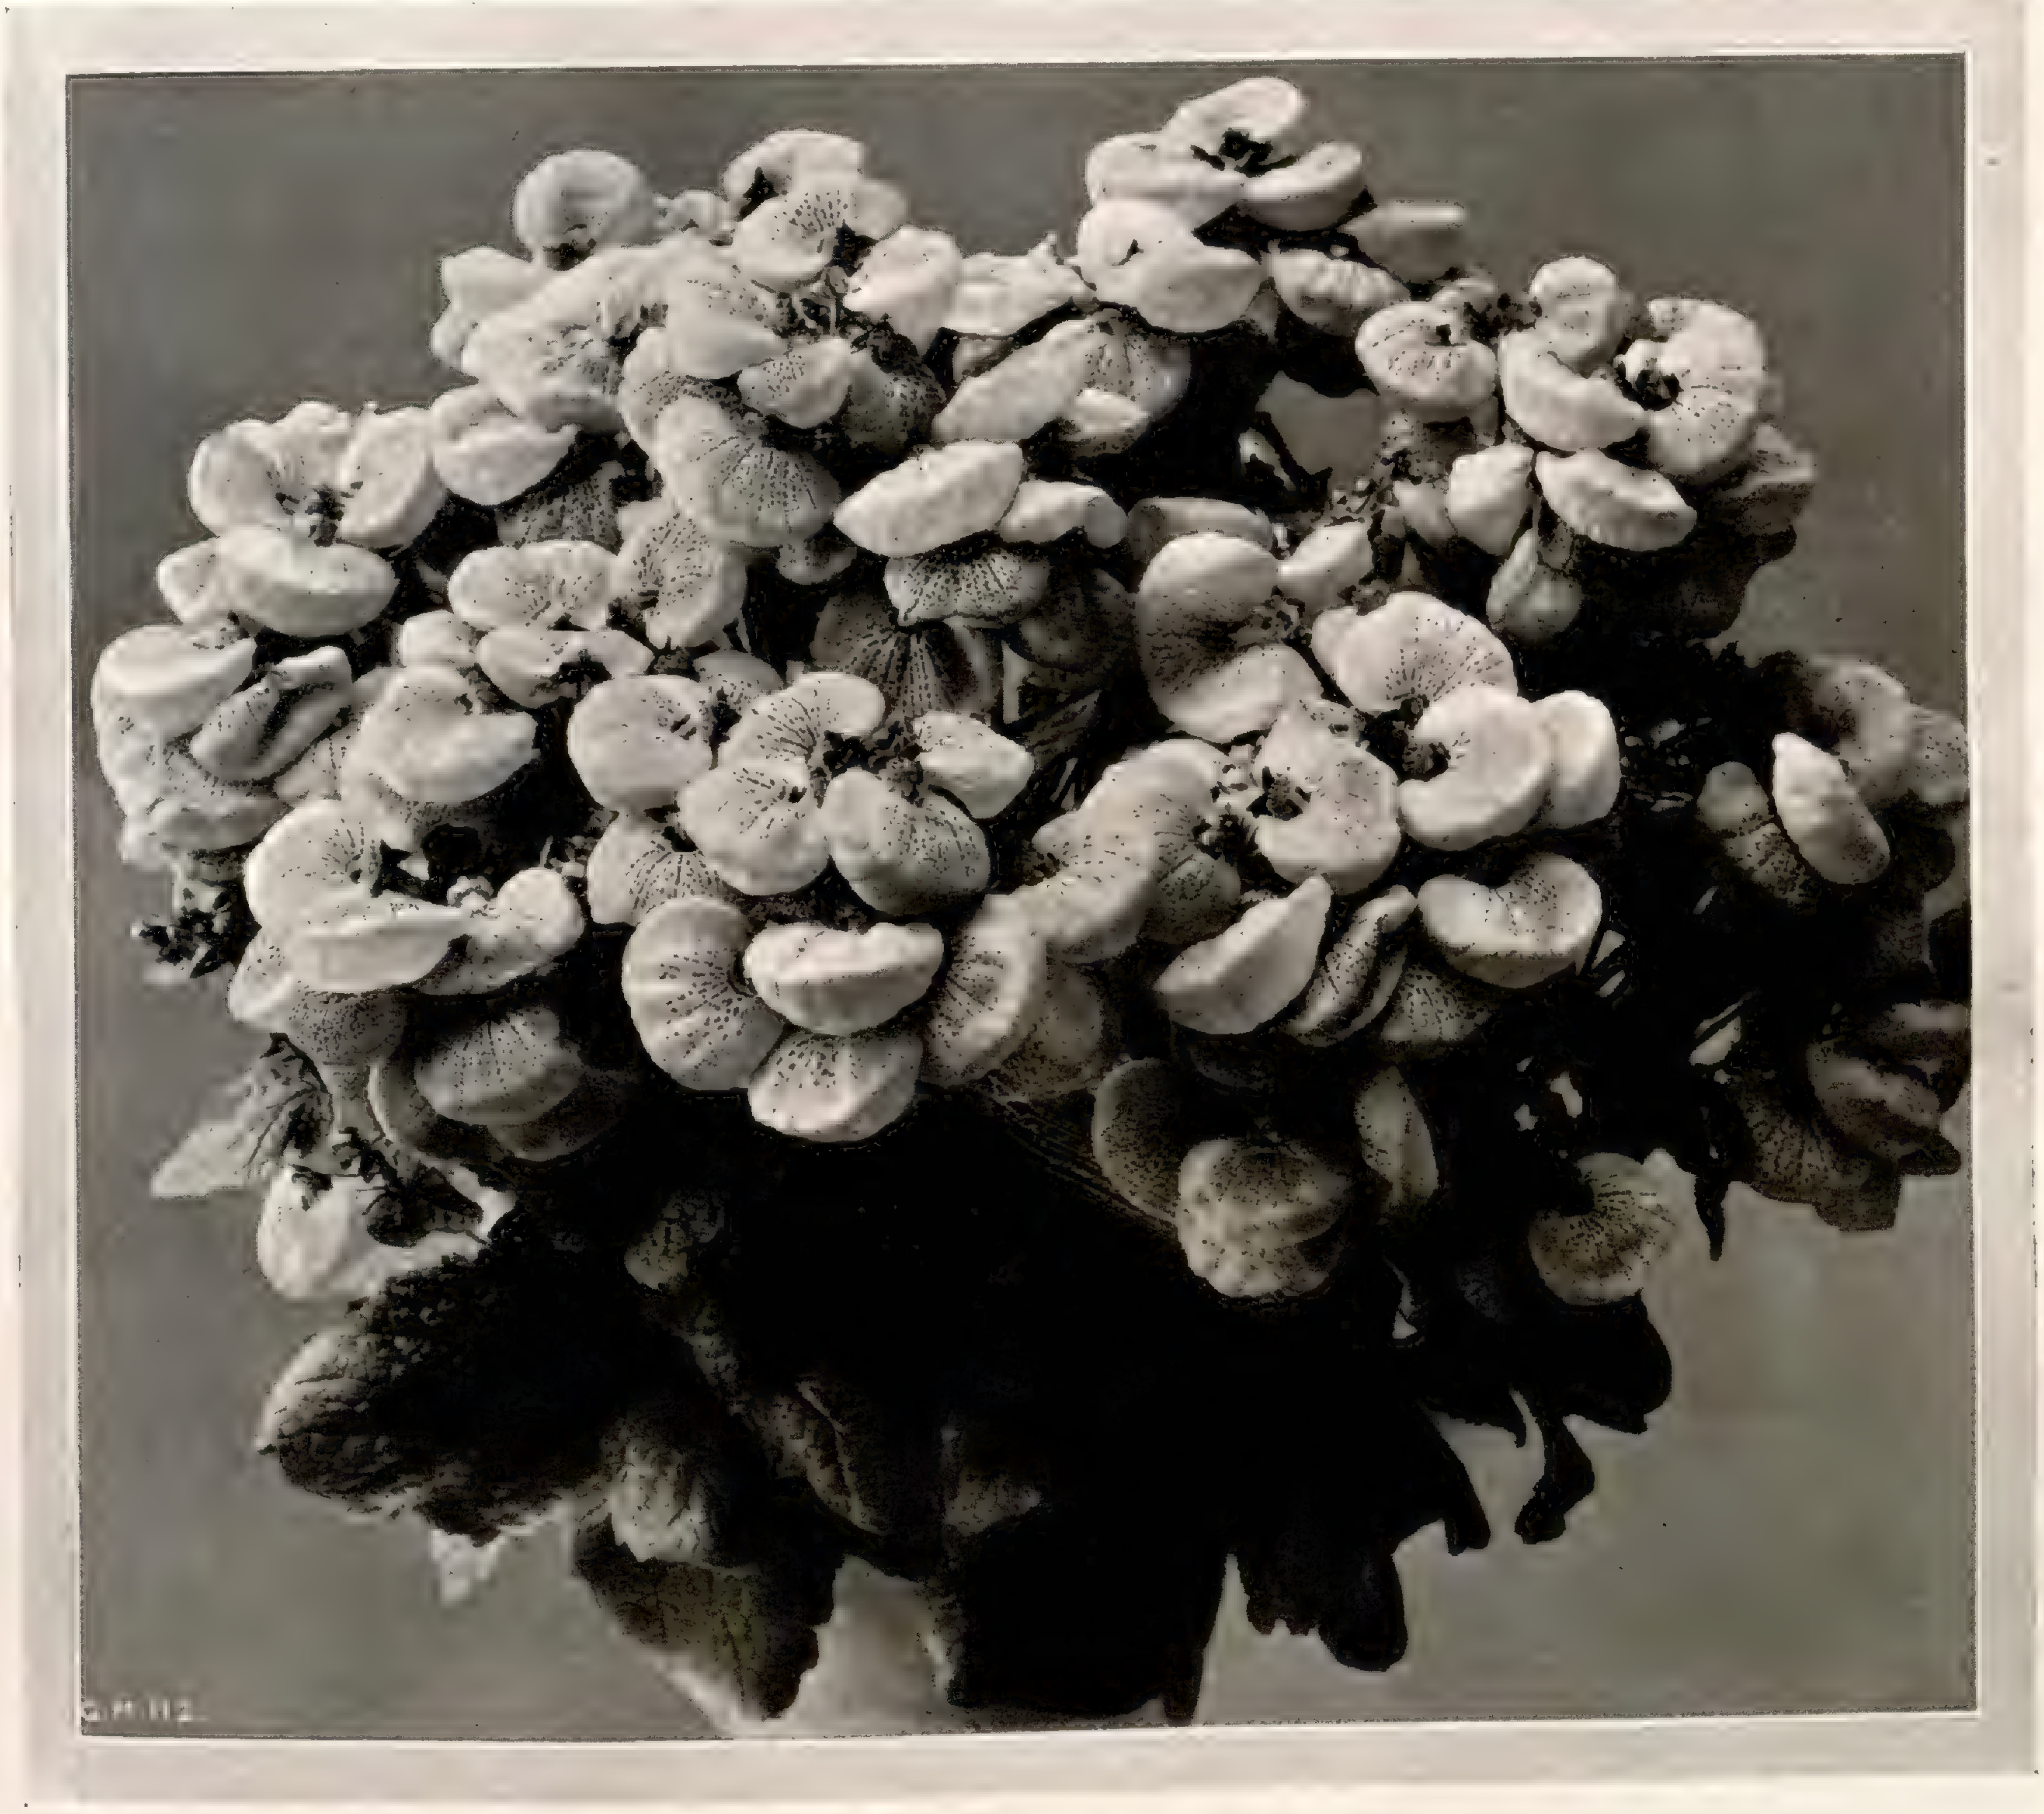
Thos. Stevenson.

Woburn Place Gardens.

**Chrysanthemum Madame R. Oberthur.**—This is one of the best of the late white chrysanthemums, either for culture as pot plants, or for the supply of cut blooms. In addition to its other desirable qualities, it is of easy culture, and the beautiful flowers can be depended upon to develop well.—W. T.

# GREENHOUSE PLANTS FROM SEEDS.

Probably in no phase of gardening has there been so many improvements effected in the past few years as in greenhouse plants that can be easily raised and grown from seeds. We can, at the present time, with a little care and forethought, produce plants in nearly every colour imaginable, that will charm the hearts of all true lovers of flowers; and, what is of infinitely greater importance, the plants, when well grown, lend themselves admirably to the beautifying of conservatories and the adornment of private rooms in large or small establishments. Seeds of these plants can be obtained in great variety at the present time, and consequently the demand for them is larger than it was many years ago. I purpose to give a few brief cultural details for a select list of plants grown easily from seeds, and which make a grand display of flowers and colour during many dull months of the year.



A WELL-GROWN HERBACEOUS CALCEOLARIA.

Admirably representing the fine strain of herbaceous calceolarias selected by Messrs. E. Webb and Sons, Wordsley.

## Schizanthuses.

Although the schizanthuses were neglected for many years, they have now become a charming and indispensable group for conservatory and house decoration. They have this great advantage over many other greenhouse plants, that the flowers are very lasting when cut, and are very effective and charming for dinner-table decorations.

To obtain fine plants to flower in March and April, seeds should be sown in August or September in pans of light soil, and placed in a warm greenhouse to germinate. When large enough to handle, put the plants singly into small pots, using a fairly rich, friable soil, for the best results will not follow if they are allowed to become starved at any time. For the flowering pots, 6in. or 7in. will be found large enough for plants intended to flower in the spring; but if large specimens are required, they can be given a shift into 8in. pots at the latter end of February. Soil for the final potting should consist of two parts good fibrous loam, two parts leaf-mould, a little pulverised cow manure, and a good sprinkling of sand. Pot firmly, and grow in a light, airy house or pit during the winter months, sufficiently heated to exclude frost. Pinch out the points of the shoots two or three times to induce the plants to make good bushy specimens. Sow seeds again at the end of January and the end of March to maintain successional batches, as the resulting plants will grow into fine, large specimens if potted into 8in. and 9in. pots.

Place one stake to each plant, and carefully tie in the shoots when required. Water sparingly during the winter months, but as the season advances larger quantities of water will be required, and when the pots are full of roots give weak liquid manure, soot-water, or some approved chemical stimulant in small quantities once or twice a week.

## Herbaceous Calceolarias.

It would be difficult to find more attractive subjects than well-grown and well-flowered plants of a good strain of calceolarias; but, alas! how often do we see poor, miserable specimens that are a disgrace to those concerned. The cause of many failures to grow this plant successfully is undoubtedly "coddling." A temperature of from 40 to 50 deg. should be maintained at all times. In penning these few remarks, I have in my mind's eye plants which were grown and flowered here in 10in. pots by the late Mr. Pettigrew, at Cardiff Castle, measuring from 2ft. 6in. to 3ft. through. These plants filled the two side stages and the centre bed of a 60ft. greenhouse, and were a sight not easily forgotten.

Seeds should be sown at the middle of June in pans of moist, light soil. Slightly cover the seed with fine soil, place in a cold frame with a piece of glass over the top of the pan, and shade from the sun. The young seedlings should be pricked off when very small into shallow pans or boxes, given a good watering, and placed in a frame, which should be kept close and moist for a few days. They will soon respond to this treatment, and in a few weeks will be large enough to place into small pots, using a light compost, with plenty of grit in it, and a good sprinkling of pulverised cow manure. Pot fairly firm, and spray the plants overhead on bright afternoons to freshen them up, and also induce the roots to push into the new soil. Admit air on all favourable occasions, and bear in mind that the less "coddling" they receive the better will be the results. At the same time, it must be clearly understood that careless treatment will likewise be disastrous; so avoid cold draughts when giving air. Calceolarias should be shifted into larger pots as more root space is required; and finally, by the middle of March, they should be in their flowering pots. A good compost consists of three parts good fibrous loam, one part leaf-mould, one part decayed cow manure rubbed through a fine sieve, a good sprinkling of coarse sand, soot, and lime rubbish. Pot the plants firmly, and stand them on sifted coal ashes, close to the glass, in a cool pit or a light, airy greenhouse. Water with great care, and keep a uniformly moist atmosphere by frequently damping the ashes and spraying the plants on all favourable occasions. Carefully stake the plants when they commence to throw up their flower stems, and tie out the growths to make good specimen plants. When the pots are filled with roots, give doses of weak liquid manure, or some approved chemical fertiliser occasionally, to accelerate the development of good strong, healthy plants.

The accompanying illustration represents a very fine specimen of Messrs. E. Webb and Sons' superb strain of calceolarias, which is equally remarkable for its brilliant colouring and excellent habit.

### Cinerarias.

The cultivation of cinerarias is comparatively easy, but they are indispensable as decorative flowering subjects for the greenhouse or conservatory. For ordinary requirements seeds should be sown in May or June; but, where cinerarias are required in bloom in December, seeds should be sown at the beginning of April. Choose a light, sandy soil, made moderately firm, and sow the seeds thinly in well-drained pans. Lightly cover them with fine soil, give a gentle watering, and place in a close, warm frame or house, with a piece of glass over the pans to assist quick germination.

Cinerarias grow very freely, and when the seedlings are large enough to handle they should be potted singly into 3in. pots, using a coarse, open soil. Place the plants in a cold frame on sifted coal ashes. Shade from bright sunshine, and lightly spray the plants over morning and evening until well established. Give the plants at all times plenty of room, so that the leaves will not become thin or weakly, and give another shift into larger pots before the roots become matted; and finally transfer them into their flowering pots. Six-inch pots are large enough to flower them in; but occasionally large specimens are required, when the best plants should be potted from 6in. into 8 or 9in. pots. A good compost for potting cinerarias is made up of two parts loam, one part leaf-mould, with plenty of sharp grit, sand, or sifted road sweepings added. Avoid using a rich soil, which will undoubtedly have a tendency to produce an abundance of soft foliage. Keep the plants in a temperature varying from 50 to 55 deg., as they are easily injured by frost. Give plenty of fresh air when possible, but avoid cold draughts. Shade the plants from excessive sunshine, and from the middle of August to the latter end of September, weather permitting, remove the sash-lights bodily from the plants at night, replacing them again the following morning. Carefully attend to the watering, and give liquid manure once or twice a week, as soon as the plants throw up their flowers.

There are a number of splendid varieties to select from, sent out by many of our enterprising seedsmen. Everyone is acquainted with the large-flowering types; but, in my opinion, the Star varieties should receive a great deal more attention. They can be obtained in separate or mixed colours, and at various heights. When in flower these have a most beautiful and graceful effect, and as cut flowers are greatly in demand, the long, elegant sprays making a most charming arrangement in vases.

### Primulas.

Probably no greenhouse plants have received more attention than these since their introduction into this country; hence their popularity as useful decorative flowering subjects.

Primula sinensis can now be obtained in splendid strains of single and double-flowered varieties, with a beautiful range of colours, strong in constitution, and very floriferous. The Star primula is a lovely type of more recent introduction, which commences to bloom early in December, and continues all through the winter months. The colours are pure white, pink, light blue, dark blue, crimson, and carmine, and the flowers are excellent for cutting, as they will travel a long distance without damage.

Primula obconica grandiflora is another very floriferous type, with flowers nearly as large as P. sinensis, and it is practically perpetual-flowering. Seeds can be obtained of white, pink, rose, crimson, and mauve varieties. As cut flowers these are as useful as the Star primulas.

Seeds of P. sinensis and P. stellata should be sown in May and June in a mixture of good loam and leaf-mould, with a good sprinkling of sand. Sow evenly and thinly upon the surface, cover the seeds lightly with fine soil, and gently press it down. Place the pots in a temperature of 60 to 65 deg., and shade from the sun. As a rule the seedlings come up very irregularly, and the largest should be carefully removed, without disturbing the smaller ones, and pricked out into small pots. Keep the plants close for a few days, and water with great care, and, when established, gradually admit air until the plants can be placed upon the shelf in the house, and near the glass. After a few weeks they will be ready to place singly in thumb-pots; and, once established in these small pots, they should be grown as hardily as possible, always, of course, avoiding cold draughts and frost. Shift the plants when necessary until the flowering size is attained, but repotting should on no account be done unless the pots are well filled with roots. Pot firmly up to the collar of each plant. During July and the two succeeding months a good place for the primulas is a cold pit.

Primula obconica seeds should be sown in February to produce good plants to flower early in the autumn and continue throughout the winter and spring months. The other cultural details are similar to that as recommended for P. sinensis and P. stellata.

### Celosias.

These are useful and highly decorative plants, their beautiful plumes of rich crimson, orange-scarlet, magenta, and yellow making them excellent subjects for conservatory and greenhouse adornment. Seeds sown in February and March produce excellent flowering plants in July, August, and September. Sow the seeds thinly in pans or pots in a light, rich compost, and place in a brisk heat to germinate. When large enough to handle pot up the seedlings singly into 3in. pots, attend carefully to watering, and grow in a temperature ranging from 60 to 65 deg. Shift the plants into larger pots as may be requisite, taking care not to allow them to become root-bound until they are in their flowering pots—in fact, they must not be allowed to receive a check at any time, or poor results will follow. Use a rich compost of three parts good fibrous loam, one part each of leaf-mould and well-decayed manure, with a good sprinkling of sand. Pot firmly, and commence to give weak liquid manure when the pots are well filled with roots, though this must be discontinued when the flowers are about half-developed. Gradually harden the plants off, admitting plenty of air at all favourable times, and flower them in a cool greenhouse, as here they will maintain their beauty for a considerable period.

Beautiful little specimen plants may be had in full flower in 5in. pots at Christmas if seeds are sown the second week in July. These will be found exceedingly useful, when their bright plumes make an attractive and brilliant display.

Cardiff Castle Gardens.

## A GOOD DRY-WEATHER VEGETABLE.

In all too many gardens the merits of New Zealand spinach are not appreciated, and so a valuable dry-season vegetable does not become so popular as it deserves to be. It is a first-rate substitute for spinach, and in a dry, hot season like that of 1911 it is a great success, when ordinary spinach quickly runs to flower, and is disappointing.

New Zealand spinach (Tetragonia expansa) is a native of New Zealand and Australia, and, though a hardy perennial, its value lies entirely in its usefulness in the summer and early autumn. In the matter of flavour New Zealand spinach compares favourably with the common form; indeed, some people like it better because of the absence of bitterness. It is possible to obtain an early crop by sowing seeds in heat in March, pricking off the seedlings into boxes, and hardening them ready for planting out on a sunny site at the end of May, but such a method will be rarely necessary.

An outdoor sowing at the end of April on rich, light, well cultivated land that lies warm, will meet the demands in most cases, and the hotter the site the better. The drills for the outdoor sowing should be three feet apart, as it must be remembered that Tetragonia expansa is a trailing plant, and needs room to develop. Sow thinly in shallow drills, and thin the seedlings to 2ft. apart. Beyond hoeing, weeding, and picking the fully-developed leaves as they are ready, little attention is needed, although a few good waterings are appreciated, and result in stronger growth and more leaves.

In 1911 one of our market growing friends had several acres of New Zealand spinach, this crop following lettuces; we have never seen finer produce, and as fast as the pickers had worked right across the big field, there was plenty of leafage ready to pick at the original starting point. The crop must have been a very paying one in such a season.

C.

## MELON CULTURE.

To grow melons successfully—and by this I mean the production of fruits of the highest quality—it will be convenient to keep two things in mind, viz., forethought and preparedness. When once the seeds are sown, a constant, steady growth must be maintained, as a check will cause serious damage and a waste of time. It is an advantage to have both top and bottom heat, the latter to run directly beneath the bed, as this does away with the employment of fermenting materials to produce heat. Iron gratings used as a base for the bed will allow the heat to come through more readily than slate slabs.

The material for the bed should consist of good turfy loam, wood ashes or lime rubble. Some growers advise the addition of farmyard manure, but my contention is that this is not necessary except where the loam obtainable is poor, for the reason that manure is likely to produce an over-vigorous growth. When mixing the compost keep a sharp lookout for wireworm, as this pest will cause considerable damage by eating the young roots.

The bed should be made up in a ridge, allowing about 2ft. width at the base, and tapering it upwards to the required height, which may be from 12 to 18in. Ram the soil firmly in the process of formation. It is advisable to make the bed about a fortnight before the time for planting, to allow the soil to become thoroughly warmed through.

When sowing, the cultivator must be guided by the demand. May is considered the earliest period that well-flavoured melons can be expected, and for this purpose a sowing should be made in the first week of January. Subsequent sowings for a succession may take place about every ten days or a fortnight. One seed in a small 60-sized pot is sufficient, using pure loam only. Plunge the pots in a bottom heat of 75 deg., and as soon as the plants come up remove them to a shelf near the roof-glass, so that they may receive all the assistance possible in becoming strong and sturdy. At this early season more than ordinary care must be bestowed on the young plants. Watering must be done judiciously, the plants staked, and repotted into 54's as soon as they are ready. Above all, avoid cold draughts. A few more seeds should be sown than the number of plants required, in case of loss or damage. Sixteen weeks is considered the average time necessary from sowing seeds to the ripening of the fruit.

Planting may commence as soon as the plants are ready. Allow 1ft. to 18in. between the plants, and make the surrounding soil firm. Well water in, and stake immediately.

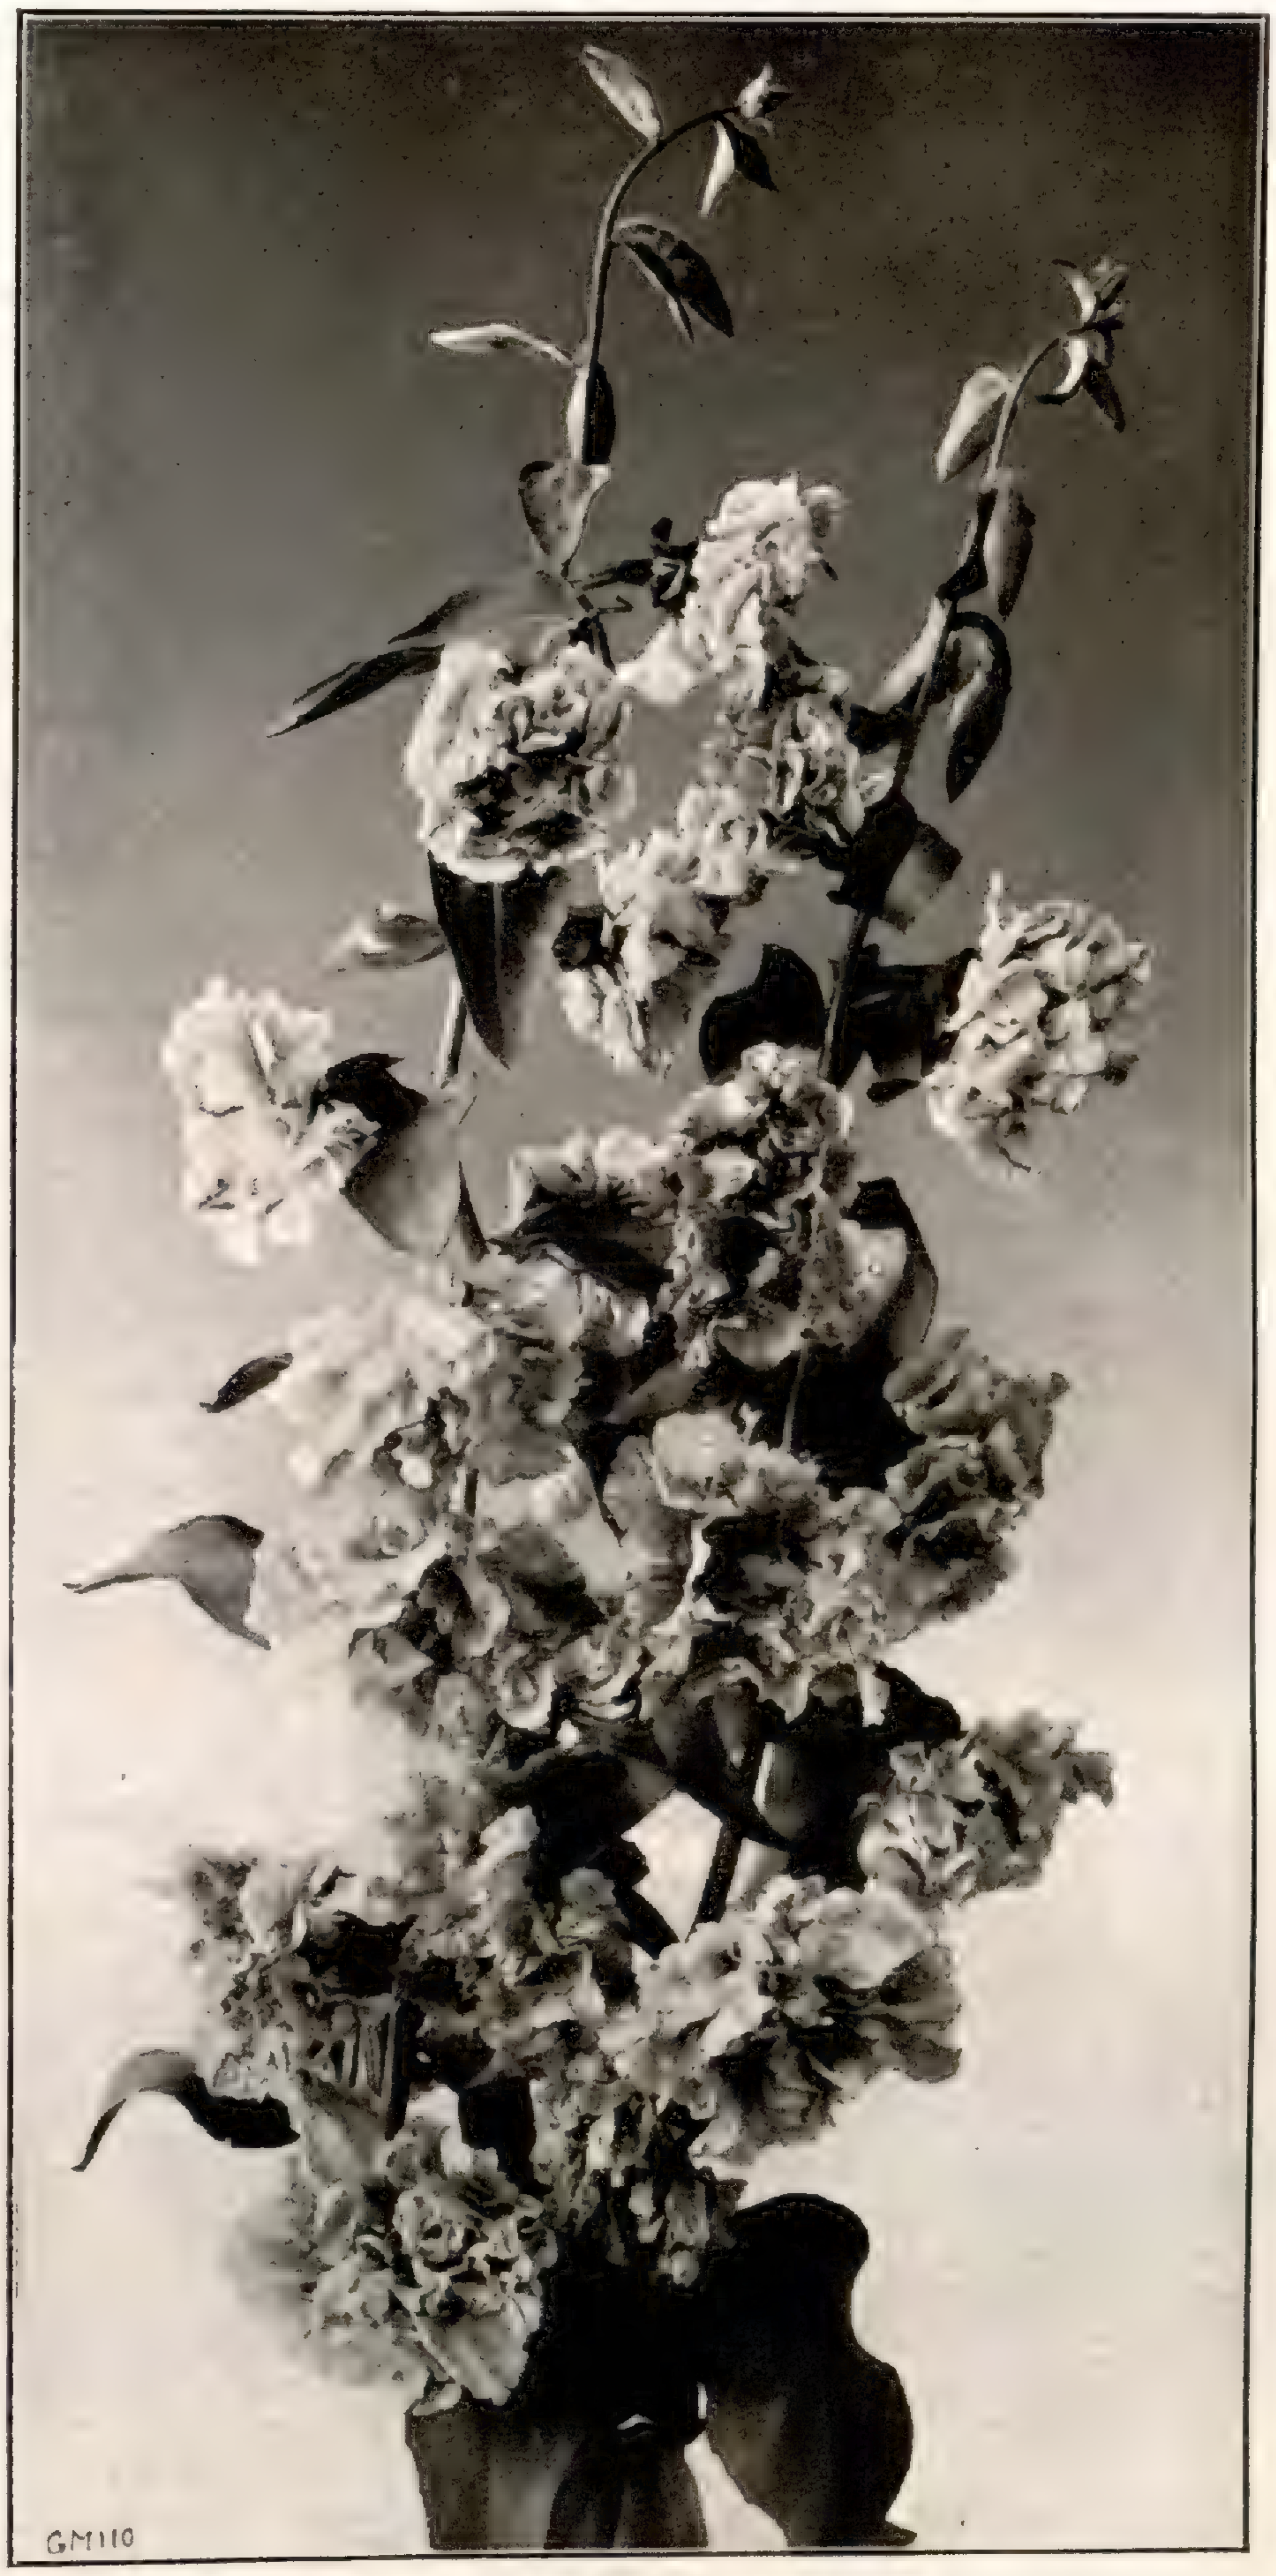
The method of cultivation which I advise is to limit each plant to a single stem, which is allowed to grow to the top wire before being stopped by removing the point. As the laterals grow they must be kept carefully tied up. The process of "setting" the female blossoms is an important one. Do not commence this as soon as the first flowers open, but rather wait until the plants have attained strength. The best fruits will be obtained from those flowers produced about half-way up the plant, and these should be set together as nearly at the same time as possible, so that they may swell together and become uniform. Two or three fruits on each plant is ample. The operation of setting is best performed on a bright day, when a little air can be admitted, midday being the best period, when the atmosphere contains the least moisture.

Melons delight in heat, and for the early sowing a minimum night temperature of 70 deg. should be maintained, this increasing as the season advances. Except during the time of setting, the atmosphere must be kept moist by damping the floors and surrounding walls. Stop all laterals at one leaf beyond the fruit, and remove all sub-laterals as they appear. Keep the plants carefully tied up and regulated, and give support to the fruits by nets when they have attained the size of an apple. Artificial feeding is necessary, but this must be given weak and often when the plants are in full growth, on account of the close proximity of the roots to the surface of the soil, as they may be easily injured by the sun's action and strong manure. Encourage plenty of root growth by top-dressings of loam.

As the fruits reach the ripening stage the water supply must be greatly reduced and air freely admitted. Each fruit will betray its readiness for cutting by cracking round the stem, and the beautiful aroma it gives off. The flavour of the melon will be greatly improved if it is placed on a shelf in the same house as grown, or perhaps in a slightly lower temperature, for about a week before use.

The question of varieties is one which must remain open for various reasons, but a few which I can strongly recommend are as follows: Green-fleshed varieties—Emerald Gem, Ringleader, Best of All, and Royal Jubilee; white-fleshed—Universal, Eminence, Countess, and Hero of Lockinge; scarlet-fleshed—Sutton's A1, Superlative, Blenheim Orange, and Sutton's Scarlet. I have grown all the above, and consider them equal to any varieties in cultivation.

A. Grubb.



CLARKIA ELEGANS FIREFLY.

A highly effective and beautiful variety, bearing large double flowers of a bright scarlet-crimson hue. Introduced by Messrs. Sutton and Sons, Reading. (See page 179.)

## FINELY-FLAVOURED PEAS.

The garden or culinary pea is undoubtedly the most popular vegetable grown, and the extent of profit which may or may not attend its cultivation, either in private or market gardens, will depend very much on soil and climatic conditions. Too often, peas are sown regardless of the special needs required to make their cultivation a success, and not infrequently we find that early varieties are sown on cold retentive soils, and main crops or later varieties are sown on land infinitely too rich in organic matter, with the result that the plants produce an over-abundance of haulm at the expense of pod formation. I have often noticed on trial grounds of many nurseries that larger and better filled pods are frequently produced than in many private gardens, where the seed is often sown on deeply trenched and liberally manured ground, the plants when established being still further nourished by the application of manure mulchings and manurial stimulants. Fine flavour in peas depends upon proper cultivation and a suitable selection of varieties.

PEA HARRISON'S AMEER.

An early and productive green marrow variety, growing about 3½ft. high.

### Soil and Situation.

Peas succeed on a wide variety of soils, but, as with the majority of other vegetables, a good rich and fairly retentive loam is preferable. Early crops require planting on lighter soils, which, in the early part of the year, contain an ample supply of moisture; but the latter is not sufficient to cause the plants to suffer from sharp atacks of frost. These lighter and sheltered soils are often found on warm borders with a south aspect in kitchen gardens and afford just that amount of warmth favourable to the growth of root and stem. It is thus seen that no hard-and-fast rules can be laid down as to when early varieties of peas may be sown; and experience proves that no real advantage is gained by sowing the earlier varieties under unfavourable conditions. There is no special need to study rotation in sowing peas, except that it is not advisable to sow the crop after any other pod-bearing plants; and the more often the situation can be changed the better, as if continually sown on the same ground, the soil becomes "pea-sick." Where kitchen garden soils are deeply trenched, it proves a wise plan to grow peas on soil that has been manured for a previous crop; a good friable seed-bed, accompanied by an equally good season, being preferable to richly-manured soil, which in cold and wet seasons becomes saturated and sour on the surface, even after having been trenched in autumn, and requires forking up in the spring as soon as it is possible to tread the ground without kneading it.

### Manuring.

It must not be understood from what has been previously said that no soils require manuring. Soils that are naturally hungry and not in "good heart" will undoubtedly require a liberal dressing of farmyard manure, as apart from the manurial constituents supplied, this manure produces a valuable mechanical action on such soils. Unfortunately, few gardeners can pick and choose in the selection of natural manures, but whenever opportunity affords, there is nothing to equal well-rotted dung produced from fattening animals, or, in fact, any stock receiving large quantities of concentrated foods. For the pea crop to obtain the full benefit of farmyard manure, either on light or comparatively heavy soils, such manurings are best applied at the time of digging or forking over the ground in spring. In market gardening, artificial manures enter largely into the cultivation of peas, more especially those manures rich in phosphoric acid. Peas, like other leguminous crops, make use of atmospheric nitrogen, which, in conjunction with the nitric acid obtained from the soil, is generally sufficient for their requirements. The form of phosphoric acid to be applied will depend largely on the character of the soil; and, if not acid, mineral superphosphate containing from 30 to 35 per cent. of soluble phosphates will be preferable to a similar kind of material of a lower grade or quality. Superphosphate, being an acid manure, is not so well adapted for soils which contain a large amount of humus; these soils usually become stagnant or sour after the winter rains. When in this condition a phosphatic manure such as basic slag or basic phosphate is best, and the higher the grade of fertiliser the better. As regards the application of potash, this will best be applied in the form of kainit, except on very heavy soils, as the salt in kainit often tends to make the latter saturated and difficult to work satisfactorily for a considerable period after its application. Lime should be applied in very small quantities, especially on heavy and sour land, as it acts chemically on inert vegetable matter, and also tends to make the soil lighter and therefore work better. On heavy land basic slag, kainit, or bone-meal, may be applied at the rate of from 2 to 4 ounces per square yard, for preference in February. On lighter and less acid soils superphosphate may be substituted in like proportion and at the same time. Light soils are always deficient in potash, therefore the amount of kainit may be slightly increased. There is no more economical method of manuring than that of supplying artificial or chemical manures in conjunction with farmyard manure.

### Selection of Varieties.

As in the case of potatoes so with peas—too much care cannot be taken in the selection of varieties, and it often happens, as with the former crop, that there is a vast deal of difference between various strains of the same variety. So much, therefore, depends on the manner in which the seed is grown and selected. It is not a wise policy to invest in cheap samples of peas, and one is impressed with this fact on visiting the trial grounds of some of our leading seedsmen in summer, and noting the care that is taken in selecting and testing the many and varied strains of the same and individual varieties; also at a later stage, when the stocks of seed are received into the warehouse and carefully graded, to ensure that the samples sent out are of a high standard of quality.

Unless grown for trial, it is unwise to sow too many varieties of peas, and it therefore becomes a matter of some difficulty to know what best to cultivate. Those who pride themselves on open-air pea culture are always anxious to obtain their first gathering in May and their last towards the end of September or October; but whether this can be accomplished or not depends very largely on climatic conditions. To obtain early crops, it is essential to select first early varieties for sowing early in February or March, while the month of March may be reserved for the second earlies. Main crop varieties are sown in April and May, while for late gatherings sowings can be made throughout the month of June. It is nothing unusual, however, to sow some of the early varieties in the first week in April, and to make gatherings from them in the second week of June; at any rate, given favourable soil conditions and a good aspect, the greater majority of early varieties can be gathered in April. For first sowings, Pioneer, Little Marvel, Hundredfold, Eclipse, Sherwood, Sutton's Reading Wonder, and Veitch's Chelsea Gem represent varieties from 9 to 20 inches in height: while Harrison's Ameer, Carter's Early Morn, Sutton's May Queen, Daisy, Excelsior, and Thomas Laxton are among taller varieties, ranging from 2½ to 4 feet in height. Second early and mid-season varieties of good repute are Sutton's Centenary, Discovery, Sutton's King Edward VII., Carter's Quite Content, Sharpe's Queen, Webb's Senator, and Telegraph; while for late supplies, Ne-Plus-Ultra, Continuity, Webb's Masterpiece, Matchless Marrowfat, Sutton's Perpetual, and Gladstone are among the best, the latter being a special favourite for late exhibition purposes.

**Grape Culture.**—An illustrated guide to the culture and management of vines in greenhouses and in the open air is published at Gardeners' Magazine Office, 148, Aldersgate Street, London, price 1s. net (by post 1s. 2d.), or bound in cloth 1s. 6d. (by post 1s. 8d.). Full particulars are also given as to renovating old vines, and the best varieties to grow.

## YOUNG CARROTS ALL THE YEAR ROUND.

Young carrots provide such a favourite and choice dish throughout the year that every endeavour should be made to obtain nice crisp roots the whole season through. Carrots, perhaps, are utilised in more ways than most vegetables, hence their special value.

Commencing early in the year slight hotbeds are required to mature the crop quickly, and this is easily accomplished where long stable litter is at hand, and a plentiful supply of any deciduous leaves, using two parts of the latter to one of the former in preparing the hotbed. The predominance of leaves will give a steadier and more lasting heat. Thoroughly mix the whole by turning thrice. When forming the bed build to a height of four feet, with a margin of two feet beyond the frames; over this margin an occasional lining of similar material will be required to maintain a steady heat. When completed place the frame squarely and firmly in position.

Have in readiness some light prepared soil, consisting of three parts finely-sifted garden soil or loam, one part road scrapings, and one part burnt garden refuse, old potting soil when available could be used in the place of the garden soil; place not less than six inches in the frame. Left thus for a few days to warm through, it will be ready for the seeds. Proceed by making the soil firm, as Shorthorn carrots will be found to form more quickly thus treated, and make less top growth. Sow in shallow drills, seven inches apart, just covering the seeds with fine soil, and when finished lightly damp the seed-bed over with tepid water, and close the frame until germination takes place; then admit air and syringe on all favourable occasions. The lights should be protected with mats or suitable material through all frosty and cold, windy weather. Later, when favourable spring weather arrives, the lights can be left off entirely.

Those not favoured with fermenting material need not hesitate to sow at once, providing a cold frame is available; place the frame in a sunny position, well sheltered from cold winds, and place therein the best soil available; sow the seeds as advised, and husband all the sun heat possible, well covering the lights, and frame sides early in the evening to retain the warmth throughout the night. Vegetables will be scarce a few weeks hence, therefore every endeavour should be made to fill up any break that must occur.

For succession to the above crops sowings will have to be made outside, the first on a south border during March, working the ground into a fine tilth, after giving a good dressing of burnt earth, particularly if the ground is heavy. It is a good practice to have a quantity of finely-sifted potting soil at hand to cover the seeds with previous to raking the bed over, as this promotes very quick root action. Make later sowings every five weeks, according to requirements. The last sowing should be made early in September, this time on a south or western border, and if all goes well, this will supply excellent young carrots until March, when hotbed carrots will be again available.

The crop to stand the winter, viz., those sown in August and September, must have the ground specially prepared. Choose a site not recently used for carrots, and add plenty of burnt garden refuse (if hot, so much the better), with lime. Bring it to a fine tilth, and sow in rows at one foot apart; this distance applies for all sowings outside. A free use of the hoe and light dustings of soot is all that will be required, but in frosty weather give protection with boughs and litter, so that the young roots can be daily drawn easily. We are now at the middle of February, drawing excellent roots from a border facing west, treated as mentioned above, and the crop will last well into March. Very little thinning is required for any of these sowings unless especially thick, the daily drawing sufficing for this purpose. Give water when required, ply the hoe freely, and give occasional dustings of soot.

Well-tried varieties are Inimitable for very early use; Parisian Forcing, French Horn, and Early Gem. For sowing in the open quarters in March for maincrop supplies, the intermediate type known as Scarlet Perfection can be strongly recommended.

Geo. Ellwood.

CARROT SCARLET PERFECTION.

An exceptionally fine intermediate type selected by Messrs. Dickson and Robinson, Cathedral Street, Manchester.

## CHICORY FOR WINTER SALADS.

In referring to the great value of the finer types of chicory for winter salads, it can hardly fail to be of interest to mention that, although the typical plant is a native of this country, the development of the cultivated forms has been effected on the Continent. In Belgium and in France the cultivation of chicory under the designation of Witloof and Barbe de Capuchin has assumed enormous proportions, more particularly in the former country, whence large quantities are exported to this country and other parts of the world. As proved by the produce exhibited at the Royal Horticultural Hall within recent years, chicory can be equally as well grown in England as in Belgium, but whether its commercial culture would be equally profitable in the two countries is yet to be demonstrated. Whether the production in England of supplies for market would be profitable or otherwise, there can be no question as to there being a large demand for the blanched crowns, or as to the freshly-gathered produce being superior to those which are imported. It should certainly be more largely grown in private gardens, for it is invaluable as a salading during the winter months, and useful for serving as a vegetable.

One of the broad-leaved types should be selected, and the best is unquestionably that known as the witloof, and found in the catalogues of the leading seed firms. For the production of the crop select a position in an open quarter that has been deeply dug, and otherwise prepared as for the ordinary root crops—carrots, for example. Make two or three sowings during the months of April and May, the first about the middle of the first of the two months, and the others at intervals of about a fortnight. For gardens that are small, or of moderate size, two sowings will suffice. Sow in drills twelve inches apart, and when the seedlings are large enough to admit of their being readily handled, commence the thinning, and proceed in such manner that when this necessary operation is completed the plants remaining are about ten inches apart. No other attention will be necessary until the autumn excepting an occasional hoeing for the purpose of keeping down the weeds and maintaining a loose surface.

The roots will have completed their growth by October, and may then be lifted for forcing and placed where they will be in darkness and assisted with just sufficient warmth to start them into growth. A mushroom house or warm cellar will be well adapted to their requirements, and it will be found convenient to place a couple of dozen or so of roots in a box about ten inches in depth with fine and rather moist soil packed about them. Previous to putting them in the box cut the leaves off about an inch above the crowns, and in filling the box the latter should be half an inch or so above the surface of the soil.

G.

# TUBEROUS BEGONIAS.

The tuberous begonias have been general favourites for many years as decorative subjects for the conservatory and the flower garden. Although fresh ideas and tastes are being continually expressed in the garden, resulting at times in some plants losing much of their popularity, so far the begonia has survived these changes, and is still holding its own amongst the best flowering plants for decorative purposes. The introduction latterly of the crested and frilled types has added greatly to the interest of this useful group, which has also been supplemented by Begonia Lloydi, a variety of slender and floriferous habit, suitable for growing in baskets. The different types are alike beautiful, and it chiefly depends on the individual taste of a person if any particular form is held in preference to the others.

A MAGNIFICENT DISPLAY OF DOUBLE-FLOWERED TUBEROUS BEGONIAS

In the nurseries of Messrs. Blackmore and Langdon, Twerton Hill, Bath, who have been highly successful in the improvement of these attractive flowers.

## Begonias in the Conservatory.

No other plant gives us such a wealth of blossom through the summer months for the flowering house and conservatory. When grown for these structures it is possible, with a little extra attention, to obtain some remarkably fine specimens with enormous flowers, and by starting the corms in batches, at intervals, the flowering season can be considerably extended. If an early display is required, it will be necessary to start the corms in good time. These quickly commence to grow when introduced into heat and kept moist. The usual practice is to plunge the tubers in shallow boxes which have been three parts filled with leaf soil, covering the top of the tubers slightly; afterwards they are put into a house or heated pit, where a temperature of about 55 degrees is maintained. The leaf soil being kept moist quickly encourages root action, and by the time young growths are an inch or two in height, and it becomes necessary to transfer them to pots, quite a ball of soil will be found adhering to the roots. Over-potting must be guarded against, and as the tubers usually vary so much in size, judgment must be used in choosing the size of pots. A compost consisting of equal parts loam and leaf soil, with plenty of sharp sand added, will be found suitable for them at this stage.

One of the most essential points in the culture of begonias is to keep the plants as sturdy as possible; this can only be done by giving them a light, airy position near the glass in a house or pit where the temperature does not fall much below 55 degrees. Admit air whenever favourable, and avoid cold draughts. As soon as the pots are filled with roots the young plants must be transferred into their flowering pots, and here again a little judgment must be used in choosing the size of the pot to correspond with the habit of the plant. Six-inch pots usually suffice under ordinary circumstances, but if large plants are desired, some of the most vigorous specimens can be shifted into eight, nine, or ten-inch pots, in which, if given good treatment, they will make fine specimens. An addition of dried cow manure and soot to the compost for this potting will be found very beneficial. Careful watering is necessary until the plants become well established, after which they require a copious supply, especially during bright, windy days. Begonias are gross feeders, and to have really good plants with large trusses of flowers to last in bloom for a considerable time, feeding becomes a necessity. In my own experience I have found good liquid manure and soot water to give better results than artificials, and safer to use. During hot, bright weather light shading, sufficient to break the direct rays of the sun, is necessary to preserve the colour of both flowers and foliage.

The plants will in many cases require stakes to support their stems, when they are becoming well advanced in growth, especially many of the double kinds with large heavy flowers. One neat stake to each stem usually suffices, and any trusses of flowers inclined to droop can be looped to this. As the plants come into flower, they can be removed to the conservatory or flowering house, arranging them with light foliage plants, such as Adiantum cuneatum or Asparagus plumosus, which will greatly relieve their heavy foliage. Colour blending should also be carefully considered, as if carried out tastefully the whole effect will be greatly enhanced.

## Begonias in the Flower Garden.

Tuberous begonias are also very accommodating for summer bedding, and when once sufficient tubers of flowering size are obtained it is not necessary to renew the stock annually from seeds, as is the case with many of the plants used for this purpose. Through the winter months the tubers may be stored in any dry place, free from frost. For brilliance of colouring and continuity of flowering begonias cannot be surpassed, and with such a variety of shades available it is possible to use them in any colour scheme. It is of great importance, to secure success in bedding out begonias, to have well-grown plants to put out, which have been carefully hardened off. Much time and labour will be saved by purchasing corms that were raised from seed last year, corms that have been selected according to their respective shades of colour should be bought.

Choose a position in which to plant them where they will receive full light and still be sheltered from rough winds, and where watering can be attended to in dry weather. To have the plants in readiness for their summer quarters by the last week in May or the first week in June, the tubers should be placed in boxes about the end of March, and started in a similar manner to that recommended for those to be grown in pots. When growth has commenced freely, plant out in a frame or pit on a partly spent hotbed, in some fairly light soil. In such quarters they will give but little trouble. At first they will require care in watering, but if watered in when planted they will not need any more for several days, but every opportunity should be taken to lightly damp them overhead when the weather is bright; and this, if carried out in the afternoon previous to closing the frames before the sun is entirely off them, will greatly assist the plants. Admit air sparingly at first until the plants are well established; then increase it gradually until the lights can be removed altogether through the day during fine weather, putting them on at night until all fear of frost is gone. When treated in this way the hardening-off process is gradual, the plants receiving no check.

STOCK WEBBS' NEW ADMIRATION.
A vigorous free-branching variety, effective in the garden, and useful for the supply of cut flowers. Introduced by Messrs. E. Webb and Sons.

The beds or borders in which begonias are to be grown will need attention, as usually they have been occupied previously for several months with spring bedding plants, some of which impoverish the soil very much. In such instances it will be necessary to work in a good dressing of decayed manure, and, if the soil is inclined to be heavy, add some light material, as begonias are not a success during a dry season in soil which soon becomes baked and hard. After planting is completed, the surface of the beds must be kept hoed as long as it is possible to get between them without injuring the leaves, and watering must be strictly attended to during dry weather. Occasional applications of liquid manure at such times will have a marked effect.

The variety of ways in which begonias can be used as bedding plants are innumerable. They form a carpet in large beds or borders under Lilium longiflorum, tall fuchsias, swainsonias, heliotropes, etc.; and when occupying beds themselves, planted in separate colours, or with two or more colours blending, they are then very effective.

T. B. Field.

Wych Cross Place Gardens.

## ANNUALS FOR BEDS AND BORDERS.

Annuals are deservedly popular, as they are very valuable either for massing in beds separately, or for planting in clumps in the mixed borders. Between the early summer and autumn-flowering herbaceous plants the annuals fill up a gap, and they continue flowering until cut down by frosts. As with other classes of plants, a great improvement has been achieved recently among annuals, and at the present time some magnificent strains of the various kinds are to be obtained.

Cultivation is comparatively easy. Many of the tender kinds can be raised with the aid of a cold frame. Some have to be sown earlier than others, and these require a little warmth, otherwise, if the sowing is delayed, the flowering season will be late. In the majority of cases the hardy types are sown in the open, where they are to flower, but it is advisable to raise as many as possible in boxes or frames, as the beds and borders are usually occupied when outside sowing should take place. If this sowing has to be delayed until the spring and early summer flowering plants are over, the beds must necessarily remain in a bare state for a long time, hence the advantage of having plants in readiness for putting out. Unless otherwise stated, the following methods of raising the plants will be found most suitable for all annuals mentioned in this article.

Boxes or pans will be found most serviceable for seed beds, and should be filled with a compost consisting of two-thirds loam, one-third leaf-soil, and a liberal quantity of sand. The end of March is quite early enough to sow the seeds, and when sown the boxes or pans should be placed in a cold frame, which must be kept close and shaded, until germination takes place. When the seedlings appear the shading must be gradually dispensed with, and air admitted carefully. Immediately the young plants are large enough to handle, they should be transplanted into frames, and afforded a slight shading, until they become fairly established. Of course, they may be transplanted into boxes, but the plants do not run such a risk of becoming starved when planted out into frames.

If one has not the advantage afforded by frames, the sowing must be postponed until the middle of April, and the seedlings transplanted into small nursery beds. Excellent results are to be obtained in this way, but the flowering period will be later. Some kinds of annuals must be sown where they are to flower, as they strongly resent any disturbance, and among these may be mentioned the beautiful Phacelia campanularia, mignonette, poppies, nemophila, and eschscholzia.

The following list of varieties does not claim to be an exhaustive one by any means, yet all those mentioned will be found most serviceable for creating a display in beds and borders.

### Asters.

For bedding purposes during August and September these popular and beautiful flowers hold an important position. The most effective display is obtained when they are massed in beds, in separate colours, and they are also indispensable for mixed borders. The single types have become great favourites, and are largely grown, the new Southcote Beauty being a grand acquisition. The variously-coloured forms of Callistephus sinensis are highly prized for their large single flowers, and they are most useful for cutting. The most popular of the doubles are the Comet, Plume, and Ray varieties, the latter having very large blooms of fine lasting quality. Besides these there are the Victoria, Pæony, and Chrysanthemum-flowered varieties.

DIMORPHOTHECA HYBRIDS.

These, introduced by Messrs. Barr and Sons, Covent Garden, range in colour from white to deep red, and have been obtained by crossing D. aurantiaca with D. pluvialis.

### Alonsoas.

Alonsoa Warscewiczi compacta and A. gracilis are beautiful subjects for small beds, or for grouping in the borders. They grow about twelve inches high, and have small scarlet blossoms, which are borne in such profusion that the plants are literally smothered with bloom.

### Amaranthus.

Amaranthus melancholicus, A. salicifolius, and A. tricolor, are prized for their ornamental foliage, and will be found extremely useful for dot plants for beds. Being rather tender, they should not be planted out until danger from frosts is over. The seeds should be sown in early March, in gentle heat, and the plants grown in pots ready for planting out.

### Clarkias and Candytufts.

Clarkias are remarkable alike for their graceful habit and attractive colouring, and are especially adapted for the formation of distinct groups in the mixed border. Five or six plants, arranged from eight to twelve inches apart, will make most effective groups if, as should be the case, each consists of a distinct variety. There are two distinct types, which are known as elegans and pulchella. The varieties of the first type are the more robust, and attain under good cultivation a height of about thirty inches, and the long, graceful sprays present a most pleasing appearance. There are white, pink, salmon, and scarlet varieties, all of which are more or less beautiful. Two of the finest of the varieties at present in cultivation are Sutton's Firefly, which has crimson-scarlet flowers, and Sutton's Scarlet Beauty, which has flowers of salmon-scarlet hue. The pulchella varieties range in height from twelve to eighteen inches, and include several beautiful shades of rose. The rose-coloured flowers with white margins are also highly attractive, and the white varieties are most useful.

The annual candytufts are of much value for producing bright and pleasing displays of flowers. The seed can be sown where the plants are to produce their flowers, and whether grown in clumps or lines the seed should be sown thinly, and the plants be thinned sufficiently to allow each one to attain its full development. Unless allowed plenty of room the candytufts have a rather short flowering season, and the flower spikes do not attain their full size. Dobbie's White Spiral is a remarkably fine strain, the plants being vigorous in growth and the flower spikes of immense size. The carmine and crimson varieties are also most meritorious.

### Celosia plumosa.

The yellow, scarlet, and crimson varieties of celosias are very effective in beds when massed in their separate colours. The seeds should be sown at the end of February, and the plants grown on in pots. A fairly rich soil should be afforded them, and the plants must not be allowed to become pot-bound.

### Chrysanthemums and Cosmeas.

The Morning Star and Evening Star varieties of this popular annual are all very beautiful, and most useful for grouping in the borders.

Cosmea bipinnata is a handsome plant with large flowers resembling single dahlias. It is a strong growing annual, reaching the height of about three feet, and having very fine and light foliage. To obtain a good display of blossom the seeds should be sown in February, otherwise the flowering season will be very late.

### Dimorpotheca aurantiaca.

This is one of the most gorgeous of annuals, the deep orange flowers producing a brilliant effect during August and September. It delights in full sunshine, and the colour does not burn or scald. Variously coloured hybrids of this flower have been obtained by crossing it with Dimorpotheca pluvialis. Messrs. Barr and Sons, of Covent Garden, have made a speciality of D. aurantiaca, and are now introducing these new hybrids. Seeds should be sown early in March, potting the young plants immediately they are large enough to handle into small pots, and repotting them if necessary into larger pots before planting out.

### Gaillardias.

The brilliant and rich colours of Gaillardia Lorenziana and G. picta create a grand effect when the plants are boldly grouped in the borders, and they remain in bloom for some considerable time. The seeds should be sown in gentle heat in February.

### Marigolds.

The African and French marigolds provide a wealth of blossoms, highly prized for their bright colours. The African varieties have large self-coloured flowers, whilst the French varieties are beautifully marked.

Tagetes pumila is a good edging plant, of neat and compact growth, literally smothered with bright yellow blossoms throughout the summer. It makes an excellent subject for ribbon borders, and requires a poor soil.

### Nasturtiums.

For clothing dry sunny positions, where the soil is poor, these plants (tropæolums) are indispensable, and when planted in such a place an abundance of flowers is obtained. When planted in rich soil, the foliage grows so strongly that the flowers are hidden by it.

### Nemesias.

The Suttoni varieties of Nemesia strumosa are most popular, and very important for bedding purposes. They possess an extensive range of colours, and hold a high position amongst our summer flowers. The seeds should be sown in gentle heat early in March.

### Phacelia.

Phacelia campanularia is a good subject for edging, and should be sown where it is to flower, as it dislikes any disturbance. The colour of the flowers is a lovely dark blue; it deserves to be grown more extensively than it is.

### Phlox Drummondi.

The various colours of this favourite annual are much appreciated, and for carpeting or edging beds these phloxes are very valuable. The plants should be pinched once or twice when in a young state, and as growth advances when they are planted out, the shoots should be pegged down.

### Salpiglossis and Schizanthuses.

Salpiglossis sinuata provides a variety of choice and elegant colours, the blossoms being beautifully veined and striped. Beds planted with these create striking effects during August and September. The seeds should be sown in a little warmth, early in March.

Schizanthus Grahami, S. sinnatus, S. retusus, and S. Wisetonensis are particularly fine subjects for outdoor cultivation during the summer, their dainty blossoms being borne in great profusion. The seeds should be sown in February, and the young plants grown in pots for planting out.

### Stocks.

The summer-flowering varieties are of immense value for providing a display during the summer months. For a succession of bloom the intermediate forms should be grown, which, if sown in March, will commence to flower in the autumn Princess Alice, New Admiration, Salmon Beauty, Mauve Beauty, and Mont Blanc are excellent examples of the summer-flowering types. Beauty of Nice, of the winter-flowering section, answers well for summer effects when sown in March.

### Sweet Sultans.

The new large-flowered forms are well adapted for the mixed borders. The flowers are large and fragrant, and borne on stouter stems than the older varieties. If necessary these annuals may be sown in the open.

### Zinnias.

The various colours of the double forms of these old favourites are very effective when massed in beds, the flowers lasting well. The single orange flowers of Z. Haageana are useful for the borders.

Gnaton Gardens. E. C. Pooley.

## FINE FOLIAGE PLANTS FROM SEEDS.

There are many very beautiful fine foliage plants that may be raised from seed sown in early spring. If a little taste is displayed in the arrangement of such plants, so that the colour of the foliage when fully developed during autumn is in perfect harmony with the floral surroundings, a charming and effective display is provided that will be much appreciated.

The general effect of many gardens and borders is much marred, and in some cases practically ruined, by the too liberal employment of flowering plants, and the evil of overcrowding.

### For the Garden.

Amaranthus tricolor splendens is best treated as a half-hardy annual, and will, if judiciously employed, as dot plants, or specimens standing boldly in a conspicuous position associated with a carpet of dwarf flowering subjects, look well. This amaranthus has large, handsome, bronzy-green and yellow foliage. In height it rarely exceeds two feet. A. salicifolius is one of the most effective fine foliage plants used as dot plants for carpet beds, and will be found to produce an unique display, adding elegance to this rather too formal style of gardening. It will attain a height of three feet under good cultivation.

Seeds of amaranthus must be sown thinly in the usual way. Avoid overcrowding and excessive applications of water. A warm greenhouse will prove suitable during the early stages of growth; pot off singly when large enough to handle, place the seedlings in a light position, and harden off as soon as the plants are established, and keep them as near the glass as convenient to insure short-jointed sturdy growth.

Centaurea ragusina, with silvery-white foliage, is a plant one may raise and successfully grow with very limited attention. Seed should be sown early in the year, and just sufficient water be given to keep the soil in a moist condition for a few weeks. It is a good plan to keep the seed pans covered with a sheet of brown paper and a layer of moss after sowing the seeds, until germination is effected. Transplant singly into shallow pans, boxes, or pots, keep the seedlings free from frost, and afford all the available light possible after the plants are well established.

Cerastium tomentosum, about six inches high, is a hardy perennial that may be used effectively as a carpet for showy flowering subjects, or employed as an edging plant for flower beds or borders; it is also invaluable in the rock garden, in which position its creeping habit and close-growing foliage are displayed to advantage. Seedlings should always be afforded cold frame protection, as they then develop freely and assume a good colour. It must be understood that "coddling," or the employment of fire heat, will have a detrimental, and, consequently, a disappointing effect.

Cineraria maritima is a splendid subject for beds or borders, where it is desirable to introduce light colours in foliage. It may be treated similarly to Centaurea ragusina.

Kochia trichophila, an exceptionally handsome foliage plant, should be treated as a half-hardy annual, as under such treatment it develops to a useful size for immediate effect after planting out in the flower garden. Under ordinary conditions, in the cool greenhouse, or a partially heated pit, it succeeds well, and grows most rapidly. It may not be generally known what an ideal plant Kochia trichophila is for seaside planting; the salt spray appears to have a curiously stimulating effect upon its development, and the bright bronze tint of autumn appears to be much enhanced near the sea. I noticed some remarkably fine specimens employed with taste in the flower beds on the Corporation Parade Grounds, Bridlington, under the care of Mr. Crofts, and during last season these were the centre of the many floral attractions provided for the education and pleasure of visitors.

### For the Conservatory.

For the adornment of the conservatory many beautiful and exceedingly handsome foliage plants may be easily raised from seeds sown during the early part of the present season, and they well merit more attention than is usually given them. Their comparatively easy culture, coupled with inexpensive production, commend them to our notice. During the hot summer weather it is often found very troublesome to maintain a successional display of flowering plants. On the other hand, foliage plants always produce a charming display, which, by contrast with the feast of flowering plants usually provided outdoors at that date, cannot fail to command appreciation.

Aralia Sieboldi is a useful conservatory or greenhouse plant, which is valuable for house decoration; it lasts in good condition for such purpose for a long time, and if occasionally changed, and replaced from the greenhouse stock, it will be found to retain its healthy glossy appearance. New seeds are not obtainable, as a rule, until April or May, when they should be steeped in water for a day or two previously to sowing. Very little attention beyond the ordinary routine of watering and repotting will be required.

Decorative asparagus are among the foliage plants that succeed extremely well when raised from seeds. A. deflexus, which produces long, drooping branches of a pleasing green colour, is admirably adapted for hanging baskets for greenhouse or conservatory, and it is also of much value for cutting. This species adds grace and elegance to table decorations if used tastefully among cut blooms.

Other kinds I have been most successful in raising from seeds are A. Sprengeri and A. plumosus, as well as the dwarf A. plumosus nanus; all these are valuable foliage plants, which retain their beauty throughout the winter. They may be easily raised from seeds, which should be immersed in water some time previous to sowing. After the seedlings are growing freely give liberal supplies of water and diluted liquid farmyard manure.

If one obtains a good strain of seeds of coleus good results are assured. Seedling coleuses are exceptionally free growing, and as a consequence fine symmetrical plants may be grown from seeds sown at this date. The undesirable colours which may be among seedlings may be discarded at an early stage. Treat on similar lines for ordinary seedlings, but after the shape, or foundation, has been formed, feeding should not be practised, as the colours of the foliage are much more pleasing when restriction of the roots is practised.

Cyperus alternifolius is an ornamental foliage plant, with deep green and glossy leafage, and is valuable for extensive house or conservatory decoration. The size of the plants is determined by the liberality of treatment provided. Seedlings may be raised any time, and after these are established must always be provided with ample moisture at the roots. Seedlings restricted to small 60-sized pots are exceptionally decorative for small vases or for edging the stages of a warm greenhouse. There is also a variegated form of this cyperus, but so far my efforts to raise variegated seedlings have met with practically no success.

Eucalyptus globulus will quickly grow up into useful-sized plants from seeds, and the glaucous-green leafage makes a striking contrast to the foliage of other plants. This is also a great success as a sub-tropical bedding plant, and if kept in pots for a few years it will become a specimen of large size.

Eulalia japonica variegata is a handsome and graceful decorative plant, that everyone ought to include in a collection, however small. When raised from seeds its variegation is scarcely so pronounced in the early stages, but as the seedlings develop and are subjected to root restriction, the variegation is all that may be desired, while the constitution of the seedlings is so robust that the plants will attain a height of five or six feet in one season under liberal treatment.

Grevillea robusta is a magnificent greenhouse shrub, with fern-like foliage, and it is easily raised from seeds, and available for decoration at any size. The seeds are often a long time germinating, and very irregular, consequently each seedling should be transplanted as soon as large enough, taking care not to disturb the rest.

John Donoghue.

Bardon Hill Gardens, Leeds.

---

**Autumn-sown Onions.**—Whenever the ground is in a working condition, plant these without delay, as far better results are achieved by transplanting the onions now than leaving them where they were sown, as they bulb more quickly and come larger. Lightly fork over the site, apply a broadcast sowing of burnt garden refuse, and plant forthwith, in lines at one foot apart, and the same distance from plant to plant. All surplus plants should be planted thickly on a small border, firmly, as these are very good for early use.—G. Ellwood.

---

## MAINCROP POTATOES.

Though the cultivation of the potato is carried out by almost everyone who makes any pretence at vegetable cultivation, there are, nevertheless, right and wrong methods, and my remarks hereafter are intended for those who may not be conversant with the best practice to obtain the most satisfactory results.

### Preparation of the Soil.

As is generally known, some localities and soils lend themselves much more readily to the production of tubers of good quality than others. Broadly speaking, the most suitable situations are those of fairly high elevation, with a natural drainage, and land also of a moderately dry character and of a chalky nature. Light sandy loam is also good for potatoes. Nevertheless, by adopting special means good results may be obtained even on soil which is less suitable and of a stubborn nature. It is essential that the plots be well drained, and the land turned up to a good depth by trenching or bastard trenching during the winter months, and wherever the soil is destitute of lime a good quantity should be strewn over the surface after the work is completed. Burnt garden refuse is also a useful addition, applied in the same way. Leave the ground in this condition until the time arrives for planting the sets.

### Preparation of the Tubers.

It is of the utmost importance that the seed tubers should be properly prepared by selecting medium-sized sets at this season of the year, and laying them out thinly in a frost-proof, fairly light building. This prevents that waste of growth which is bound to occur if the tubers are left in the clamps for a further period.

Change of seed is another matter in the cultivation of the potato which ought not to be overlooked, as it has been proved over and over again that fresh supplies from quite another district amply repay for their extra cost. Both Irish and Scotch grown sets are generally preferred here, and prove to be the best for most English counties; on our heavy land we have made many experiments in this way, and I do not hesitate to recommend purchasing seeds from one or other of the countries named.

### Planting.

Much will depend upon the locality in which one resides as to when planting is to begin, but, speaking generally, from the middle of March to the middle of April is the best time, and, if possible, the work should be carried out when the ground is in a fairly dry and workable condition.

More potatoes are ruined through overcrowding than from any other cause. It is simply a waste of seed and time to plant too thickly, and particularly so with varieties which make a lot of growth, as in wet seasons sun and air are practically excluded, and disease is almost certain to put in an early appearance, and ruin a great portion of the crop. From 2ft. 6in. to 3ft. should be allowed between the rows, and twenty to twenty-four inches between the sets. It is a capital plan after the trench is opened to place a little long stable litter or well-decayed leaf-soil in the bottom, and, after the tubers are placed thereon, add a slight covering of the same material before placing the excavated soil over them. Nothing further will need to be done until the young growth makes its appearance above the soil. If late frosts are likely to occur the growths should be covered over with a little fine soil during the afternoons, as it is well to remember that when the growths are injured by frost, even ever so little, they never give the same results as when unaffected.

Before earthing up the ground should be flat-hoed between the plants and rows three times, if possible, as this has a stimulating effect, and keeps weeds in check. When about from three to four inches in height the growths should be carefully moulded up with a draw-hoe, at the same time taking care to finely break up any lumps of soil. A dressing of soot at this period will be found of much assistance.

POTATO DOBBIE'S PROLIFIC.
A handsome and productive maincrop variety introduced by Messrs. Dobbie and Co., Edinburgh, which received an Award of Merit from the Royal Horticultural Society, September 26, 1911.

### Lifting and Storing.

I am strongly in favour of lifting the crop immediately the tubers are matured, as by so doing I am fully convinced many of the tubers are saved from the ravages of disease. Many cultivators hold the opinion that unless the tubers are thoroughly ripened their keeping qualities will be much impaired, but this is quite a mistaken idea, and practically no waste takes place, and the quality is none the worse. Last season, fearing a spell of wet after the long dry time, we lifted the whole of our main crop before the beginning of September, and the quality is everything that can be desired, with practically no disease. The best means of keeping potatoes is to clamp them in the ordinary way, making sure that plenty of ventilation is afforded them to prevent overheating, and a small quantity of slaked lime should be placed between each layer of potatoes, as this has a sweetening effect, and much improves the quality.

### Varieties.

Every year new varieties are added to the lists, and it is hardly safe to recommend any one variety for general cultivation, as some are especially adapted for certain districts where others are practically a failure. Probably no variety that has been raised has found such a worldwide reputation as that old favourite, Up-to-Date, or selections from it; this is a heavy cropper, of fine appearance, not subject to disease, as many others are, and of first-rate quality. Windsor Castle, wherever it does well, is, in my opinion, the finest maincrop potato for quality yet put on the market. Unfortunately it is very prone to disease, and especially so when left in the ground too long; therefore it should be planted and lifted early. Webbs' New Guardian is a most prolific variety, and one of the best disease resisters that has come under my notice. Dobbie's Prolific, a fine variety that has successfully passed the Royal Horticultural Society's cropping and cooking tests, promises to be a great addition to this section. As a coloured variety King Edward VII. finds much favour among cultivators in many districts. During the past season it did remarkably well, and realised high prices. It is quite the best coloured variety I know for table use, and as an exhibition variety is of much value, and very attractive.

Edwin Beckett.

Aldenham House Gardens.

---

**Potatoes.**—To keep up a succession to those in pots and boxes, pits and frames on hotbeds must be prepared. Prepare a compost of three parts loam, a good quantity of leaf-soil, and burnt garden refuse; place in position a foot in depth, and when about the same heat as the pit, plant prepared sprouted tubers three inches deep at sixteen inches apart, observing a distance of eighteen inches in the lines. Sutton's Ringleader, Gladiator, and Webbs' Express are excellent sorts for frame culture. It is usual to sow a pinch of Early Forcing radish broadcast at the time of planting the potatoes. When tubers of maincrop varieties are stored in clamps, etc., they must be overhauled, placing those intended for seed in a light and airy structure, or much vitality will be wasted through blanched growths. The better plan is to place the seed tubers in boxes "eyes" upwards, packing them thickly in so doing; it is astonishing what a number can be placed in a box treated this way. Place the boxes in the best available position to form strong and short sprouts preparatory to the April planting. A change of seed is recommended strongly.—G. Ellwood.

## POTATO GREAT SCOT.

Potatoes for seed purposes are now receiving a large share of attention from those who are responsible for the maintenance of an abundant supply of tubers throughout the year. Not only is it necessary to give the finishing touches to the preparation of the soil and to prepare the seed tubers of standard varieties for planting, but due consideration has to be given to the question of selecting varieties of promise for trial purposes. As we have frequently stated it is not prudent to replace standard varieties of the potato, as of other vegetables, with novelties until they have been subjected to a thorough test; at the same time we have again and again suggested the desirability of annually making a trial of such novelties as have the promise of proving useful. Hence it was with much interest that we opened the package containing the tubers of Great Scot potato that Mr. J. W. Cross, Old Grammar School, Wisbech, had kindly submitted to us. This variety, which Mr. Cross is introducing this season, is classed with the mid-season potatoes, but evidently it might have a place with those specially adapted for late use, for the appearance of the tubers suggests that they would remain in the best possible condition for some months. It has unquestionably a long period of usefulness, a point of no small importance in a potato that is not less useful for market culture than for home supplies. It is evidently highly productive, for very heavy crops have been recorded. The tubers are of large size, round, shapely, and with distinct netted skin, while the quality is said to be high. The tubers are admirably adapted for baking, and also for boiling in their jackets. Our illustration has been reproduced from one of the tubers that were sent by Mr. Cross.

POTATO GREAT SCOT.

A distinct and remarkably prolific main crop variety, introduced by Mr. J. W. Cross, Wisbech.

# WORK FOR THE WEEK.

◆

### THE ORCHID HOUSES.

EAST INDIAN HOUSE.—Many occupants of this house will now require attention in the way of repotting, as, for instance, ærides, vandas, saccolabiums, and angræcums. The receptacles may be pots, pans, or baskets, the latter being preferable for the smaller growing ærides and saccolabiums. Plants of this class often appear leggy and unsightly through loss of the lower foliage, and if they are in a lanky condition they should be lowered, so that the bottom leaves are just clear of the compost. This operation must be done with great care and judgment, or much injury will follow, and should never be attempted unless it can be done without great root mutilation. Whenever the plants are seen to be pushing new roots, they may have attention as regards new compost. I find them succeed in equal parts of living sphagnum moss and clean polypodium fibre. I do not favour top-dressing at any time. The pots and pans must be well drained, with clean crocks, and the compost finished off with a surfacing of sphagnum moss. After the plants have been dealt with, water must be given with discretion, taking care the compost gets thoroughly dry between each application. Ærides Fieldingi, A. crassifolium, and A. odoratum require a shady position in the warm cattleya house; other kinds succeed best in the warm house.

ANGRÆCUMS. — Many of these are fast developing their flower spikes, amongst which may be mentioned A. Sanderianum, A. Ellisi, A. Leoniæ, and others. A. Sanderianum I find always succeeds better on the stage than when suspended. Any repotting necessary should be delayed until the flowering period is over. The plants should still receive water in moderation. The small-growing section does best grown in shallow pans; the larger growing ones, such as A. sesquipedale, A. eburneum, and A. Veitchi, should be grown in pots. A compost such as used for ærides will answer their requirements, as also it will for vandas.

VANDAS.—Some of these will require attention, notably V. Sanderiana, V. Roxburghi, V. insignis, V. Parishi, and V. lamellata, baskets suiting their requirements, especially if they are large for ordinary orchid pans. They should be suspended in a humid part of the house, and position is everything, as they will thrive luxuriantly in one part of the house, and fail absolutely in another. A plant that fails to grow satisfactorily should never be allowed to remain long in one position. V. gigantea and V. Batemaniana require pot culture, being strong growing species; afford them a light position and a moderate supply of water until the growing season is more advanced. V. tricolor and V. suavis delight in the temperature of the warm intermediate house. V. cœrulea, one of the most delightful of orchids, succeeds under somewhat cooler treatment than those previously mentioned; and, above all, must have pure atmosphere. Plants that have been kept cool and dry since they flowered, and are now emitting new roots, should have attention. I find they succeed in ordinary flower pots, and are best grown in the intermediate house, where they receive a plentiful supply of fresh air, light, and moisture when in full growth.

TEMPERATURE.—The temperature in the various departments may now be slightly increased with advantage from the figures given in January; an all-round increase of 4 degrees may be allowed both by night and day. With the increase of temperature, it follows that the atmospheric conditions should gradually become more conducive to new growth. The amount of water afforded may be increased without fear of injury, and damping down may be done more frequently; but a moist atmosphere together with a low temperature must be avoided. Also avoid urging the plants unduly into active growth by using over much heat and moisture, but rather allow them to grow in their own natural way. Take advantage of mild weather and bright days to give more air than hitherto, being careful that no draughts are admitted.—J. T. BARKER, The West Hill Gardens.

## STOVE PLANTS.

EUCHARIS GRANDIFLORA. — Under good cultivation this bulbous plant produces three or four crops of fragrant blossoms in the course of the year. As is well known, eucharis revel in plenty of heat and moisture both at the root and overhead, therefore a heated pit or house should be devoted to them entirely. This is one of the few plants grown in our stoves that does not need an entire rest at any time of the year. Our plants luxuriate in a rather deep brick pit, heated by one 4-inch pipe running round it. The last crop of flowers was cut about mid-December, and the plants have since made good growth. We shall now keep them somewhat quiet until flower scapes appear, and then give a higher temperature accompanied by increased moisture, and frequent applications of liquid farmyard manure. Eucharis resent disturbance at the roots, and until the pots are becoming overcrowded with bulbs no repotting should be done, merely applying a top-dressing occasionally, and using a compost of loamy soil, leaf-mould, dried cow manure, and a sprinkling of sand and bone-meal.

GARDENIAS.—Plants that have been rested after yielding a crop of fragrant, pure white flowers last autumn should now be cut down, and the old ball of soil reduced; then repot in a compost consisting of two parts fibrous loam, one of peat, and one of dried cow or sheep manure, adding sufficient sand and charcoal to keep the soil open. Gardenias are gross feeders, and respond well to liberal treatment. Where large numbers of these flowers are in demand, and space is at command, I advise planting them out in a restricted border in a house or pit, and tying the growths to wires stretched six or eight inches from the roof-glass. Should mealy bug or other insects attack them, syringe heavily with paraffin, used in the proportion of a wineglassful to each gallon of clear rain-water. Keep the mixture well stirred during application. When the flower buds are observed the young shoots produced at the side of it must be pinched out, in order to concentrate the whole energy of the plant on the development of blooms. If this is neglected the buds become yellow and drop.

SHADING.—It is now time to fix the blinds or other shading to the houses. In all cases where possible this should be movable, and not painted upon the roof-glass, for during dull weather shade is harmful to the plants. Except in the case of the propagating house containing cuttings and tender seedlings, the blinds will only need to be let down for three or four hours in the middle of the day, and then only in very sunny weather.

GENERAL WORK.—Push on with the work of repotting, or top-dressing, and encourage new root action as much as possible by maintaining the proper temperature and humidity. Attend closely to pricking off and potting seedlings as soon as large enough to handle, so that they receive no check. A few days lost in this respect now cannot well be made good afterwards. The man on duty in the evening should keep a watchful eye open for slugs, etc. It is seldom these can be located except in the evening.—H. T. MARTIN, Warren Wood Gardens.

## THE FLOWER GARDEN.

THE ROCK GARDEN should be examined, and any of the strong-growing plants, like arabis and aubretia, that need restriction round the edges should have attention. Hardy alpines that have been wintered in cold frames may be planted out at the first favourable opportunity. Lightly stir up the vacant soil between the plants with a hand fork, and apply a top-dressing of a light compost, with which a little bone-meal should be mixed. Those species that are lime-loving subjects will benefit by having some old mortar rubble mixed with the soil. Keep a sharp look-out for slugs or they will do considerable damage.

PROPAGATION. — Cuttings of various tender bedding plants that it is necessary to increase will root readily now, if inserted in shallow boxes or pots filled with a light sandy compost. Give them a good watering in with tepid water, place in a fairly warm structure, and shade lightly from bright sunshine until they are rooted. Heliotropes and fuchsias growing in 60-sized pots will need shifting into 48's to make good specimens by bedding out time. Grow them near the glass to promote sturdy growth, and ventilate carefully when cold winds prevail.

STANDARD BEDDING PLANTS.—Those that have been kept from last year for use as dot plants in the bedding scheme must now be gently started into growth by placing them in a house with a temperature of about 55 deg. Spray them over frequently during bright weather, but give water at the root sparingly until growth is advanced. Any pruning required, such as shortening back the long, straggling shoots, can be attended to now. Young plants that are being cultivated to form standards must be given every encouragement, and be grown on single stems until the required height is reached, when the lead should be pinched out to induce the formation of bushy heads.

CLIMBERS.—Those growing on pergolas, arbours, or poles will now need pruning and training, and in doing this work care must be taken to retain a sufficiency of the growths on which the various species produce their flowers. Clematis Jackmani should be pruned fairly close, as it flowers on the young growths late in the summer. C. montana and its varieties flower on last season's wood, so all that is needed is a careful thinning of the growths. The various species of vitis may be pruned according to the amount of space at their disposal; they look very charming when allowed to ramble over forest trees in the wild garden. Loniceras and wistarias do not need much shortening back, an occasional thinning of their growths being all that is necessary. Choisya ternata, Chimonanthus fragrans, and Bignonia radicans grow well against walls in a sheltered position. The lovely orange-coloured flowers of the latter are very charming in September. Pergolas and arbours should be examined, and any decayed woodwork be repaired before the climbers commence growth.—J. GARDNER, Batsford Park Gardens.

## FRUITS UNDER GLASS.

YOUNG POT VINES. — "Eyes" which were placed in 3in. pots early in January will have made sufficient growth to be shifted into 5in. pots; use a compost of loam and leaf-mould, with a little lime rubble added; make this moderately firm, place a neat stake to each plant, and place them near the glass, so that they may receive as much light as possible. The temperature of the house should at all times be kept at 70 degrees with fire-heat, allowing a rise to between 80 to 90 degrees with sun heat; air should be admitted on all favourable occasions; close the house early in the afternoon, thoroughly syringing the plants and damping down the walls and paths of the house at the same time. The plants will soon respond to this treatment, and grow rapidly, and when the pots are filled with roots a shift should be given into 8in. pots. These latter must be clean and well-drained; ram the soil firmly as the work of potting proceeds. The compost for this and the final potting should consist of three barrow-loads of good fibrous loam, one barrowful of leaf-mould, half a barrowful each of lime rubbish and well-pulverised cow manure (rubbed through a fine sieve), and a 10in. potful of some approved vine manure. Water the plants carefully, until the roots have permeated the new soil, and place longer stakes to the plants, to which they should be carefully tied as required.

FINAL POTTING.—After this treatment the young vines will grow away vigorously from now onwards, and in a few weeks' time they will be ready to shift into 11in. or 12in. pots; again ram the soil firmly to within 3in. of the top. They must then be placed where they are to remain to grow for the season, which should be close to the front lights; stakes sufficiently long will be required to reach from the top of the pot to the first wire of the trellis, and the vines should be allowed to grow unchecked until they are about 13ft. to 14ft. in length. Remove all tendrils, and pinch the laterals and sub-laterals to one leaf. It is surprising the large quantities of water well-rooted vines require during the summer months, and it is often necessary, during hot weather, to water them three and four times a day. Liquid manure should be given, and some approved vine manure three or four times a week, to accelerate the development of good, strong, short-jointed canes. Towards the latter end of August, the vines will have finished growing, and should be removed to their outside quarters, fully exposed to the sun and air, to thoroughly ripen the canes.

FIGS.—Whether grown in pots or planted out, abundance of water should be given to the roots of figs as growth advances; maintain a night temperature of from 60 to 65 degrees, attend to the disbudding of the shoots to prevent overcrowding, and stopping the growths should receive careful attention; over-vigorous shoots should be pinched at once, or the young fruits will drop off; remove all suckers immediately, or the ultimate results will be a greater loss of fruits. Syringe the plants when the weather will allow, but guard against having wet foliage at night; maintain a moist, humid atmosphere, and should red spider make its appearance dust the affected parts with flowers of sulphur.—HENRY R. FARMER, Cardiff Castle Gardens.

NATIONAL SWEET PEA SOCIETY. Great Exhibition at Royal Horticultural Hall, Westminster, July 9 and 10. Join now. Minimum Annual Subscription, 5s. Schedule on Application. "Sweet Pea Annual," free to members; 2s., post free, to non-members. "List of Sweet Pea Names," free to new members. CHARLES H. CURTIS, Hon. Sec., Adelaide Road, Brentford, Middlesex.

## Royal Horticultural Society.

### SCIENTIFIC COMMITTEE.

### FEBRUARY 6.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Sir Everard im Thurn, Messrs. J. O'Brien, A. Worsley, G. Massee, W. Hales, A. Rolfe, G. Wilson, W. T. Ledger, A. D. Michael, and F. J. Chittenden (hon. secretary).

ABNORMAL CATTLEYA.—Mr. Manda, of St. Albans, sent a cattleya bearing several flowers, every one of which were abnormal, some much more markedly than others.

CATASETUM RANDI.—Mr. A. Rolfe drew attention to a catasetum shown by Messrs. Charlesworth, which he recognised as Catasetum Randi, Rolfe ("Bot. Mag., t. 7,470, where both male and female flowers are shown). This species differs from C. barbatum and its few allies in having the crest of the lip shortly truncate and broken up into many short filaments, not forming a single horn-like tooth. It is a native of the Amazons.

FLORAL DRAWINGS. — Miss Massee showed some excellent coloured drawings of various types of plants, faithfully coloured and showing dissections of the essential parts very clearly.

NEW HIPPEASTRUM. — Mr. Worsley showed a new hippeastrum, for which he proposed the name of Hippeastrum Forgeti in honour of the collector. The bulbs had been received by Messrs. Sander from Monsieur Forget, their collector in Bolivia, and is closely allied to H. pardinum, but without spots. A full description will appear in the society's "Journal."

CHRYSOPHLYCTIS ENDOBIOTICA. — Mr. H. T. Güssow, of the Central Experiment Farm, Ottawa, wrote: "From Mr. Horne's paper on 'Tumour and Canker in the Potato' in the society's last 'Journal' we may conclude that all efforts to secure confirmation as to the identity of the potato disease with Schilberszky's from the discoverer himself were futile, and that 'it is necessary, therefore, to rely upon Schilberszky's original, somewhat meagre description.' Early in 1905 I wrote to Professor Schilberszky, submitting a diseased tuber to him, but received no reply. Again in 1909, when I discovered the disease in Newfoundland, I wrote to Professor Schilberszky, and received a letter from him, which I very carefully kept. The following is a translation: 'Budapest, March 12, 1910. I have the honour to inform you that I have already sent you a little time ago a statement regarding the potato tuber which you sent me. I am now appealed to by Dr. v. Degen to write you again in the same connection. I beg to inform you that the potato tuber was infected by Chrysophlyctis endobiotica. The diseased portions alone made the identification very easy by their external characteristic appearance. I may say that in one of the infected foci I found masses of bacteria, which I have not examined any closer. It would interest me to have your observations on the spread of this disease in your country. (Signed) Prof. Dr. K. Schilberszky.'" In reference to the foregoing, Mr. A. S. Horne wrote: "It is interesting to find that Professor Schilberszky has identified the disease which was recorded by Dr. Güssow, of Newfoundland, as that described by himself in potatoes derived from Upper Hungary. There are two points at issue in Britain, concerned both with the disease and the organism: (1) Professor Schilberszky stated in his published description that crater-like depressions were formed in some tubers. Symptoms of this kind were not found in potato tumour in this country. (2) At first spores of only one kind were found in this country. It is a well-known fact that tumours of a similar form may be caused by different organisms. There was confusion between the tumour in beetroot, caused by Urophlyctes leproides, and potato tumour. It was possible, therefore, that the tumour in the British disease might have been due to a different organism, or perhaps to more than one organism. For these reasons investigators in England desired the personal assurance of Professor Schilberszky that potato tumour was due to his Chrysophlyctis endobiotica.'"

### FEBRUARY 20.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Sir John Llewelyn, Sir Everard im Thurn, Dr. Rendle, Messrs. J. O'Brien, W. Hales, C. Shea, G. Massee, G. Gordon, W. Cuthbertson, and F. J. Chittenden (hon. secretary).

OBERONIA SP.—Mr. J. O'Brien showed a species of oberonia from Uganda. It was referred to Dr. Rendle for examination.

ONCOBA ROUTLEDGEI.—Mr. Shea remarked with reference to seedlings of this plant, that of 17 raised by him from one fruit 15 were spiny and two quite without spines.

CŒLOGYNE VENUSTA.—Sir Frederick Moore sent an inflorescence of this interesting species from Glasnevin. It is a native of Yunnan. On the motion of Mr. O'Brien, seconded by Mr. Shea, it was unanimously resolved to recommend the award of a Botanical Certificate.

VIOLETS WITH BRANCHED PEDUNCLES.—Miss Dalton sent from Sway, Hants, a number of violets bearing branched peduncles, and apparently more or less fasciated. They had been cultivated in the ordinary way, but in some two or three double flowers were produced at the apex of the common peduncle; in others the peduncles separated lower down. Several examples of a similar nature have been sent to the committee during the present season from widely-separated localities, otherwise it appears that violets are but rarely fasciated.

NEW ORANGE.—Mr. H. S. Rivers sent a variety of orange newly introduced, known as "Ooushin," "Satsuma," and "Kü Seedless." It is a Japanese variety somewhat like a Mandarin. The somewhat flat fruits shown were from maidens, and the variety is said to be almost hardy, ripening its fruit very early. The skin is thin and deep yellow; the flesh juicy, sweet, and well-flavoured; quite seedless. One of the calyx lobes in one fruit was somewhat foliose, an unusual character in the orange.

PYRONIA ×.—Messrs. J. Veitch sent a fruit raised from quince × pear, "Bergamotte Esperen." A fruit from this cross has already been shown under the name Pyronia × "John Seden." The present example was borne on a second seedling from the same parent fruit. It was highly aromatic, and much more rounded than the fruit previously shown. The flesh was firm and cream in colour, the eye sunken and the cells open, one containing an apparently well-developed seed.

DISEASED TULIPS.—Messrs. Lowe and Shawyer sent some tulips having poorly-developed and brown blotched leaves, the vascular tissue being marked with brownish streaks. They were referred to Mr. Massee for further examination.

FUMIGATION WITH HYDROCYANIC ACID GAS.—Mr. Hales referred to same results obtained at Chelsea Physic Garden lately in fumigating with hydrocyanic acid gas. The fumigation had been done on a very dull day, and the house had not been damped down for two days previous to the operation. The fumigation was with material of ordinary strength, but it had failed to destroy all the mealy bug, and had caused considerable injury to many plants, especially those with somewhat succulent leaves, such as clivias.

## North of Scotland Horticultural and Arboricultural Society.

"Sweet Pea Cultivation" was the subject of a most instructive lecture delivered to the members of this association in the Botany Classroom, Marischal College, Aberdeen, on Wednesday evening, 21st inst., by Mr. John Grigor, head gardener, Seapark, Forres, Elginshire. There was an exceedingly large attendance, and Mr. John McKinnon, Haddo House, president, occupied the chair. In introducing the lecturer, the Chairman referred to the very prominent place Mr. Grigor had occupied in sweet pea culture during last season, he having carried off the chief prizes at the leading horticultural exhibitions in Scotland.

Mr. Grigor, having thanked the meeting for his kind reception, said his own experience was that a great deal of success in sweet pea cultivation lay in the preparation of the trenches, because if the soil were not properly prepared, one need never expect good exhibition blooms. Light, sandy soil suited the sweet pea very well, although it might remain longer in bloom in a heavy soil. It was essential to secure fresh soil or turf each year to fill the trenches, the turf being stacked for a month or two before use. Some growers dug out their trenches to a depth of five or six feet, and others to a depth of three feet. For his own part, he did not think anything was to be gained by deep trenching. He spoke from experience, and he favoured eighteen inches deep and eighteen inches wide. The lecturer then referred to the preparation of the soil used in filling the trenches, and said the composition he most favoured, and which he had found highly successful, was two parts fibrous soil, one part each of sand and old manure from mushroom beds, with a few handfuls of charcoal. The best time for sowing seed for exhibition purposes was early spring. They could either sow in pots or boxes, but he favoured the latter method, as in his experience he always obtained stronger plants from seeds sown in boxes. By the second week in March he had his peas transferred to a cold frame. The first week in April he found was the most favourable time to start planting.

Mr. Grigor then proceeded to deal with planting, staking, and feeding and watering, putting emphasis on the last two as points of great importance if real success were to be achieved. Mr. Grigor concluded his greatly appreciated lecture by stating that, under the method of cultivation he had described, his plants had always been healthy and free from disease.

Warm encomuims on the lecture were passed by Mr. Alexander Robson, vice-president, Mr. C. S. France, and others, and Mr. Grigor was heartily thanked for his very interesting and educative lecture.

Thereafter, the secretary, Mr. William Reid, read a paper by Mr. Clark, King's College Observatory, Aberdeen, entitled, "Meteorological Notes for the Year, and Lessons from the Drought of 1911." Mr. Clark treated his subject in a manner which indicated how thoroughly conversant he was with it, and characterised last summer as one of the brightest, warmest, and driest seasons on record, the mean temperature exceeding the usual average. The hearty thanks of the society were ordered to be conveyed to Mr. Clark for his interesting contribution.

A large number of new members were enrolled, and a most instructive evening closed with the usual votes of thanks to the chairman.

### Reading Gardeners' Association.

At the fortnightly meeting, held in the Abbey Hall, on Monday, Mr. F. G. Drew (chairman of committee) presided over an excellent attendance of members. The lecturer for the evening was Mr. F. Barnes, from the University College Gardens, his subject being "The Production of Early Vegetables and Salads."

Mr. Barnes, who is to be congratulated on a very able maiden effort in the rôle of lecturer, handled his subject with considerable ability, giving at the outset full information respecting the construction and upkeep of beds so as to ensure a proper conservation of heat. He passed on to the cultural details necessary to secure early and continuous crops of vegetables amenable to forcing, such as potatoes, carrots, turnips, beetroot, radishes, cauliflowers, rhubarb, asparagus, sea kale, peas, and beans. In dealing with early "saladings," lucid instructions were given as to the best methods of producing a supply of cucumbers, tomatoes, radishes, lettuces, dandelion, and chicory. At the conclusion of the lecture an instructive discussion took place, bringing out the experiences of the prominent vegetable growers among the members. Mr. Barnes was the recipient of a hearty vote of thanks.

Numerous really excellent exhibits were staged. Groups of Lachenalia luteola and cineraria (scarlet) by Mr. H. C. Loader, head gardener to Mr. M. H. F. Sutton, Erleigh Park, and a basket of sea kale, "Ivory White," by Mr. J. Wynne, head gardener to Mr. H. R. Beeton, Checkenden, were awarded the Association's certificate for cultural skill. Mr. E. Parker, Waltham St. Lawrence, was highly commended for his exhibit of apples. From the vice-president's gardens at Hillside (Mr. F. Townsend) came a fine collection of forced hyacinths and tulips; from Mr. J. Walker, Bear Wood Gardens (Mr. W. Barnes) branches of Berberis nepalensis, in bloom; while from the University College Gardens an exhibit of forced vegetables, lettuce (in pots), chicory, rhubarb, etc., illustrative of the lecture, was staged. Two new members were elected.

### Broughty Ferry Horticultural Association.

The ordinary monthly meeting was held under the presidency of Mr. James Bethel on February 20, when "A General Treatise on Forestry" formed the subject of an admirable lecture delivered to a large audience by Mr. Alexander Campbell, head forester, Strathmartine. In a practical and able manner, Mr. Campbell assumed a commission to plant the southern slopes of the Sidlaw Hills lying around "Craigoul." The project was undertaken as a paying concern, and from the draining of the ground and planting the young two-year seedlings, until the second harvest of "pit props" was removed, every detail in cultivation and management was lucidly dealt with. Larch, Douglas pine, and plane were the most remunerative timber trees for the district, and ought to be the leading features in new plantations where remunerative returns were expected. Quoting from prices obtained, his own records for plane and beech were 2s. 4½d. and 2s. per cubic foot respectively. After satisfactorily answering a number of questions put by members, Mr. Campbell was cordially thanked for his highly instructive and interesting lecture. The exhibits consisted of two dishes of Bramley's Seedling apples and a seedling from the Newtown Pippin, from Mr. John Machar, Pothrington Gardens; one vase of Primula obconica and one of Primula sinensis stellata, from Mr. Grant, Fernhall Gardens; one vase of Chrysanthemum Queen of the Exe, from Mr. Wm. Brown, Cambustay Gardens; and a pigmy Japanese tree, upwards of 100 years old, from Mr. James Slater, Panmure Villa Gardens; and two specimens of Dracæna Bruanti variegata, from Messrs. D. and W. Croll, Dalhousie Nurseries.

In accordance with arrangements made at the general meeting, the members present decided the merits of each exhibit by ballot, and the result was that the exhibit of Mr. Grant received the highest number of votes, and was entitled to the prize for the meeting. All the others followed in point of merit as named above, excluding the apples which did not come within the scope of the regulations.

### Basingstoke Gardeners' Mutual Association.

The fortnightly meeting of the members was held in the Town Hall on Monday evening, February 26, when an interesting lecture on winter-flowering begonias (other than Lorraines) was given by Mr. Cleed, the county instructor in horticulture. A feature of the meeting was a splendid exhibit of apples, remarkable for colour and finish, including well-known dessert and culinary varieties, Cox's Orange Pippin and Beauty of Kent being in excellent condition. This exhibit was staged by Mr. Learmonth, of Sherfield Manor Gardens. The fruit was backed up with some excellent amaryllis, carnation blooms, and euphorbia. A vote of thanks was accorded Mr. Learmonth, and also one to the lecturer.

### Weybridge Horticultural Society.

This society held its recent monthly meeting at the Village Hall, Sir Herbert Ellis (president) presiding. The lecturer was Mr. Smith, of the R.H.S. Gardens, Wisley, and his subject was "The Cultivation of the Vine." In a most practical manner he explained the different operations of pruning, thinning, stopping, formation of the border, planting, ventilating, and damping down. Mr. Smith paid special attention to ventilation, as he said he considered it one of the chief items in grape growing; he advised ventilating a little at a time, not reducing the temperature, but allowing it to rise steadily with the extra ventilation. Another item of special mention was the formation of the border. He considered 3ft. deep and 15ft. wide inside ample.

There was a good discussion, and a hearty vote of thanks to the lecturer concluded the meeting, at which some forty members were present, and a dozen new members were elected.

There were some splendid exhibits of cyclamens, lachenalias, primulas, Calanthe Veitchi, apples, and leeks.

## GOLD-LACED POLYANTHUSES

There is a revival in Lancashire in the cultivation of these flowers, and many good seedlings have been raised of late years. It is, however, a very sad fact that many old and good varieties are now extinct so far as the growers who exhibit are concerned, and as some of the old varieties were better than anything now existing, and as some of them may still be grown in gardens that one knows not of, I ask your readers to let me know if they can given any information as to the existence of Bullock's Lancer, Cox's Prince Regent, Maud's Beauty of England, Hufton's Lord Lincoln, Addis' Kingfisher, or any other old named variety. The old varieties that we still have are Saunder's Cheshire Favourite, Crownshaw's Exile, Buck's George IV., and Sir Sydney Smith. I have been emboldened to make this enquiry because recently a florist brought me a bloom of Nicholson's King, an old-time flower, the existence of which at the present time I had no knowledge of. Other old flowers may be surviving somewhat, and any genuine information about them will be gladly received. I use the word "genuine" advisedly, as a certain enthusiastic florist friend of mine was, a few years ago, supplied with common cowslips and primroses from an enterprising floricultural fraud. There is nothing more beautiful than cowslips and primroses, but even the most ardent florist feels disappointed when they appear instead of the rare, if not extinct, Bullock's Lancer.

James W. Bentley,
Late Hon. Sec. Northern Auricula Society.
Stakehill, Castleton, Manchester.

## TESTED SEEDS.

Time was when seedsmen sold "seeds," and sometimes those seeds, if record be true, were as uncertain of age as the dealers' eggs that were labelled "eggs," as distinct from fresh eggs and new-laid eggs. To-day, however, the gardener demands, and gets, seeds that are both cleaned and tested, which means that the risk of failure and disappointment with the resulting crops is reduced to a minimum.

Cleaning and testing is a huge task in a large seed warehouse, involving heavy outlay in elaborate machinery and labour. An insight into this interesting and highly important part of the seedsman's work was afforded on the occasion of a recent visit to the new and up-to-date establishment which Messrs. James Carter and Co. opened about a year ago at Raynes Park, S.W. A review of these splendidly equipped premises was published in the Gardeners' Magazine last year; but important additions have been made since that time, in the direction of more storage room to enable the firm to cope with their ever-increasing trade, new, and still more effective cleaning machines, and a every respect a model of what such a laboratory. It was the latter that occupied most of our attention on this occasion, it being in every respect a model of what such a laboratory should be. To the student, interested solely from the scientific standpoint, here is sufficient to absorb attention for hours, for one may examine minute seeds through powerful microscopes that will reveal the slightest deformity, or may study remarkable photographs portraying seeds in various stages of germination, and inspect an apparatus for pulping mangolds for the purpose of discovering by analysis the percentage of sugar contained.

To the practical gardener and progressive farmer the feature of more direct importance is the actual process of testing the germinating power of the seeds. For this purpose the laboratory contains a number of cases which are of Messrs. J. Carter and Co.'s own design, and constructed somewhat on the lines of an incubator, with a water tank, fitted with gas lamp, and a number of trays upon which the samples of seeds are placed, the small seeds on paper dascs, and larger seeds, such as peas and beans, on squares of thick felt. The cases are glazed, enabling an even degree of warmth and moisture to be maintained. Under these conditions germination takes place in a very short time, and with great care and precision a record is entered in the stock books of the percentage of every stock of seeds in the warehouse. Thus it becomes possible to ensure that every packet of flower seed, or every sack of barley, clover or swede seeds, shall be of satisfactory germinating power.

The testing for type and strain has, of course, to be carried out in the trial grounds, and this again is a task that involves an immense amount of labour, and extreme care and judgment.

Before leaving, we made a tour of the well-arranged dining-rooms and kitchens which the firm have provided for the use of their extensive staff of employees. The dining-rooms are four in number, accommodating from 150 to 160 at each midday meal, and there are about an equal number of employees who, living in the village, go home to their meals. It is very evident from what we saw that Messrs. J. Carter and Co. study the comfort of their employees, and doubtless it is largely due to this that the work of this large and busy hive of industry goes on smoothly and pleasantly, everyone taking a lively interest in his or her appointed task.

"Carnations, Picotees, and Pinks" will tell you plainly how to grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

# A DISEASE OF SWEET PEAS, ETC.

We take the following account of Mr. G. Massee's important investigations of the "streak" disease in sweet peas from the "Kew Bulletin":

A disease attacking asters, sweet peas, and various other cultivated plants, more especially during the seedling stage, caused by a minute parasitic fungus, Thielavia basicola, Zopf, has become so prevalent during recent years, that in some localities their cultivation has been practically abandoned. The receipt at Kew of a considerable amount of diseased material in a condition favourable for investigation has led to the discovery of the cause of the disease, and also of measures whereby the danger can be prevented.

## Morphology, Etc.

The several very dissimilar forms constituting the life-cycle of Thielavia basicola, Zopf, has led to much complication and synonymy.

The mycelium first produced as the result of infection, permeates the tissues and remains slender and colourless. As a rule, the host shows decided signs of injury, or is killed outright before the fungus commences to produce its fruit on the surface of the injured portions. When this stage has been reached, if conditions are favourable, branches of the mycelium grow outwards and cover the surface of the diseased part with a plexus of mycelial branches, which soon give origin to the first or Milowia form of fruit, which consists of simple or branched, upright, septate branches, becoming gradually narrowed upwards, and remaining perfectly colourless. In due course the apical portion of each erect branch becomes ruptured, and the contents grow out through the torn apex as a chain of spores which readily separate from each other, and germinate at once. This form of fruit is very ephemeral, and is rarely seen in the field, although in pure cultures it forms a snow-white, mould-like stratum. It alone is responsible for the spread of the fungus in the form of an epidemic during the early stage of growth of the host-plant, but it does not appear to be capable of infecting the root of a mature plant. The sports retain their power of germination for a very limited period of time, not more than one month so far as my experience goes. I first met with this stage of Thielavia forming a delicate white mould at the base of a dying plant of Blysmus compressus, and at the time considered it as an entity and worthy of generic rank, and published it as Milowia nivea. Saccardo afterwards placed Milowia as the type of a new tribe of the Hyphomycetes which he established under the name of Milowieæ. The spores or conidia are somewhat variable in size, thin-walled, cylindrical with truncate ends, and average 15-25 × 4-6.

As the Milowia stage of fruit disappears, the mycelium developed externally on the host, becomes tinged brown, and gives origin to a second or Torula form of fruit. In fact, the Milowia and Torula stages may sometimes be met with on the same branch of mycelium; in such instances the Torula or second phase of the fungus always occupies the youngest or apical portion of the mycelial branch. The Torula spores are comparatively quite large, clavate and multiseptate, at first thin-walled and colourless, but gradually changing to a dark brown and eventually becoming quite opaque. The cell-walls also increase considerably in thickness during the growth of the spore. When the spores are mature they break up into their component cells, which resemble discs of varying thickness, and are circular, or more or less obtusely polygonal, in outline. These detached cells or chlamydospores cannot be induced to germinate at the moment of maturity, but do so readily after remaining in a passive condition for some months. This phase of the fungus is usually the only one observed, unless special watch is kept, being rendered conspicuous by the copious production of spores, which often form black, crust-like patches on the diseased root and collar of the host-plant. The spores vary considerably in size, and may be straight or curved, average size 40-65 × 12-20 at the widest part near the apex. This stage of Thielavia was first observed, in 1850, by Berkeley and Broome, who considered it as a member of the genus Torula, and described it as T. basicola. It was found at the base of stems of peas, and of nemophila. Respecting its propensities, the authors wrote as follows: "It is either destructive of the plant on which it grows, or is developed on it in consequence of previous disease." From an economic standpoint, this is the most dangerous phase of the fungus, as the resting spores enable the parasite to tide over that portion of the year when its host-plants, which are mostly annuals, are not in active growth. These resting spores germinate readily on dung, and produce the Milowia and Torula forms of fruit on this matrix; in fact, the fungus appears invariably to commence life as a saprophyte, and when conditions are favourable, as expressed by the presence of rootlets of seedlings, it assumes a parasitic habit; otherwise it can pass through all the phases of its life-cycle as a saprophyte. In fact, the fungus at best is but a very imperfect parasite, the vegetative mycelium first resulting from the germination of the sports being alone parasitic, but its action is sufficient to cripple, if not completely to kill, the host. The various forms of fruit are then produced externally on the host, which it has previously killed. I have repeatedly observed the Torula follow the Milowia stage, when the fungus was growing on pea seedlings infected with diseased portions of plants killed by the fungus, and have also observed the same sequence when a pure culture of Milowia spores was used.

## Distribution.

The fungus was first observed by Berkeley in England in 1850. It has also been recorded from France, Germany, Italy, Russia, the United States, and Cuba. It has proved to be very destructive to cultivated crops in Italy, Germany, and the United States, and is probably much more widely distributed in the soil than is generally suspected.

Now that a simple and certain method for determining its presence has been discovered we are in a position to anticipate it and to act accordingly, as the means necessary for its arrest are practical, inexpensive, and effective.

In England its distribution is certainly widespread; seedling asters and sweet peas, more especially, have been received at Kew in large quantities from practically every part of the country; many weeds also suffer from its presence. Excluding trees and woody plants, the fungus appears to be practically omnivorous.

It has been recorded as parasitic on plants belonging to the following genera: Apium, Aralia, Aster, Begonia, Beta, Blysmus, Cochlearia, Cyclamen, Daucus, Lathyrus, Lupinus, Cypripedium, Nemophila, Nicotiana, Onobrychis, Pisum, Scorzonera, Senecio, Trigonella, Viola. In some instances the injury caused by this fungus assumes serious proportions, and the tobacco crop, both in Europe and in the United States, has suffered to the greatest extent. In this country the disease has assumed the proportions of an epidemic in the case of asters and peas; in fact, during the past few years it has become practically impossible in certain districts to grow asters, the seedlings being destroyed wholesale. Sweet peas also suffer to a very serious extent in many places, and culinary peas to a less extent.

## Cultures of the Fungus.

The conidia of the summer stage (Milowia) germinate freely within twenty-four hours in water. As a rule, only one germ-tube is produced from one end of the conidium. In those instances where two germ-tubes are produced, one from each end of a conidium, one of the germ tubes continues to grow vigorously, the other remaining small and stunted, and eventually dying. The conidia only retain their vitality for about ten days, and no conidium was observed to germinate after it had been liberated for more than a fortnight. Germination is most vigorous immediately after the conidia are liberated, and the percentage of germination decreases daily with the increasing age of the conidia. As compared with a neutral medium, the presence of a slight amount of acidity in the nutrient solution favours germination and the development of mycelium, whereas, on the other hand, a trace of akalinity in the nutritive medium retards germination and subsequent growth of the mycelium. The conidia also germinate freely on moist stable manure, covering the surface within a week with the snow-white tufts of the Milowia stage of the fungus, which is followed by the black masses of conidia forming the Torula stage. The ascigerous condition was not observed. The fact that the fungus can produce its two conidial phases as a pure saprophyte is a point of great importance from an economic standpoint, and suggests the importance of burning all diseased plants, lest they should by any chance find their way to the manure heap, from whence the conidia of the Torula stage of the fungus would eventually be returned to the land in a condition favourable for germination. By such means the widespread occurrence of the fungus may probably be explained.

The chlamydospores resulting from the breaking up of the Torula form of fruit do not germinate until after a period of rest, and serve to tide the fungus over that period when living host-plants are not forthcoming.

Chlamydospores obtained from aster seedlings that had been dried for a year germinated in a very dilute solution of stable manure, at the end of four days, and another batch of chlamydospores obtained from the same source germinated on sterilised stable manure, and produced the Milowia form within a week, followed by the Torula form. Experiments prove that the Milowia conidial form constantly reproduces itself; this takes place so long as climatic conditions are favourable for its development, and the distribution of the fungus in space depends entirely on its Milowia conidial phase.

(To be continued.)

'Four Oaks' Limewashing Machine, "Royal Pattern" £3 18s. 6d.

FOUR OAKS SPRAYING MACHINE CO.,
No. 3G, Sutton Coldfield, Birmingham.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Prior Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

DECAYED BULBS.—A. B., Essex: Would you please tell me what is the cause of failure in the bulbs sent? Both narcissi and tulips are enclosed, and a sample of the soil in which they were grown. I have a large batch, and, with the exception of a stray plant here and there, the bulbs have made no roots whatever. They were potted in October in loam, leaf-soil, old mushroom-bed material, sand, and charcoal. They were covered with burnt earth and transferred to frames when heavy rains came, and then covered with old sawdust. I am entirely at a loss to understand the cause of failure, as in previous years I have had splendid lots of bulbs under exactly the same kind of treatment as accorded this season.—The bulbs sent were decayed at the base. They attempted to make roots, but the roots decayed, and the decay apparently spread inwards. With few exceptions, the bulbs were sound inside. It would appear that they became very wet and remained so, or that white worms, eelworms, and bulb mites, which were all present, brought about the decay. There are considerable numbers of larvæ of two-winged flies which are usually associated with soil either wet or sour, and containing too much organic matter. The use of old soil from a mushroom-bed and leaf-soil would tend to make the compost sour if there was any probability of water standing about it for any length of time.

COUNTY SECRETARIES FOR THE INTERNATIONAL HORTICULTURAL EXHIBITION.—H. S., Lichfield: In a recent issue of the Gardeners' Magazine, it was stated that application forms for cheap tickets of admission to the International Horticultural Exhibition could be obtained from the county secretaries. It would be interesting to know who are the county secretaries, and many, no doubt, like myself, have no information on this point. Perhaps you could obtain and publish a list of the county secretaries for the benefit of your readers.—We have obtained the following list of county secretaries from Mr. E. White, the Hon. Director of the exhibition: Bedfordshire, Mr. Edward Laxton, Bedford; Berkshire, Mr. J. T. Strange, Firlands, Sulhamstead; Bucks, Mr. W. J. James, Woodside, Farnham Royal, Slough; Cambridgeshire, Mr. Rupert Fuller, St. Andrew's Street, Cambridge; Cheshire, Messrs. Dicksons, Lim., Chester; Cornwall, Mr. W. H. Shilson, Trewhiddle, St. Austell; Cumberland and Westmoreland, Mr. H. Britten, Prospect House, Salkeld Dykes, Penrith; Devonshire, Mr. P. C. M. Veitch, Exeter; Derbyshire, Mr. Bailey Wadds, 101, Uttoxeter New Road, Derby; Dorset, Mr. T. Turton, Castle Gardens, Sherborne; Essex, Rev. J. H. Pemberton, Havering, Romford; Gloucestershire, Mr. W. Jefferies, Cirencester; Hampshire, Mr. E. Molyneux, Swanmore Park, Bishops Waltham; Hertfordshire, Mr. A. Graveson, Little Molewood, Hertford; Isle of Wight, Mr. A. Kime, Westhill Gardens, Yarmouth, I. of W.; Kent, Mr. Walter P. Wright, The Grey House, Lyminge; Lancashire, Mr. R. C. Waterman, Woolton, Liverpool; Leicestershire and Rutland, Mr. W. H. Divers, The Gardens, Belvoir Castle, Grantham; Monmouth and Herefordshire, Mr. T. Coomber, The Gardens, The Hendre, Monmouth; Norfolk, Mr. T. H. Cook, The Gardens, Sandringham; Northampton, Mr. F. Perkins, Queen's Parade, Northampton; Northumberland and Durham, Mr. H. J. Chapman, Oakwood, Wylam-on-Tyne; Nottingham, Mr. Jas. Gibson, The Gardens, Welbeck Abbey, Worksop; Shropshire, Rev. J. Jacob, Whitewell Rectory, Whitchurch; Staffordshire, Mr. J. H. Goodacre, The Gardens, Elvaston Castle, Derby; Somerset, Mr. F. W. Cooling, 11, Northgate Street, Bath; Suffolk, Mr. R. C. Notcutt, Woodbridge, and Mr. W. Norton, 71, Guildhall Street, Bury St. Edmunds; Surrey, Mr. Thos. Stevenson, Woburn Place Gardens, Addlestone; Sussex (East), Mr. W. Goaring, Elmdene, Lewes; Sussex (West), Mr. A. R. Harvey, Eastergate, Chichester; Warwickshire, Mr. T. Humphreys, Botanic Gardens, Edgbaston, Birmingham; Wiltshire, Mr. T. Challis, The Gardens, Wilton House, Salisbury; Worcestershire, Mr. W. Crump, Madresfield Court Gardens, Malvern; Yorkshire (East Riding), Mr. H. J. Clayton, Wharfe Bank, Ulleskelf, Yorks; Yorkshire (West Riding), Mr. Jas. Backhouse, Holgate, York; Scotland (East), Mr. J. W. McHattie, Parks Office, Edinburgh; Scotland (West), Mr. Jas. Whitton, City Chambers, Glasgow; Ireland, Sir F. W. Moore, Glasnevin, Dublin; Wales (North), Mr. H. W. McLaren, Belgrave Square, London, and Bodnant, Talycafn, R.S.O.; and Wales (South), Mr. W. W. Pettigrew, Roath Park, Cardiff.

WOOD LICE IN GREENHOUSE.—A. J. B., Cardiff: I should be very much obliged if you could give me some assistance in my efforts to rid two new houses of woodlice. These houses are swarming with the pests, and yet our old houses are fairly free from them. I have scoured the place with carbolic acid, laid Vaporite and quick lime over the floors, and fumigated with six times the usual dose of nicotine; I have also put grease bands on the bottom of each door inside, and laid down a number of freshly-cut potatoes and wads of dry moss as traps, but still the infestation goes on. Can you suggest a remedy?—Beyond fumigation with cyanide, which is a proceeding attended with some danger, there does not seem to be much you have left undone in your battle with woodlice. Woodlice are scavengers, and are usually found where there is decaying vegetable matter; but, unfortunately, they also take toll of juicy shoots, young orchid spikes and peaches. You must discover what the attraction is, and also the chief points of harbourage; lay some dirty boards all over the floor and under the staging, and let these remain for a day or two; on examination the undersides will be found swarming with woodlice, which should be swept into a bucket of very hot brine or carbolic mixture. In any trouble of this kind persistence is the great thing; use any and every kind of trap for a few weeks, and, we doubt not, success will attend your efforts.

GRASS DRESSING.—F. M., Epsom: Please advise me as to dressing a rather poor paddock with some artificial fertiliser.—Without some knowledge of the soil and general conditions, it is not easy to give you useful advice. For present application, a good general fertiliser consists of 5cwts. basic slag, 2½cwts. sulphate of lime, ½cwt. sulphate of iron, and 2½cwts. of common salt per acre. This is excellent for improving the quality of the grass, and also tends to keep down moss.

SUCCESSIONAL CROPS OF VEGETABLES.—J., Hereford: I am anxious to maintain a succession of vegetable crops, and shall be glad of your help in the matter.—In our "Work for the Week" columns we publish a calendar of kitchen garden work and operations each alternate week, and if you follow the instructions given therein you should have no difficulty in maintaining a supply of vegetables. We also publish special articles on the cultivation of special vegetable crops, and as these are from the pens of experienced growers, the information they convey cannot fail to be of the utmost service to you. Keep a book, such as "Vegetables and their Cultivation" (W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C., 5s., post free 5s. 6d.), handy, read the Gardeners' Magazine regularly, use your judgment as to weather, condition of soil, site, etc., and obtain your seeds from one or more of the firms who advertise in our columns. We shall be glad at any time to render any assistance in our power in connection with any special matter.

DISEASED PELARGONIUM LEAVES.—F. M., Epsom: The undersides of pelargonium leaves sent herewith have a rusty appearance, suggestive of red spider, but I cannot trace any signs of the latter pest. Kindly tell me what is the cause of the trouble and the remedy.—The leaves are not in the very best condition, and suggest a too free use of heat and moisture, but the rusty appearance is due to the presence of a mite like the one that causes rust on begonias. Apply tobacco powder by means of one of the little distributors, taking care that the powder is applied so that it reaches well in between the prominent leaf-ribs where these radiate from the leaf-stalk. Renew the application every few days until the pest disappears, and the new leaves come quite clean.

SEEDLING SNOWDROPS.—T. J. N., Kent: Two years ago I sent you a new snowdrop, and asked your opinion of it. The flower was spoilt before it reached you, and you asked for another specimen to be sent the following year. In 1911 I left the matter too late, but now send a couple of flowers, and hope they will reach you safely. Your opinion will greatly oblige.—The flowers arrived in excellent condition, and were remarkably pretty. The equal development of all six segments is very interesting, and a mass of the variety should present a finer appearance than an equal number in which the three inner segments are smaller than the outer ones. It seemed to us that one of the flowers had the faintest possible pink tint, but placed against dead-white paper no colour was evident. The variety is certainly well worth retaining, and an effort should be made to increase the stock.

SPRAYING FRUIT TREES.—Amateur: I sprayed my apple trees during the winter with caustic alkali wash, and would be glad to know if I may spray again with lime.—It is not necessary, or, indeed, desirable, to spray your apple trees with lime. The spraying of the trees with caustic alkali should have been sufficient to clear them of insect pests for which sprays of caustic alkali and lime are used, and it is now too late in the season for such sprays to be used with safety.

## NAMES OF PLANTS.

F. S., Northampton.—Lachenalia Nelsoni.

H. M. T., Jersey.—Muehlenbeckia complexa.

A. W., Poole.—1, Odontoglossum ardentissimum; 2, O. crispum; 3, Cypripedium longifolium; 4, Cattleya labiata.

C. T. G., Leicester.—1, Berries of the Fire Thorn (Cratægus Lelandi); 2, Cineraria maritima; 3, Hoffmannia Ghiesbreghti.

W. S. T., Chester.—1, Helleborus colchicus; 2, Iris histrio; 3, Hamamelis mollis; 4, apparently a leaf of Medinilla magnifica.

F. D., Petworth.—The seedling is a plant of Canterbury Bell. The apple we do not recognise, but will endeavour to have it named for you.

**Cœlogne Cristata** and its varieties are now pushing up their flower spikes, and must not be allowed to suffer from lack of water, or their flowers will be small and lacking in substance. This old but beautiful species is not easy to surpass. After the plants have passed out of bloom, it is desirable that they should be rested for a time, keeping them dry, but not allowing them to shrivel. Should any of the plants, through carrying a very heavy crop of flowers, shrivel, water must not be given them in excess to induce them to become plump again. While in flower, or at rest, a cool position in the intermediate house will suit their requirements.—J. T. Barker.

## Situations Vacant.

**BRITISH GARDENERS' ASSOCIATION.**

The Executive Council are prepared to receive Applications for the post of GENERAL SECRETARY, at a commencing salary of £104 per annum. Candidates must have a general knowledge of the various branches of horticulture, and be competent to Organise and Address Meetings, and devote their whole time to the duties. Age not to exceed 40 years.

For further particulars of the duties and forms of application, which must be returned not later than March 23rd, 1912, apply to Mr. A. E. CRESWELL, 44, Albert Road, Leyton, N.E.

CANADA.—Wanted, several GARDENERS or NURSERYMEN to complete orders. Definite situations. Apply early, UNION TRANSIT COMPANY, 381, Argyle Street, Glasgow.

LAD WANTED, understand Nursery Work; able to serve. Apply, with references, to COLE, 326, Camberwell New Road, London.

NURSERY OFFICE MANAGER, with good knowledge of sales department. Must be fully competent and ready to proceed to Canada in April-May. First-class salary. Address M. F., c/o Street's, 30, Cornhill, E.C.

WANTED, LAWN HAND; must be experienced in herbaceous borders, etc., alternate duty, good Bothy. Apply, stating particulars, JOHN M. HANBURY, West Hatch, Chigwell, Essex.

Per packet 1s. 6d. and 2s. 6d., post free.
Mr. G. Cross, Ardingly, writes:—"Your First Crop Cauliflower has been splendid this season. I started cutting June 19, and have had beautiful compact heads all through this exceptional weather."

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

KELWAY'S MANUAL OF HORTICULTURE is the best of all Garden Books. 2s., post free, from KELWAY and SON, LANGPORT, SOMERSET.
From ———, Esq.,
Northwood,
Middlesex.
28 September, 1911.
"I find that I have never forwarded 2s. for your lovely Catalogue you sent me some weeks since. It would be cheap at five times the price, and I sincerely regret the oversight."

NOW is the time to plant KELWAY'S DELPHINIUMS—fine, bold, upstanding plants, with a wealth of bloom in all shades of blue and purple. They are from strong country-grown stocks, and flourish under almost all conditions.
———, Callander.
"It is gratifying to find that plants raised so far south do so well here, but the climate evidently suits Delphiniums."
Choice named collections, 15s., 24s., 34s., 56s. a dozen.
KELWAY AND SON, The Royal Horticulturists,
Langport, Somerset.

THE MODERN HERBACEOUS BORDER.

Full particulars and prices of Kelway Borders, packed, arranged for planting, to flower in tasteful schemes of colour, from
KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.
———, Esq., Summerland,
British Columbia, Canada.
"The perennial plants, Delphiniums and Pyrethrums, which you sent by post on October 1st last, arrived here on October 26th, and opened up in good condition. The plants apparently were in the best of condition, so should be no apprehension about sending by post."

FIDLER'S NEW ILLUSTRATED CATALOGUE OF CHOICE GARDEN SEEDS will be sent, post free, to any address, on receipt of postcard. Write at once for a copy. It may help you to save 50 per cent. on your seed bill this season. FIDLER and Sons, Royal Berks Seed Stores, Reading.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Parasites.

In the history of the evolution of organic forms of life, both animal and plant, that of the parasites forms certainly one of the most interesting chapters. There are, however, parasites and parasites, some having reached such a degree of degradation that they do nothing for their own living, but exclusively prey upon their hosts, while others help a little. In the familiar plant world these two kinds may be typified by the Dodder and the mistletoe. The former is the relentless bloodsucker which does its very best to deplete its involuntary host of every drain of sap which it has collected for its own benefit and convert it into an intricate labyrinth and network of mere stalks and insignificant flowers, while leaves which, in a properly conducted and self-respecting plant would do some of the vital work, are reduced to mere rudiments. The mistletoe, on the other hand, although still a blood-sucker, does form a bunch of green leaves, and wherever that green is seen in vegetation, it is a sign of some self-supporting work which redeems the "sponge" character to some extent. In defining a parasite as an organism which lives at the expense of another, we must go further both botanically and zoologically by assuming a bodily association and connection, the parasite either living fixed upon or in the host, and in most cases unable to exist without it. In this sense we are invaded and ever pervaded by myriads of parasites, invisible, it may be, but none the less dangerous. The air is full of these germs, and every breath means an inroad of fresh hordes, which certain living bodies (phagocytes) in our blood are constantly engaged in meeting and destroying. With plants there is no such provision in their sap, nor do they need it so much, though they, too, have their battle to fight against invading fungi, ever ready to attack a wounded spot or take advantage of a weakened constitution, due to injudicious treatment or neglect. We have assumed a parasite proper to be fixed to its victim more or less permanently, but it is somewhat hard to draw the line between, say, the dodder and a brood of aphis or greenfly as regards capacities of parasitic suction. The baby dodder no sooner touches a growing plant with its slender fingers than it grips it fast, plunges a series of suckers through its epidermis, and commences to grow apace at its host's expense. The pretty, delicate-winged aphis, floating in the air, drops upon a tender plant, and in like fashion plunges a sucker through the epidermis, and sucks the sap beneath it. Being, however, an insect and not a plant, it is incapable of branching out in all directions and producing flowers and innumerable seeds, but instead it calmly proceeds to multiply itself on such an extreme scale that myriads result in a very short time, each one of which is busy all the time in its congenial parasitic task. In the plant world, however, there are parasites of a still more insidious type, inasmuch as they attach themselves, not openly, like the dodder and mistletoe, to the stems and branches above the ground, but surreptitiously to the root systems beneath it. Two species of this kind, Orobanche and Lathræa, are not uncommon, and often grow and show their inconspicuous flowers in places where their parasitical character is not known until it is attempted to transplant or eradicate them, when their absence of a proper root system betrays them. As regards plants, mere association with them by external attachment by no means implies parasitism. Under very damp and warm forestal conditions we shall find the larger tree trunks and even branches covered with innumerable plants, all growing without any connection with the soil, and therefore apparently dependent upon the tree for board as well as lodging, so to speak, which, however, is not the case. On examination, we shall find that all the roots, fibrous and other, simply travel superficially, and at the most pentrate crevices in the bark without going beneath it. The necessary plant food is supplied by falling leaves and vegetable débris, plus, of course, the liberal supply of humidity which such a habitat affords. It is such homes as these in tropical regions which have given us the bulk of our finest orchids. The giving of lodging, however, even minus board, may be fatal to the host. Many a fine tree has yielded under the fatal embrace of over-assertive ivy, and in the tropics the battle between the immense lianes or vines and the tall trees for a needful share of sunshine is ever drastically waged, the originally slender shoot of the "parasite" in one sense, though not in another, eventually invading a monster of the forest and strangling it in its perfidious embrace after robbing its foliage of theh needful light and air.

MR. J. B. RIDING.

**Mr. J. B. Riding**, of Forest Side, Chingford, has always been closely associated with horticulture, and at fifteen years of age he commenced the serious business of life under his father, who was gardener at Beech Hill Park, Waltham Abbey. Seven years later he went to Poles, near Ware, as foreman, and there stayed about four years, leaving to become manager to Mrs. Chapman's Bluecoat Nurseries, Ware. In 1890 Mr. Riding started business on his own account, and this he continues, chiefly on wholesale lines. Dahlias and chrysanthemums are special favourites, and of these he has a wide and intimate knowledge, and annually raises immense stocks of these popular flowers. He has been chiefly instrumental in bringing the collarette dahlias before the public, and from the first has believed in the future of this section. Mr. Riding is a staunch advocate of dahlias for garden decoration, and in this and other directions his own optimism becomes infectious. He has a seat on both the Executive and Floral Committees of the National Chrysanthemum Society, and is an irrepressible member of the National Dahlia Society's governing body. As a writer for the horticultural Press Mr. Riding has had a long and wide experience, his first article appearing when he was seventeen years of age. To our own pages he is a frequent contributor. Mr. Riding is a capable lecturer on horticultural subjects, and in this connection has acted as assistant lecturer under both the Surrey, Essex, and Kent County Councils, and, as he puts it, has "lectured in all sorts of places, from public-houses to churches." Forcible of speech, of genial temperament, generous to a fault, and a born optimist, Mr. Riding has a wide circle of friends, and deserves every bit of the popularity he enjoys.

**Attempt on the Life of Mr. Leopold de Rothschild.**—The attempt that was made on Monday evening to shoot Mr. Leopold de Rothschild as he was leaving his offices in New Square was a general subject of conversation among horticulturists present at the exhibition of the Royal Horticultural Society on Tuesday; and many were the expressions of gratitude that he should have escaped uninjured. Mr. Leopold de Rothschild is so keen a horticulturist, and so generous a supporter of all that tends to the advance of gardening and of the charities connected therewith, that there is no occasion for surprise that the deplorable occurrence should have evoked the warmest expression of sympathy for him in horticultural as in other circles.

**Frost and Flowers at Leonardslee.**—Mr. W. A. Cook, gardener to Sir Edmund Loder, Bart., Leonardslee, Horsham, writes: "In spite of the 20 degrees of frost experienced recently on the grass, and 16 degrees in the screen, Erica lusitanica is quite uninjured and flowering as freely as ever. Camellia blooms that were expanding were spoilt, but the unopened buds are now expanding well, and in a few days we shall have thousands of blooms out in the open. Narcissus palidus præcox opened its first bloom on February 15; N. minimus is quite gay, and has been for some time. Very little damage appears to have been done by the frost amonst choice trees and shrubs. Daphne japonica is charming on a south wall, and Rhododendron præcox is fast opening its flowers, and will be a fine sight in a few days. R. parviflora has recovered from the frost, and Edgworthia chrysanthia is fast unfolding its blooms.

**Gardeners' Notice to Leave.**—A case of interest to gardeners was heard at the Marylebone County Court a short time since, its importance being accentuated by the fact that the decision of the Judge differed from those that have been given in similar cases. The case, according to the "Journal" of the British Gardeners' Association, was a claim by Mr. Lewenden, a member of the association, for a fortnight's wages, amounting to £3, in lieu of notice. Mr. Lewenden had been head gardener to Mr. Spyer during a period of two years at a wage of 30s. per week, and one day was told that his services were no longer required, no reason being stated, and was given a week's notice. He claimed a month's notice, or wages in lieu thereof. Mr. Spyer gave him another week's wages, and the claim, as stated, was for the balance. In view of the importance of the principle involved the plaintiff was represented by counsel, and the case was argued at some length. In giving judgment Judge Selfe stated that, in his view, the weekly payment of wages was presumption of weekly hiring, and he failed to see that the plaintiff was entitled to a month's notice, or wages in lieu thereof; also that the custom referred to by the plaintiff's witnesses was not sufficiently known to deserve recognition. He accordingly gave a verdict for the defendant. The counsel for the plaintiff asked leave to appeal, but this was refused. In all the cases that have come under our notice the decision has been the other way, and it is, therefore, unfortunate that leave to appeal was refused, because there is now no opportunity of the association obtaining the decision of the Court of Appeal on the question. Leave to appeal is necessary when a contract is in question, and the claim is for a sum less than £20.

**The United Horticultural Benefit and Provident Society** holds its annual meeting at the Royal Horticultural Hall, Westminster, on Monday, March 11, at eight p.m. Mr. C. H. Curtis will preside. The meeting should prove a very interesting one, in view of the changes that must necessarily be made owing to the passing of the National Insurance Bill.

**Botanical Institute for South London.**—The South London Botanical Institute, at 323, Norwood Road, S.E., was informally opened to the public on the evening of February 28 with a lecture on "Folk Lore Connected with Familiar Wild Flowers," by Mr. W. H. Griffin, keeper of the herbarium. The institute, whose collection has been the work of some years, is the gift to South London of Mr. A. O. Hume, C.B., who has been a distinguished Indian Civil Servant, and was for many years Secretary of the Department of Agriculture. Shortly after his retirement and return to England in 1899, Mr. Hume took up the study of botany as a recreation, and the whole of the large collection of dried plants in the institute is wholly due to his exertions. It is hoped that the institute will prove useful to botanical students in South London by providing a centre where specimens, help, and advice are afforded to students and visitors.

**The Coal Strike,** which has engaged so much attention for some time, has become general since the publication of our last issue, and its terrible effects on industries of all kinds is now being felt in all parts of the kingdom. The effects of the strike may not yet have been seriously felt by those engaged in commercial horticulture, but there can be no question as to their being such as to prove disastrous to them should the strike be long continued.

**Messrs. J. Cheal and Sons, Lim.**—Messrs. J. Cheal and Sons, Crawley, have, for family reasons, formed their business into a private company, under the Limited Liability Act. The business was established in 1871, and the nurseries were commenced on ground at Lowfield Heath, on a portion of the common, and had an area of forty-five acres. The land was purchased by the late Mr. John Cheal on the enclosure of the common about sixty years ago. The business has from the first shown steady and continuous progress, and the landscape department has now become an important branch, as the result of the high reputation enjoyed by the firm for the designing and laying out of public and private gardens. The objects of the formation of the company are the facilitating family arrangements, the establishment of the business on a firm basis, and provision for its further growth. The directors are Messrs. Joseph and Alexander Cheal, who, with their late father, founded the business, with Messrs. Ernest and Arthur Cheal, sons of Mr. Joseph Cheal, who have for many years taken an active part in the management, and Mr. Reginald Dann, who has during the past eleven years been connected with the landscape department. We understand that all the ordinary and a portion of the preference shares are held by the directors, and that a few of the latter are being subscribed for by others.

**Crimson Sweet Peas.**—Mr. A. Malcolm, chairman of the National Sweet Pea Society's Floral Committee in 1911, writes: "The Gardeners' Magazine of January 27 was remarkable for the very beautiful illustrations of sweet peas; they were charming. I noticed in Mr. T. Stevenson's article a comparison between Maud Holmes and Dobbie's Sunproof Crimson, the former being favoured. In the struggle for supremacy the last-named gained the unanimous vote of the Floral Committee, when the two were growing side by side. Mr. Stevenson admits there is little to choose between the two. I would like to see varieties of superlative merit, but which fail to secure awards, valued by means of a sliding scale of votes, using seven as a maximum, and three as a minimum; all below the latter would be in a hopeless position."

**Kent Commercial Fruit Show.**—At the recent meeting of the Kent Commercial Fruit Show Association, held at Maidstone, Mr. M. J. R. Dunstan, Principal of Wye College, presiding, it was decided to hold the next show at Maidstone during the last week in October, to throw open the majority of the larger classes to fruit growers in Great Britain, and to introduce several fresh classes, especially for pears. Mr. F. S. W. Cornwallis was elected president, in succession to Lord Northbourne, who was cordially thanked for his services during the past year.

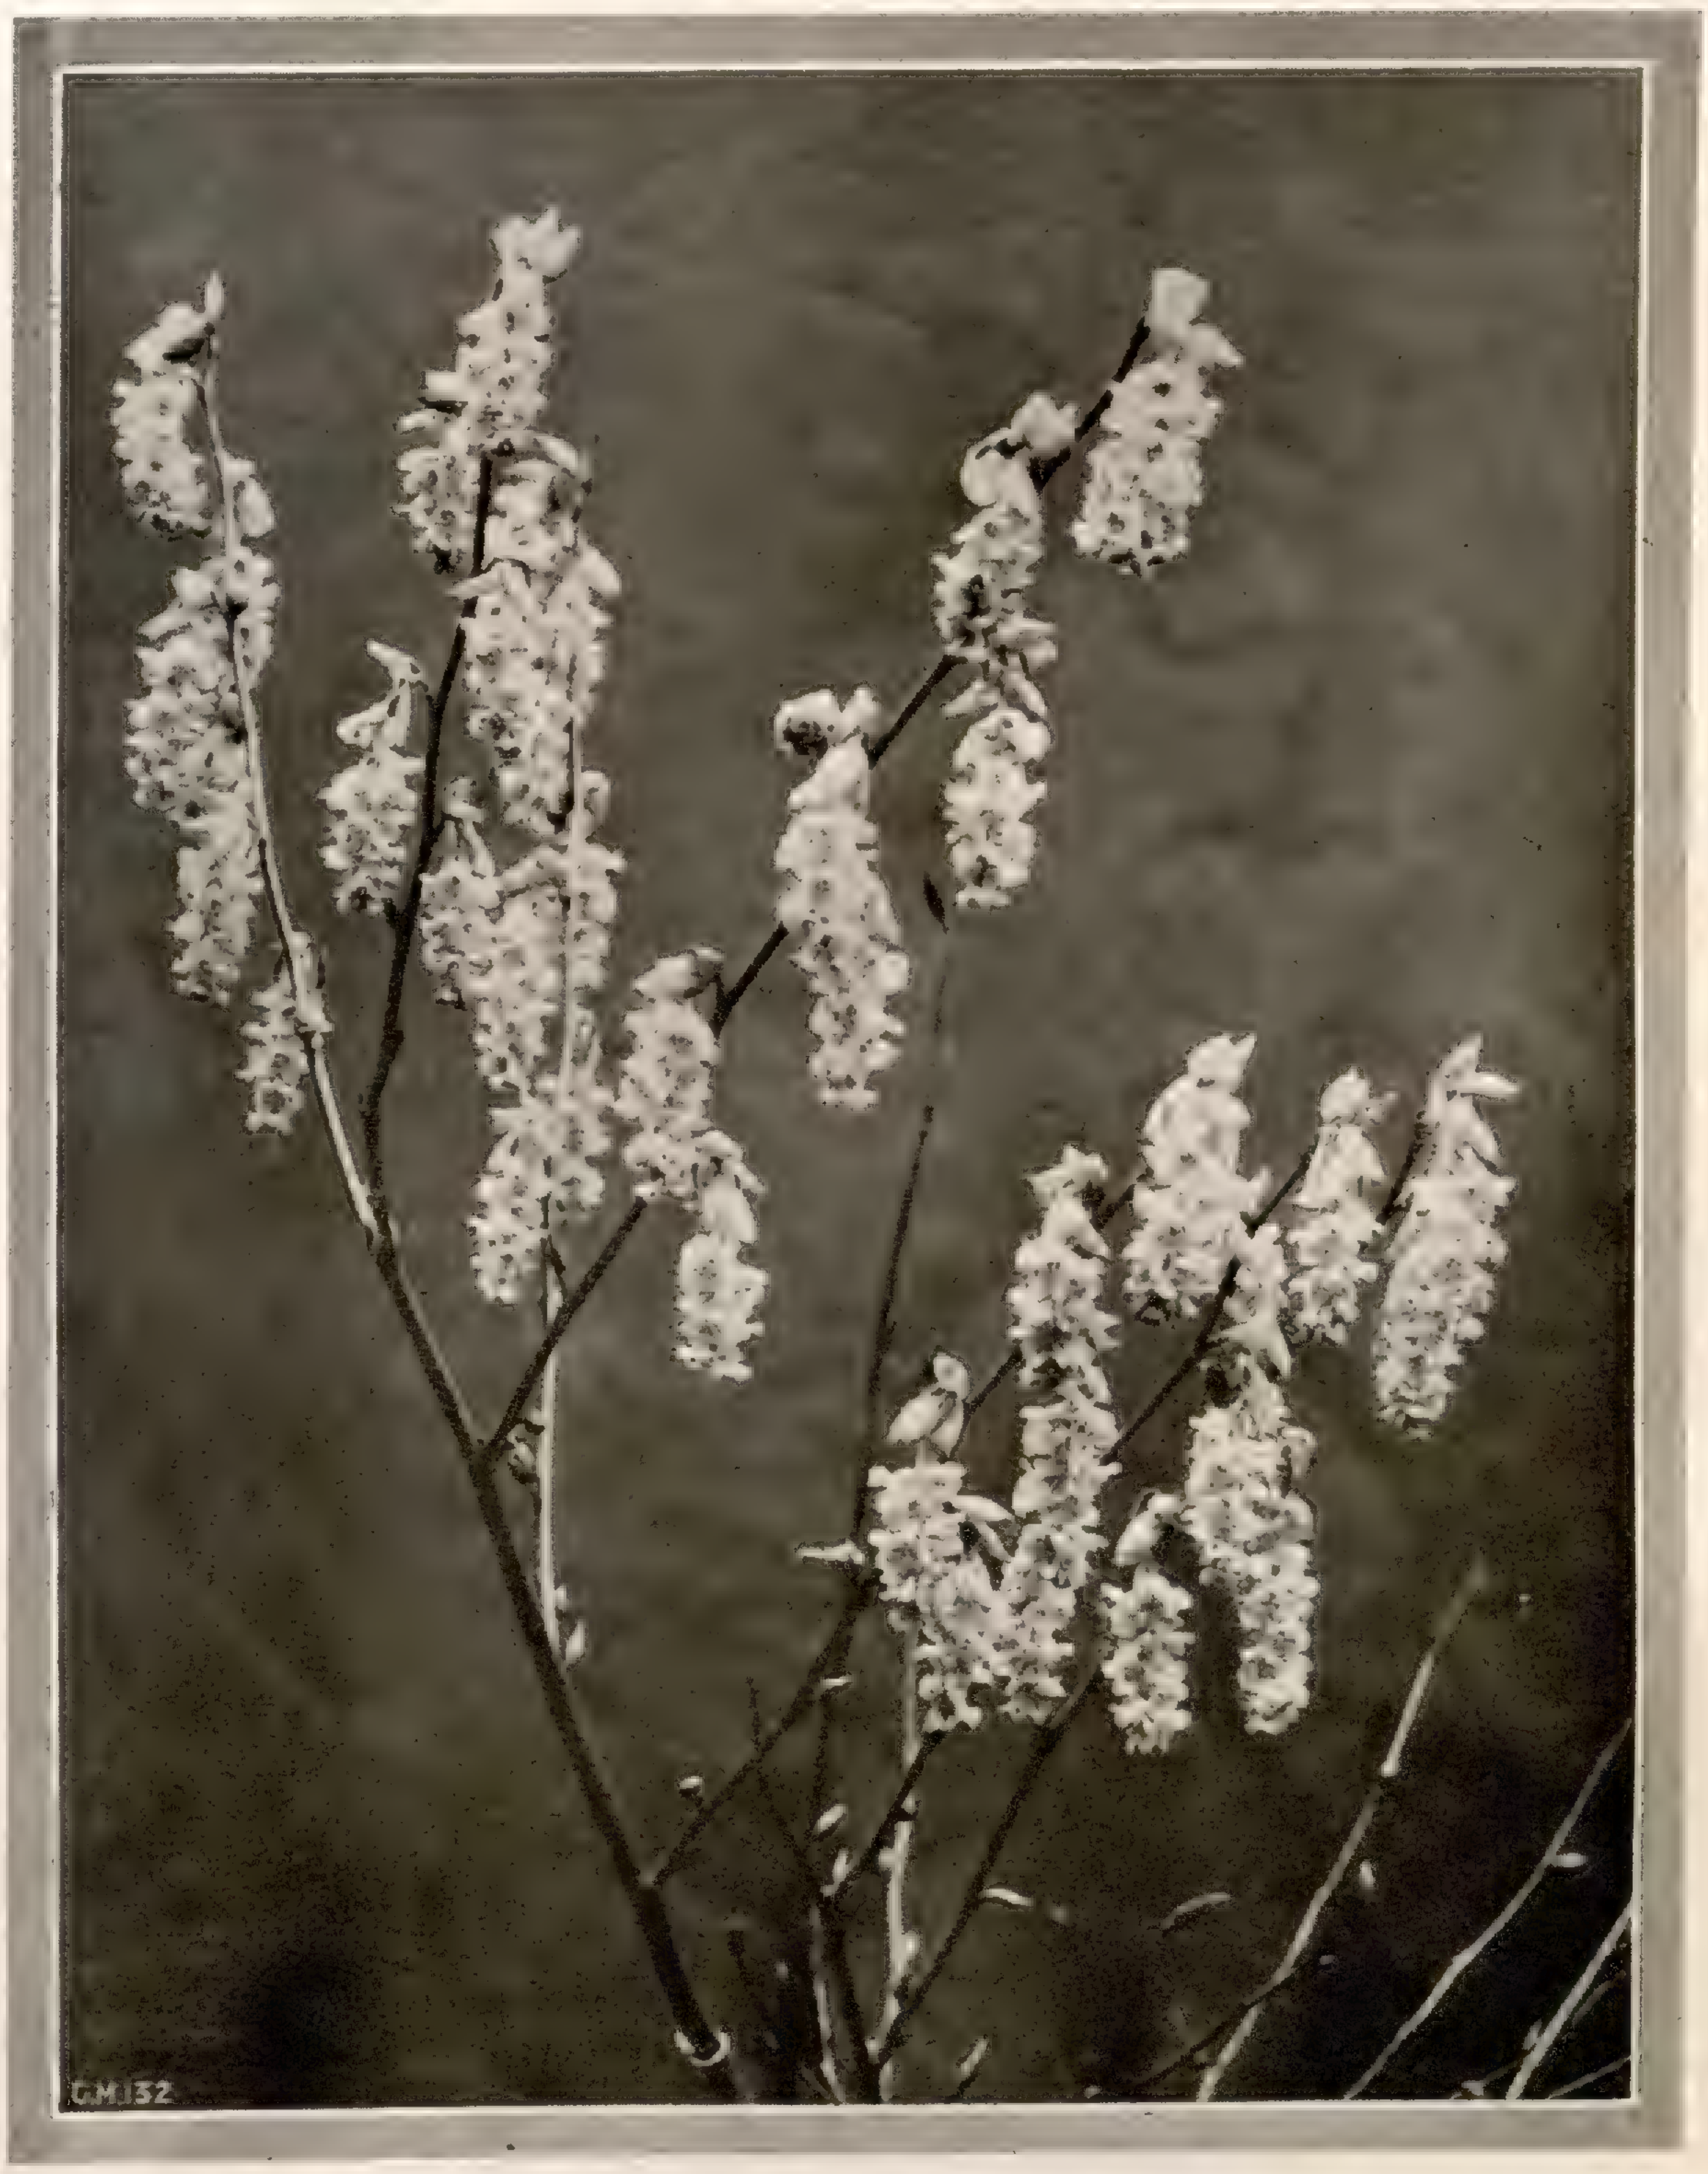
**National Dahlia Society.**—Instead of holding two exhibitions, as for some years past, the National Dahlia Society will this year concentrate its efforts on the great show that it will hold at the Crystal Palace on September 17 and 18. The schedule, which is now being issued, is more comprehensive than in any previous year; and, with a view to give the fullest possible encouragement to amateurs, the classes have been increased, and arranged in three sections. The classes in the first of the sections is open to all amateurs and gentlemen's gardeners, the second to amateurs who grow their dahlias unaided or have occasional help, and the third to those who have not won a prize at any previous exhibition held by the society. Ample provisions are made in both the amateur and trade divisions for cactus, show, fancy, single, and pompon dahlias; and, in addition, classes are provided for giant, decorative, pæony-flowered, and collarette varieties. In addition to the cash prizes in the forty-eight classes, five silver challenge cups, ranging in value from £5 to £20, are offered for competition. Given a favourable season, the exhibition should be one of the best the society has held within recent years. Schedules may be obtained of the hon. secretary, Mr. E. F. Hawes, Ulysses, Fortune Green, N.W.

**British Gardeners' Association.**—The first dinner of this association will be held at the Holborn Restaurant on Thursday next, March 14. The Earl of Plymouth will preside, and in the course of the after-dinner proceedings, a gold medal and address will be presented to Mr. J. Weathers, the retiring general secretary, and the gold medals and diplomas awarded to the successful candidates at the first examination will be presented to them. The dinner will commence at 6.30 p.m., and applications for tickets, 4s. 6d. each, should be made to Mr. A. E. Cresswell, 44, Albert Road, Leyton.

**Retirement of Mr. Samuel Pope.**—Mr. S. Pope, the begonia specialist, of Messrs. Thomas S. Ware, Lim., has so long been associated with tuberous begonias, and has done such splendid work in their improvement, that his many friends will regret to learn that he has found it necessary to retire from business life. For upwards of half a century Mr. Pope has made the raising and cultivation of begonias his chief study, and his latest achievement, the beautiful double variety, Lady Cromer, may be mentioned as a proof of his success in the creation of new forms of these valuable flowers. He commenced his career in the nurseries of Messrs. Lucombe, Pince, and Co., Exeter, and for several years was with Messrs. John Laing and Co., Forest Hill. In 1890 his services were secured by Messrs. Thomas S. Ware, Lim., in whose employment he has been during the past twenty-one years as begonia specialist at their Bexley Heath nursery. To his success in this position the fine collections of begonias exhibited by the firm at the Temple and other shows have amply testified. Latterly Mr. Pope has been in indifferent health, and, acting under medical advice, he is retiring to Torquay, his native place. As a mark of the esteem in which Mr. Pope is held by the firm and their employees, he was last week presented with a handsome marble clock bearing a suitable inscription. The presentation was made by Mr. W. G. Valentine, the managing director of the firm, and in a few well-chosen words he expressed the feelings of esteem and goodwill that are entertained for him by all. We learn with pleasure that Messrs. Ware have recognised the splendid services of Mr. Pope by granting him a pension for the remainder of his life. Mr. Pope is succeeded by his son-in-law, Mr. R. Bastin, who has been trained by him, and for some time has been his right-hand man. Mr. Bastin has indeed achieved so much success in connection with begonias that there is full justification for anticipating that the fame of the firm in connection with these flowers will be fully maintained, if not greatly enhanced.

**February in the North.**—The weather during February, writes our Aberdeen correspondent, has been unusually mild for the season of the year. The amount of rain and melted snow has been about 2¾ inches, falling in measurable quantity on nine days, and distributed pretty equally over the month from the 1st to the 29th. What fell during the first five days of the month was in the form of snow. After that we had only rain, but the ground continued white for seven days. Frost was rather keen on the 4th, but otherwise it was not strong. February, as a rule, is a time in which our greatest frosts are apt to occur, but during the last three weeks of the month the temperature was very mild and springlike. The absence of persistent or hard frost has allowed the husbandman to proceed with his work.

**No Salisbury Show in 1912.**—The Wilts Horticultural Society has decided to suspend operations for the present year owing to lack of support. An attempt was made to arouse public interest in the society's work, but without success. Lord Pembroke, who presided at the meeting held to consider ways and means, considered suspension better than dissolution, and promised that if in the future it was decided to revive the society and show he would give all the assistance in his power.



CORYLOPSIS MULTIFLORUS.

An elegant hardy shrub, bearing racemes of pale green flowers. A.M., R.H.S., March 5, Miss Willmott, Great Warley (gardener, Mr. C. R. Fielder).

**British Association.**—The annual meeting of this body will be held at Dundee, beginning on Wednesday, September 4. The president-elect is Professor E. A. Schäfer, LL.D., D.Sc., M.D., F.R.S., and the Sectional Presidents are: A.—Mathematical and Physical Science, Professor H. L. Callendar, LL.D., F.R.S.; B.—Chemistry, Professor A. Senior, M.D., Ph.D.; C.—Geology, B. N. Peach, LL.D., F.R.S.; D.—Zoology, P. Chalmers Mitchell, D.Sc., F.R.S.; E.—Geography, Sir C. M. Watson, K.C.M.G., C.B., R.E.; F.—Economic Science, Sir H. H. Cunynghame, K.C.B.; G.—Engineering, Professor A. Barr, D.Sc.; H.—Anthropology, Professor G. Elliot Smith, M.D., F.R.S.; I.—Physiology, L. Hill, M.B., F.R.S.; K.—Botany, Professor F. Keeble, Sc.D.; L.—Education, Professor J. Adams, M.A.; M.—Agriculture, T. H. Middleton, M.A. It will be seen from the list of sectional presidents that this year there will for the first time be an agricultural section at the forthcoming meeting.

**National Chrysanthemum Society.**—The schedule of prizes offered by this society is before us, and we are reminded that the exhibitions will be held on October 2 and 3 and October 29, 30, and 31 at the Crystal Palace, and on November 20 at Essex Hall, Strand. Some of the class specifications have been made easier, and there is an intimation that prizes for the best seedling plant of anemone, anemone pompon, and pompon chrysanthemums will be awarded in 1913; exhibits for this competition must be staged before the society's Floral Committee in 1913. Following the plan that has proved so successful in connection with other societies, the N.C.S. will issue the "Transactions" of the society in May. New members joining now will receive a copy of "The Culture and Exhibition of Large Chrysanthemums," as well as the current literature of the year.

# HORTICULTURAL EDUCATION.

## Self-education of Young Gardeners.

Notwithstanding all that has been said and written within recent years on the advantage to the gardener of a knowledge of the principles underlying successful practice, there are not wanting those who still hold the opinion that an acquaintance with the practical details of garden work is sufficient to ensure a full measure of success. If you discuss the question of horticultural education with those who hold such views, you are told before the discussion has proceeded very far that someone with whom they are acquainted has obtained a foremost position among practical horticulturists, although his general education was not of the best, and he knows practically nothing of the scientific aspects of gardening. They will also tell you in support of their contention of men who commenced life with great educational advantages and have failed to make their mark, and, in consequence, occupy a relatively low position. Facts such as these, however convincing they may appear at first sight, hardly touch the question at issue. They simply show that in gardening, as in other pursuits, men with great natural abilities are able to succeed whatever may be the obstacles in their way, and that others who do not possess the energy essential to the proper application of the knowledge with which they have been furnished will, on the contrary, assuredly fail. There cannot well be any difference upon this point, and certainly not among those who have opportunities for observation over a wide area, and have given some thought to the subject.

Whatever knowledge a man may possess must be applied, and with a due amount of skill, before he can derive any material advantage from its possession. In other words, the gardener must have a full knowledge of the practical details of garden work and garden management, which can only be obtained by several years of strenuous endeavour, before he can hope to achieve even a moderate degree of success. So essential is a practical training regarded by the writer that he has no hesitation in stating that, in his opinion, a man who cannot even read or write will, after a few years' work in the garden, prove superior as a cultivator to a man who has from the study of books become acquainted with scientific methods, but will not take the trouble to become well versed in the essentials of good practice. This much has been stated to show that, while the young gardener will be strongly advised to devote some portion of his spare time to the study of such sciences as have a direct bearing on the work of the garden, no one holds a stronger opinion as to the paramount importance of practice than the writer.

As the general aspect of horticultural education is far too wide a subject to admit of it being properly dealt with in one article, the education of young men who have entered on their gardening career will on this occasion alone be discussed. To fully appreciate the importance of the question to the younger members of the profession who will have to depend upon their own efforts, it is necessary to remember that within recent years there have been considerable advances in horticultural education, and that much more rapid advances may be anticipated within the next ten years or so. If these anticipations are realised, it follows that those who are now entering on their career and fail to take advantage of the opportunities they have for the acquisition of scientific knowledge will at an important period in their life have to compete with men who have been more fully equipped for the battle of life than they. Therefore, whether the young gardener has only recently entered on his training or has been engaged therein several years, he should take full advantage of his opportunities for strengthening the weak points in his general education and the acquisition of an elementary knowledge of those sciences which have a direct bearing upon his work. If he is really desirous of rising to a good position in his profession he must turn a deaf ear to those who are ever ready to contend that, because some gardeners have achieved success with a modicum only of science, the study of science is wholly unnecessary. Further, he should not at this period of life concern himself over much about the material results that will be obtained from well-directed study. He may be well assured that they will be such as to render him substantial assistance in his endeavours to make his mark, and what is hardly less important, some knowledge of the natural sciences will greatly increase the interest of the garden and add much to the pleasures of life.

Having thus briefly stated the case in favour of a combination of science with practice in the education of the young gardener, it will now be convenient to consider what subjects he should study for the purpose of fully equipping himself for his work and on what lines should be the study conducted. To avoid any misapprehension, it may be well to state that it is not necessary for the gardener to become an expert botanist, entomologist, geologist, or chemist. It is a question whether it would even be desirable that the studies should be carried far enough in either direction to admit of the student proceeding beyond the elementary stage. But it must be admitted that one whose life will be devoted to the cultivation of useful and ornamental plants should have a sufficient acquaintance with their various parts to be able to describe them clearly and accurately, and to understand the structure of root and branch, and the processes of reproduction, nutrition, cross-fertilisation, and hybridisation, so that he may be in a position to determine with some degree of accuracy beforehand what the results will be from a certain course of procedure. Again, he should be well acquainted with the constituents and inhabitants of the various classes of soil that have to be dealt with in garden management. Neither elementary chemistry or geology, nor, indeed, the two combined, will tell the cultivator all he should know about soils, but some knowledge of these sciences will enable him to more readily understand the information that is to be obtained from advanced works on soils and fertilisers. Then, with regard to economic entomology, which, for our present purpose, may be described as the study of insects injurious to plant life, it may be stated that those who are well acquainted with the life history of the various pests will be in a much better position for contending with them successfully than those whose knowledge does not extend beyond the remedies by which plants can be cleared of their enemies when an attack has been made.

(To be Continued.)

---

**Cabbages.**—The severe frosts recently experienced have worked havoc among this crop; perhaps at no season previously had cabbages looked so promising in this district. Whenever possible the crop should be hoed, the blanks filled up with plants from the seed bed, and the whole crop made firm by treading if needed. A small sowing of nitrate of soda mixed with an equal bulk of dry soot strewn between the lines will be very beneficial at hoeing time.—G. E.

---

# ROYAL HORTICULTURAL SOCIETY'S EXAMINATION.

The Royal Horticultural Society's seventh examination of employees in public parks was held on January 8, 1912.

As previously, the examination was partly viva voce and partly written, occupying three hours and twenty minutes. It was held at the Society's Hall in Vincent Square, Westminster.

Forty-nine candidates entered, and of these 17 secured places in the first class, 7 in the second, and 16 in the third, leaving 8 who failed to satisfy the minimum requirements of the examiners and one who was absent.

The examiners report that the average quality of the written answers equals that of former years, no marked advancement being noticeable in the examination taken collectively. Many cases of individual improvement, however, were noticed—candidates of past years being found to have considerably extended their knowledge. The identification of specimens in the viva voce section was better, the names being generally given unhesitatingly and correctly.

Some good answers were given to question 7 on leaf physiology; otherwise there was evident lack of careful reading on the subject of the structure and operations of the leaf.

The selection and action of artificial manures were well known.

Scope was given in question 9 to select and arrange plants suitable for ornamental water, but few candidates were familiar with the many beautiful forms of reeds, leaves, and water plants that give character to the water margin; lists of subjects were given, but they were too formal, and all kinds of unsuitable stuff were included.

Examiners.

CLASS I.

1. Fred J. Nash, Leicester.
2. Thos. Scott, Stoke Newington; and Wm. Chas. White, Hatfield.
4. Walter Davies, Richmond.
5. John Tyrrell, Cardiff.
6. William Good, St. Albans.
7. George Nile, Highbury.
8. James Hurley, Deptford.
9. William H. Jeffery, Lee Green.
10. James Jarrett, Birmingham.
11. Frederick Stevens, Forest Hill.
12. William E. Kemsley, Sittingbourne.
13. Henry Herne, Herne Hill.
14. Edward Martin, Highgate.
15. H. Johnson, Lewisham.
16. G. Bowles, Mottingham, Eltham.
17. Herbert G. Foster, Child's Hill, Hendon.

CLASS II.

1. Albert G. King, Kew Gardens.
2. W. H. Mouser, Highgate.
3. George Brooks, Wood Green.
4. Harry Adams, Upper Sydenham.
5. J. H. Copeland, East Dulwich.
6. W. Wickenden, West Norwood.
7. W. A. Cooper, E. Dulwich.

CLASS III.

1. W. Power, Victoria Park, N.E.
2. Geo. Miller, E. Dulwich.
3. T. S. Newman, Lewisham.
4. G. J. Rule, Wandsworth Common.
5. John F. Lee, Sydenham.
6. Richard Streatfield, Upper Sydenham; John W. Cordock, Charlton, Kent; and J. E. H. Ward, Camberwell.
9. P. Perry, Highgate.
10. E. J. Stewart, Highgate, N.
11. Percy Church, Highbury; and John Chapman, Brockley.
13. H. Crane, S. Lambeth.
14. C. T. Free, Limehouse; and George W. Allchin, Battersea.
16. Harry Cotton, Roydon, Essex.

## PRUNING ROSES.

The sharp nip of frosts and snow experienced during early February quite checked the tendency to prune roses so ridiculously early as many practice. I cannot call to memory a single season when roses grew extra early but what they suffered very much for such precocity sometime during the spring; and, recognising this, is my reason for much later pruning than we generally find.

If we limit the number of eyes, it stands to reason we must lose more than if we waited later and so secured some that could grow away with far less risk of severe checks. Personally, I look upon these early growths at the tips of the shoots as a decided safeguard, because the natural tendency to grow at the points or upper eyes first keeps the lower eyes comparatively dormant, and it is these eyes, or buds, that will be of most service later on.

The middle of March is quite early enough to prune in any district, however favourably it may be situated, while the end of the month is early enough for teas and those of precocious and often somewhat tender growth.

There is undoubtedly a great temptation to prune when one notices how well and promising this top growth appears. Some have fears of free bleeding or loss of sap when these shoots are cut down in such a state of activity. But this, from my own experience, is not so harmful as encouraging growth upon the wood left after the knife has done its work. The cut soon dries, and the basal eyes left quickly help to absorb the superfluous sap.

The art of pruning has been so often noted in the pages of the Gardeners' Magazine that the subject is apt to tire. Excellent cuts have frequently appeared, and these are far more explicit than mere written or spoken words. I may, however, perhaps be allowed to warn against the hasty and too similar use of the knife upon varieties of entirely different characteristics. By all means give a little consideration to the habit of the variety operated upon. A glance at the growth before us should be a good guide; that is, if one has been at all observant during the previous season.

Always make a practice of cutting quite close down to the eye that is to remain; never leave an inch or two of wood above the eye or bud. It cannot do otherwise than die if you do, and unfortunately this decay often extends below the growing eye, and either kills or greatly weakens it.

Another golden rule is to cut to an eye with an outward tendency, or the growth will be apt to crowd the centre of your plants, to their great disadvantage. Any crowded wood in the centre of the plant should invariably be removed. Roses enjoy light and air, which they do not get when a number of shoots are crowded in the centre.

Much may be done in this respect when young growth has progressed sufficiently for one to see which have a tendency to crowd or become misplaced. These should be cut out. Even if one does lose a few flowers, the rest amply repay in quality, while we are keeping the plant in a much more serviceable condition for the future.

A little thought should be given as to whether quantity or quality in the blooms is the chief desideratum, and the plants pruned a little closer in the latter case.

Rosarian.

## IRISES AT CLANDON PARK.

As these pages have testified, the late Earl of Onslow had a great love for his interesting garden at Clandon Park, Surrey, and, in conjunction with Mr. Blake, the head gardener, he made it especially remarkable for fine collections of hardy primulas and irises. Both these families of hardy flowers are extensively cultivated at Clandon Park, the natural conditions prevailing having been improved so as to find congenial homes for the several groups of each. In the accompanying illustration one of the iris gardens is shown on the bank of one of the numerous pieces of water at Clandon. On the higher and steeper parts of the bank the various varieties of the several sections of German irises are cultivated with immense success, while I. florentina, I. ochroleuca, I. Monnieri, I. anglica, I. xiphium, and many others occupy the more level spaces, with I. sibirica and its varieties, the gorgeous I. Kæmpferi and I. orientalis in the moister places. It is only when irises are grouped freely in this fashion that they are seen to the fullest advantage; and, so far as our experience goes, there is no other garden where the various kinds have been cultivated so extensively and so well as at Clandon Park.

IRISES BY THE WATER SIDE AT CLANDON PARK, SURREY.

---

**Magnolia speciosa.**—This Magnolia is one of the Soulangeana section, and a particularly desirable variety for early forcing. Some large specimens shown by Messrs. R. and G. Cuthbert, of Southgate, at the Horticultural Hall on February 6 were much admired. It is freely branched, yet of rather upright habit, and the flowers, which are in colour white tinged outside with purple, are borne in great profusion.—K.

## THE USEFULNESS OF ASTERS

Though the aster has been in cultivation for a long number of years, it was not until of late that its popularity became great, and this was not to be wondered at, seeing that the old forms were so stiff in appearance, and the flowers were of indistinct colours, produced on short stems, and therefore quite useless for decorative purposes. Truffaut's Pæony variety was a great advance on the old type, and ever since its introduction every effort has been made to improve the flower, so that at the present time there is a whole list of different sections that the cultivator may choose from, embracing a wide range of colouring. This, no doubt, has had much to do with increasing the popularity of asters; and when we take into consideration the length of time the flowers remain in perfection, either when cut or on the plants, and the variety of purposes for which they may be employed, there can be no doubt about the aster being the most useful annual in cultivation. As a florist's flower the aster occupies the same place in summer as the chrysanthemum does in the winter, and it may be employed in like manner either as a decorative pot plant, for bedding, or for filling up gaps in the herbaceous borders. As cut flowers for furnishing large vases and for wreath-making the flowers are indispensable.

To provide a constant supply of cut flowers through the summer and autumn months it will be necessary to make several sowings, the first about the middle of February. It is advisable to make this first sowing in pans or boxes, using a light, rich soil for the purpose. After the seeds are sown, the boxes should be placed on the greenhouse shelf near the glass, where a temperature of from 50 to 55 degrees can be maintained. It is not advisable to raise the early batches in a strong heat, as the young plants are so liable to damp off close to the roots, owing to the closeness of the atmosphere in which they are growing. If the boxes or pans are stood on a shelf where there is a free circulation of air about them this is not so likely to happen as when stood on a bed or stage further from the glass. When the young plants have made three or four rough leaves, they should be pricked off into other boxes or pans, and again returned to the greenhouse shelf until established; afterwards they may be transferred to a cold frame to harden off, and then be either potted or transplanted about three inches apart in cold frames where they can remain until the weather conditions are favourable for transferring them to the open ground.

A second batch should be sown about the second week in March, but as the young plants are so susceptible to damping off, a light, airy place should be provided for them until they are strong enough to be pricked out. As the days will now be getting longer this may be done in a cold frame, or, if one is not at command, boxes about three inches deep may be used. A further sowing may be made in April, either on a slight hotbed or in a cold frame, due care being taken to prevent the plants from damping off in their early stages.

Double asters for cut flowers are largely grown, the most popular kinds being Comet and Ostrich Plume. In some places these are grown by the thousands for cutting, their finely shaped flowers standing well up on long stems, and thus rendering them most useful. These are the two double kinds that are such favourites with market growers, and are seen in such abundance in the florists' shops. There is also one known as the Mammoth which is a great favourite. To produce the finest flowers the plants must have ample room for development. The dwarfer kinds should be allowed a distance of at least a foot between them, while the taller ones ought not to be planted closer together than eighteen inches. The flowers should be cut before they are fully expanded, as they will open in water, and keep fresh much longer if they have not been exposed to the full sunshine.

### Asters for Bedding.

As bedding plants asters are charming subjects, but for their full beauty to be appreciated the colours should be so used as to harmonise with each other. The soft and hard shades should not be planted together. The soil ought to have been previously well manured and deeply dug, as the tall growing kinds are gross feeders, and require a lot of nourishment. The plants should also be allowed sufficient space so that they may develop freely, as nothing detracts so much from the beauty of a plant as overcrowding. It is not well, as some advise, to plant two sections together, that is, quilled and pæony-flowered, single and double, etc. Each kind or section shows to better advantage when planted by itself; therefore, when selecting the kinds to grow, this ought to be taken into consideration, as tall varieties do not look well in small beds, neither do the dwarf ones show themselves to advantage in large ones.

For small beds it is better to choose such varieties as the Victoria or Bouquet, as these do not grow more than a foot or fifteen inches high, even when treated liberally. Instead of edging the beds with very dwarf quilled sorts, it is better by far to have a distinct edging of something else that will harmonise with them. For larger beds, such sorts as Comet, Ostrich Plume, Mammoth, Truffaut's Pæony Perfection, and the like may be chosen, and these should on no account be overcrowded.

### Asters for Pots.

Unless for large conservatories, it is better to grow some of the medium kinds, as the tall ones take up too much room, especially when the plants have to be stood on stages. Those, however, who have grouping to do indoors, or who have large conservatories to decorate, would do well to grow some of the giant kinds, as they stand well up on long stems, and the pots may be hidden by plants of a dwarfer nature. To keep up a constant supply for this purpose it will be necessary to make several sowings at intervals of about three weeks. The soil used should be of a light rich nature, and ample drainage afforded to allow of the water passing away freely, for, though these plants are gross feeders, they resent stagnant water about their roots. It is always preferable in hot weather to have the pots plunged up to their rims, as this not only keeps the soil more evenly moist, but avoids the necessity of watering so frequently.

### Single Asters.

During late years there has been quite a rage for single flowers of all descriptions, even the rose and dahlia must have their single forms, and there can be no doubt, viewing them from an artistic point of view, that these single forms are most beautiful, their light, graceful appearance, either as pot plants, or as cut flowers for furnishing large vases, giving them a commanding place in the floral world.

The long graceful petals of the single asters, loosely arranged round the disk, make them very conspicuous. Then the flowers last such a long time in perfection that one cannot fail to appreciate their worth, especially in the hot weather, when many other kinds so soon fade. The flowers being borne singly on the tips of long stems of sufficient strength to carry them upright enable us to employ them to greater advantage when arranging tall vases. There are several types of these, but the giant forms are the most useful, being produced on stems of from eighteen inches to two feet in length. As plants for filling up the herbaceous borders they are invaluable, as they may be lifted and transplanted with safety when the plants have attained a large size, but the best way of overcoming any difficulty is to grow a quantity in pots, as they could then be planted out even in very hot weather without the least risk of failure. The only care necessary to ensure success would be to shade for a few days from the bright sun, and to see the plants did not suffer for lack of water until established, when they would take care of themselves.

### Diseases.

The aster, like all other plants, is liable to the attack of various pests. In a young state there is "damping off," usually caused through the plants growing in too close an atmosphere. Sometimes the plants "go off" after being planted out, and when this occurs, they should be pulled up on the first signs of withering, and at once destroyed. If examined it will be found usually that a small caterpillar has eaten the pith out of the stems, thus destroying the plant's vitality. Asters are also liable to the attack of fly, but this can easily be got rid of by syringing them with one of the numerous insecticides that are on the market.

Then in very hot weather the plants are liable to suffer from the attacks of red spider and rust, but this is usually through lack of moisture or insufficient nourishment to keep them in a healthy condition. The most troublesome pest the aster is subject to is the sawfly, as the larvæ of this insect eats the pulp of the leaves, feeding under the skin in the same way as the celery maggot does in the celery leaves. To ward off the fly it is well to dust the young plants occasionally with soot, and the ground around them should be treated in like manner.

H. C. PRINSEP.

## CHRYSANTHEMUM MRS. GEORGE RUNDLE.

I am pleased to see attention drawn to this old favourite chrysanthemum, which was introduced by Rundle in 1868, and was for many years seen on exhibition stands as one of the leading varieties. With the advent of larger-flowered sorts, naturally this variety was ousted from favour because, no matter how good it was as a small flower, it was not to be compared with larger and equally good blooms of other sorts. At Sheffield, Nottingham, and Hull the blooms were, and are now, staged in triplets, and create much interest; but where this variety scored the most was in larger vases with long stems, with its own foliage, and at the least a dozen blooms together. Here we had decorative effect of the highest order, especially if a few trails of Ampelopsis Veitchi, croton leaves, or Asparagus Sprengeri were added.

For growing at the foot of a south wall in the open, this is an admirable variety, opening its blossoms early and of full size when disbudded to single flowers on a stem. Grown in this way, it was a great favourite in gardens around Liverpool thirty-five years ago. As a standard, in pots, no variety was ever more popular, as evinced by the displays at the Brighton shows, and I see no reason why it should not be again popular, but, unfortunately, size is the god that governs nowadays.

E. M.

## VERONICA HULKEANA.

This is certainly the most beautiful of all the shrubby veronicas. Like the majority of the family, it is a native of New Zealand, where it is found in the mountainous districts. It was introduced into this country in 1865, but, in spite of its loveliness, is seldom met with, even in the highly favoured south-western counties. In the late spring a plant such as that shown in the accompanying illustration, which occupied a wall space of 7ft. in height and 8ft. in breadth, is a most beautiful picture, being covered from its highest point to the ground-level with long, branching flower-panicles of a delicate lavender colour. If left to itself, the plant will form a loose-growing bush, but it presents a more attractive picture when grown against a wall, the wall being also valuable for the additional protection it affords the plant. When cultivated in this manner it is a charming sight at the close of the month of May, when its countless bloom-sprays, many of them from 18in. to 2ft. in length, standing out from the wall, and slightly drooping, form a cloud of delicate lavender colour, at once attracting the attention and exciting the admiration of every beholder.

It is totally distinct in appearance from all other shrubby veronicas, and far exceeds the most ornamental of these in loveliness, surpassing them in the grace of its long, branching flower-panicles. A large plant will often bear as many as two hundred flower-sprays. Veronica Hulkeana is frequently reported to be very tender, but it has proved hardier than many others of the shrubby section, these having been badly injured by frost in a garden where Veronica Hulkeana is grown, while the latter was quite unharmed, and for this reason it would be well to try it in the open on south walls, anywhere in the warmer localities. The cause of its having gained a character for tenderness is doubtless owing to the fact that large plants, and in some cases even young ones, sometimes die off in an unaccountable manner. The death of the plants is sometimes attributed to the strain of flower and seed production, but a plant only 2ft. in height, which bore but half a dozen flower sprays, died suddenly, and large specimens have flowered and borne seed year after year in perfect health, only to succumb eventually. With the possibility of this sudden collapse in their minds, possessors of fine examples are naturally on tenter-hooks lest their favourite should show signs of failing vigour, for the loss of a large plant of this veronica deprives the garden of one of its most beautiful objects in the latter days of May, and many years must elapse before a small plant can attain large proportions. If the flower-sprays were cut immediately they reached their prime, the drain of seed-bearing would be spared the plant, but even this could not ensure its continued health.

Cuttings from four to six inches in length, taken off with a heel in the early summer, strike readily, and plants may also be raised from seed, but it takes a long time for a cutting or seedling to rival the proportions of a fine specimen which has died. However, plants are pretty, even in their early stages of growth, and they commence to flower when quite small. In the colder districts Veronica Hulkeana makes a most charming greenhouse plant. With regard to the tenderness of this veronica we have just experienced exceptionally cold weather for this district, 12 degrees of frost being registered. Very many tender plants have been killed outright, but Veronica Hulkeana is unhurt, not even a leaf showing the slightest sign of damage.

Wyndham Fitzherbert.

## LACHENALIAS.

The lachenalias, or Cape Cowslips, as they are sometimes termed, are charming plants for the greenhouse, where they flower during the winter and early spring months. A great number of garden forms have been raised within recent years, but one of the best of all is Nelsoni, with rich golden-amber coloured blossoms. It is by no means a novelty, but for all that it is a very beautiful form, and, furthermore, of good constitution.

Some of the original species are also very pretty, notably the well-known Lachenalia tricolor, and the quaintly-coloured Lachenalia pendula. One of the finest exhibits of this last that has ever come under my observation was contributed by Messrs. Sutton and Sons, of Reading, to the first meeting this year of the Royal Horticultural Society.

Complaints are by no means infrequent that lachenalias do not always prove a success, and this is, I think, chiefly to be attributed to the rough treatment they sometimes have to undergo. When the flowering season is past, they should be looked after as carefully as before, and not stuck underneath stages or in any out-of-the-way place. When totally dormant they should be kept quite dry; a frame is a good place for them till August, when they must be shaken quite clear of the old soil and be repotted.

K.

## AMONG THE ALPINE FLOWERS.

"The sap will surely quicken soon or late,
The tardiest bird will twitter to a mate;
So spring must dawn again with warmth
and bloom."
CHRISTINA G. ROSSETTI.

Spring always seems to come too tardily for the lover of flowers who is eagerly watching for the uprising of his favourites from that black earth or between the stones of his rock garden. He is sure of their appearing; he looks for their coming as the lover watches for his dear one; and he longs for the spearing shoot, the swelling bud, and the opening blossom. Spring cannot well be said to be here, though March will have been ushered in ere these notes can appear. There is a dalliance and a reluctance of the flowers, as if they knew too well that fate has yet some trials for their tender leaves and fragile petals.

Yet many of them are here, and many more are pressing forward, less timorous than others, and we see their advance from day to day with ardent satisfaction. They are all around. Bulbous plants are in the majority, but others are in the field seeking our favour—a favour we cannot deny to such lovely things.

### Snowdrops.

In the rock garden, the border, or amid the grass, are the snowdrops, the virgin flowers of the winter, which, happily, dwell with us until the sharp winds of March bring the daffodils to bear them company ere they depart for the year.

The old lover of the snowdrop would hardly recognise his favourite as it is now present in our gardens. The art of man has wedded different races of the galanthus, and has provided us flowers of the utmost beauty, and far more opulent in their loveliness than the little Galanthus nivalis of the past time. Yet there is nothing more beautiful than thousands of the common snowdrop spread in sheets among the grass, scattered about the rock garden, or in clumps of rare beauty in many parts of the pleasaunce. Here are many species and still more hybrids, from the quaint Galanthus Scharloki, with its divided spathe and its spot of green on each outer segment, to the massive G. Imperati Atkinsi, one of the most imperial of all the snowdrops.

Then there are hybrids of Galanthus plicatus, of noble beauty and with truly fascinating eardrops of white and emerald green. The many know not the loveliness of these new snowdrops, but soon shall come the time when, like the daffodil, they shall find their way into many gardens, and be sought after like those narcissi which "take the winds of March with beauty." Those of us who are privileged to own these patrician flowers, look thankfully upon their transcendent loveliness.

### Crocus tomassinianus.

Gladly do we see among our flowers of the early days the dainty Crocus tomassinianus, a charming little flower, not bold enough, perhaps, to attract the admiration of those who can see no beauty in crocuses save in the glowing massive cups of the Dutch varieties. These may affect to despise the exquisite soft-coloured daintiness of Tomassini's crocus, but we who love our flowers for other things than mere size and regularity of contour are in the seventh heaven of delight as we study the beauties of these crocus gems. We have no little spring crocus more beautiful than this; and we have none more reliable. It grows readily in a sunny spot; it flowers freely, giving us an abundance of its lilac or purple flowers; it seeds well, and thus increases with more rapidity than do some of the other species. There are now several shades of purple or of lilac to be procured among the varieties of this gem, and all are very pretty. A little group with the soft exterior colouring displayed when the flowers are closed gives us pleasure—a pleasure vastly heightened when the little flowers open to the sun of the months of February and March.

### Adonis amurensis.

The introducer of a flower such as the Amoor adonis deserves a wreath of fame, so great has been the boon he has bestowed upon those of us who yearn for the earliest flowers. And Adonis amurensis, which first bloomed in February, is one we may well visit from time to time to see if it has begun to open its golden flowers. It reminds one, as might be anticipated, of its ally Adonis vernalis, the spring adonis, but it comes so much earlier and is so attractive in itself, with its fine golden flowers borne above its gracefully-cut leaves, that it is one of the plants we can never praise too much. Our enemies the slugs have an affection of an inordinate kind for this Amoor adonis as well as we; but their desire assumes a different form, the gastropods seeking to enjoy the pleasures of appetite, while we, let us hope, are governed by higher tastes than they. In a dryish soil Adonis amurensis does well here, though not in a place where it can ever suffer from drought.

### Scilla bifolia.

The earliest flowers on the forerunners of the different forms of Scilla bifolia are in full blow, and other varieties are loth to lag behind. Looking through the garden to-day I renewed my pleasure at the sight of a little deep-coloured form sent to me from Asia Minor, and which is the first of all, and rejoiced to see another one—grandiflora—in bloom, with others, such as S. bifolia ruberrima, fast showing colour. Too few know the usefulness of Scilla bifolia in the rock garden, and it ought to be more highly appreciated than it is. I have a goodly number of varieties here, but none give more pleasure than these very early ones, harbingers of others to come, with blue, pink, flesh-coloured, or white flowers. They are so easily grown that they need not be absent from any garden; while their value is all the greater because they come as the vanguard of the varieties of the Siberian squill, Scilla sibirica, and others of the race.

### Other Flowers.

Here are a few early narcissi, gladly opening to hail the month of March, though minimus has forestalled the others of the race, and has given its dainty flowers for some time; a few of the Glories of the Snow have also opened their blooms of blue in the case of Chionodoxa sardensis, and a single early plant of C. Luciliæ has almost rivalled in earliness its sister Glory. There are sprays of Arabises, dwarf hyacinths, Mezereons, a saxifrage or two, with various other early gems of the rock garden, delightful pioneers of the vast army of the blossoms of the year, such as primroses, violets, aconites, and early aubretias.

Truly the opening months, trying though they are to us poor mortals, bring in their train real joys and visions of floral loveliness.

S. ARNOTT.

## ROCK GARDEN NOTES.

The continuously wet weather experienced during the past season has been the cause of many losses in this department. Although the inhabitants of the rock garden are quite hardy where extreme cold is concerned, many succumb to excessive moisture, and some of our choice subjects will be found to be either dead or in a state of collapse. It is a difficult matter to winter many of the natives of the high mountainous regions, owing to the prevailing dampness of our winter climate. During a warm autumn, when the atmosphere is excessively humid, the plants are forced into strong sappy growth, which is quite unfit to stand severe weather. Of course, many choice subjects are protected by overhead coverings, yet it is impossible to shelter all from the rains, and consequently many are lost.

The idea—and it is a very prevalent one—that when once a rock garden is planted it should go on for ever is absolutely wrong, as the plants cannot always stand our climate. One of the most important points regarding the maintenance of a rock garden is to have a good stock of reserve plants in readiness to fill up vacancies in the spring. In damp, low-lying districts the losses during the winter are much heavier than in dry ones, yet at the same time it is quite essential that there should be a reserve supply connected with every rock garden.

Generally speaking, the early half of March is a most suitable time for filling up all gaps, and by this time it is easily seen which plants are going to survive. When replanting, it is advisable to remove the old soil and replace it with fresh, not only taking off the top but going to a good depth, bearing in mind the fact that the majority of rock garden plants are deep rooting. Each subject must be afforded soil to meet its requirements, and to accomplish this a thorough knowledge of the various plants is necessary. The androsaces, dianthuses, æthionemas, alyssums, edaianthuses, phyteumas, and many of the saxifrages that delight in soil of a calcareous nature, should be afforded plenty of limestone chippings or old mortar rubble. Then there are the peat-loving subjects, which include the daphnes, Eomecon chionantha, Epigæa repens, Linnæa borealis, some of the primulas, shortias, and many others. Each should be afforded a suitable rooting medium to ensure success.

In the majority of cases a rich soil shou be avoided, for, although a strong growt is produced by its use, collapse often f lows. Firm planting is of great importanc and when filling up the crevices between t rocks, hammer and chisel will have to b brought into use to fix the plants firmly in their positions. The work should be accomplished carefully and thoroughly, for the future welfare of the plants depends great deal on how they are put in. T roots must be laid out, and the soil work in amongst them, so that they may sta growing right away. When a plant turned out of its pot and the roots are a tight ball it is of great advantage loosen them and spread them out inste of pushing the ball in undisturbed.

If dry weather prevails during the ope tions, the plants should be well wate after they are in their places, and wa will be frequently required until they a established.

E. C. POOLEY.

Gnaton Gardens.

A practical and well-illustrated work on Rockeries is ROCK GARDENS AND ALPINE PLANTS, E. H. Jenkins. It is full of skilled directions, can be obtained by post from our Publisher 2s. 10d.

## PRUNING AND NAILING.

Although the weather has been so mild in many places, the rainfall during November and December was very excessive, and prevented or delayed both pruning and nailing. Where this was the case, no time should now be lost in getting the work finished before the pressure of other duties comes. Some gardeners reserve pruning and nailing for frosty weather, but there is nothing gained by doing so; in fact, it is next to a waste of time putting men to nail trees when they are so benumbed with cold as to cause them to run up and down the paths to warm themselves. Those who, like myself, have had much experience of this work in their early days, know full well what it means.

I lived at one place where the young men in the houses did all the nailing, both inside and out. Nailing was a considerable item, as there were about one hundred and twenty yards of Morello cherry wall to do. The same of outdoor peaches, in addition to several hundred yards of apricot, plum, pear, cherry, and other fruits. No matter how cold it was, the young men, when they had done their work in the warm houses in the morning, had to turn out in the biting cold winds to take their turn on the walls. It was not so bad when the weather was mild, and one enjoyed the change, but in some winters the frost was very severe, and one winter I remember well in the early sixties, when the snow was on the ground for several weeks together, and the weather was so cold that one scarcely knew whether they were hitting their fingers or the nails, yet we were compelled to turn out. It was this that made me determined that, if ever I was in charge of a garden where there was a quantity of nailing to be done, it should be given to the outside men to do before the weather became too cold, and this I succeeded in doing, for, although there was a Morello cherry wall with an area of over seven thousand square feet, the nailing on this was usually completed by the end of November, and no finer or better trained trees were to be found in the kingdom. It was the rule to have all the north, north-east, and north-west walls done first, as it is when nailing these that one feels the cold most, especially when the wind is blowing a gale. It is astonishing how much of such work a couple of good hands that have been well trained will get through, but when novices are put to the job without anyone of experience to teach them, there can be little wonder at slow progress and bad work.

Nailing, like all other work, requires practice if it is to be done quickly and well; the operator should see at a glance where the shoot should go, and on which side to place the shred so that the nail may not press against the young growth. It is bad nailing oftener than not that causes canker, for wherever the nail comes in contact with the wood it is sure to cause harm. I have stood for hours at a wall instructing beginners how to do the work, and that is the only way to have it done satisfactorily. Gardening is carried on in private establishments for the pleasure and enjoyment of the owners, but there can be neither when the work is done in a slovenly manner, and unless young men have a good training in their early days, it is quite certain they will never be able to properly organise a staff under them in after life.

Nailing may be thought to be of little moment, but I have seen visitors stand and look at a well-trained tree for a considerable time, remarking that every shoot seemed to be in its proper place, no over-crowding, and space for each growth to extend itself indefinitely without coming into contact with its neighbour. One sometimes hears gardeners remark, "We have not time to do such good work now." It is not the time that is spent on it, but doing the work in the right season and in the most systematic manner. When nailing, the shred should always be placed on the opposite side of the shoot to that which it is inclined to grow, so that whatever strain there is it should be on the shred, and ample space should always be allowed for the swelling of the wood the following year. With all trees this is important, but more especially is this the case with young vigorous ones, whose growths swell rapidly. Young trees need more attention than older ones, for, should a leading shoot be crippled through the shred being too tight, this often causes the tree to be ill-shaped and unevenly balanced.

Pruning is an art that can only be learned by practice, and to become proficient in that art one must have practical demonstrations, for not only is there a great difference in the habit of growth and mode of fruiting of the various species under cultivation, but the different varieties of the same species require special treatment peculiar to themselves. Take, for example, Belle Magnifique cherry; few would prune this in the same way as they would the Bigarreaus, but treat it more in the way of the Morellos. Yet, in dealing with cherries, many would simply state that shoots should be cut to a certain bud, treating all varieties alike. The same remark applies also to plums and pears, as no two varieties grow exactly alike.

Now, in pruning either wall trees, or those growing in the open ground, the operator should know exactly the position he wants the next season's growth to take, and should cut to a bud accordingly. It is always preferable to use a sharp knife to seccateurs, and the blade should be placed in such a position that when the cut is made the top edge shall be just above the bud, so that the growth proceeding therefrom may heal over the wound made, which cannot take place when seccateurs are used. In pruning wall trees the aim should be to have the shoots as evenly balanced as possible. Do not try to cover the wall in a season or two, but consider what the tree should be in ten or a dozen years' time, and treat it accordingly. Many trees are spoiled when young owing to their shoots not having been pruned back far enough, thus leaving a portion of the wall bare. When selecting fan-trained trees at a nursery, always discard those having a centre shoot, as such can never be got into a good shape afterwards. A well-trained tree is not only a credit to the person who is in charge, but is a pleasure to the owner who takes a pride in his garden, and, though they may not express themselves as being well pleased, one can usually tell by their manner whether they are satisfied with the way things are managed. I was once told by a gentleman who was very fond of his garden that it was seldom a person had due credit for doing things well, but if anything went amiss it was soon brought to notice. This is undoubtedly so, for it is impossible to pass by a dead tree unnoticed, though one may go by a dozen in a flourishing condition without attention being arrested, but when we see a notably fine specimen one is sure to stop and gaze on its proportions, and pass some observations about it. To obtain trees of this class special attention must be given from their youth up, each shoot must have been cut to the right bud, and assigned its proper position. Sap has a tendency to flow more rapidly to the upper branches, therefore these should be cut to a bud on the lower side of the shoot, while those on the lower portions should be cut to a bud on the upper side. It may also be necessary to check the flow to the upper shoots by pinching them when they have made three or four inches of growth, so as to divert the sap in other directions, and more equalise the flow. It is a mistake to produce over-gross shoots, as these have to be cut away. The aim should be to only encourage the growth required, removing all superfluous and ill-placed shoots at the first possible opportunity, and regulating those that remain in such a manner that an even and well-balanced tree is the result; if this is accomplished, the operator will have every reason to congratulate himself.

H. C.

## PYRAMID AND STANDARD FUCHSIAS.

I cannot call to mind any plant that gives such a generous return for a small amount of attention and labour as the fuchsia. Further, it lends itself to a variety of purposes, including the very important part it plays in bedding arrangements and garden decoration generally. We have been taught to believe that at least partial shade is essential to the well-being of these plants, but that fallacy is exploded by a very clear demonstration of their ability to thrive in luxuriant fashion in sun-baked and exposed situations. The weather we experienced last summer provided a very severe test, and was very trying to vegetation generally, and yet, where fuchsias received close and regular attention to artificial watering, together with refreshing shower baths in the evenings of those hot days, they were clothed in beauty the season through.

I propose to offer a few remarks as to their production as standards and pyramids, and it may be said that the orthodox way to proceed for standards is to commence with cuttings and to allow the resulting plants to run up to the required height before being stopped.

Assuming that the cuttings are inserted in February, and the plants are grown under glass, they will reach 3ft. in height by the end of September, and in this way the foundation of the standards is laid. Nothing is gained by stopping them until early February of another year, and if subjected to warm and fairly moist conditions, good compact heads are soon formed.

Another plan I have adopted in recent years is to utilise surplus plants of tall growth to form standards. These are clean pruned with the exception of 6in. at the top, when the stock of plants is being overhauled in February, and as these have thick and strong stems and a large root system, splendid heads are formed in a very short time. To my mind, fuchsias are seen to the best advantage in standard form, and as seen arranged thinly over violas, to harmonise or contrast pleasingly with them, a fine and charming effect is produced.

It is hardly necessary to point out that in the production of pyramids the mode of procedure is entirely different from that for standards, and certainly both methods of training should be employed. A very ready method of getting together a stock of large and serviceable fuchsias for park and garden decoration is to plant out each season a number of plants from 4½in. pots and keep them pinched with a view to symmetry.

Some wonderful examples of pyramid fuchsias have been exhibited at the Temple and Holland Park shows in recent years, and it is nothing short of marvellous how these giants were brought from a long distance without suffering.

W. H. Aggett.

## ANNUAL CANDYTUFTS.

Candytufts are so easily grown that perhaps it would be better for them if the seeds germinated indifferently, and the best results could only be obtained by special efforts on the part of the cultivator. We are apt to think best of those things that cost us most to produce or achieve. But candytufts are cheap, they germinate freely, and the plants thrive almost anywhere. The great cause of comparative failure is thick sowing, while allowing the seedlings to stand thickly, instead of severely thinning them out, is a cause that also generally follows the initial mistake of thick sowing. The splendid strains of large-flowered bold-spiked candytufts like Dobbie's White Spiral need room to develop, and a square foot is none too much room for the best plants, though thinning need not be quite so severe as this when a mass of florescence is desired. From white to a deep shade of rose-red that is nearly crimson, there are many shades of colour available in candytufts, and it is surprising what a capital display can be produced in beds or borders from seeds sown in the open in March. Thin sowing and early thinning result in large freely-branched plants that flower over a cosiderable period, whereas thick sowing and failure to thin early and severely result in slender plants that quickly run their course.

CANDYTUFT WHITE SPIRAL.
A fine selection made by Messrs. Dobbie and Co. of this valuable white-flowered annual.

---

**Seedling Azalea mollis.**—It is impossible to even hazard a guess as to the number of these that are sent to this country every year from the Continent, and a great proportion of which are employed for forcing into bloom. At one time complaints were made that the flowers of many of them were poor in colour; but this fault does not prevail to a great extent.—T.

## ACACIA BAILEYANA.

The illustration on page 131 gives a capital impression of the grace and floriferousness of this, as yet, uncommon species, though, of course, it does not show the rich golden colour of its flowers. Besides this brighter colour, the smaller leaves are a great recommendation, for anyone who has used cut sprays of the well-known Acacia dealbata cannot fail to have regretted the unfortunate habit the latter species has of half closing its leaves at an early stage, and so giving the sprays a partially withered appearance. Being naturally a bush, the species under notice is admirably adapted for greenhouse culture, and, even if it did not flower so beautifully, Acacia Baileyana would be well worth growing as a foliage plant. The young leaves are very silvery, and plants with several branches would be useful for grouping, and especially so in jardiniere and other forms of house decoration.

Besides already recorded instances of its culture in Cornwall, this species finds a place in the Channel Islands, and is, I believe, listed by Messrs. Robert Veitch and Son, of Exeter. As it is not so strong a grower as the Silver Wattle, I am afraid A. Baileyana will not successfully compete with the former as a popular cut flower, though, of course, there are many purchasers who would willingly give a higher price for the more decorative species.

Considering their great beauty, it is surprising to find how rarely the acacias are grown as greenhouse plants in this country. There are no difficulties attendant upon their culture; the chief point to remember is that, except during the flowering period, and for a short time after the plants have been pruned, abundant moisture at the roots is absolutely essential. A light rich soil, such as fibrous loam and leaf-mould, with a good proportion of sharp sand, is required, and, of course, ample drainage must be provided. The best time for pruning is after the flowers have faded, and when the plants have made their growth it is advantageous to place them out of doors until the late autumn, when they should be housed in a greenhouse; much artificial heat is not to be recommended.

As anyone with but a passing knowledge of Australian plants knows, there are a great number of species of acacia—Nicholson's "Dictionary of Gardening" says fully 400—and probably, as is the case with that other bewildering Antipodean genus, Eucalyptus, no one knows how many. Besides the two species already named there are not more than a score or so in cultivation in this country, whilst it would be difficult to purchase more than a dozen different kinds. There are several varieties of Acacia longifolia well worth growing; A. longifolia mucronata, which is now in flower in the Temperate House at Kew, bears numbers of bright yellow cylindrical flowers, and is even more ornamental than the variety magnifica. A. Riceana is a desirable species, producing long spikes of globular flowers, well set off by the neat, dark green, linear leaves. The flowers of A. lineata are small, but of a very rich golden colour. As its name implies, A. juniperima has all the appearance of a juniper bush, with very dark green leaves, but the illusion is dispelled when the golden cylindrical flowers appear. Acacia armata and A. acinacea are other desirable species, as also is A. affinis, which has been described as an improved A. dealbata.

Cecil Aubrey.

## THE PIERIS.

Pieris is a genus of Ericaceæ, which is usually represented in gardens by one or more of three species, although nineteen species are enumerated in the Kew Index. The three most familiar are P. floribunda, P. formosa, and P. japonica, the former a North American shrub, the two latter of Asiatic origin.

PIERIS JAPONICA.
A hardy evergreen shrub with panicles of white flowers.

Some confusion exists relative to the generic name, for, in addition to pieris, the names of Leucothœ, Portuna, Zenobia, Andromeda, and Lyonia have been used in connection with one or more of the species. Andromeda is by far the most widely known of these synonyms, and many people persist in its use, instead of that of pieris. Attention may be directed to a true Andromeda in the European A. polifolia, a low-growing, wiry-branched shrub, with small evergreen leaves, and pink, urn-shaped flowers, which is sometimes found wild in the bogs of this country.

Pieris, like other plants of the erica family, attain their greatest luxuriance in soil of a peaty character, although they thrive well in sandy or loamy soil, providing it is comparatively free from limy matter. Propagation is effected by means of seeds, cuttings, or layers, but in either case it is a rather slow business to obtain good saleable plants, for growth in the early stages is slow. The positions which pieris may be called upon to occupy are many, for they are choice enough to warrant their use as specimen beds on lawns; their evergreen character ensures them shrubbery space, and they should always be included in collections of choice peat-loving shrubs, while one or two kinds form handsome specimen plants.

A hot, dry position is not suited for pieris, the best plants being found in somewhat shaded situations, where the ground is naturally a little damp. When making up ground for pieris, it is not necessary to introduce a large quantity of peat into ground which is not naturally of a peaty character, rather select sweet, sandy, or light, loamy soil, and fork a few inches of peat into the upper foot. Manure must not be given, but the plants will be benefitted by a surface dressing of half-decayed leaves, applied in spring. Such a dressing has the advantage of keeping the ground moist and encouraging surface roots at the same time. The encouragement of surface roots is quite as necessary as it is in the case of rhododendrons; therefore, deep planting must be avoided.

P. floribunda is a North American species which was introduced about a century ago, a figure appearing in the "Botanical Magazine," t. 1,566, in 1813, two years after its debut. It is usually met with as a compact bush, two to four and a-half feet in height, with oblong or oval, serrate evergreen leaves, one to two inches long. The white flowers are borne during March in short upright terminal panicles. As a rule, it blossoms freely, although a thin crop of flowers may be expected now and then.

P. formosa is the most imposing of the species, though unfortunately it is less hardy than either P. floribunda or P. japonica. Nevertheless, in the southern counties, and particularly in Devonshire, Cornwall, and South Wales, it grows magnificently, and fine examples are to be seen. Several plants are to be seen in the Kew collection, which, though occasionally cut by late spring frosts, have made satisfactory progress since they were cut to the ground line during the severe frost of February, 1895. These plants neither grow nor flower so freely as those in south-west gardens, however.

P. formosa is a native of the temperate Himalaya, and of various parts of central and southern China. At its best it forms a small tree 200ft. or upwards in height, with a considerable spread. Such a specimen is referred to as growing in the gardens at Pentille Castle in the description which accompanies figure 8,283 of the "Botanical Magazine." The oblong or lance-shaped evergreen leaves are up to five inches in length and 1¾ inch wide, deep green and glossy. When young they, with the soft shoots, are of a bright red hue. The white, urn-shaped flowers are borne in large terminal panicles during April and May. These panicles are often six inches long and eight inches across. In the neighbourhood of Tunbridge Wells it is said to thrive almost as well as in Devonshire.

P. japonica may be met with as a bush 2 to 4ft. high, with dark green, more or less oval leaves, which may be anything between 1 and 3½in. long and from a quarter to 1in. wide. The white flowers are borne in terminal drooping panicles late in March or in April, the panicles often being from 4 to 6in. long on vigorous specimens. The accompanying illustration gives a good idea of the beauty of a flowering spray of this shrub. Where one kind only is grown this ought to be selected. A variety with variegated leaves is sometimes met with.

P. Mariana and P. nitida are North American species, which are sometimes seen in cultivation. They are less beautiful in this country than the above-mentioned kinds, although showy shrubs in their native country. Neither do they appear to be very hardy, for young plants produce sappy growth, which is easily injured by frost.

P. ovalifolia is a distinct species by reason of its broadly oval leaves, which on some specimens are 8in. long and 4in. wide. The white, pink-flushed flowers are in long, slender axillary racemes. It is a native of the temperate Himalaya, and is not in general cultivation.

During the present century a number of new Chinese species have been described by M. Hector Léveillé. In the "Bulletin de l'Académie de Geographie Botanique," XII. (1903), pp. 251-253, descriptions of the following species appear: P. Gagnepainiana, P. divaricata, P. Martini, P. Kouyangensis, P. Duclouxi, P. Bodinieri, and P. repens. In "Bulletin de la Société Botanique de France" (1904), p. 211, the same author describes P. longicornu and P. Cavalerei. The other species are P. phillyreæfolia, P. villosa, P. nana, and P. Swinhoei.

W. Dallimore.

## PROPAGATION OF CHRYSANTHEMUMS.

An amateur gardener—and very much an amateur—once said to me that it was no trouble to grow chrysanthemums, for someone had given him some plants which had been on a rubbish heap all the winter, and they had grown and flowered well. This is on a par with the remark of another amateur that Shirley poppies would grow on a dust heap. Both statements are true, and yet very misleading, if made without qualification. With plants, as with children, it is a great thing to give them a good constitution to start with. In the rearing of plants of the hardy border, or early-flowering, chrysanthemums which are now so much in vogue, there are two main factors which determine the degree of success we attain to, and these are the old stools and the cuttings.

First, as regards the old stools. Viewing the old plants solely as a source of cuttings, it is a mistake to cut them down as soon as they have finished flowering, as the tops continue to strengthen the young shoots from the base for some time, often, in fact, until the former are finally cut off by frost. We speak of these chrysanthemums as hardy, but they can only be called so relatively to the choicer indoor varieties. Both severe and wet winters are alike fatal to them in the open ground, and in a damp season slugs are no less destructive, as it was the experience of a great many, perhaps most, growers on wet soils that they lost all their plants in the open ground during the winters of 1908-9 and 1909-10.

Some precautions must be taken, then, to secure a stock of plants to supply in the spring, and the nature of these must depend upon circumstances. In a light soil in a slugless garden they will be safe enough in the open in an ordinary winter, with, perhaps, some ashes round the crowns, and, if the weather becomes very severe, a little litter thrown over them lightly. On the other hand, in a wet, or slug-infested, garden, it is advisable to put a certain number of plants into pots in the late autumn, and keep them through the winter in a cold frame, which is made as nearly slug-proof as possible by the use of lime or soot, or both. If any have been grown as pot plants during the summer and autumn, these, kept in the frame during the winter, yield the best young stock. As a possible reserve some plants may be laid in under the shelter of a south wall, or even partially buried in one corner of the frame.

Care should be taken that the young growths from the base do not get drawn up and succulent, either through being too thick, or having too little light or air in the frame, as such material does not make good cuttings. The object should be to keep the young growth as short and sturdy as possible. To attain this some take up the best of the old plants in the autumn and plant them in an earth staging near the glass. Other growers like to have the old plants out in the open for a month at least before taking the cuttings in the spring, and it is undoubtedly a good plan if a look out is kept for a sudden sharp spell such as we often have in March.

Next, as regards the cuttings. The only ones to use are those originating from the part of the old plants below the surface, and the best of those which are already provided with some roots. The latter pieces may be taken off any time after the middle of March, and put in sixties, one in a pot, but the rootless pieces should be put near the sides of pots in the ordinary way, and, if too long, shortened to two inches or so, and cut clean through just below a leaf, the lower leaf, or leaves, on the remainder being removed before insertion in the mixture of loam and sand. Shoots originating from the portion of the stem above the ground are no good for cuttings, as they always show a bud soon after they begin to grow. When the cuttings have rooted they should be potted off before the roots have become matted together, as these are very brittle, and the plants suffer a considerable check in consequence if the rooted cuttings have to be pulled asunder. It is better to pot them off earlier even if it means the sacrifice of a few which have not yet made any roots. In about six or eight weeks from the time the cuttings are taken, they should be nice strong plants ready for putting out in their flowering positions. Those which are planted out early, say the middle of April, need carefully hardening off.

When plants have stood the winter where they flowered the previous autumn they should be taken up and not left a second year, as much better flowers are obtained from fresh plants. If taken up and divided, nice, young, rooted pieces may often be obtained without any old wood attached, and these make fine plants if planted at once in some well-cultivated ground. Cuttings may be taken any time during June, or even in early July, and the plants grown on in pots to be kept in a frame during the winter, when they furnish a good supply of material for propagation in the spring, and possibly also some late flowers in November. This method sometimes solves the difficulty of keeping the old plants through the winter.

Alger Petts.

**Iris fimbricata.**—This beautiful greenhouse iris is not grown as much as it deserves to be. Its delicate lilac blossoms are splendid for buttonhole wear; indeed, it rivals the famous Odontoglossum crispum for this purpose, and, bearing as it does a continuation of its flowers from the same spike it remains in perfection for a long period. The plants are now pushing their flower spikes freely. The cultivation of this subject is very easy. When the plants have done flowering, they are best repotted annually. It will be found they increase readily from growths which are pushed out freely from the base. They should be shaken out of the pots and pulled to pieces. For specimen plants select five or six of the strongest growths for a ten-inch pot, placing five near the sides and one in the centre, while one strong growth in a 5in. pot will suffice. The best compost is good loam two parts, decayed manure one part, and plenty of old mortar rubble broken up finely. When potted they should be placed in a frame and grown cool, giving plenty of water while growing. When the centre leaves have attained the same length as the others, water must be gradually withheld, and from October onwards the plants must be kept quite dry until the flower spikes can be felt rising in the centre of the growth. The secret of successful flowering is this complete rest. After October the plants will need the protection of a heated frame, and when showing flower should be removed to the conservatory.—Lewis Smith, Shotesham Park Gardens.

## FINELY-FLAVOURED PEAS.

(Concluded from page 176.)

### Sowing.

Much of the success in the after-cultivation of peas depends upon the amount of care taken at the time of sowing. A plan often advocated—namely, that of sowing two rows of peas some 6 or 8 inches apart and several inches from pea to pea in the rows—is not one which works out satisfactorily in practice. In sowing early peas it is always wise to give a liberal seeding, as the plants are never so robust as with late varieties, and they have much more to contend with as regards pests, such as birds, slugs, mice, etc. On light soils the trenches can be drawn out with a hoe to a width of eight inches, the seed sown, and the soil immediately replaced over it. Heavy retentive loams should, however, be forked over a day or so before drawing the trenches, while the latter should be exposed for a few hours during the day time in order that the soil may dry as much as possible before sowing.

The shallower peas are sown the better, although in the case of the early varieties it is well to place them at a greater depth than the main crop varieties or those sown from March onwards; by so doing, the tender seedlings are, to some extent, protected from frosts. Two inches is a suitable depth for March and later sowings, while those made in February may be placed at a depth of from 3 to 4 inches.

### Pests.

Immediately after sowing, precautions must be taken to protect the seed from the ravages of depredators, such as birds, slugs, mice, etc., for unless the latter are kept at bay the time and labour involved in sowing is set at naught, and disappointment will follow. Birds are a source of trouble, particularly where gardens are in close proximity to dwellings; the common practice of placing a few strands of black cotton along the rows is undoubtedly one of the best methods of scaring small birds, as when their wings come into contact with the invisible cotton they are readily scared. Soaking or damping the peas and sprinkling them over with red lead before sowing, although an old practice, is also to be recommended. Slugs are by far the most troublesome pests, and the plants require continuous attention until they are well above ground.

Repeated dressings of freshly slaked lime are useful for destroying slugs; one dressing, however, has little or no effect, as there is a sufficient coat of slime on their bodies to render this quite ineffective. The sprinklings of lime are best applied when the slugs are feeding or late in the evening and early in the morning. Mice are also an annoyance to the pea grower, and are usually more abundant in those gardens where there is ample accommodation for harbouring them. For effectually dealing with these pests, I know of no better method than the use of "break-back" traps; if sufficient numbers of the latter are used, and kept properly baited, there need be no fear of these little trespassers prove destructive to the crop.

### Staking.

While many of the dwarfer varieties of peas produce an abundance of pods without staking, it by no means follows that this is a practice to be recommended for those which attain to a greater height than 18 inches; and in wet weather even dwarf varieties suffer where no attempt is made to keep them off the ground. The proper time to stake peas is when they have attained a height of from 6 to 8 inches, at which stage the soil should be drawn towards the plants from either side of the rows. Hazel branches cannot be equalled for the purpose of staking; and these can be purchased at a very cheap rate in winter and spring when copse wood is being cleared. In the North of England, where less hazel is grown, branches of beech trees are more commonly used, while in town gardens the plants are generally supported by means of wire supports or trellis work. If young plants are allowed to become "laid" or broken down, they do not completely recover from the check thus received. There is no prettier sight in the kitchen garden than to see neatly staked rows of peas, and this work can only be successfully accomplished where care is taken in the grading of the sticks or branches to be used; also to see that the latter are placed at a proper angle in the ground and the tops neatly cut and levelled off.

PEA LORD KITCHENER.

A first early wrinkled marrow remarkable for earliness, heavy cropping, and high quality, introduced by Messrs. J. K. King and Sons.

---

**Peristrophe speciosa.**—Many acanthaceous plants flower during the winter months, and this peristrophe, known also as Justica speciosa, is one of them. It is a plant of quick growth, and, potted into six-inch pots, it soon forms a bushy specimen a couple of feet or so in height. The flowers are of a bright purple colour. In many parts of India this peristrophe is, I understand, a perfect weed; but in this country it is well worthy of consideration where winter-flowering plants are in demand.—W. T.

## ROTHAMSTED EXPERIMENT STATION.

The annual report by Mr. A. D. Hall, F.R.S., on the work accomplished at the Rothamsted Experiment Station during the past year is, as usual, of much interest, especially to those who are engaged in agriculture. It shows that both the director and the members have been active, not only in the conduct of experiments on the lines which have made the station famous throughout the civilised world, but in carrying out others of a somewhat different character that promise to be of far-reaching importance to those concerned with the various branches of horticulture.

There is a full report on the experiments with farm crops, and with reference to investigations in connection with garden crops it is stated that at the laboratory the pot experiments on the continuous growth of plants in the same soil have been continued for another season without as yet any conclusive results, and the same statement might be applied to the experiments upon clover sickness. The vegetation house was very largely given up to a new series of experiments on the treatment of "sick" greenhouse soils, which have become unfit for the continued growth of crops after two years' use in the greenhouse, though they are still exceptionally rich in plant food. Methods of treating the soil by heating to various temperatures and by the use of antiseptics were tested with satisfactory results, and a method for dealing with soil on a commercial scale has been worked out, which is being extensively tested. It seems likely that at a very small cost the growers of tomatoes and cucumbers under glass may be saved from what has hitherto been the expensive necessity of frequently renewing their soil. Dr. Russell and Dr. Hutchinson, with Mr. Petherbridge, have been studying in detail the chemical, physical, and biological changes brought about in the soil by the treatment, and the results are almost ready for publication. Dr. Russell has also been extending his work upon the part played by the protozoa in the production of sewage-sick soils and the effect of partial sterilisation in restoring their activity. This work has been undertaken in connection with Mr. J. Golding on sewage farms at Kegworth and Kingston, and a very considerable measure of success has been attained by the treatment.

The experiments on the toxic and stimulating effects of small quantities of various mineral substances were continued, and a series of experiments were begun on the growth of plants in extracts of the soils from the experimental plots. These latter trials have yielded some very striking results, which are to be repeated and extended in the coming year. Another series of experiments dealt with the growth of plants in nutritive solutions of various concentrations, either as water cultures or with the nutritive solution added to sand so as to keep the soil moist but not wet. In all cases growth was found to be proportional to the concentration of the solution, even though the solutions were regularly renewed and always provided the plant with an excess of nutrients. It was also found that the soluble nutrients could diffuse with perfect freedom along the thin water films coating the grains of sand, and that there was no retardation of growth even when the nutrients were enclosed in porous pots inside the sand, so that they were forced to travel by diffusion before they could reach the plant's roots. Further experiments on this subject are projected for the coming year.

Dr. Brenchley resumed her study of the weeds of arable land, taking this time a district on the borders of North West Wiltshire and Somerset, which gave her a range of formations including some of those that were dealt with in her work of 1911 on the soils of South Bedfordshire. It is interesting to find that the association of particular weeds with particular soils which prevailed in South Bedfordshire did not always hold for the same formations and weeds in the new district. In Bedfordshire, a distinct association was found to exist between some of the species and the soils upon which they grew, but the determining factor proved to be the texture of the soil, except in the one case of the calcareous soils derived from the chalk.

---

## GARDEN CITY PROBLEMS.

(Concluded from page 161.)

### Types of Garden Cities.

There are three distinct types of Garden City, and as to which of these is the ideal type there may be difference of opinion. A great deal must depend on local and other circumstances. We have, first, the older cities and towns, with their centres of civic life, and their outlying garden suburbs; secondly, we have the complete industrial town with its sites for public works, and its civic buildings, etc., laid out on a complete Garden City plan, such as Letchworth, Bournville, Port Sunlight, etc.; and, thirdly, we have the simply garden village, such as New Earswick. From a health point of view, there doesn't seem to be much to be said for the one in preference to the other, provided there is no overcrowding of the dwellings, for the death-rate per 1,000 at Bournville (5.7) is not a great deal lower than that of uncrowded Kelvinside (7.7.); but when we compare it with crowded Cowcaddens (24.3), the contrast is very striking. But to whichever of these types the Garden City belongs, it is essential that it be well planned. There must be economy in everything. There must be no wasteful expenditure on unnecessarily winding streets or roads, but at the same time, the lay-out of the streets is a matter of much importance when considered in relation to the prevailing winds. Long, straight streets running in the direction of the prevailing winds, especially if the buildings be high, are not favourable to tree growth, and street trees are one of the most essential features of the Garden City. Many of you, no doubt, have heard of, and some of you may have seen, the "ringed" streets of Cologne, Weisbaden, or Frankfort. It is said that the planners of these towns adopted this system of laying out these streets in order to check wind currents, and it certainly must have a considerable effect in this way.

Another objectionable feature in the Garden City is the presence of high buildings amongst the cottage dwellings. These form wind blocks, and they do immense mischief to vegetable life in their vicinity. In fact, so well aware are the German town planners of drawbacks of this sort that they always endeavour to place factories and other high buildings in such positions that this will not happen, and that the smoke discharged from them will not be carried over the town. Other things essential to the success of a Garden City are a reasonably good soil, and a fairly pure atmosphere, and, above all, there must be no crowding of the dwellings, and there must be plenty of open space.

As to the particular lay-out which should be adopted, this will, of course, vary according to circumstances; in this, as in the designing of the dwellings, and in everything else connected with it, the charm of the problem is, as Lord Pentland remarked in his address at the Town Planning Exhibition in Edinburgh in March last, "its many-sidedness." But the chief charm of the problem, it seems to me, lies in the fact that it is the only possible system of housing of the working classes (who, with few exceptions, have nothing to look to at present but a tenement house), which will provide a good, healthy environment, which is absolutely necessary to prevent degeneration of the race.

Nowadays, we hear a great deal about school gardening in connection with the education of our children, and a very laudable effort is being made by the "Open Spaces Committee of the Outlook Tower" to convert waste spaces in the old town of Edinburgh into gardens for the people; and quite recently a proposal was made to establish garden allotments in the Gorgie district. There can be no doubt about the propriety of instilling into every boy and girl by a little practical demonstration, no matter what walk in life he or she may afterwards tread, a love for gardening, and it can have nothing but an elevating influence, if nothing else, on the minds of our slum children, to draw them from the streets into these open spaces, in order to, if possible, give them a little interest in the art; but in our Garden City all this would be part of their existence.

The allotment idea is all very well in a way. To the town dweller who, perforce, has to live in one of these tenements I have been alluding to, the allotment affords a means not only of indulging in a hobby, but of providing healthy recreation for both mind and body; but, to my mind, the allotment is only a makeshift at the best. The tenant himself may benefit, but as the allotment must of necessity, in the majority of cases, at any rate, be at some distance from his home (and the distance will generally be found to be greater or less, according to whether he happens to live in a more or less densely populated part of the City), it cannot afford much in the way of facilities for obtaining fresh air and healthy enjoyment to his wife and family.

Given cheap land and cheap and rapid transit, I have said that all the other difficulties would vanish. Let me now refer for a moment to some of the advantages we now enjoy in the possession of plant materials of all kinds compared with what our forefathers had. Never was there a time in our history when the plant materials necessary to produce our ideal Garden City were more plentiful or more easily obtained than at present. We have now a wealth of hardy flowers and shrubs, which were unobtainable, and in many cases unknown, 50 years ago. I need only mention the decorative roses and chrysanthemums, the new types of sweet peas, and the hardy herbaceous plants and bulbs which are now easily obtainable by all, and which can be grown by the humblest cottager.

It has often been remarked that in Scotland the working classes are far behind their English brethren in the cultivation of flowers, fruits, and vegetables, but I believe the reason for this difference is largely due to the different conditions under which they are housed, though no doubt there are other reasons. But all this will, no doubt, soon be changed when we adopt the Garden City plan of housing, which, after all, is based in its inception on "the cottage homes of England." I can conceive nothing which would have such a potent influence in the bringing about of more temperate habits in the people, which would lessen vice and crime so much, which would, I believe, have such an influence in staying that mad rush after sport which seems to have seized our youth, and even some of our elders, in our large towns, than the cultivation of a taste for gardening, and the opportunity to prosecute it in one's own ground, for which the Garden City offers such an inducement. Not that I condemn sport as such, for in our Garden City we would have cricket and football fields, tennis courts and bowling greens, and every facility for healthy recreation by both old and young. But the mode of life would certainly have a steadying influence on our youth, and in what more delightful way could the artizan spend his leisure time than in his garden? What more wholesome influence could he exert on his children, to say nothing of the benefits which they would derive from it otherwise, than in the cultivation of his plants and flowers. How else can we expect to rear healthy, self-respecting, self-reliant citizens in our large towns than by such means?

We hear much of the cry, "Back to the Land." It seems to me now that we have got an Agricultural Small Holdings Act that the Garden City question has assumed a position of greater importance than ever; for it is on the outskirts of the Garden Cities, as at Letchworth, that these small holdings are more likely to prosper than in the more outlandish and more inhospitable parts of the country.

## EUPHORBIA FULGENS.

Euphorbia fulgens, or E. jacquniæflora, to give it its more popular name, should be cut back to about half its height after flowering, and kept in a house having a temperature of 55 to 65 degrees, and watered only if necessary to keep the stems from shrivelling.

About the middle of March begin to syringe the plants daily in bright weather, closing the house so that with sun heat the temperature reaches 75 to 80 degrees. Ventilate at 65 degrees, increase it at 70 degrees, and again at 75 degrees, shading only if the temperature exceeds 80 degrees. Cuttings produced under these conditions will root more readily than if grown in a close, shaded house.

Cuttings may be taken in April, May, and June, when about three inches in length; they should be cut cleanly, with a slight heel, and inserted in saucers filled with silver sand which has been previously watered; place in the propagating frame in a temperature of 70 to 75 degrees, keeping them close and shaded during the day with just a crack of ventilation at night, if necessary, to prevent damping. In a fortnight or three weeks, they will be ready for potting into 3in. pots, using a compost of four parts loam, two of leaf-mould, two of peat, and one each of sand and ashes from the garden rubbish fire; pass the whole through a half-inch sieve. After potting return the little plants to the propagating frame, and keep them close. Syringe lightly occasionally, but do not give water. It is remarkable how little watering they require at this stage; we have frequently potted euphorbias into 60's, and transferred them to 48's for a fortnight, before water, other than that received by light syringings, has been necessary.

When rooted through the 3in. pots, remove the plants to a house having a temperature of 60 to 65 degrees at night, keeping them rather close until settled in their new home. From now onward through the growing season a little night ventilation is beneficial; give shade at 70 degrees, increase ventilation at 75 degrees, and as often as is necessary afterwards to keep below 80 degrees, reducing it as the temperature recedes, closing the house, and removing shading when about 80 degrees is reached, at the same time syringing lightly and damping the house.

When ready transfer to 4½ or 5in. pots, using compost as before, but well broken up instead of sifted; pot firmly. When well established euphorbias should be removed to a cooler house and given plenty of room, standing them on a damp base; increase the ventilation, and lightly shade at the temperature before mentioned; this, of course, will be comparatively cool treatment, as by this time (July or early August) we shall have much warmer weather.

Place the larger plants into 7in. pots, and the smaller into 6in., using the same kind of compost, but do not add artificial manure; pot quite firmly, and keep closer for a few days afterwards. When well established in these pots a little plant food may be given occasionally. By the end of September the plants will require very little shade, though, if not carefully inured to the sun they will probably flag somewhat.

From now throughout the winter the plants will require a temperature of 55 to 65 degrees by night, and 60 to 70 degrees by day, with sufficient fire heat and ventilation to keep up a buoyant atmosphere. At all times, water should be carefully applied.

Hatfield Gardens.

PEA DREADNOUGHT.

A handsome, finely flavoured and productive maincrop variety, introduced by Messrs. James Carter and Co.

## WORK FOR THE WEEK.

### THE ORCHID HOUSES.

COOL HOUSES.—At the warm end of the cool house, or in a house which is slightly warmer than where the odontoglossums are grown, quite a lot of plants will succeed. Amongst them are Dendrobium Kingianum, D. K. album, D. delicatum, D. linguæforme, D. Hilli, D. speciosum, and its variety fusiforme, which bloom very profusely at this season, and are very attractive. These thrive well in shallow pans, suspended near the roof glass, and as they root chiefly on the surface, the compost should not be too deep, and the pans should be quite half-filled with crocks. They will succeed in the compost previously recommended for imported dendrobiums. The proper time to afford new rooting material is when the new growths make new roots, but as these growths do not extend themselves very far, the plants, if allowed a reasonable space wherein to grow, need not again be disturbed for some time, provided the compost is sweet, and in good condition. D. Victoria Regina will also succeed under the same conditions.

ONCIDIUM PULCHELLUM is another of these little gems, and the plants are now commencing to grow again, and will need more water at the roots; the flower spikes will soon begin to show, and, as these take some time to develop, the plants should be placed near the light. In our houses it is essential that the inmates should enjoy all the light possible, especially during the dull months of the year.

PLEUROTHALLIS ROEZLI is another orchid which will thrive under similar conditions, and, having just passed out of bloom, may be repotted, should this be necessary, in a compost suitable for masdevallias. This is largest and the most striking species of the genus.

EPIDENDRUM (NANODES) MEDUSÆ is another quaint and singular orchid which will succeed under the above conditions, suspended from the roof, where it receives a free circulation of air at all times. This and the pleurothallis have no pseudo bulbs to support them, so should at no time be allowed to suffer for lack of water.

ODONTOGLOSSUM GRANDE, O. Insleayi, and O. Schlieperianum will succeed in a similar position, but these are now at rest, and should not be repotted until the new growths are forward and about to produce new roots. Small yellow thrips often infest this group, therefore the plants should be periodically sprayed with a weak solution of insecticide, and vaporised from time to time as a preventive measure.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

CARNATIONS.—The Malmaison carnations are now growing freely. Plants that were potted into 32's in the autumn, and have now become well rooted, will need more moisture at the roots. It will be noticed the plants are producing shoots freely from the axils of the leaves simultaneously with the centre stem or flower spike; Malmaisons should not be pinched with a view to produce bushy plants, as with tree varieties, or it will be at the expense of flowers. Each plant should be supported by a neat stake, and as the flower spike advances it should be neatly tied and disbudded to a single crown bud. Fowl manure, and sheep or deer droppings, in liquid form, are excellent stimulants. There are also many artificial manures for the purpose. All stimulants must be given sparingly at first, gradually increasing their strength as the flower spikes develop. Stock plants potted last year with a view to making specimens are now also pushing their flower spikes. These should be staked and disbudded. Malmaisons resent coddling; they like a light, span-roofed house, with a temperature of about 50 degrees at night, up to 60 by day, with a current of air always passing among the plants. The bottom ventilators should never be closed night or day (except in extremely cold weather). This will encourage a sturdy growth, the leaves will curl, and a heavy bloom appear on them. Greenfly is the worst enemy, but vaporising occasionally will keep the plants clean.

BORDER CARNATIONS.—Where border carnations will not do satisfactorily it is a good plan to grow the glorious Cecilia and the huge crimson King Arthur in pots and treat them similarly to the Malmaisons. Lady Hermione and Trogan also are splendid grown in pots. In fact, any good border varieties that were potted into 60's, and wintered in a cold frame, if placed, three plants of a variety, in 9in. pots, will make a fine show just before the Malmaisons come in.—Lewis Smith, Shotesham Park Gardens.

IMANTOPHYLLUMS OR CLIVIAS. — These are among our most useful plants for the conservatory during the spring months, and they are splendid for house decoration. Their cultivation is very simple. Plants that are in bloom now will require plenty of water, and liquid manure is very beneficial. After they have passed out of bloom they should be liberally treated, and a cool greenhouse or warm frame suits them admirably. It is always best to confine the roots somewhat, as this tends to free flowering. Should any plants need a shift they may be potted directly their flowers are over, or cut. If the centre of the crowns are bare the specimens are best divided. Cut the rhizome through with a sharp knife, and pull the portions apart, but avoid damaging the thick fleshy roots as much as possible. Repot at once, using suitable sized pots, and a compost of three parts loam, one part coarse sand and mortar rubble, adding dried cow manure. From October onwards water should be almost withheld, and the plants receive a rest until the flower spikes appear in spring.

HUMEA ELEGANS.—This graceful subject is not grown so freely as it deserves to be. For grouping it is unsurpassable. Generally speaking, they are biennials; for, although some plants will run to bloom the first year, the second season they are seen at their best when the plants have grown into fine specimens, attaining a height of 5 to 6 feet. Their peculiar odour is appreciated by many. Seeds should be sown at once, in a pot or pan, in a compost of finely sifted loam, leaf-soil, and sand; place the pan in a warm house, and cover with a piece of glass. So soon as the young plants are large enough they should be potted into 60's, and grown steadily. Place them in a warm frame on an ash base, and repot as they require it. Loam, leaf-soil, and coarse sand suits them well. In February the large plants should have their final shift.—Lewis Smith, Shotesham Park Gardens.

## HARDY FRUITS.

FIGS.—In the warmer parts of the country it will be fairly safe to give attention to fig trees grown on walls, but in colder and more exposed districts it will be advisable to defer the work to the latter end of the month. When pruning the trees it must be borne in mind that the fruit is formed on the tips of the past year's growth, and it is therefore essential to preserve and lay in those growths which show the best signs of giving a crop (the embryo fruits can easily be noted). Frequently fruits swell away in late summer and remain on the tree until the spring, but such fruits are of no value, and should be rubbed off. Figs resent hard pruning, and with trees which have received due attention in the way of summer pinching and the removal of superfluous growths, it will only be necessary to thin out weedy or other faulty growths and lay in the most promising shoots; overcrowding should be avoided; allow a space of 9in. at least between the bearing wood. As it is desirable to cover the wall space with fruiting growths, young shoots from the base of the tree should be laid in to take the place of older growths; where there is a sufficiency of young growths it is the best plan to cut out some of the older wood, as it is on the young and vigorous growths the finest fruits are produced. Outdoor fig trees are seldom troubled with insect pests. White scale sometimes is found, and if allowed to spread and multiply will seriously affect the trees and fruit. As a remedy for this pest, apply forcibly with a syringe or spraying engine, hot water at a temperature of 145 degrees; if the scales are numerous a second application may be necessary. This should be done before growth commences, or the young tips may be injured. Two or three applications of a strong solution of soapy water are usually effectual, and there are several insecticides on the market which may be used if desired.

PLANTING FIG TREES IN THE OPEN.—When planting young fig trees means must be taken to restrict the roots, for if allowed an unlimited root they will make far too much growth, and fail to fruit satisfactorily. As to soil, the fig is not fastidious, but prefers an open, well-drained rooting medium. Old mortar or plaster rubble and wood ashes should be incorporated with the soil. Firm planting will ensure short-jointed and fruitful growths. Old trees, if growing too vigorously, and failing to crop, should be root-pruned and kept within bounds. Bush trees require but very little attention, merely cutting out a branch here and there where there is an excess of growth.

BIG BUD IN BLACK CURRANTS.—Last year I had a number of black currant bushes so badly infested with big bud that they were condemned to be burnt; but, noting Mr. Pearson's recipe for this pest in the Gardeners' Magazine, I was desirous of testing its efficacy, and sprayed the bushes with quassia extract five times—twice in March, twice in April, and once during May, at intervals of a fortnight. The results were gratifying; there was a good crop of currants, the fruits clean and bright, and, although the bushes are not free from big bud, the attack is slight in comparison to that of last year. I hope by further spraying to practically clear out the pest. I would certainly advise those who are troubled with big bud to give it a trial.—W. Messenger, Woolverstone Park Gardens, Ipswich.

## THE KITCHEN GARDEN.

MAINCROP ONIONS.—As soon as the ground is in a workable condition, this crop should be sown without delay. The onions prefer a long season of growth, and when the seedlings are up early they withstand the attacks of the dreaded onion fly much better, being larger and therefore stronger. If the site is rather wet, a good dressing of burnt garden refuse direct from the heap will help the surface wonderfully, preventing it from kneading. Little time will be required on the plot if it was previously prepared, and the surface left rough; simply break it down with a fork, level, make firm, and rake the coarse stones off; square the bed, and then draw drills one foot apart and an inch in depth. After covering the seeds, rake down parallel with the lines. A wooden rake is preferable, as it leaves the soil rough, and therefore prevents a caked surface, which would hinder and cripple the growth of the seedlings. Main Crop, Improved Reading, and Long Keeping are good varieties, and will give a continuous supply. After-treatment will consist of regular hoeings and an occasional dusting of soot.

VEGETABLE MARROWS. — These are much appreciated when obtained early. The seeds must be sown in a temperature of about 60 degrees, placing each seed in a small 60-sized pot. Shift the plants into larger pots as required, eventually planting them out on a mild and gentle hotbed in a light compost, consisting of equal parts of loam and spent mushroom-bed manure, with a little leaf-soil and mortar rubble added. Other plants may be placed in boxes and large pots, training them up trellises in an intermediate house should room be available. Pen-y-byd and Table Dainty are excellent for early crops.

CELERY.—By the middle of the present month the main batch should be sown in boxes in a very gentle heat; use soil of a light, sandy nature, and just cover the seeds. If preferred, and a large batch has to be raised, the seeds could be sown on a mild hotbed in frames, making the soil level and firm. Keep the frame lights closed till germination takes place. Sulham Prize and Standard Bearer are first-rate main-crop varieties, the last-named standing better and later than any variety. Celery sown early must be pricked off into boxes filled with a light, sandy compost, and placed in gentle heat.

LETTUCE. — Those sown during the autumn and wintered in rough frames should now be planted on sheltered borders in a rich soil, as no crop responds more readily or pays better when given good treatment. Should good endive not be plentiful, the forward plants of lettuce should be transplanted into warm frames, and give every inducement to hasten growth by light sprayings on fine days, and closing the frames early to husband the sun heat. We find Stanstead Park to be one of the best varieties, and very hardy, large, and of excellent flavour. Continue to prick off spring-sown seedlings in boxes and frames. A small sowing should now be made outside for succession, Commodore Nutt being a good and quick variety for this purpose.

POTATOES. — Plant another batch of sprouted tubers in a skeleton frame for succession, taking great care to protect them whenever frosts appear.—G. Ellwood, Swanmore Park Gardens.

SOUTHAMPTON ROYAL HORTICULTURAL SOCIETY.

GREAT JUBILEE SHOW.
JULY 16 and 17.

£250 in Prizes for Carnations, Sweet Peas, Plants, Miscellaneous Cut Flowers, Fruit, and Vegetables.

Schedules of
C. S. FUIDGE, Secretary,
7, Silverdale Road, Southampton.

THE HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY.

THE TWENTY-FIRST SHOW
of the above Society will be held in the CITY HALL, VICTORIA SQUARE, HULL, on WEDNESDAY and THURSDAY, 20th and 21st NOVEMBER next.
Schedules Free.
JAMES DIXON,
County Buildings, Hull, Hon. Secretary.

NATIONAL VEGETABLE SOCIETY.

Schedule of Classes and Prizes offered at the Society's
GREAT EXHIBITION OF VEGETABLES,
to be held in the
CLARENDON HALL, WATFORD, OCTOBER 2 next,
are now ready, and can be had on application to
E. G. QUICK, Hon. Sec.,
Kelmscott, Harrow View, Wealdstone, Harrow.

THE PERPETUAL-FLOWERING CARNATION SOCIETY.
GREAT SPRING EXHIBITION, THURSDAY and FRIDAY, March 21st and 22nd, 1912, HORTICULTURAL HALL, VINCENT SQUARE. Nine Silver-gilt and Silver Challenge Cups offered for Competition. Special Classes for Amateurs. Also Conference on Carnations (First Day of Show), March 21st., at 3.30 p.m. Admission 1s. For schedules, etc., apply E. F. HAWES, Ulysses, Fortune Green, London, N.W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

Every foot of available space in the Society's Hall at Vincent Square, Westminster, was filled with exhibits on Tuesday and Wednesday, March 5 and 6, and during a very considerable part of the first day there seemed to be no room to get another Fellow or visitor in the hall, and the crowd moved slowly in a solid mass. Even at twelve o'clock there was a very large attendance. Tempers got somewhat frayed in the crush, and time after time the complaint was made that "the hall was not half large enough." Much to their annoyance, the orchid people, with the exception of the Messrs. Cyphers, were ousted from their favourite annexe, and they did not like having to give place to hyacinths.

Orchids were finely represented, and tulips, hyacinths, and daffodils were present in considerable force. Alpine and other hardy flowers, Indian azaleas, and carnations were other prominent subjects staged.

On this occasion a few classes were provided for hyacinths, and for daffodils and tulips grown in fibre; the competition was very keen, and this part of the exhibition was itself of considerable size, and deserved more space than it received.

Novelties were not numerous, Corylopsis multiflorus being the most striking new subject on view.

An exhibit that attracted a great deal of attention was the low rock garden, arranged by Messrs. R. Wallace and Co., Colchester; Iris bucharica, Primula denticulata alba, Pulmonaria augustifolia azurea, Fritillaria imperialis chitralensis, Saxifraga apiculata, Tulipa Clusiana, erythroniums, and hardy heaths were represented by good colonies. The Burton Hardy Plant Nurseries, Christchurch, presented a small rock garden exhibit. Hepaticas, white and blue, various primroses and anemones, double adonises and numerous saxifragas made up a pretty little group from Messrs. Bakers, Wolverhampton. Mr. Maurice Prichard, Christchurch, exhibited Primula cashmeriana Riverslea finely, and had hepaticas, Orobus vernus atropurpureus, and other pretty things on view. Messrs. G. and A. Clark, Dover, again exhibited the blue-green junipers to which we recently referred, and with these staged coloured primroses, Pulmonaria saccharata, Iris stylosa, etc. Iris sindjarensis, Trillium grandiorum and T. g. roseum, hardy heaths, and Bletia hyacinthina were shown among other hardy flowers by Messrs. Thos. S. Ware, Lim., Feltham.

Very beautiful was the little rock garden display made by Mr. Clarence Elliott, Six-Hills Nursery, Stevenage. On this were lovely sheets of Saxifraga apiculata, S. oppositifolia alba, S. Boydi, the splendid S. Burseriana Gloria, S. oppositifolia splendens, S. Elizabethæ, and a few other fine subjects. A delightful little group of early spring flowers from Messrs. Barr and Sons proved very attractive. Iris reticulata, Rhododendron præcox, and a charming lot of crocuses and saxifragas were included.

Alpine plants and other hardv early flowers were also submitted by Mr. G. Reuthe, Keston; Messrs. Whitelegge and Page, Chislehurst; Messrs. Thompson and Charman, Bushey; Mr. Pulhams, Elsenham; Mr. J. Box, Lindfield; and Messrs. J. Peed and Sons.

Corylopsis multiflora (A.M.), with catkin-like drooping spikes of yellowish-green, was shown by Mr. Fielder, gardener to Miss Willmott, Great Warley, Essex, and promises to be a useful and attractive early-flowering shrub. Himalayan rhododendrons were beautifully staged by Messrs. R. Gill and Sons, Falmouth, and the brilliant rosy-crimson variety Cornubia gained an A.M.; R. Thomsoni, R. Duchess of Cornwall, and R. barbatum, were also well shown, and the new Primula Winteri was again on view. The new Ribes laurifolium, with its pendant spikes of green flowers, was again exhibited by Mr. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree.

Messrs. S. Low and Co., Enfield, contributed greenhouse-flowering plants, and so did Messrs. Jas. Veitch and Sons, Chelsea, the latter staging a fine blush-pink Indian azalea, named Blushing Bride (A.M.), and some superb cyclamens and hybrid greenhouse rhododendrons. Indian azaleas were very largely exhibited by Messrs. Jas. Veitch and Sons, Chelsea, in a separate group, and it would appear that these very free-flowering greenhouse plants are again coming into popular favour; deutzias, viburnums, prunuses, and wistarias flanked the azaleas.

Against a background of glossy-leaved, freely-flowered camellias Messrs. W. Paul and Son, Waltham Cross, set up particularly beautiful plants of double white, double pink, and double carnation-flowered; and double crimson peaches, as well as double almonds; all these were smothered with exquisite flowers, and were greatly admired. A solid bank of Indian azaleas, representing a great range of varieties and colouring, provided a brilliant display from Mr. L. R. Russell, Richmond.

Messrs. W. Cutbush and Son, Highgate, presented a fine lot of perpetual carnations, and a delightful lot of forced early-flowering shrubs, these latter including the lovely Prunus trilobia, lilacs, magnolias, and mollis azaleas. The same firm had also a goodly group of hyacinths. Lilacs in pots, staged by Messrs. Paul and Son, Cheshunt, were delightfully fragrant, and the spikes of Marie Legraye and Belle de Nancy attracted no small amount of attention.

Mr. H. Burnett brought over some splendid carnations from Guernsey, and put up May Day, R. Felton, White Enchantress, Gloriosa, and Mrs. H. Burnett in grand style. Carnation Coronation was largely staged by its raiser, Mr. B. Bell, Castel, Guernsey. A bold display of perpetual carnations from Mr. C. Engelmann, Saffron Walden, contained rare blooms of Mrs. C. W. Ward, Carola, Prince Charming, and Lady Northcliffe.

The Hon. Lady Neeld, Duchess of Devonshire, Mikado, Mrs. Greswold Williams, and Winsor were perpetual carnations admirably shown by Messrs. Young and Co., Hatherley, Cheltenham. Messrs. Allwood Brothers, Haywards Heath, exhibited perpetual carnations in great variety, and staged these in fancy vases in good style.

A spring flower garden set out artistically by Messrs. Jas. Carter and Co., Raynes Park, was a centre of attraction all day. In front of a background of cupressus, small cedars and other conifers, this firm set up a low rockwork filled with daffodils and other bulbous flowers. Into two pools water trickled all the time, and this with the lovely green grass was pleasant to turn to from the masses of colour round about. In the centre was a raised vase of tulips set in a bed of blue hyacinths; circular groups of rosy hyacinths occupied positions at either end, while yellow and white crocuses encircled the water pools.

A pretty exhibit of hyacinths from Messrs. Sutton and Sons, Reading, was arranged so as to show charming combinations of colours by way of suggestion for future planting; the groups were of dark and pale blue, deep pink and salmon pink, dark blue and cream, pale blue and pale pink, red and cream, deep pink and dark blue, cream and pale blue, and mauve shades.

Hybrid gerbera flowers of exquisite beauty were finely shown by Mr. H. N. Ellison, West Bromwich; the colour range of these lovely and elegant blooms was from pinkish-white to deep crimson, the yellow and pink shades being very delightful. Mr. Ellison also showed freesias in variety.

Mr. J. Dickson, gardener to Adeline Duchess of Bedford, exhibited finely-grown plants of a splendid strain of Primula obconica, some of the deeper colours being especially fine. Freesias, well grown and charmingly sweet-scented, were exhibited in some quantity by Mr. H. Brotherston, Knebworth, Herts. Messrs. H. Cannell and Sons had a blaze of zonal pelargoniums, and Messrs. W. Wells and Co., Merstham, contributed perpetual carnations, and Messrs. H. B. May and Sons staged clematis and ferns.

### ORCHID COMMITTEE.

Another superb exhibit of orchids, arranged with the usual taste by Mr. H. Alexander, grower to Lieut.-Colonel Sir George Holford, Westonbirt, Tetbury, Gloucester, was a striking and beautiful feature of the show. Not one plant exhibited in the Gold Medal group of the fortnight previously was present in this display. Odontoglossums and large branching sprays of phalænopsis, with tall spikes of white Lælia anceps, formed a beautiful background for a grand lot of cattleyas and lælio-cattleyas. The central specimen plant was of the famous Cattleya Trianæ Hydra, carrying sixty flowers; of C. Trianæ there were sixteen fine varieties, C. T. Colossal and C. T. Prince Rupert being extra fine. C. Maggie Raphael var. Flambeau, the handsome and large C. Percivaliana Westonbirt var., and C. Brenda were all fine, as were Brasso-cattleya Thorntoni Colossal, B.-c. Enterpe Westonbirt var., the yellow Lælio-cattleya Cranstoniæ Holford's var., L.-c. Arbaces, the new L.-c. Voltaire, Sophro-lælia Psyche, the distinct yellow Odontoglossum Canary Bird, and Phalænopsis Schilleriana, with 84 flowers on one spike.

In Messrs. S. Low and Co.'s group of orchids we noticed Odontioda Bradshawiæ, Cymbidium insigne, white forms of Cattleya Schroderæ Cœlogyne panduata, and other good things. Messrs. James Veitch and Sons, Chelsea, submitted a considerable group of orchids, and their collection included the fine Brasso-cattleya Digbyano-Mendeli, the graceful Odontoglossum Dora, Cymbidium insigne, Dendrobium spectabile, Pleurothallis Roezli, Cypripedium macrochilium, C. Thomsoniana, etc., etc.

Messrs. Armstrong and Brown, Tunbridge

RAFFIATAPE.—To pass off green corrugated tape (that rots and fades) for this is to sell old seed as new. Raffiatape is bound with strong unfadeable cotton, which gives it great strength, durability, and, being two colours, it is never unsightly. Plants are as quickly tied as parcels, as it expands with growth. 1d. coils (ties up 150 plants); 6d., 1s., and 1s. 6d. reels. Samples and catalogue of all garden sundries.—C. E. WEST, Higham Hill, London, N.E. Please ask your seedsman for West's Patent Garden Sundries.

Wells, presented a large and beautiful exhibit of orchids, and these consisted of odontoglossums and odontiodas and dendrobiums in great variety. A few of the former, of special note, were O. ardentissimum, O. armairvilliersense, O. crispum, and various hybrids. Brasso-cattleya Schroderæ-glauca, Cypripedium Baron Schroder, Lælio-cattleya Warnhamense, Brasso-cattleya Leemanæ, Miltonia Bleuana, Dendrobium nobile virginale, D. n. Rappart, D. Chessingtonensis, D. Apollo, and D. Melpomene were all finely represented, while Cypripedium Boltoni, C. Cowleyanum, and C. Venus Orchidhurst var. were also of special interest.

Mr. White, grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, showed a fine Cymbidium Colmaniæ Edenside var., with five lovely spikes of white flowers. Mr. Carpenter, West Hall Gardens, Byfleet, gained a Cultural Commendation for a very fine Angræcum sesquipedale. Cymbidium grandiflorum was grandly shown by Mr. Collier, gardener to Sir J. Colman, Bart., Gatton Park, Reigate, and this carried a spike of fifteen big blooms; dendrobiums from Gatton were also well shown, and D. Golden Ray superba (A.M.), yellow and purple, was very pretty

Messrs. Charlesworth and Co., Hayward's Heath, had Odontoglossum Ashworthianum, O. armairvillierense xanthotes, a beautiful O. ardentissimum, the white Cattleya Trianæ alba floribunda, Brasso-cattleya Queen Alexandra var superba, and a fine Odontioda Cooksoni. F. M. Ogilvie, Esq., Shrubbery, Oxford, showed a freely-flowered and elegant Odontoglossum Valeria, Cypripedium Euryades rubrum, etc.

The Hon. Lady Neeld, Grittleton, showed a beautiful Odontoglossum percultum. Mr. G. Day, gardener to H. S. Goodson, Esq., Putney, presented the brilliant Odontoglossum ardentissimum Dayanum, and a fine Odontioda Diana. Messrs. J. and A. McBean, Cooksbridge, Sussex, had several very beautiful odontoglossums, and a particularly fine form of Odontioda Charlesworthi. Messrs. Cypher and Sons, Cheltenham, put up Masdevallia macrura, Odontioda Charlesworthi, Dendrobium nobile virginale, the big Cypripedium Masterianum, and the graceful Angræcum citratum. Messrs. Hassall and Co., Southgate, had a rare display of Angræcum sesquipedale, carrying about twenty-seven flowers; Cattleya Empress Frederick and some good forms of C. Trianæ were included in the group. Messrs. Sander and Sons, St. Albans, had such interesting orchids on view as Dendrobium speciosum, Cœlogyne flaccida, Renanthera Imschootiana, the pretty Phalænopsis Stuartiana, etc.

## DAFFODIL COMMITTEE.

Messrs. Cartwright and Goodwin, Kidderminster, had a bright exhibit of daffodils, the flowers clean, and of fair size; Circlet, Weardale Perfection, Amazon, Mervyn, Long Tom, Horace, the double Red and Gold, and Lady M. Boscawen were charming varieties. Mr. F. Herbert Chapman, Rotheside Gardens, Rye, put up a pretty exhibit of daffodils, chionodoxas, and squills. Among new daffodils he had the White Madonna, Mrs. Veitch, Albatross, Alabaster, Whitewell, and Acme.

Messrs. R. H. Bath, Lim., Wisbech, showed how well tulips and hyacinths can be grown in fancy bowls in fibre, and both Messrs. Carter Page and Co., London Wall, and Mr. Robert Sydenham, Birmingham, assisted in the same demonstration. A small group of daffodils from Messrs. Barr and Sons, Covent Garden, included a fine lot of King Alfred and numerous seedlings.

Tulips were shown in great quantity by Messrs. R. and E. Cuthbert, Southgate; these were in pots and well grown. They were staged in groups of a variety, the whole display filling one end of the hall. Mr. Stanley, Proserpine, Duchess de Parma, Le Reve, Montresor, Pink Beauty, Sir Thos. Lipton, and De Wet were capital varieties. Mr. Christopher Bourne, Sompson, Beltchley, put up a beautiful lot of the newer daffodils, his set including St. David, a neat golden trumpet, J. T. Bennett Poe, Circlet, Helios, White Slave, Lady de Bathe, Armorel, King Alfred, Golden King, and White Lady.

## FRUIT AND VEGETABLE COMMITTEE.

Vegetables were quite prettily staged by Messrs. Sutton and Sons, Reading; Chicory, cabbage lettuces, Superb Early White broccoli, seakale, radishes, dandelion, mushroom, rhubarb, and a selection of coloured kales were included in this interesting exhibit.

One exhibit of fruit was staged, and this consisted of about forty dishes of well preserved apples from Mr. W. H. Divers, gardener to the Duke of Rutland, Belvoir Castle, Grantham; Blenheim Pippin, Baillie Neilson, Russian Transparent, Hormead Pearmain, Barnack Beauty, Hambling's Seedling, Belle Dubois, Belle Pontoise, and Belle de Boskoop were all notably good.

## AWARDS.

No first-class certificates were awarded on this occasion.

Award of Merit.—To Azalea Blushing Bride, from Messrs. Jas. Veitch and Sons, Chelsea; to Rhododendron Cornubia, from Messrs. R. Gill and Son, Falmouth; to Corylopsis multiflora, from Miss Willmott, V.M.H. (gardener, Mr. C. Fielder), Great Warley; to Pteris Parkeri, from Messrs. Parker and Son, London, N.; to Odontoglossum Jasper, from J. Moss, Esq.; to Dendrobium Golden Ray superba, from Sir Jeremiah Colman, Bart. (gardener, Mr. W. Collier), Gatton Park, Reigate.

## MEDALS.

Gold.—To Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester, for orchids.

Silver-gilt Knightian.—To the Duke of Rutland, Belvoir Castle (gardener, Mr. Divers), for apples.

Silver-gilt Flora.—To Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; to Messrs. Jas. Carter and Co., Raynes Park, for spring bulb garden; to Messrs. Jas. Veitch and Sons, Chelsea, for azaleas and other greenhouse flowering plants.

Silver-gilt Banksian.—To Mr. L. R. Russell, Richmond, for Indian azaleas; to Messrs. Sutton and Sons, Reading, for hyacinths; to Messrs. R. and G. Cuthbert, Southgate, for tulips.

Silver Flora.—To Mr H. Burnett, Guernsey, for carnations; to Messrs. Cutbush and Son, Highgate, for carnations, hyacinths, etc.; to Messrs. Wm. Paul and Son, for camellias and flowering peaches; and to Messrs. J. Veitch and Sons, Chelsea, for orchids.

Silver Banksian.—To Mr. Christopher Bourne, Simpson, Bletchley, for daffodils; to Messrs. Cartwright and Goodwin, Kidderminster, for daffodils; to Messrs. Barr and Sons, Covent Garden, for spring bulbous flowers; to Adeline Duchess of Bedford (gardener, Mr. J. Dickson), for Primula obconica; to Mr. Clarence Elliott, Stevenage, for rock garden; to Messrs. H. B. May and Sons, Edmonton, for ferns and clematis; to Messrs. Jas. Cypher and Sons, Cheltenham, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Sir J. Colman, Bart. (gardener, Mr. Collier), for orchids; and to Messrs. Hassall and Co., Southgate, for orchids.

Bronze Flora.—To Mr. C. Engelmann, Saffron Walden, for carnations; and to Messrs. Stuart Low and Co., Enfield, for carnations.

## HYACINTH AND DAFFODIL COMPETITION.

The premier class for eighteen distinct varieties was hotly contested by seven exhibitors. The first prize, however, was won by Mr. Jas. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop. The whole exhibit was in fine condition, the varieties being Electra, Lord Balfour, King Menelik, Le Grandesse, Perle Brilliante, La Jacques, Moreno, Corregio, Lady Derby, La Victorie, City of Haarlem, Ivanhoe, King

Robinsons' Guaranteed Gardenalities

The first principle of successful gardening is fertilization. Your soil must be thoroughly fertilized or it cannot thoroughly maintain fruit and floral life.

This is why "Carmona" Fertilizers are essential to garden success, for in every respect they minister to the needs of trees and plants.

"Carmona Fertilizers are supplied in every necessary variety, and have been prepared specially for such purposes.

Not to fertilize is to neglect a fundamental gardening law—to attempt to fertilize with inferior and commonplace substitutes is waste of time and money.

**USE ONLY "CARMONA" FERTILIZERS.**

Robinsons particularly invite sweet pea growers to use their "Carmona" Sweet Pea Fertilizer. Its value is remarkable.

Bulks and prices of "Carmona" Fertilizers are: 1 cwt., 20s.; ½ cwt., 12s. 6d.; 28 lbs., 7s. 6d.; 14 lbs., 4s. 6d.; 7 lbs., 2s. 6d.; 1s. and 6d. tins.

Of all Seedsmen and Agents, or write direct.

**CLIFT'S FLUID INSECTICIDE.**

Messrs. Robinson Bros., Ltd., most strongly advise every gardener to write for a copy of the very convincing reports upon the extensive laboratory and outdoor experiments, conducted by an eminent expert, in relation to the efficacy of Clift's Fluid Insecticide. The facts and figures contained therein will at once demonstrate the absolute superiority of this standard insecticide. The prices are:—

40 galls., per gall. 4s. 6d.; 20 galls., per gall. 5s.; 10 galls., per gall. 5s. 3d.; 5 gallons, per gall. 5s. 6d.; 1 gall., 6s.; ½ gall., 3s. 6d.; 1 pint, 1s.

**ROBINSON'S £350 SHOW**

will be held on August 28th and 29th, at the Botanical Gardens, Edgbaston, Birmingham, and every buyer of "Carmona" Fertilizers will get an entry "Fee" coupon free. £350 in cash prizes, and also many Championship Medals.

This show will be one of the gardening events of the year. Show Schedules now ready, and forwarded free upon request.

When writing also ask for full details of all Robinsons' Guaranteed Gardenalities, together with copies of two highly valuable gardening booklets, viz.:—Robinsons' Guaranteed Gardenalities Booklet and Robinsons' Garden Enemies Booklet.

**THE BEST OF THEIR KIND**

are:—"ERADIWEED"—the wonderful guaranteed cent. per cent. Weed Killer.

"VELVAS" LAWN SAND.

All Robinson's Guaranteed Gardenalities are of the highest value. Absolutely true to description and indispensable to gardeners who are keen to achieve success. When writing address to

**ROBINSON BROS., LTD., WEST BROMWICH, STAFFS.**

Guaranteed Gardenalities

FLORA ABUNDA

of the Blues, Queen of the Pinks, Schotel, General Vetter, Koh-i-Noor, and L'Innocence. Mr. J. H. Barker, gardener to F. R. Dixon Nuttall, Esq., Ingleholme, Eccleston Park, Prescot, who had fine fresh spikes of Gounod, Madame Kruger, King Menelik, City of Haarlem, La Victorie, and King of the Blues.

The class for twelve hyacinths was keenly contested, there being no fewer than seven entries. The first prize was awarded to Mr. A. Hanson, Ivanhoe, Victoria Park, Liverpool, for massive spikes of Corregio, Lady Derby, Enchantress, Gounod, Schotel, King Menelik, La Victorie, and Madame Kruger. Mr. H. Prime was a good second with Ivanhoe, and City of Haarlem in fine form. Mr. J. Shelton, gardener to Lord Hillingdon, Wildernesse, Sevenoaks, was third.

For six hyacinths, Mr. R. Morrison, Prince Alfred Road, Wavertree, Liverpool, led the way with fine spikes of Ivanhoe, Gounod, La Victorie, Corregio, Madame Kruger, and Menelik. Mr. H. Edwards, gardener to C. E. Bishop, Esq., Norton Priory, Chichester, was second; and Mr. H. Brotherston, gardener to the Earl of Lytton, Knebworth, third.

The best six single hyacinths grown in moss fibre were exhibited by Miss E. M. Rawlings, Great Houghton Hall, Northampton, who was closely followed by Mr. W. Howe; and Miss Michell, Oakfield, Cricklewood, third.

Messrs. R. and G. Cuthbert, Southgate, were the only exhibitors of twelve varieties of hyacinths in pans, making one hundred and twenty spikes. The plants were splendidly developed, the varieties employed being Mr. Plimsoll, City of Haarlem, Perle Brilliante, King of the Blues, Ivanhoe, La Victorie, Jacques, Corregio, King Menelik, Queen of the Pinks, Linneæus, and Schotel.

There were but three competitors for four pans of hyacinths, each containing ten bulbs. Here Mr. Jas. Gibson was again first with fine examples of King of the Blues, La Victorie, Corregio, and City of Haarlem; Mr. H. Prime, gardener to the Marquis of Salisbury, Hatfield, was second, with good examples of Electra, La Grandesse, City of Haarlem, and La Victorie; while Mr. G. Mackinley, gardener to his Excellency the American Ambassador, Wrest Park, Ampthill, was third, with neater examples. The same competitors were the only exhibitors for one hundred plants in twenty varieties. These were splendidly grown, and arranged in five plants of one variety made a brave show, the whole being bedded in maidenhair ferns. Some of the best varieties were King Menelik, General Vetter, Linnæus, Perle Brilliante, Corregio, Queen of Pinks, Ivanhoe, and City of Haarlem; a very fine exhibit.

There were two exhibitors of six bowls of tulips grown in fibre, and the first prize fell to Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham, for very finely grown sets of Keiserskroon, Duchesse de Parma, Rose Luisante, Prince of Austria, White Joost van Vondel, and La Rêve. The second prize was awarded to Mr. Bates, gardener to the Hon. Mrs. Guy Baring, Chesterfield Street, Berkeley Square. For six bowls of narcissi grown in fibre, Miss Michell led with a good exhibit of Lucifer, Victoria, White Lady, Emperor, Red Flag, and Leoine. Mr. W. Howe came second, and Miss E. M. Rawlins third.

### Gardeners' Royal Benevolent Institution.

The Liverpool Auxiliary has added another successful meeting to its series of annual reunions in the form of a smoking concert held at the Bear's Paw on Tuesday, the 27th ult. The committee were fortunate in having their President, the Right Hon. the Earl of Derby, G.C.V.O., C.B., Lord Mayor of Liverpool, in the chair, and this, with an attractive programme, filled the spacious hall to its utmost limit, and a record may be claimed for the music, decorations, and attendance. The chairman, in a brief and cheery address, referred to the great progress made in the gardener's art during the last 50 years. A man loving flowes 50 years ago would hardly believe it possible that such a change could be made; but, for himself, he sometimes wished that they had not gone so far in their scientific knowledge and cultivation. He liked to see the spring flowers come up in the open, then he began to think spring had come. Members of their profession, however, did a great service to mankind generally, and he doubted whether there was anything in this world which gave as great a pleasure, and at so little cost, as flowers. They could not go into a hospital ward where there were flowers without feeling that these gave hope to those who felt hopeless; and by giving hope they gave assistance to the doctors' skill, and for that reason he hoped there would be a generous response on behalf of the Gardeners' Royal Benevolent Institution. An excellent programme was carried out, and Mr. Allan H. Bright moved, and Mr. C. A. Young seconded, a vote of thanks to his Lordship, which was carried with the utmost enthusiasm.

The decorations were ably carried out, and the thanks of the committee were accorded to Messrs. R. P. Ker and Sons, B. Webb and Sons, C. A. Young, W. Rowlands, and others, for choice plants and flowers.

## A DISEASE OF SWEET PEAS, ETC.

(Continued from page 187.)

### Cypripediums, Culinary Peas, Etc.

A batch of orchids (Cypripedium) attacked by Thielavia was sent to Kew for investigation. The basal portion of each plant was soft and decayed, and covered on the surface with a dense, black, crusty layer consisting of the Torula condition of the fungus. When placed in a damp chamber at the ordinary temperature of the laboratory, the white Milowia stage of the fungus developed within a few days, and gradually encroached on the still living green portion of the leaves. This material, available in quantity for the first time, enabled a series of experiments to be made on the action of the fungus on germinating seeds and on seedlings.

Twelve "marrow fat" peas were planted in each of two Petri dishes, in soil sterilised by steam and afterwards mixed with a copious growth of the Milowia form of the Thielavia. A third Petri dish used as a control, was prepared in a similar manner, excepting that no fungus was mixed with the soil. After a period of ten days five seedlings appeared above ground in one of the infected dishes and three seedlings in the other. All thes seedlings, however, died within a few days. On examining the peas that had not appeared above ground, it was found that both plumule and radicle had in every instance been killed by the fungus, as was also the case with those that appeared above ground at a later stage. All the peas in the control dish germinated and produced healthy seedlings. No success attended the many attempts to infect the leaves or above-ground portion of the stem of peas with the Milowia stage of the fungus. Seedlings of the Shepherd's purse (Capsella Bursa-pastoris) were also killed by the fungus. On the other hand, germinating oats were not attacked, neither were those of another grass, Briza maxima. Four Petri dishes containing ordinary garden soil, sterilised by steam and afterward infected with Thielavia in the Milowia stage, obtained from a pure culture on manure, were prepared. Two of these were flooded with one per cent. of formalin in water for an hour, after which the liquid was poured off and the soil allowed to remain for a week, when all trace of the smell of formalin had disappeared. The soil in the two remaining dishes was left untreated. Twelve peas were placed in each dish. At the expiration of ten days, all the peas in the two dishes treated with formalin were making vigorous growth, whereas in one of the dishes not treated with formalin no growth appeared above the surface of the soil, and in the second untreated dish four sickly seedlings continued to grow for a few days, but finally collapsed with one exception. When peas germinate in pure sand, mixed with the Milowia stage of the fungus attached to fragments of manure, infection of the seedlings occurs, whereas, when spores of the Milowia stage of the fungus alone are mixed with the sand, no infection takes place. This, along with experiments already recorded, proves that the germinating spores of the fungus cannot infect a host-plant directly, but only after the mycelium has existed for some time as a saprophyte, on humus or decaying vegetable matter.

### Symptoms of the Disease in Sweet Peas.

In those instances where the land is badly infected, the majority of the peas do not appear above ground at all. This occurs when both the plumule and radicle are attacked. In such case, if a number of the peas are dug up and placed with sterilised manure in a Petri dish, the contents kept moist and at a temperature of about 65 deg. F., the white Milowia condition of the fungus will appear on the surface of the manure within a few days. In the majority of cases the root only is attacked, at least at first, and the plant often attains a considerable growth before any sign of injury appears, but suddenly the plant may begin to wilt, turn yellow, and die, or in some instances only one branch dies, the rest of the plant remaining green for some time, but rarely producing perfect fruit. Another very common symptom of the disease is known to growers of sweet peas under the name of "streak" or "stripe," characterised by the presence of dingy yellow streaks or stripes on the leaves and stem. This condition is the result of what may be termed a mild attack, the fungus not being present in the tissues of the root and collar in sufficient quantity to kill the plant outright, yet sufficiently abundant to prevent the root from performing its function to the fullest extent, hence the stem and leaves lack water and are hungered. The green portions of a plant showing "streak" correspond to the position occupied by the vascular bundles or water-conveying vessels where the limited supply of water obtained by the root makes itself evident, whereas the yellow portions between the veins are dead, owing to lack of water. If the root of a pea plant that has been attacked by the fungus is examined, it will be seen to present a blackened or charred appearance, and very frequently to be more or less decayed on one side, suggesting the idea that it had been gnawed by wireworm. In some cases small black patches of the Torula form of fruit are present on the surface.

### Symptoms of the Disease in Asters.

So far as my experience goes, asters are always killed outright during the seedling stage. When the plants are about three inches high they commence to wilt, and soon fall over as in the disease known as "damping off." The roots of diseased plants are shrivelled and blackened, and all the rootlets are dead. The fungus appears to spread very rapidly in the soil, as whole batches of seedlings collapse simultaneously.

(To be Continued.)

→ Spraying ←
The question to-day is not **"Shall we Spray,"** as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers, Use **only** the **reliable** tested **"FOUR OAKS"** which have won **30** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-**. No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—**THE FOUR OAKS SPRAYING MACHINE CO., No. 3 G, SUTTON COLDFIELD.**

## ANSWERS TO CORRESPONDENTS.

ASPARAGUS BEDS.—F. B., Norwood: We wish to re-make an old asparagus bed, 12 yards by 3ft. 6in. wide. The soil is a heavy clay. The old plants have done badly of late, so we wish to re-make the bed and plant two-year-old roots. Kindly advise us how to proceed.—The better plan would have been to re-make the bed in the autumn; but, as planting time is close at hand, the work must be tackled immediately. Poor or heavy soil should be removed to a depth of at least two feet below the general soil level; break up the subsoil as much as possible, and then wheel in a quantity of the best well-worked soil to be found in the garden, mixing with this a large addition of crushed mortar rubbish, old manure, sand or road grit, burnt earth, and ashes from the burnt garden refuse. If the site lays very wet, excavate somewhat lower, and place a couple of inches of coarse mortar rubble, crushed brick, etc., in the bottom, for drainage. The soil should be made firm as filling in proceeds, and the bed should be made up to about a foot above the surrounding level. At the end of March or early in April plant the new crowns, spreading the roots evenly all round, and covering them with three inches of the best and finest soil. If you can possibly do so, make the bed four feet wide, as this will allow three rows of plants; set the crowns fifteen inches apart in the rows.

POSTCARDS OF CURIOUS PLANTS.—E. S., Norfolk: Have you any postcards or similar illustrations of curious plants, such as Mimosa pudica, Primula obconica, or of insects and birds that are troublesome in gardens? If so, I should be glad if you would send them, as I wish to use them in a lantern that will throw such pictures on a screen, in connection with a lecture I am giving shortly.—We have no postcard pictures of the kind you refer to, but if you mounted the illustrations that have appeared in the GARDENERS' MAGAZINE, they would help you materially. There are picture postcards of many kinds of British birds, and of a fair range of flowers, and these can be obtained at most shops where postcards are made a special feature.

JOURNAL OF THE KEW GUILD.—A. W. E., Reading: In referring to the "Journal" of the Kew Guild in your issue of February 24, you do not mention where it can be obtained, but say it is interesting even to "a man who is not a Kewite," in which category I am included. Please say to whom I might apply for a copy.—The secretary of the Kew Guild, and the Editor of its "Journal," is Mr. H. Cowley, South Side, Kew Green, Surrey. The "Journal" is issued for and to the Guild members, but we believe it is possible to purchase a copy.

DWARF BUSH CHRYSANTHEMUMS.—R. W. E., St. Albans: Kindly tell me how to produce dwarf, bushy, decorative chrysanthemums, so as to have them flowering in five-inch pots.—Insert cuttings at the end of March or in early April, in sandy soil, in a warm frame or greenhouse. Several may be placed in one pot, and each one potted into a thumb pot as soon as rooted. From thumb pots they must in due course be shifted into 60's, and early in July they should be ready for the final shift. Two or three, or possibly more, stoppings will be necessary, but only one stopping should be given after the final potting. A cold frame, with abundant ventilation, will provide sufficient shelter after the young plants are potted from the cutting pots, and every effort should be made to secure hardy, sturdy growth, so that when the plants are in bloom they are only about 18in. or 2ft. high, and carry from ten to twenty-five blooms. Directly after the final potting the plants will do best if placed out of doors in an open position, and plunged to the rim of the pot in ashes. They must have ample room for development, and for the admission of light and air among and around them. The potting material should not be so rich as that adopted for the production of large blooms, and sound, fertile loam should form the basis of the compost, adding a little bone-meal or dried cow manure, if necessary, or sand and leaf-soil if the loam is rather heavy and adhesive. Feeding should commence as soon as the flower buds have set, and should consist of frequent waterings with liquid manure and guano, using these in alternate weeks. Soot water is helpful if given occasionally, as it imparts a deeper green to the foliage, and increases the purity of the floral colours. In a hot, dry summer plunging the pots in ashes is almost essential to success, as the pots become so full of roots that, if exposed to sun and air, the root tips next the pot would become severely damaged if the soil was allowed to become at all dry. In a wet season extra care must be taken in watering, as there is then a little risk of harm resulting from an excess of water in the case of plunged plants.

LIFE HISTORY OF THE PEAR LEAF BLISTER MITE.—W. W., Cheltenham: I am becoming interested in the various mites that plague horticulturists, and have carefully followed the references made in the GARDENERS' MAGAZINE to the black currant bud mite, and the begonia mite. Can you tell me the life history and description of the pear leaf blister mite?—Nalepa, who named the pear leaf blister mite Eriophyes pyri, gives the size of the mite as from 1/147th to 1/125th of an inch long. The anterior end of the body (cephalo-thorax) has a semicircular shield on its upper surface. In front is the rostrum with its piercing and sucking mouth parts. There are two pairs of 5-jointed legs; each leg ends in a claw with a 4-plumed bristle. The abdomen is transversely ringed. On the upper surface of the mite and springing from the hind edge of the shield are two bristles. The abdomen bears two bristles towards its front end; about the middle are two moderately long bristles; near the hind end are two very short bristles; while there are two long bristles at the tail.

In the larval state the mite resembles the adult in external appearance, except for the smaller size, and a weaker bristling. In colour the mite is whitish. The winter is passed under cover of the outer bud-scales of the buds on the shoots of the year. In this position the mites shelter in numbers. In spring the mites proceed to gall the young leaves. The adult female lays her eggs in the gall. New broods of mites spread from the galls, forming fresh blisters on the same and other leaves. Before leaf-fall the mites pass to their winter quarters in the buds.

### NAMES OF PLANTS.

B. G. R., Hants.—1, Viburnum tinus; 2, Rhododendron præcox.

J. B. H., Cardiff.—1, Lippia citriodora; 2, Chionodoxa Lucilæ; 3, Garrya elliptica.

C. W., Lichfield.—1, Boronia megastigma; 2, Erica hyemalis; 3, Cestrum elegans; 4, Lachenalia Nelsoni.

H. E., Wimbledon.—1, Odontoglossum cirrhosum; 2, O. crispum, a pretty form; 3, probably a form of O. ardentissimum.

G. C., Loughborough.—1, Pelargonium crispum; 2, P. quercifolium; 3, the common rue, Ruta graveoleus; 4, Phyllanthus glaucescens; 5, Doodia aspera multifida; 6, Selaginella erythropus.

## GARDENING ENGAGEMENTS.

Mr. M. T. Heard, late of Broad Oak, Accrington, has been appointed head gardener to Oliver Riley, Esq., Embsay, Skipton, Yorkshire.

Mr. Arthur Mansfield, late of Merthyr Tydvil, has been appointed head gardener to the Hon. J. W. Rice, Brooklands, Swansea.

Mr. John H. Shipley, for the past four years head gardener at the Old Vicarage, Shiplake, Henley-on-Thames, Oxon, has been appointed head gardener to H. G. Rose, Esq., Ingleside, Stevenage, Herts.

## OBITUARY.

◆

### MR. W. A. GARAWAY.

Mr. Wm. Alexander Garaway, of Messrs. Jas. Garaway and Co., Bristol, passed away on February 19. He was well known in the nursery trade, and had reached the age of 75 years, but of late his health had been such that he was not often away from home.

### MR. THOMAS MUIR.

After thirty years' service as head gardener at Biel, Prestonkirk, the residence of Mrs. Hamilton Ogilvy, Mr. Thos. Muir passed away on February 26. He was a very capable gardener, and we have a vivid recollection of the fine display of Kniphofias at Biel, of which he was very proud.

## FORTHCOMING ENGAGEMENTS.

MONDAY, March 11.—United Horticultural Benefit and Provident Society, Annual Meeting at Royal Horticultural Hall, at 8 p.m.

TUESDAY, March 12.—Surbiton Spring Flower Show.

WEDNESDAY, March 13.—East Anglian Horticultural Club.

THURSDAY, March 14.—North of England Horticultural Society meets at Bradford.

British Gardeners' Association, Dinner at Holborn Restaurant, 6.30 p.m.

TUESDAY March 19.—Royal Horticultural Society. Narcissus Committee meets at 11.30. Fruit, Floral, and Orchid Committees meet at 12 o'clock. Lecture at 3 p.m. on "Ferns," by Mr. H. B. May, V.M.H. Scientific Committee at 4 o'clock.

WEDNESDAY, March 20.—Royal Meteorological Society.

THURSDAY, March 21.—Perpetual Flowering Carnation Society, at Royal Horticultural Hall, Westminster; two days.

Linnean Society Meeting.

Manchester and North of England Horticultural Society.

TUESDAY, March 26.—Bournemouth Spring Flower Show; two days.

WEDNESDAY, March 27.—Liverpool Spring Show; two days.

Royal Horticultural Society's General Examination in Horticulture.

Royal Botanic Society Meeting.
